Format cell	See <a href="#">Using the Format cell action</a> on page 3018.
Get cell	See <a href="#">Get cell action in Microsoft 365 Excel</a> on page 3019.
Get cell/text color	See <a href="#">Using the Get cell/text color action</a> on page 3019.
Get multiple cells	See <a href="#">Get multiple cells action in Microsoft 365 Excel</a> on page 3020.
Go to cell	See <a href="#">Go to cell action in Microsoft 365 Excel</a> on page 3020.
Insert cell	See <a href="#">Insert cell action in Microsoft 365 Excel</a> on page 3021.
Insert range	See <a href="#">Insert range action in Microsoft 365 Excel</a> on page 3021.
Paste cell	See <a href="#">Paste cell action in Microsoft 365 Excel</a> on page 3021.
Read cell format	See <a href="#">Read cell format action in Microsoft 365 Excel</a> on page 3021.
Read cell formula	See <a href="#">Read cell formula action in Microsoft 365 Excel</a> on page 3022.
Set cell	See <a href="#">Set cell action in Microsoft 365 Excel</a> on page 3022.
Set cell color	See <a href="#">Set cell color action in Microsoft 365 Excel</a> on page 3022.
Set cell formula	See <a href="#">Set cell formula action in Microsoft 365 Excel</a> on page 3023.

### Delete cell action in Microsoft 365 Excel

The Delete cell action in Microsoft 365 Excel enables you to delete an active cell or a specific cell from the current worksheet.

#### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select either the active cell or a specific cell. If you select **Specific cell**, enter the cell location. For example **A1**.
- From the delete options, select one of the following options:

- **Shift cells left:** Deletes the specified cell and shifts the cell one position to left.
- **Shift cells up:** Deletes the specified cell and shifts the cell one position up.
- **Entire row:** Deletes the entire row that contains the cell that you have specified to delete.
- **Entire column:** Deletes the entire column that contains the cell that you have specified to delete.

## Delete range action in Microsoft 365 Excel

The Delete range action in Microsoft 365 Excel enables you to delete a specific range of cells.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the cell range. For example **A1 : B4**. This deletes an area consisting of the first four rows by the first two columns.
- Specify whether to shift the cells up or left.
  - **Shift cells up:** Deletes the specified cells and shifts the cells up by the number of rows deleted.
  - **Shift cells left:** Deletes the specified cells and shifts the cells left by the number of columns deleted.

## Using the Format cell action

Use the **Format cell** action to set the format of a cell or group of cells.

To format a cell or group of cells, do the following:

1. Double-click or drag the **Format cell** action.
2. Enter the name of the session used to open the workbook with the **Open** .
3. Select the **Active cell**, **Specific cell**, or **Multiple cells** option and provide cell location or cell range, as necessary.
4. Mark the **Font** option to modify any of the following:
  - Font name
  - Font size (between 8 and 72)
  - Bold or italicize
  - Underline
  - Font color (accepts color name or hex value). For a list of color names and corresponding hex values, see [Frequently used cell colors](#) on page 3019.
5. Mark the **Alignment** option, then use the drop-down lists to modify the vertical or horizontal alignment.
6. Mark the **wrap text** option to expand the cell(s) vertically to show long strings of text.
7. Mark the **Merge Type** option to select the any of the following operations:
  - Merge and center
  - Merge across
  - Merge cells
  - Unmerge

**8. Click Save.**

## Frequently used cell colors

Review the color names and their corresponding hex values you can use to set a cell color for a cell or text within a cell in a worksheet. These are the most frequently used options for formatting worksheets.

Name	Hex
Aqua	#00FFFF
Black	#000000
Blue	#0000FF
Gray	#808080
Green	#008000
Fuchsia	#FF00FF
Lime	#00FF00
Maroon	#800000
Navy	#000080
Olive	#808000
Purple	#800080
Red	#FF0000
Silver	#C0C0C0
Teal	#008080
White	#FFFFFF
Yellow	#FFFF00

**Get cell action in Microsoft 365 Excel**

Use the Get cell action in Microsoft 365 Excel to retrieve the value of a cell.

**Settings**

- Enter the name of the session used to open the workbook with the **Open** action.
- Select either an **Active cell** or **Specific cell**. If you select a specific cell, enter the cell location.
- Assign the output to a String variable. To perform mathematical operations, convert the string to a number using the **String > To number**. See [To number action](#) on page 3295.

**Using the Get cell/text color action**

Use the **Get cell/text color** action to get the color of the background or text in a cell. This action retrieves the color of a cell as RGB values. For example, if the background or text in a cell is of red color, the value retrieved is 255,0,0.

To get the color of the background or text in a cell, do the following:

1. Double-click or drag the **Get cell/text color** action.
2. Enter the name of the session used to open the workbook with the **Open** .
3. Select the **Active cell** option to get the color from the current active cell or the **Specific cell** option to get the color from the address of the cell you have specified.
4. Select the **Cell color** option to get the background color of the cell, the **Text color** option to get the color of the text, or both.
5. Specify whether to retrieve the cell color by name or as an RGB value.
6. Select a variable from the **Assign the output to variable** list to assign the cell/text color to a List variable.
7. Click **Save**.

If both cell and text colors are retrieved, the List variable contains the cell color at index 0 and text color at index 1.

## Get multiple cells action in Microsoft 365 Excel

Use the Get multiple cells action in Microsoft 365 Excel to retrieve the values of multiple cells within a worksheet and assign the output to a variable.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select either the **Multiple cells** or **All cells** option. If you select **Multiple cells**, enter the cell range. For example, if you enter **A1 : D1**, values of the first four cells in the top row are retrieved.
- Assign the output to a String variable. To convert the string to a number, use the **String > To number** action. See [To number action](#) on page 3295.

## Go to cell action in Microsoft 365 Excel

Use the Go to cell action in Microsoft 365 Excel to move the cursor to a specific cell in the worksheet.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select from the following cell options:
  - **Specific cell**: Moves to the specified cell address.
  - **One cell to the left**: Moves one cell left.
  - **One cell to the right**: Moves one cell right.
  - **One cell above**: Moves one cell up.
  - **One cell below**: Moves one cell down.
  - **Beginning of the row**: Moves to the first cell in the same row.
  - **End of the row**: Moves to the last cell that contains data in the same row.
  - **Beginning of the column**: Moves to the first cell in the same column.
  - **End of the column**: Moves to the last cell that contains data in the same column.

## Insert cell action in Microsoft 365 Excel

Use the Insert cell action in Microsoft 365 Excel to insert a value to an active cell or a specific cell in the current worksheet without overwriting the existing value.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select either **Active cell** or **Specific cell**. If you select **Specific cell**, enter the cell location, for example **A1**.
- After inserting the cell, you can perform these operations:
  - **Shift cell > Down**: Shifts the existing values down by the specified number of rows.
  - **Shift cell > Right**: Shifts the existing values right by the specified number of columns.

## Insert range action in Microsoft 365 Excel

Use the Insert range action in Microsoft 365 Excel to insert a range in the current worksheet without overwriting the existing value.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the cell range, for example **A1 :B4**. This inserts a range of cells consisting of the first four rows by the first two columns.
- After inserting the cell, you can perform these operations:
  - **Shift cell > Down**: Shifts the existing values down by the specified number of rows.
  - **Shift cell > Right**: Shifts the existing values right by the specified number of columns.

## Paste cell action in Microsoft 365 Excel

Use the Paste cell action in Microsoft 365 Excel to copy a value from a cell and paste it to a specified cell. If there is a value in the destination cell, this action will overwrite the value.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select either the **Active cell** or **Specific cell** option to specify the cell from which to copy the value. If you have selected the **Specific cell** option, specify the address of the cell in the **Cell name** field.
- Enter the destination cell address to paste the value. For example, **B3**.

## Read cell format action in Microsoft 365 Excel

Use the Read cell format action to retrieve the format of an active or a specified cell (such as vertical or horizontal alignment and wrap text) and assign the output to a string variable.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select the **Active cell** or **Specific cell** option to specify the cell from which to read the format. If you have selected the **Specific cell** option, specify the address of the cell in the **Cell name** field.
- Select a String variable to store the cell format from the **Assign the output to variable** list.

## Read cell formula action in Microsoft 365 Excel

Use the Read cell formula action to retrieve a formula from an active or a specific cell and assign the output to a string variable. This action returns a blank value if the specified cell does not contain a formula.

## Settings

- Enter the name of the session used to open the workbook with the **Open** .
- Select the **Active cell** or **Specific cell** option to specify the cell from which to read the formula. If you have selected the **Specific** option, specify the address of the cell in the field.
- Select a string variable to store the name of the formula from the **Assign the output to variable** list. The shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.

## Set cell action in Microsoft 365 Excel

Use the Set cell action to set a value in an active or a specific cell of an Excel spreadsheet or a CSV file. You can also use this action to set a formula.

## Settings

- Enter the name of the session used to open the workbook with the **Open** .
- Select the **Active cell** or **Specific cell** option to specify the cell in which to set the value. If you have selected the **Specific cell** option, specify the address of the cell in the field.

---

**Note:** You can enter a cell range in the **Specific cell** field to set a particular value in all the cells of the range. For example, to set a value of 5 on all cells in the second row and from the first through third column, enter **A2 : C2**.

---

- Enter the value to set in the **Cell value** field.

## Set cell color action in Microsoft 365 Excel

Use the Set cell color action to set a color to the background or text of an active cell or a Specific cell in a worksheet.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.

- Select the **Active cell**, **Specific cell**, or **Cell range** option to specify the cell in which to set the color. If you have selected the **Specific cell** option, specify the address of the cell in the **Cell name** field.
- Select the item to which you want to apply the color: **Cell** or **Text within cell**.
- Enter a cell color by name or code.

Use either the color name or the hex value. For a list of color names and corresponding hex values, see [Frequently used cell colors](#) on page 3019.

## Set cell formula action in Microsoft 365 Excel

The set cell formula action enables you to set the formula of a specified cell in a worksheet.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select the **Active cell**, **Specific cell**, or **Multiple cell** option to specify the cell in which to set the formula. If you have selected the **Specific cell** option, specify the address of the cell in the **Cell name** field. For the multiple cell option, specify a cell range.
- Enter the value to set in the **Cell formula** field, without an "=".

## Column/Row operations in Microsoft 365 Excel

The Microsoft 365 Excel package contains actions that you can use to automate tasks related to column and row operations such as autofit, delete, insert, and read.

The Microsoft 365 Excel package includes the following actions:

Actions	Description
Autofit columns	See <a href="#">Autofit columns action in Microsoft 365 Excel</a> on page 3024.
Autofit rows	See <a href="#">Autofit rows action in Microsoft 365 Excel</a> on page 3024.
Delete row/column	See <a href="#">Using Delete row or column action</a> on page 3024.
Get row count	See <a href="#">Get row count action in Microsoft 365 Excel</a> on page 3025.
Insert row/column	See <a href="#">Using Insert row or column action</a> on page 3025.
Read column	See <a href="#">Read column action in Microsoft 365 Excel</a> on page 3026.
Read row	See <a href="#">Read row action in Microsoft 365 Excel</a> on page 3026.

## Autofit columns action in Microsoft 365 Excel

Use the **Autofit columns** action in Microsoft 365 Excel package to resize the width of the columns in a workbook for the specified session.

### Settings

- Enter the name of the session used to open the workbook with the **Open** .  
See [Using the Open action](#) on page 3029.
- Click **Save**.

The column width in the selected workbook is automatically resized when this action is executed.

## Autofit rows action in Microsoft 365 Excel

Use the **Autofit rows** action in the Microsoft 365 Excel package to resize the height of the rows in a workbook for the specified session.

### Settings

- Enter the name of the session used to open the workbook with the **Open** .  
See [Using the Open action](#) on page 3029.
- Click **Save**.

The row height in the selected workbook is automatically resized when this action is executed.

## Using Delete row or column action

Use the **Delete row or column** action to remove rows or columns from the current worksheet.

To delete rows or columns in a worksheet, do the following:

1. Double-click or drag **Delete row or column**.
2. Enter the name of the session used to open the workbook with the **Open** .
3. Select one of the following:
  - **Row Operations**
    - a) Select the **Delete Row at** option to delete all of the cells in a specific row. Specify the row number to delete in the field. For example, to delete the tenth row in the worksheet, enter 10 in the field.
    - b) Select the **Delete Row by** option to delete all of the cells in either:
      - the row of the active cell.
      - a specific range of cells. Specify the range to delete. For example, to delete the first five rows, enter 1 : 5 in the field.
  - **Column Operations**
    - a) Select the **Delete Column at** option to delete all of the cells in a specific column. Specify the address of the column to delete in the field. For example, to delete column 'D' in the worksheet, enter D in the field.

- b) Select the **Delete Columns by** option to delete all of the cells in either:
- the column of the active cell.
  - a specific range of cells. Specify the range to delete. For example, to delete the first five columns, enter **A:E** in the field.

4. Click **Save**.

## Get row count action in Microsoft 365 Excel

Use the Get row count action in the Microsoft 365 Excel package to retrieve the number of rows that contain data in a worksheet.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Assign the output value to a Number variable.  
To convert the variable to a String variable, use the **Number > To string** action. For more information, see [To string action in Number](#) on page 2996.

## Using Insert row or column action

Use the **Insert row or column** action in Microsoft 365 Excel package to create rows or columns in the current worksheet.

To insert or delete rows or columns in a worksheet, do the following:

1. From the Microsoft 365 Excel package, double-click or drag **Insert row or column** action.
2. Enter the name of the session used to open the workbook with the **Open** .
3. Select one of the following:
  - **Row operations**
    - a) Select the **Insert Row(s) at** option to insert a row and specify the location where to insert the row in the field. For example, to insert a row of cells in the tenth row in the worksheet, enter 10 in the field.
    - b) Select the **Insert Row(s) by** option to insert all of the cells in either:
      - the row of the active cell.
      - a specific range of cells. Specify the range where to insert the row. For example, to insert a row of cells in the first five rows in the worksheet, enter **1:5** in the field.
  - **Column operations**
    - a) Select the **Insert Column(s) at** option to insert a column and specify the location where to insert the row in the field. For example, to insert a column of cells in column 'D' in the worksheet, enter D in the field.
    - b) Select the **Insert Columns(s) by** option to insert all of the cells in either:
      - the column of the active cell.

- a specific range of cells. Specify the range to insert the column. For example, to insert a row of cells in the first five columns, enter **A:E** in the field.

4. Click **Save**.

## Read column action in Microsoft 365 Excel

Use the Read column action in the Microsoft 365 Excel package to extract data from a column and store it in a List variable.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select the cell option as **Active cell** or **Specific cell** to specify the starting point.
- You can also select the **Read full column** option to extract data for the entire column.
- Assign the output value to a List variable.

## Read row action in Microsoft 365 Excel

Use the Read row action in the Microsoft 365 Excel package to extract data from a row and store it in a variable.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select the cell option as **Active cell** or **Specific cell** to specify the starting point.
- You can also select the **Read full row** option to extract data for the entire row.
- Assign the output to a variable: Multiple variables or a Record variable.

## Table operations in Microsoft 365 Excel

The Microsoft 365 Excel package contains various actions that you can use to automate tasks related to the table operations such as create, delete, filter, get properties, rename, and sort.

The Microsoft 365 Excel package includes the following actions:

Actions	Description
Create table	See <a href="#">Create table action in Microsoft 365 Excel</a> on page 3027.
Delete table	See <a href="#">Delete table action in Microsoft 365 Excel</a> on page 3027.
Get table column	See <a href="#">Get table column action in Microsoft 365 Excel</a> on page 3027.
Get table names	See <a href="#">Get table names action in Microsoft 365 Excel</a> on page 3027.

Actions	Description
Get table row	See <a href="#">Get table row action in Microsoft 365 Excel</a> on page 3028.
Get table row count	See <a href="#">Get table row count action in Microsoft 365 Excel</a> on page 3028.
Rename table	See <a href="#">Rename table action in Microsoft 365 Excel</a> on page 3028.

## Create table action in Microsoft 365 Excel

The Create table action in the Microsoft 365 Excel package enables you to create a new table in the specified table range.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the table name.
- Enter the cell range in which to create the table. For example, A1:D4.
- Optional: Select the **Table has headers** option to establish the first row as the header row.

## Delete table action in Microsoft 365 Excel

The Delete table action in the Microsoft 365 Excel package enables you to delete a table in the active worksheet.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the table name that has to be deleted.

## Get table column action in Microsoft 365 Excel

Use the Get table column action in the Microsoft 365 Excel package to retrieve the column values of a specified table and column index, and assign the values to a List variable.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the table name.
- Enter the column index. For example, enter 5 to indicate the fifth column from the left.
- Select a List variable to store the values.

## Get table names action in Microsoft 365 Excel

The Get table names action in Microsoft 365 Excel enables you to retrieve the names of all the tables in a workbook and assign them to a List variable.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Optional: Select whether to specify a sheet either by index or name.
- Select a List variable to store the values.

## Get table row action in Microsoft 365 Excel

The Get table row action in Microsoft 365 Excel enables you to retrieve the row values of a specified table and row index, and assign the values to a variable.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the table name.
- Enter the row index. For example, enter 5 to indicate the fifth row from the top.
- Assign the output to a variable: Multiple variables or a Record variable.

## Get table row count action in Microsoft 365 Excel

The Get table row count action in Microsoft 365 Excel enables you to retrieve the row count of a specified table and assign the values to a number variable.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the table name.
- Select a Number type variable to store the values.  
To convert the variable to a String variable, use the **Number > To string** action. For more information, see [To string action in Number](#) on page 2996 .

## Rename table action in Microsoft 365 Excel

The Rename table action in Microsoft 365 Excel enables you to rename a table.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the current or existing table name.
- Enter a new table name.

## Workbook operations in Microsoft 365 Excel

The Microsoft 365 Excel package contains actions that enable you to automate opening, closing, or creating a new workbook.

The Microsoft 365 Excel package includes the following actions:

Actions	Description
Close	See <a href="#">Close action</a> .
Create workbook	See <a href="#">Create workbook action</a> .
Open	See <a href="#">Using the Open action</a> on page 3029.

## Close action in Microsoft 365 Excel

Use the Close action in Microsoft 365 Excel package to close a workbook.

### Settings

Enter the name of the session used to open the workbook with the **Open** .

## Create workbook action in Microsoft 365 Excel

Use the **Create workbook** action in Microsoft 365 Excel package when you want to create a new workbook.

### Settings

- Enter the name of the session used to open the workbook with the **Open** .
- In the **Workbook name including path** field, enter the workbook name that you want to create.

Click the **Insert a value** icon to select an existing variable.

---

**Note:** The workbook is created by default in the root directory. You can use the **Move file or folder** action in the Microsoft 365 OneDrive package to move this workbook to the desired location.

For more information, see [Move file or folder action](#) on page 3041.

---

## Using the Open action

Use the **Open** action to open a specific workbook from a Microsoft 365 Excel file. Ensure that you insert this action at the start of your automation sequence.

1. Double-click or drag the **Open** action.
2. Enter the user session name in the **Microsoft 365 user session** field.  
Provide the username entering an unencrypted value or click the **Insert value** icon and select an existing variable.
3. Enter the session name in the **Microsoft 365 Excel session** field.  
Use this same session name in subsequent actions to associate them with this workbook.
4. Use the **File Path** to select one of the following options:
  - **File name including Path**  
Use this option if you know the name of the Microsoft 365 Excel file and the filepath. For example, to perform this action on a file named `SalesReport.xlsx`, located in

the `Accounts` folder of your OneDrive, enter `Documents/OneDrive/Accounts/SalesReport.xlsx`.

**Note:** Ensure that the Microsoft Excel file is placed in the **My Files** folder in OneDrive.

- **Select existing file variable**

Use this option if you want to select an existing variable from the drop-down menu. Optionally, click the **Create variable** icon if there is no variable available.

5. Optional: If you want to open a specific worksheet, select the **Specific sheet name** check box and enter the name of the worksheet.

If you have stored the name of the worksheet as a variable, click the **Insert a value** icon to select the variable.

6. Optional: Select the **Sheet contains header** check box if the sheet contains a header row.
7. Click **Save**.

## Worksheet operations in Microsoft 365 Excel

The Microsoft 365 Excel package contains actions that you can use to automate tasks related to worksheet operations, such as delete, find, get worksheet names, hide, retrieve worksheet count, and show.

The Microsoft 365 Excel package includes the following actions:

Actions	Description
Copy worksheet	See <a href="#">Using the Copy worksheet action</a> on page 3031.
Create sheet	See <a href="#">Create sheet action in Microsoft 365 Excel</a> on page 3031.
Delete worksheet	See <a href="#">Delete worksheet action in Microsoft 365 Excel</a> on page 3031.
Get current worksheet name	See <a href="#">Get current worksheet name action in Microsoft 365 Excel</a> on page 3032.
Get worksheet names	See <a href="#">Get worksheet names action in Microsoft 365 Excel</a> on page 3032.
Hide worksheet	See <a href="#">Hide worksheet action in Microsoft 365 Excel</a> on page 3032.
Rename worksheet	See <a href="#">Rename worksheet action in Microsoft 365 Excel</a> on page 3032.
Retrieve sheet count	See <a href="#">Retrieve sheet count action in Microsoft 365 Excel</a> on page 3033.
Show worksheet	See <a href="#">Show worksheet action in Microsoft 365 Excel</a> on page 3033.
Switch to sheet	See <a href="#">Switch to sheet action in Microsoft 365 Excel</a> on page 3033.

## Using the Copy worksheet action

Use the **Copy worksheet** action to copy values of a worksheet from one worksheet to another. This action overwrites any existing values. To move values from one worksheet to another without overwriting existing values, use the **Append worksheet** action.

Open the workbook(s) containing the source and target worksheets. See [Using the Open action](#) on page 3029.

---

**Note:** This action identifies the destination and source workbooks by the session names used to open them. If opening two workbooks, enter a session name for the source workbook that is different than the one used to open the destination workbook.

---

To copy the values of a worksheet into another, do the following:

1. Double-click or drag the **Copy worksheet** action.
2. Enter the name of the session that you used to open the destination workbook in the **Open** action.
3. If the workbook contains more than one worksheet, mark the **Specific Sheet** option, then enter the index number or name of the source worksheet.
  - The index number represents the position of the worksheet in the workbook. For example, to perform an operation on the worksheet at the third position in the workbook, enter 3 in the field.
  - The sheet name field is case insensitive.
4. Enter the name of the session that you used to open the source workbook in the **Open** action.
5. If the workbook contains more than one worksheet, mark the **Specific Sheet** option, then enter the index number or name of the destination worksheet.
6. Click **Save**.

## Create sheet action in Microsoft 365 Excel

The **Create sheet** action in the Microsoft 365 Excel package enables you to add an empty sheet in the current workbook.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter a **Worksheet name** of up to 31 characters. The name cannot contain the following characters: \ / ? \* [ ]

## Delete worksheet action in Microsoft 365 Excel

The **Delete worksheet** action in the Microsoft 365 Excel package enables you to delete a spreadsheet from the current workbook.

### Settings

- Enter the name of the session used to open the workbook with the **Open** .

- Specify either an index number in the **Sheet by Index** field or a name in the **Sheet by Name** field for the worksheet. The index number is the number assigned to a worksheet. For example, if you want to perform an operation on the worksheet at the third position in the workbook, enter 3 in the field.

---

**Note:** You can delete a worksheet only if the workbook contains more than one worksheet.

---

## Get current worksheet name action in Microsoft 365 Excel

The **Get current worksheet name** action in the Microsoft 365 Excel package enables you to retrieve the name of the currently active worksheet.

### Settings

- Enter the name of the session used to open the workbook with the **Open** .
- Select a string variable that you want to use to store the name of the worksheet from the **Assign the output to variable** list. The shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.

## Get worksheet names action in Microsoft 365 Excel

The **Get worksheet names** action in the Microsoft 365 Excel package enables you to retrieve the names of all the worksheets in the workbook.

### Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Select a list variable to store the worksheet names from the **Assign the output to variable** list.

## Hide worksheet action in Microsoft 365 Excel

The **Hide worksheet** action in the Microsoft 365 Excel package enables you to hide a worksheet from the current workbook.

### Settings

- Specify the name of the worksheet to hide in the **Enter worksheet name to hide** field.

---

**Note:** You can hide a worksheet only if the workbook contains more than one worksheet.

---

- Enter the name of the session used to open the workbook with the **Open** .

## Rename worksheet action in Microsoft 365 Excel

The **Rename worksheet** action in the Microsoft 365 Excel package enables you to rename a worksheet in the current workbook.

## Settings

- Specify the index number or name of the worksheet to rename in the **Sheet by Index** or **Sheet by Name** field.

The index number is the number assigned to a worksheet. For example, if you want to perform an operation on the worksheet at the third position in the workbook, enter 3 in the field.

---

**Note:** You cannot rename the worksheet if a worksheet with the same name already exists in the workbook.

---

- Enter the new worksheet name that is under 31 characters.
- Enter the name of the session used to open the workbook with the **Open** .

## Retrieve sheet count action in Microsoft 365 Excel

The **Retrieve sheet count** action in the Microsoft 365 Excel package enables you to get the number of sheets available in the current workbook and stores it in a number variable.

## Settings

- Select the appropriate option to specify whether to include the hidden worksheet or not and assign the count to a variable.
- Enter the name of the session used to open the workbook with the **Open** .
- Select a number variable that you want to use to store the name of the worksheet from the **Select the variable to assign to** list. The shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.

## Show worksheet action in Microsoft 365 Excel

The **Show worksheet** action in the Microsoft 365 Excel package enables you to show the hidden worksheet.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Enter the **Worksheet name**.

## Switch to sheet action in Microsoft 365 Excel

The **Switch to sheet** action in the Microsoft 365 Excel package enables you to activate a particular sheet in a Microsoft Excel file.

## Settings

- Enter the name of the session used to open the workbook with the **Open** action.
- Specify whether to activate the **Sheet by Index** (numerical value) or **Sheet by Name**.

## Microsoft 365 OneDrive package

The Microsoft 365 OneDrive package contains actions that enable you to automate many of the repetitive tasks in Microsoft cloud storage.

### How to use the actions in the Microsoft 365 OneDrive package

**Note:** Microsoft has deprecated EWS API for Exchange Online and has recommended users to move to Graph API. Starting from Automation 360 v.29, Office 365 OneDrive package is called Microsoft 365 OneDrive package. Although the package name has changed, the functionality remains the same. So your existing bots from previous releases will continue to work as expected after an update to Automation 360 v.29.

Perform the following actions within the **One Drive** package as part of using the set of available actions:

1. Use the **Connect** action to establish a connection to the Microsoft 365 server.

See [Using Connect action in Microsoft 365 OneDrive package](#) on page 3036.

**Note:** Microsoft 365 packages do not currently support multi-factor authentication (MFA) or single sign-on (SSO).

2. Use a combination of actions available in this package to automate tasks.

**Note:** To use actions from other Microsoft 365 packages, establish a connection using the **Connect** action from that package.

3. Use the **Disconnect** action to terminate the connection.

For an example on how to setup and connect to the Microsoft 365 OneDrive package, see [Setup Azure App to connect using Microsoft OneDrive package \(A-People login required\)](#).

### Actions in the Microsoft 365 OneDrive package

Use the actions in the Microsoft 365 OneDrive package to perform an operation on a single file or folder. To perform the operation on every file in a folder, use that action in a loop. See [Using the One Drive actions in a loop](#) on page 3043.

**Note:** Automation 360 supports the shared drive. To use shared drive items such as a file or folder, ensure that you provide the link and name of that file or folder.

The Microsoft 365 OneDrive package includes the following actions:

Action	Description
Check permission	See <a href="#">Check permission action</a> on page 3035.

Action	Description
Connect	Establishes a connection with the Microsoft 365 server using your organization's client ID and tenant ID, and user credentials.  See <a href="#">Using Connect action in Microsoft 365 OneDrive package</a> on page 3036
Copy file or folder	See <a href="#">Copy file or folder action</a> on page 3038.
Create folder	See <a href="#">Create folder action</a> on page 3038.
Delete file or folder	See <a href="#">Delete file or folder action</a> on page 3039
Disconnect	See <a href="#">Using Disconnect action in Microsoft 365 Calendar package</a> on page 3011.
Download file	See <a href="#">Download file action</a> on page 3039.
Export as PDF	See <a href="#">Export to PDF action</a> on page 3040.
Find files and folders	See <a href="#">Find files and folders action</a> on page 3040.
Get file or folder information	See <a href="#">Get file or folder information action</a> on page 3041.
Move file or folder	See <a href="#">Move file or folder action</a> on page 3041.
Rename file or folder	See <a href="#">Rename file or folder action</a> on page 3042.
Restore last version	See <a href="#">Restore last version action</a> on page 3042.
Upload file	See <a href="#">Upload file action</a> on page 3042.

Related reference

[Microsoft 365 OneDrive package updates](#) on page 988

Review the updates in released versions of the Microsoft 365 OneDrive package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Check permission action

The **Check permission** action in the Microsoft 365 OneDrive package checks for read and write permission for a file or folder in your OneDrive.

### Settings

- Enter the Microsoft 365 user session that you provided in the **Connect** action.
- Use the **Check Permission for** field to select one of the following options:

- **File name on OneDrive (including path & extension)**: to enter the file name on OneDrive for which the permissions must be verified.
- **Folder name on OneDrive (including path)**: to enter a folder name on OneDrive where the permissions must be verified.

(Optional) For the above options, click the **Insert a value** icon to select an existing variable.

- Select one of the following options in the **Check permission type** field to specify the permission type to verify:
  - **Read**
  - **Read & Write**
- Use the **Assign output status to variable** drop-down to select a predefined Boolean type variable to hold the output during bot runtime.

(Optional) Click the **Create variable** icon on the right for a new variable. The Boolean type variable will provide a true (user has permission) or false (user does not have permission) response.

## Using Connect action in Microsoft 365 OneDrive package

Use the **Connect** action in the Microsoft 365 OneDrive package to establish a connection with the Microsoft 365 server using your organization's (client ID and tenant ID) and user credentials.

All the fields in the **Connect** action accepts a credential from the Credential Vault or a user-input value.

---

**Note:** Note the following conditions for the **Connect** action:

- Does not currently support MFA or SSO.
- Ensure that the administrator consent for the permissions is granted.

- 
1. Log in to the [Azure portal](#) using your Microsoft 365 credentials.
  2. Register your application with the Microsoft identity platform to obtain the client ID and tenant ID. See [Register your app](#).
  3. Grant the required permissions for Microsoft Graph to the application.  
See [Permissions for application](#) on page 3008.

---

**Note:** For your app registration on Azure portal, navigate to **Authentication > Advanced Settings > Allow public client flows** and ensure that you select **Yes**.

- 
4. To add a client secret, you must first subscribe to Azure. See [Subscribe to Azure](#).
  5. Add a client secret. See [Add a client secret](#).

For an example on how to setup and connect to the Microsoft 365 OneDrive package, see [Setup Azure App to connect using Microsoft OneDrive package \(A-People login required\)](#).

1. In the Actions palette, double-click or drag the **Connect** action from the package you want to use.

2. In the **Microsoft 365 OneDrive user session** field, enter a session name.  
(Optional) Click the **Insert a value** icon to select an existing variable.

---

**Note:** Enter this session name in subsequent actions in this package.

---

3. Click the **OAuth2 Authentication Mode** to select one of the options:

- **Control Room managed**

Use the following fields to update the information:

- **Connection:** click the **Pick** button to select an existing connection.
  - Click the **Provider type** drop-down menu to select an available or custom provider.  
For information in creating a custom provider, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.
  - Click the **Connection name** to select the corresponding connection for the selected provider.
  - Use the **Token type** field to select one of the following options:

- **Shared:** for a global token.

An access token of shared type is created when a connection is established to the Control Room. This access token is stored as a credential. When you run your automation, the access token is referenced in the automation using the enterprise application provider type set up in the Control Room.

- **User-specific:** for a token that is specific to a user.

If you select this option, ensure that you log in to your Microsoft 365 account to authenticate and generate a user-specific token. Perform the following steps to use this option:

- a) Log in to Control Room and navigate to **My settings > OAuth connections** in your profile.
- b) Under the **OAuth connections** tab, click **Login to authenticate**.
- c) Sign in to your Microsoft 365 account and select **Continue**.
- d) Verify the services you have access to and click **Continue**.

If the connection is succeeded, it will display the status as **Active** under the **OAuth connections > Connections** table.

- Click one of the following tabs in the **Username** field:
  - **Credential:** click the **Pick** button to select a value in the Credential Vault that contains information about the username.
  - **Variable:** to use a user-defined variable that contains information about the username.
  - **Insecure string:** to enter a value.

- **ROPC**

Use the following fields to enter the information that is provided for your account on your [Azure portal](#)

- **Client ID:** enter the Microsoft 365 client ID or insert it from the Credential Vault.

- **Tenant ID:** enter the unique ID for your Microsoft 365 subscription or insert it from the Credential Vault.
- **Username:** enter the username that you want to use for accessing Microsoft 365 OneDrive.
- **Password:** specify the Microsoft 365 password:
- **Client secret:** enter your access token or insert it from the Credential Vault.

For all the above fields, you can use one of the following tabs to insert a value:

- **Credential:** to use a value in the Credential Vault that contains information about the Client ID/Client secret/ username/ password..
- **Variable:** to use a user-defined variable that contains information about the Client ID/ Client secret/ username/ password.
- **Insecure string:** to enter a value.

4. Click **Save**.

## Copy file or folder action

The Copy file or folder action in the Microsoft 365 OneDrive package duplicates a file or folder from one folder to another in your OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Select whether to copy a file or folder.
- Provide the source and destination file/folder names and paths or file/folder link.

To obtain the file or folder link, copy the link generated from [Share OneDrive files and folders](#)

For example, to perform this action on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Create folder action

The Create folder action in the Microsoft 365 OneDrive package creates a new folder in a specific directory in your OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Enter the parent folder name and path, or folder link.

To obtain the folder link, copy the link generated from [Share OneDrive files and folders](#)

For example, to perform this action on a folder named Q1, located in the Survey Results folder, enter `/Survey Results/Q1`.

- Enter the new folder name.

## Delete file or folder action

The Delete file or folder action in the Microsoft 365 OneDrive package removes a file or folder from a specific directory in your OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Select whether to delete a file or folder.
- Provide the name and path, or file or folder link.

To obtain the file or folder link, copy the link generated from

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

## Download file action

The Download file action in the Microsoft 365 OneDrive package downloads a file from a specific directory in your OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide the file name and path, or file link.

To obtain the file link, copy the link generated from [Share OneDrive files and folders](#)

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

- Enter the destination folder path on the local device.
- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Export to PDF action

The Export to PDF action in the Microsoft 365 OneDrive package exports an existing file in your OneDrive to a PDF on your device. This action supports the following file extensions: doc, docx, oentry, odp, pps, ppt, pptx, tf, xls, and xlsx.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide the file name and path, or file link. Either enter the values or insert a predefined string variable.

To obtain the file link, copy the link generated from [Share OneDrive files and folders](#)

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

- Enter the export folder name and path or select a predefined string variable.
- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Find files and folders action

The Find files and folders action in the Microsoft 365 OneDrive package returns a table of files and folders in a specific directory in your OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide directory details in the **Folder to search** field: enter the folder name and path, or folder link.

To obtain the folder link, copy the link generated from

For example, to perform this on a folder named Q1, located in the Survey Results folder, enter `/Survey Results/Q1`.

- Specify whether to search for **All items in folder** or a **Specific file (or folder)**.

---

**Note:** The **Drive Item Name** field accepts wildcard characters in the file name and extension. For example, to search for all documents with extension docx, enter `*.docx` in the **Specific file (or folder)** field.

---

- Assign the output to a table variable.

The variable will hold the following file or folder details: Name, ID, CreatedBy, CreationDate, LastModifiedBy, LastModificationDate, and ParentFolderPath.

## Get file or folder information action

The Get file or folder information action in the Microsoft 365 OneDrive package retrieves information for a specific file or folder from OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide the file or folder name and path, or file/folder link.

To obtain the file or folder link, copy the link generated from

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

- Assign the output to a record variable.

The variable will hold the following file or folder details: Name, ID, CreatedBy, CreationDate, LastModifiedBy, LastModificationDate, and ParentFolderPath.

## Move file or folder action

The Move file or folder action in the Microsoft 365 OneDrive package moves a file or folder from one folder to another in OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Select whether to move a file or folder.
- Provide the source and destination file or folder names and paths, or file/folder links.

To obtain the file or folder link, copy the link generated from

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Rename file or folder action

The Rename file or folder action in the Microsoft 365 OneDrive package renames a file or folder in a specific directory in OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Select whether to rename a file or folder.
- Provide the current and new file or folder names, or file/folder link.
- To obtain the file or folder link, copy the link generated from
- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Restore last version action

The Restore last version action in the Microsoft 365 OneDrive package restores a file to the last version.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide the file name and path, or file link.

To obtain the file or folder link, copy the link generated from

For example, to perform this on a file named SalesReport.xlsx, located in the Accounts folder, enter `/Accounts/SalesReport.xlsx`.

---

**Note:** The forward slash that indicates that a file or folder is located in the root directory is optional.

---

## Upload file action

The Upload file action in the Microsoft 365 OneDrive package uploads a file to a specific directory in OneDrive.

### Settings

- Enter the user session that you provided in the **Connect** .
- Provide the file name and path on the local directory.  
For example, `D:/Mydata/HR/EmployeeSurvey.xlsx`.
- Provide the upload folder name and path, or folder link.

To obtain the folder link, copy the link generated from

For example, to perform this action on a folder named Q1, located in the Survey Results folder in home directory, enter `/Survey Results/Q1`

---

**Note:** You cannot provide the private folder path from one drive as it is not supported.

---

- Optional: If there is file or folder with the same name in the destination folder, select the **Override existing file/folder** option which replaces the existing file or folder with the one being copied.

## Using the One Drive actions in a loop

Use the **Find files and folder** action to return a table of files and their properties inside of a specified folder, the **Loop** action to loop through each row in the table, and a **One Drive** action to perform an operation on every file in the table.

To perform an action on every file in a folder, do the following steps:

1. Double-click or drag **One Drive > Find files and folders**.
2. Provide your username with either a credential variable or an unencrypted value.
3. Enter the file path of the folder in which to perform the search.
4. Select the **All items in folder** option.  
You can alternatively select **Specific file (or folder)** to limit the search to a specific folder on your OneDrive.
5. Select or create a table variable to hold the output.  
The table variable holds information on files and folders in rows, under the following columns: name, id, createdBy, creationDate, lastModifiedBy, lastModificationDateTime, parentFolder, and Path.
6. Double-click or drag the **Loop** action.
7. Select the **For each row in table** iterator.
8. Select the table variable holding the output from step 5.
9. Select or create a record variable to temporarily hold each row.

Insert the action inside of the **Loop** container that you want to repeat on every file in the folder. This example uses the **Download file** action.

10. Double-click or drag **Outlook > Download file**.
11. Provide your username with either a credential variable or an unencrypted value.
12. Enter the following in the **File name including path** field, replacing the generic variable names with the names of the record variables from step 10:  
`$$RecordVariable[7]$$/$RecordVariable[0]$$`
13. Enter the path to the folder where to download the files.
14. Click **Save**.

## Microsoft 365 Outlook package

The Microsoft 365 Outlook package enables you to automate Outlook emails over Microsoft Outlook server.

### Before you start

Microsoft has deprecated EWS API for Exchange Online and has recommended users to move to Graph API.

See [Upcoming API Deprecations in Exchange Web Services for Exchange Online](#).

The Microsoft 365 Outlook package is based on the Graph API and can be used to automate email-related tasks for sending, receiving, and modifying emails and folders in Microsoft 365 Outlook.

---

**Note:** The integration of Graph API requires an administrator to grant access, after which you can configure an application access policy and limit the scope of application permissions. See [Configure application access policy](#).

---

**Note:** Limited support is available for Graph API from Microsoft. Therefore, if you are using the **Azure US GCC High** for Microsoft 365 version, the following actions might be impacted:

- **Forward, Reply** and **Reply all**
  - **Send** action if you have any attachments
- 

Use this package in the following sequence:

- Use the **Connect** action to create a session.
- Use the various actions to automate tasks related to Microsoft 365 Outlook emails.
- Use the **Disconnect** action to terminate the connection to the Microsoft Outlook server.

The Microsoft 365 Outlook package supports the email automation of a shared mailbox in Outlook 365. You can automate emails retrieved from a shared mailbox and perform email-related tasks by accessing each folder(s) and its subfolder(s) in the shared mailbox. Ensure the following requirements are met:

- Administrator has enabled your access to shared mailbox.
- The required delegated permissions are granted.
- The shared mailbox is setup in your Microsoft 365 Outlook application.

Review the following table for important proxy considerations while using the Microsoft 365 Outlook package:

Proxy type	Description	Status
Authenticated	Same proxy settings for Control Room URL and Graph API Endpoints	Supported

Proxy type	Description	Status
	Different proxy credentials for Control Room URL and Graph API Endpoints	Not supported
	Bypass authenticated proxy for Control Room URL and authenticated proxy settings for Graph API Endpoints	Not supported
Unauthenticated	Same settings for Control Room URL and Graph API Endpoints	Supported
	Different proxy settings for Control Room URL and Graph API Endpoints	Supported
Combination of Authenticated and Unauthenticated	Authenticated proxy for Control Room URL and unauthenticated proxy settings for Graph API Endpoints	Supported
	Unauthenticated proxy for Control Room URL and authenticated proxy settings for Graph API Endpoints	Not supported
None	No Proxy found on the Bot Runner machine	Supported

**Note:** NTLM authentication for proxy server is available that enables you to connect to Exchange online.

## Actions in the Microsoft 365 Outlook package

In the **Actions** palette on the Bot editor screen, double-click or drag any of the following actions in the **Microsoft 365 Outlook** package:

Action	Description
Change status	See <a href="#">Change status action in Microsoft 365 Outlook package</a> on page 3046.
Check if folder exists	See <a href="#">Check if folder exists action in Microsoft 365 Outlook package</a> on page 3047.
Connect	See <a href="#">Using Connect action in Microsoft 365 Outlook package</a> on page 3047.
Delete	See <a href="#">Delete action in Microsoft 365 Outlook package</a> on page 3059.

Action	Description
Delete all	See <a href="#">Delete all action in Microsoft 365 Outlook package</a> on page 3059.
Disconnect	See <a href="#">Disconnect action in Microsoft 365 Outlook package</a> on page 3060.
Forward	See <a href="#">Forward action in Microsoft 365 Outlook package</a> on page 3061.
Move	See <a href="#">Move action in Microsoft 365 Outlook package</a> on page 3062.
Move all	See <a href="#">Move all action in Microsoft 365 Outlook package</a> on page 3062.
Reply	See <a href="#">Reply action in Microsoft 365 Outlook package</a> on page 3063.
Reply all	See <a href="#">Reply all action in Microsoft 365 Outlook package</a> on page 3065.
Save all attachments	See <a href="#">Save all attachments action in Microsoft 365 Outlook package</a> on page 3067.
Save attachments	See <a href="#">Save attachments action in Microsoft 365 Outlook package</a> on page 3068.
Save email	See <a href="#">Save email action in Microsoft 365 Outlook package</a> on page 3068.
Send	See <a href="#">Send action in Microsoft 365 Outlook package</a> on page 3068.

Related reference

[Microsoft 365 Outlook package updates](#) on page 991

Review the updates in released versions of Microsoft 365 Outlook package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Change status action in Microsoft 365 Outlook package

Use the **Change status** action in the Microsoft 365 Outlook package to change the status of emails. Ensure that you use this action within a **Loop** action to mark an email as Unread or Unread in Microsoft 365 Outlook.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - Session name:** to enter the session name that you have used in the **Connect** action.
  - Variable:** to specify a session variable that can be used to share that session with other child bots.
- Use the **Change status to** field to select one of the following options:

- **Unread:** to change the status of your email to Unread.  
This is the default selection.
- **Read:** to change the status of your email to Read.

## Check if folder exists action in Microsoft 365 Outlook package

Use the **Check if folder exists** action in the Microsoft 365 Outlook package to verify if a specific folder is available in the Microsoft Outlook server.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- In the **Folder name** field, enter the name of the folder you want to verify in your Microsoft 365 Outlook inbox.

---

**Note:** Review the following conditions for the **Folder name** field:

- Is not case sensitive.
- Regular expressions are not supported.
- Use \ (backslash) to specify a nested folder path.

For example, `inbox\folder1`

- 
- In the **Save the outcome to variable** field, select a Boolean variable to store the output of the action.

---

**Note:** The Control Room shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication

---

## Using Connect action in Microsoft 365 Outlook package

Use the **Connect** action in the Microsoft 365 Outlook package to establish a connection with a Microsoft 365 Outlook server. This is the first action you must use to automate Microsoft 365 Outlook related tasks.

OAuth 2.0 is used to connect to the Microsoft 365 Outlook server. Ensure that you configure OAuth 2.0 properties in Microsoft Azure and then configure the OAuth connection in the Control Room.

1. Configure OAuth 2.0 properties in the Microsoft Azure portal:
  - For information on using the **Client credentials** authentication mode, see [Set up OAuth 2.0 using client credentials](#) on page 3050.

- For information on using the **Authorization code with PKCE** authentication mode, see [Set up OAuth 2.0 using authorization code with PKCE](#) on page 3052.
  - For information on using the **Control Room managed** authorization mode, see [Set up OAuth 2.0 using Control Room managed](#) on page 3055.
2. Configure OAuth connection in Control Room.
- For more information, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.

## Settings

- Click the **Azure cloud** drop-down and select one of the following:
  - **Azure Global**: for Microsoft 365 Commercial version (login.microsoftonline.com)
  - **Azure US GCC High**: for Microsoft 365 Government version (login.microsoftonline.us)
- Click the **OAuth2 Authentication mode** drop-down and select one of the following authentication modes:

- **Client Credentials**

For more information, see [Microsoft identity platform and the OAuth 2.0 client credentials flow](#)

Use the following fields to enter the information that is provided for your account on your [Azure portal](#)

- **Client ID**: enter the Microsoft 365 client or insert it from the Credential Vault.
- **Tenant ID**: enter the unique ID for your Microsoft 365 subscription or insert it from the Credential Vault.
- **Username**: enter the username that you want to use for accessing the Microsoft 365 Outlook server.

If you are accessing shared mailbox, ensure that you provide the email address of the user who has access to the shared mailbox

- **Client secret**: enter your access token or insert it from the Credential Vault.

For all the above fields, you can use one of the following tabs to insert a value:

- **Credential**: to use a value in the Credential Vault that contains information about the Client ID/Client secret/ username/ password..
  - **Variable**: to use a user-defined variable that contains information about the Client ID/ Client secret/ username/ password.
  - **Insecure string**: to enter a value.
- **Authorization Code with PKCE**

For more information, see [Microsoft identity platform and OAuth 2.0 authorization code flow](#)

Use the following fields to enter the information that is provided for your [Azure portal](#):

- **Client ID**: enter the Microsoft 365 client or insert it from the Credential Vault.
- **Tenant ID**: enter the unique ID for your Microsoft 365 subscription or insert it from the Credential Vault.
- **Redirect URL**: enter the URL address.

The bot must run in an attended mode by providing a log in form for the first time where you can enter your log in credentials.

- **Username:** enter the email address of the mailbox you want to access within Microsoft 365 Outlook server.

OAuth2 credentials configured in the Microsoft Azure portal must be used to access this mailbox. If you are accessing shared mailbox, ensure that you provide the email address of the user who has access to the shared mailbox

---

**Note:** If you have selected the **Authorization Code with PKCE** option, a browser is displayed that implies the connection to the Microsoft 365 Outlook server was established successfully. Ensure that you close this browser to continue.

---

- **Control Room managed**

Use the following fields to update the information:

- **Connection:** click the **Pick** button to select an existing connection.
  - Click the **Provider type** drop-down menu to select an available or custom provider. For information in creating a custom provider, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.
  - Click the **Connection name** to select the corresponding connection for the selected provider.
  - Use the **Token type** field to select one of the following options:
    - **Shared:** for a global token.

An access token of shared type is created when a connection is established to the Control Room. This access token is stored as a credential. When you run your automation, the access token is referenced in the automation using the enterprise application provider type set up in the Control Room.

- **User-specific:** for a token that is specific to a user.

If you select this option, ensure that you log in to your Microsoft 365 account to authenticate and generate a user-specific token. Perform the following steps to use this option:

1. Log in to Control Room and navigate to **My settings > OAuth connections** in your profile.
2. Under the **OAuth connections** tab, click **Login to authenticate**.
3. Sign in to your Microsoft 365 account and select **Continue**.
4. Verify the services you have access to and click **Continue**.

If the connection is succeeded, it will display the status as **Active** under the **OAuth connections > Connections** table.

- Click one of the following tabs in the **Username** field:
  - **Credential:** click the **Pick** button to select a value in the Credential Vault that contains information about the username.
  - **Variable:** to use a user-defined variable that contains information about the username.

- **Insecure string**: to enter a value.

If you are accessing shared mailbox, ensure that you provide the email address of the user who has access to the shared mailbox

- In the **Create Microsoft 365 Outlook session** field, use one of the following tabs for creating a session:
  - **Local session**: to specify a session name that can be used only in the current bot.
  - **Global session**: to specify a session name that can be used across multiple bots, such as parent bots, child bots, and all other child bots of the parent bot.

---

**Recommendation:** The parent and child bots should have the same package version.

---

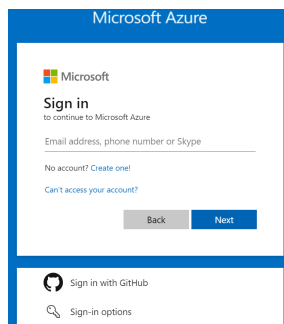

- **Variable**: to specify a session variable that can be used to share that session with other child bots.

## Set up OAuth 2.0 using client credentials

To set up OAuth 2.0 to use client credentials, you must register your Azure Active Directory application.

To register your Azure Active Directory application with the Microsoft identity platform, perform the following steps.

1. Log in to the Microsoft Azure portal.

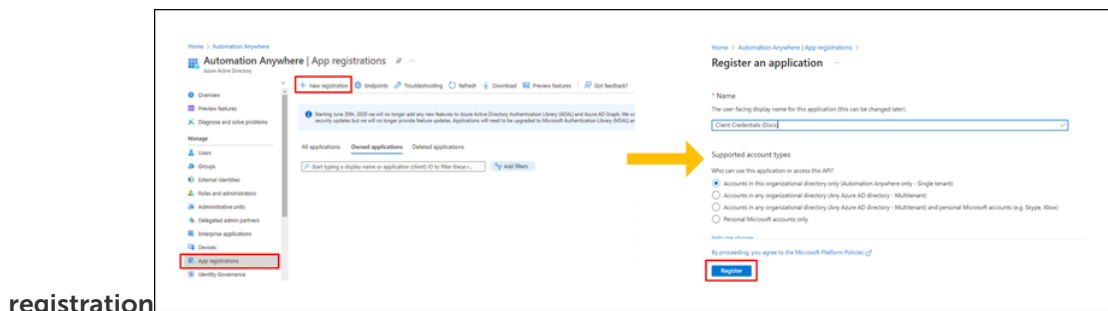

---

**Note:** Enter your complete email address including the domain (for example, abc@domain.com).

---

2. On the **Home** page, click **View** under the **Manage Azure Active Directory** option.
3. On the **Overview** page, select **App registrations** from the **Manage** panel and then click **+ New**

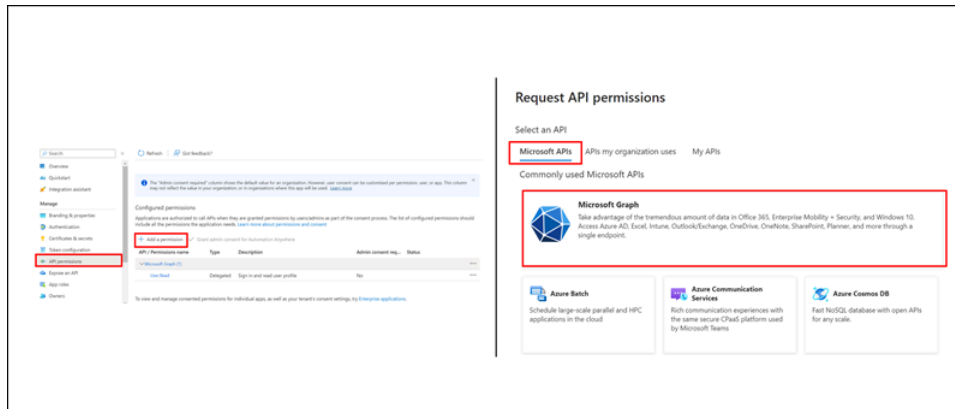

registration

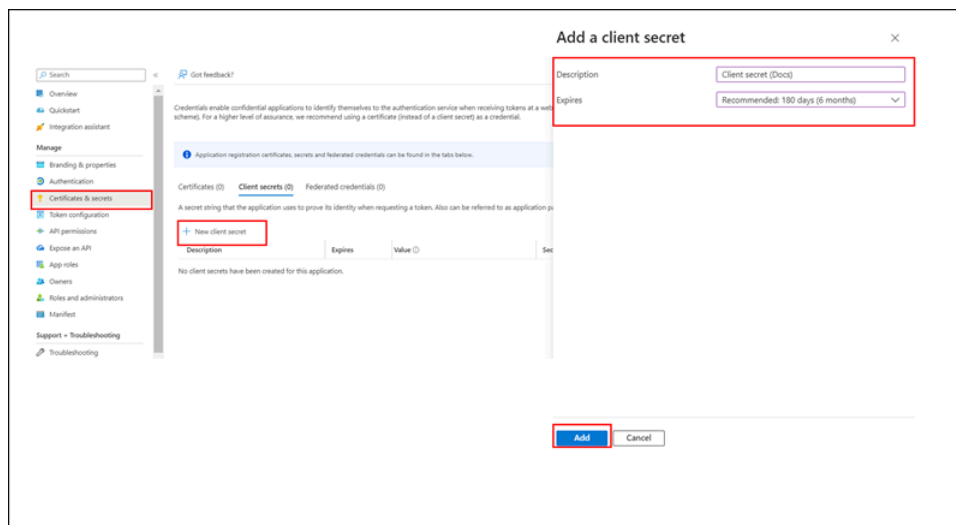

- On the **Register an application** page, enter the appropriate name in the **Name** field, then select the account type and click **Register**.

**Note:** You do not need to enter the Redirect URL because it is not required for the Client Credential flow.

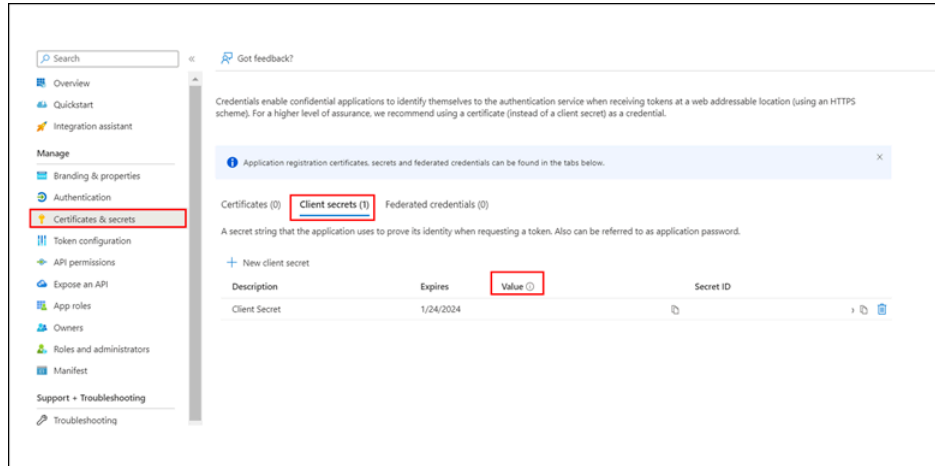

- To set the API permission for the application to access the API resources, select the **API permissions** option under the **Manage** panel.
- Click **+ Add a permission > Microsoft APIs** and select **Microsoft Graph**.

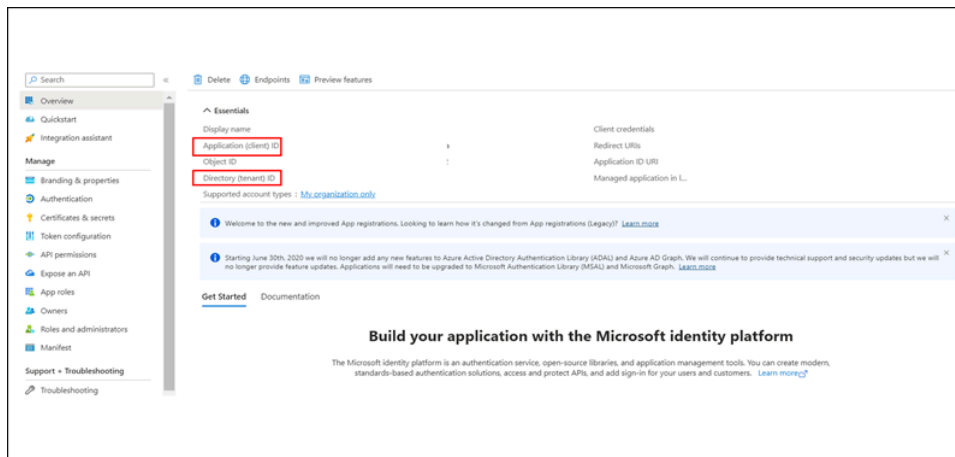

- Select **Application permissions** and perform the following steps:
  - Search with **Mail** in the **Select permissions** search box and expand the **Mail** option.
  - Select the **Mail.ReadWrite** and **Mail.Send** API permissions check boxes.
  - Click **Add permissions**.
- Click **Yes** to grant permission to use the API.
- To create a client secret, click **Certificates and secrets** option under the **Manage** panel.
  - Click **+New client secret** to open the **Add a client secret** window.
  - Enter an appropriate description in the **Description** field and set the expiry duration.
  - Click **Add**.

- d) Copy and save the Client secret value to a safe location for your reference. We recommend that you do not share the value with anyone.

10. After an application is registered, the application is assigned with the **Client ID** and **Tenant ID**. You can click **Copy to clipboard** to copy the tenant and the client IDs.

You can use the Client ID, Tenant ID, and Client secret to establish a connection with a Microsoft 365 Outlook server.

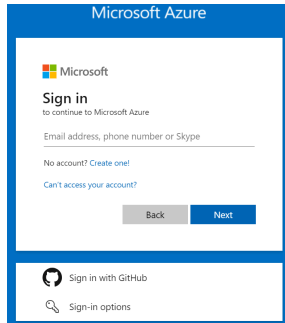

**Note:** If the mailbox is used inside a **Loop**, ensure that you register the user who is assigned to perform the automation. For more information, see .

## Set up OAuth 2.0 using authorization code with PKCE

To set up OAuth 2.0 to use authorization code with PKCE, you must register your Azure Active Directory application.

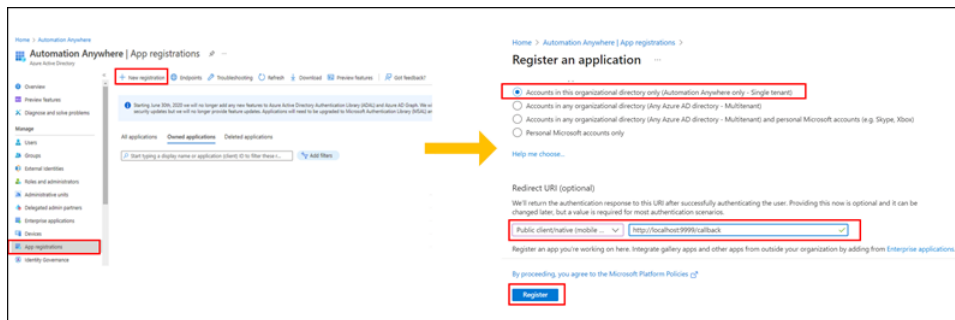

To register your Azure Active Directory application with the Microsoft identity platform, perform the following steps:

1. Log in to the Microsoft Azure portal.

**Note:** Enter your complete email address including the domain (for example: abc@domain.com).

2. On the **Home** page, click **View** under the **Manage Azure Active Directory** option.
3. On the **Overview** page, select **App registrations** from the **Manage** panel and then click **+ New registration**.
4. On the **Register an application** page, enter the appropriate name in the **Name** field, then select the supported account type and configure the Redirect URI.
  - a) For the Redirect URI platform, select the **Public client/native (mobile & desktop)** option.
  - b) Set the Redirect URI to `http://localhost:9999/Callback`. Ensure that port 9999 is open or use any other open port.
  - c) Click **Register** to complete the initial app registration.

5. To set the API permission for the application to access the API resources, select the **API permissions** option under the **Manage** panel.
6. Click **+ Add a permission > Microsoft APIs** and select **Microsoft Graph**.

7. Select **Delegated permissions** and perform the following steps:

a) Select the following permissions:

- email
- offline\_access
- openid
- profile

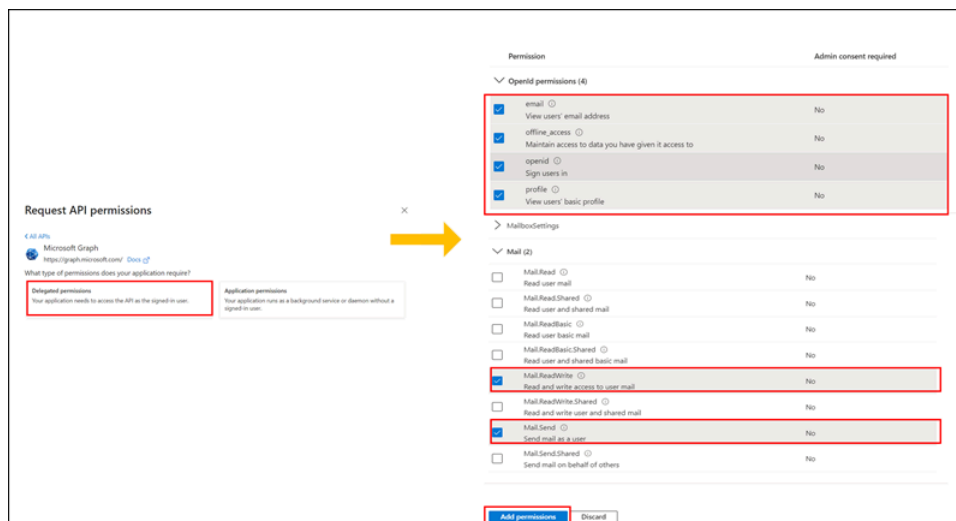

b) Search with **User** in the **Select permissions** search box and expand **User** option.

c) Select the **User.Read** check box.

**Note:** Administrators can use `New-ApplicationAccessPolicy` PowerShell cmdlet to limit access to specific mailboxes. For more information, see [Limiting application permissions to specific Exchange Online mailboxes](#).

d) Search with **Mail** in the **Select permissions** search box and expand the **Mail** option.

e) Select the **Mail.ReadWrite** and **Mail.Send** API permissions.

f) Click **Add permissions**.

g) Click **Yes** to grant permission to use the API.

Ensure that the permissions are granted by an administrator or a user with administrator privileges, as shown in the following:

Configured permissions

Applications are authorized to call APIs when they are granted permissions by users/admins as part of the consent process. The list of configured permissions should include all the permissions the application needs. [Learn more about permissions and consent](#)

+ Add a permission ✓ Grant admin consent for Automationanywhere Store

API / Permissions name	Type	Description	Admin consent requ...	Status
Microsoft Graph (7)				
email	Delegated	View users' email address	No	✓ Granted for Automation...
Mail.ReadWrite	Delegated	Read and write access to user mail	No	✓ Granted for Automation...
Mail.Send	Delegated	Send mail as a user	No	✓ Granted for Automation...
offline_access	Delegated	Maintain access to data you have given it access to	No	✓ Granted for Automation...
openid	Delegated	Sign users in	No	✓ Granted for Automation...
profile	Delegated	View users' basic profile	No	✓ Granted for Automation...
User.Read	Delegated	Sign in and read user profile	No	✓ Granted for Automation...

- After an application is registered, the application is assigned with the **Client ID** and **Tenant ID**. You can click **Copy to clipboard** to copy the tenant and the client IDs.

You can use the Client ID, Tenant ID, and Client secret to establish a connection with a Microsoft 365 Outlook server.

**Note:** If the mailbox is used inside a **Loop**, ensure that you register the user who is assigned to perform the automation. For more information, see .

## Set up OAuth 2.0 using Control Room managed

Create an application in the Microsoft Azure Console and retrieve the OAuth 2.0 parameters to configure OAuth connection in the Control Room.

A Control Room administrator or a user who has the required set of permissions (or role) can setup OAuth 2.0 connection.

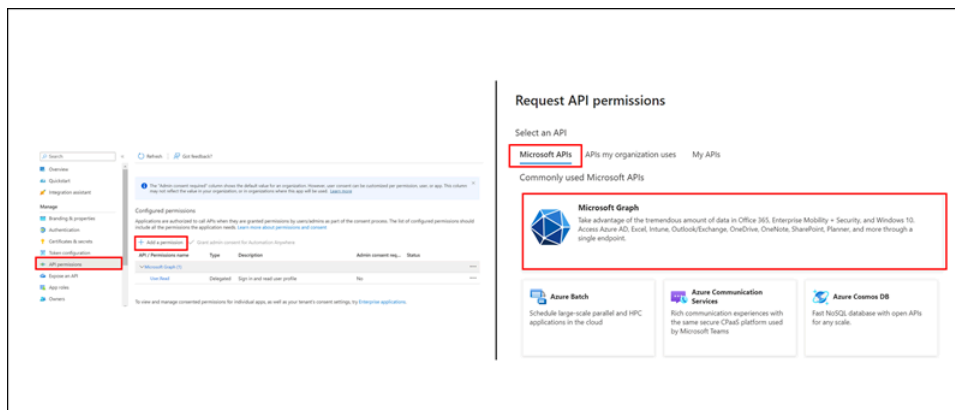

To register your Azure Active Directory application with the Microsoft identity platform, perform the following steps:

- Log in to the Microsoft Azure portal.

**Note:** Enter your complete email address including the domain (for example: abc@domain.com).

2. On the **Home** page, click **View** under the **Manage Azure Active Directory** option.
3. On the **Overview** page, select **App registrations** from the **Manage** panel and then click **+ New registration**.
4. On the **Register an application** page, enter the appropriate name in the **Name** field, then select the supported account type and configure the Redirect URI.
  - a) For the Redirect URI platform, select the **Web** option.
  - b) Provide the callback URI from OAuth connection.
  - c) Click **Register** to complete the initial app registration.
5. To set the API permission for the application to access the API resources, select the **API permissions** option under the **Manage** panel.
6. Click **+ Add a permission > Microsoft APIs** and select **Microsoft Graph**.

7. Select **Delegated permissions** and add the required permissions. The permissions can vary based on your requirement. For example, email, offline\_access, and so on.
8. After an application is registered, the application is assigned with the **Client ID** and **Tenant ID**. You can click **Copy to clipboard** to copy the tenant and the client IDs.

You can use the Client ID, Tenant ID, and Client secret to establish a connection with a Microsoft 365 Outlook server.

After you have established the OAuth 2.0 connection and parameters, administrator or a user who has the required set of permissions (or role) can configure the OAuth 2.0 connection in the Control Room, which is used in various Microsoft 365 packages.

For more information, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.

## Configure OAuth 2.0 connection in Control Room

As an administrator or any user with **Manage connections** and **View connections** permission, can create **OAuth connections** in the Control Room that can be used in Microsoft 365 packages.

**Note:** If you want users to view and edit OAuth connections, then you must assign a custom role that has the **Manage connections** and **View connections** options enabled.

1. Log in to the Control Room.
2. Navigate to **Manage > OAuth connections**.
3. Click the **Create connection** icon or **create a connection** link in the table.
4. On the **Connection settings** screen, click the **Provider type** drop-down menu and select **Custom**.
5. In the **Connection name** field, enter a unique name to identify the connection.
6. Click **Next**.
7. On the **Create connection** screen, click the **Grant type** drop-down menu and select **Authorization Code Flow**.
8. In the **Client ID** and **Client secret** fields, enter the values from the OAuth client application created in the Microsoft Azure portal. For more information, see [Set up OAuth 2.0 using client credentials](#) on page 3050.
9. In the **Authorization URL** field, enter `https://login.microsoftonline.com/{tenant_id}/oauth2/v2.0/authorize`.

**Note:** You can extract the tenant\_id from OAuth client application from the Microsoft Azure portal that you have created.

10. In the **Token URL** field, enter `https://login.microsoftonline.com/{tenant_id}/oauth2/v2.0/token`.
11. Enter the scopes in the **Scope (optional)** field.  
This information is used as claims (information about the user) in an access token and forwarded to the resource server to limit access.

**Note:** If you are adding more than one scope, ensure that you use comma or space separated delimiter to separate the entries.

12. Click **Next**.

13. On the **Edit connection** screen, select the **Save login credentials** check box and click **Save changes and test connection** button.  
When you click **Save changes and test connection** button, it redirects you to sign into Microsoft Azure portal.
14. Select the appropriate Microsoft Azure account and click **Continue**.
15. Verify the services and click **Continue**.

**Note:** When using the **Authorization Code Flow** grant type, after you click the **Save changes and test connection** option and if the connection is successful, the **Next** button is disabled. Click the **Back** button, enter the Client secret again, and then click **Next**. You need not test the connection again unless you have made any changes to the previously provided authentication details.

16. Click **Next**.  
The **Invite roles** screen appears.

17. Optional: Select the custom roles to generate user specific token and click **Save**

changes.

18. Click **Create connection**.

An OAuth 2.0 connection is created in the Control Room.

## Delete action in Microsoft 365 Outlook package

Use the **Delete** action in the Microsoft 365 Outlook package to delete a specific email from your Microsoft 365 Outlook inbox. Ensure that you use this action within a **Loop** action.

### Settings

In the **Microsoft 365 Outlook session** field, click one of the following tabs:

- **Session name:** to enter the session name that you have used in the **Connect** action.
- **Variable:** to specify a session variable that can be used to share that session with other child bots.

## Delete all action in Microsoft 365 Outlook package

Use the **Delete all** action in the Microsoft 365 Outlook package to delete read, unread, or all emails from a specific folder in Microsoft 365 Outlook inbox.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- Use the **From specific folders** field to specify the email folders from which you want to delete the emails.

For example, `Inbox/folder1`; `Inbox/folder2` or `Inbox/test*`.

**Note:** Microsoft 365 Outlook does not allow the use of wildcard entries (such as \*) to run a search on folders. Ensure that you specify the folders individually in the **From specific folders** field.

---

- Use the **Status of email to delete** field to select one of the following type of emails you want to delete:
  - **Read:** emails that are in Read status.
  - **Unread:** emails that are in Unread status.
  - **Both:** emails in Read and Unread status.
- (Optional) Use the following fields to provide additional email filters:
  - Enter keywords from the email subject line in the **When subject contains** field for the emails you want to delete.
    - This field is not case sensitive.  
For example, the search results are the same for 'Sales information', 'sALes Information' or 'SALES INFORMATION'.
    - An empty space is treated as a character.  
For example, `salesinformation` will display different results as compared to `sales information`.
    - Enclose the **Subject** link in double quotes (") for an exact match.  
For example, use `"July sales information"` in the **Subject** line.
  - For more information, see [How subject filter works when moving emails](#) on page 2706.
  - **From specific senders:** to specify the senders' email addresses.  
For multiple senders, use semi-colon (;) to separate the email addresses.
  - Use the **When the received date is on or after** field to select a date after which you received the emails.  
Click the **Create variable** icon if there is no existing variable.
  - Use the **When the received date is before** field to select a date before which you received the emails.  
Optionally, you can also click the **Create variable** icon if there is no existing variable.

## Disconnect action in Microsoft 365 Outlook package

Use the **Disconnect** action in the Microsoft 365 Outlook package to terminate an active connection with Microsoft 365 Outlook server.

### Settings

In the **Microsoft 365 Outlook session** field, click one of the following tabs:

- **Session name:** to enter the session name that you have used in the **Connect** action.
- **Variable:** to specify a session variable that can be used to share that session with other child bots.

## Forward action in Microsoft 365 Outlook package

Use the **Forward** action in the Microsoft 365 Outlook package to send emails and attachments to one or more recipients as plain text or HTML through Microsoft Outlook server. Ensure that you use this action within a **Loop** action.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - Session name:** to enter the session name that you have used in the **Connect** action.
  - Variable:** to specify a session variable that can be used to share that session with other child bots.
- Enter the email addresses of the recipients in the **To** field.
- (Optional) Use the **Cc** and **Bcc** fields to enter email addresses of other recipients you want to mark a copy of the email.
- (Optional) In the **Attachment** field, select one of the following options to upload a file as an email attachment:

Option	Description
<b>List</b>	<ul style="list-style-type: none"> <li>Click <b>Add</b> to attach files.</li> <li>Use one of the following tabs in the <b>Value</b> field to specify the location of the files that you want to attach:               <ul style="list-style-type: none"> <li><b>Control Room file:</b> To select an attachment that is available in the Control Room repository.</li> <li><b>Desktop file:</b> To select an attachment that is available on your device.</li> </ul> <p>You can provide a combination of static path and string variable. To use it as a string variable, press F2 and select the string variable that stores the filepath. Or click <b>Browse</b> and select the filepath. After you have selected the filepath, you can insert a variable at any location to make it a dynamic filepath.. Enter the <b>Variable</b> name and paste the file path in the <b>Default value</b> field. Press F2 to insert the value of the filepath.</p> </li> <li><b>Variable:</b> To specify or select the file variable from the list.</li> </ul>
<b>Variable</b>	Click the <b>Insert a value</b> icon to select an existing variable.

- Use the **Email body** field to select one of the following options for the email body:

- **Plain text:** Use regular text in your email body, with no formatting effects, such as bold, italic, or underline, or special layout options.
- **HTML design:** Use HTML script in your mail body when you want your content to be displayed in a certain layout every time. You can also include interactive elements, such as links.
- **HTML code:** Use this option to create and customize your email layout and body. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it in the **Message** field.
- Enter the content you want to send along with the email in the **Message** field.

## Move action in Microsoft 365 Outlook package

Use the **Move** action in the Microsoft 365 Outlook package to move an email from one folder to another in the mailbox. Ensure that you use this action within a **Loop** action.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- Use the **Destination folder path** field to enter the destination folder path that you want to move the email to.  
For example, `Inbox/finance/April`.

## Move all action in Microsoft 365 Outlook package

Use the **Move all** action in the Microsoft 365 Outlook package to move all your emails in Microsoft Outlook server from one folder to another.

The **Move all** action must be used outside a **Loop** action. For more information, see [Can Move all action be used within a loop? \(A-People login required\)](#).

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- Use the **Destination folder path** in mailbox field to provide the folder location where you want to move all the emails.
- Use the **Status of email to move** field to select one of the following types of emails to move:
  - **Read:** emails that are in Read status.

- **Unread:** emails that are in Unread status.
- **Both:** emails in Read and Unread status.
- Enter the folder path in the **From specific folders** field to specify the folder from where you want to move the emails.  
For example, `Inbox/project1`.
- Enter keywords from the email subject line in the **When subject contains** field for the emails you want to move.
  - This field is not case sensitive.  
For example, the search results are the same for `Sales information`, `sALes Information` or `SALES INFORMATION`.
  - An empty space is treated as a character.  
For example, `salesinformation` will display different results as compared to 'sales information'.
  - Enclose the **Subject** link in double quotes (") for an exact match.  
For example, use "July sales information" in the Subject line.  
  
For more information, see [How subject filter works when moving emails](#) on page 2706.
- Enter email addresses of specific senders in the **From specific senders** field.  
For multiple senders, use semi-colon (;) to separate the email addresses.
- Use the **When the received date is on or after** field to select a date after which you received the emails.  
Click the **Create variable** icon if there is no existing variable.
- Use the **When the received date is before** field to select a date before which you received the emails.  
Click the **Create variable** icon if there is no existing variable.

## Reply action in Microsoft 365 Outlook package

Use the **Reply** action in the Microsoft 365 Outlook package to send an email response without changing the subject line in the original email. Ensure that you use this action within a **Loop** action. This action does not include any files attached to the original email.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- (Optional) Use the **Cc** and **Bcc** fields to enter the email address of additional recipients.  
The **Cc** and **Bcc** are not case sensitive.
- (Optional) Use the **Attachment** field to select **List** or **Variable**.

The **Attachment** field enables you to specify if multiple files can be attached as a list or a variable must be created to hold the list values of the file object. Review the following table for more information:

Option	Description
<b>List</b>	<ul style="list-style-type: none"> <li>• Select the attachment from a location:               <ul style="list-style-type: none"> <li>• <b>Control Room file:</b> To select an attachment that is available in the Control Room repository.</li> <li>• <b>Desktop file:</b> To select an attachment that is available on your device.</li> </ul> </li> </ul> <p>You can provide a combination of static path and string variable. To use it as a string variable, press F2 and select the string variable that stores the filepath. Or click <b>Browse</b> and select the filepath. After you have selected the filepath, you can insert a variable at any location to make it a dynamic filepath.. Enter the <b>Variable</b> name and paste the file path in the <b>Default value</b> field. Press F2 to insert the value of the filepath.</p> <ul style="list-style-type: none"> <li>• <b>Variable:</b> To specify or select the file variable from the list..</li> </ul> <ul style="list-style-type: none"> <li>• Specify the path that you want to attach in the <b>Value</b> field. Click <b>Add</b> to attach multiple files.</li> </ul>
<b>Variable</b>	<p>Enables you to specify the list of file objects that contain the location of the attachments.</p> <p>Create a new variable of type List with subtype <b>File</b>, and add the filepath in the <b>Default value</b> field (optional). You can choose the file from the <b>Desktop</b> or <b>Control room</b>.</p>

- Use the **Email body** field to select one of the following format options for the body of the email:
  - **Plain text:** Use regular text in your email body, with no formatting effects, such as bold, italic, or underline, or special layout options.
  - **HTML design:** Use HTML script in your mail body when you want your content to be displayed in a certain layout every time. You can also include interactive elements, such as links.

- **HTML code:** Use this option to create and customize your email layout and body. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it in the **Message** field.
- Enter the content you want to send along with the email in the **Message** field.  
The email is appended to the message that you have specified.

## Reply all action in Microsoft 365 Outlook package

Use the **Reply all** action in the Microsoft 365 Outlook package to send an email response with the same or modified subject and include all the recipients of that email. Ensure that you use this action within a **Loop** action.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- (Optional) Use the **Cc** and **Bcc** fields to enter the email address of additional recipients.  
The **Cc** and **Bcc** are not case sensitive.
- (Optional) Select the **Exclude the sender of the email** check box to remove the email address of the sender.
- (Optional) Use the **Attachment** field to select **List** or **Variable**.

The **Attachment** field enables you to specify if multiple files can be attached as a list or a variable must be created to hold the list values of the file object. Review the following table for more information:

Option	Description
<b>List</b>	<ul style="list-style-type: none"> <li>• Select the attachment from a location: <ul style="list-style-type: none"> <li>• <b>Control Room file:</b> To select an attachment that is available in the Control Room repository.</li> <li>• <b>Desktop file:</b> To select an attachment that is available on your device.</li> </ul> </li> </ul> <p>You can provide a combination of static path and string variable. To use it as a string variable, press F2 and select the string variable that stores the filepath. Or click <b>Browse</b> and select the filepath. After you have selected the filepath, you can insert a variable at any location to make it a dynamic filepath.. Enter the <b>Variable</b> name and paste the file path in the <b>Default value</b> field. Press F2 to insert the value of the filepath.</p> <ul style="list-style-type: none"> <li>• <b>Variable:</b> To specify or select the file variable from the list..</li> <li>• Specify the path that you want to attach in the <b>Value</b> field. Click <b>Add</b> to attach multiple files.</li> </ul>
<b>Variable</b>	Enables you to specify the list of file objects that contain the location of the attachments. Click the <b>Insert a value</b> icon to select an existing variable.

- Use the **Email body** field to select one of the following format options for the body of the email:
    - **Plain text:** Use regular text in your email body, with no formatting effects, such as bold, italic, or underline, or special layout options.
    - **HTML design:** Use HTML script in your mail body when you want your content to be displayed in a certain layout every time. You can also include interactive elements, such as links.
    - **HTML code:** Use this option to create and customize your email layout and body. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it in the **Message** field.
  - Enter any content you want to send along with the email in the **Message** field.
- The email will be appended to the message you have specified.

## Save all attachments action in Microsoft 365 Outlook package

Use the **Save all attachments** action in the Microsoft 365 Outlook package to save all the email attachments on Microsoft Outlook server to a specific folder.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- Use the **Status of email** field to select one of the following type of emails from where you want to save the attachments:
  - **Read:** emails that are in Read status.
  - **Unread:** emails that are in Unread status.
  - **Both:** emails in Read and Unread status.

- Enter the folder path in the **From specific folders** field to specify the folder from where you want to save the attachments.

For example, `Inbox/project1`. Although multiple folder paths separated by semicolon are supported in this field, the regular expressions are not supported.

- (Optional) Enter keywords from the email subject line in the **When subject contains** field.

The **When subject contains** field is case sensitive. When you enter keyword within double quotes (""), the bot retrieves all the emails where the subject matches the text and the case
- (Optional) Enter email addresses of specific senders in the **From specific senders** field.
- (Optional) Use the **When the received date is on or after** field to select a date after which you received the emails.

Click the **Create variable** icon if there is no existing variable.

- (Optional) Use the **When the received date is before** field to select a date before which you received the emails.

Click the **Create variable** icon if there is no existing variable.

- In the **Save attachments to folder** field, enter the filepath of the folder where you want to save the email attachments.

You can also click the **Insert a value** icon to select a variable.

- (Optional) Clear the **Overwrite file(s)** check box if you do not want to overwrite any existing files in the folder.

The **Overwrite file(s)** option is enabled by default.

## Save attachments action in Microsoft 365 Outlook package

Use the **Save attachment** action in the Microsoft 365 Outlook package to save attachments from a specific email to a folder. Ensure that you use this action within a **Loop** action.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- In the **Save attachments to folder** field, enter the filepath of the folder where you want to save the email attachments.
- (Optional) Clear the **Overwrite file(s)** check box if you do not want to overwrite any existing files in the folder.

The **Overwrite file(s)** option is enabled by default.

## Save email action in Microsoft 365 Outlook package

Use the **Save email** action in the Microsoft 365 Outlook package to save an email as an EML file to a folder. Ensure that you use this action within a **Loop** action.

### Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - **Session name:** to enter the session name that you have used in the **Connect** action.
  - **Variable:** to specify a session variable that can be used to share that session with other child bots.
- Enter the location where you want to save the email in **Save emails to folder**.

The **Save emails to folder** is not case sensitive.
- (Optional) Clear the **Overwrite file(s)** check box if you do not want to overwrite any existing files in the folder.

The **Overwrite file(s)** option is enabled by default.

## Send action in Microsoft 365 Outlook package

Use the **Send** action in the Microsoft 365 Outlook package to send an email to one or more recipients from Microsoft 365 Outlook, as plain text or HTML format.

The **Send** action enables you to attach multiple files of various formats to an email. There is no restriction on the type or size of file you can attach. However, restrictions implemented by the Microsoft exchange server you are using to send an email apply.

**Note:** Attachments sent as part of email automation are subject to the policies and rules set at the level of the proxy server, firewall, anti-virus, email server, customer environment, and so on.

## Settings

- In the **Microsoft 365 Outlook session** field, click one of the following tabs:
  - Session name:** to enter the session name that you have used in the **Connect** action.
  - Variable:** to specify a session variable that can be used to share that session with other child bots.
- Enter the email addresses of the recipients in the **To** field.
- (Optional) Use the **Cc** and **Bcc** fields to enter email addresses of other recipients you want to mark a copy of the email.
- Enter the email subject in the **Subject** field.
- (Optional) In the **Attachment** field, select one of the following tabs to upload an file as an email attachment::

Option	Description
<b>List</b>	<ul style="list-style-type: none"> <li>Click <b>Add</b> to attach files.</li> <li>Use one of the following tabs in the <b>Value</b> field to specify the location of the files that you want to attach:                             <ul style="list-style-type: none"> <li><b>Control Room file:</b> To select an attachment that is available in the Control Room repository.</li> <li><b>Desktop file:</b> To select an attachment that is available on your device.</li> </ul> </li> </ul> <p>You can provide a combination of static path and string variable. To use it as a string variable, press F2 and select the string variable that stores the filepath. Or click <b>Browse</b> and select the filepath. After you have selected the filepath, you can insert a variable at any location to make it a dynamic filepath.. Enter the <b>Variable</b> name and paste the file path in the <b>Default value</b> field. Press F2 to insert the value of the filepath.</p> <ul style="list-style-type: none"> <li><b>Variable:</b> To specify or select the file variable from the list..</li> </ul>
<b>Variable</b>	Click the <b>Insert a value</b> icon to select an existing variable.

- (Optional) Select the **Raise error if the attachments are missing (Desktop only)** check box if you want to be notified when you have not attached any files to your email.
- Use the **Email** field to select one of the following options for the email body:

- **Plain text:** Use regular text in your email body, with no formatting effects, such as bold, italic, or underline, or special layout options.
- **HTML design:** Use HTML script in your mail body when you want your content to be displayed in a certain layout every time. You can also include interactive elements, such as links.
- **HTML code:** Use this option to create and customize your email layout and body. Use the editor toolbar to make various changes to your text, such as applying bold, italic, and other formatting effects, inserting links, and changing the font and size of the text. You can copy the content from the design editor and paste it to other windows.
- (Optional) Enter the content you want to send along with the email in the **Message** field.

## PDF package

Use the PDF package to automate various operations on a PDF file.

The PDF package enables you to perform the following tasks:

- Encrypt or decrypt a PDF file.
- Extract text from a PDF file.
- Convert a PDF file to an image.
- Merge several PDF files into a single file.
- Split a single PDF file into multiple files.

It is not necessary to have a PDF reader installed on your device.

### Actions in the PDF package

The PDF package includes the following actions:

**Note:** The Extract field, Extract image, and Extract text actions in the PDF package are supported only for PDF files that are editable. These packages are not supported for scanned PDF documents that contain the PDF content as images.

Action	Description
Decrypt document	See <a href="#">Using the Decrypt document action</a> on page 3076.
Encrypt document	See <a href="#">Using the Encrypt document action</a> on page 3071.
Extract field	See <a href="#">Using the Extract field action</a> on page 3072
Extract image	See <a href="#">Using the Extract image action</a> on page 3074.
Extract text	See <a href="#">Using Extract text action from PDF</a> on page 3073.
Get property	See <a href="#">Using the Get property action</a> on page 3076
Merge documents	See <a href="#">Using the Merge documents action</a> on page 3077.
Split document	See <a href="#">Using the Split document action</a> on page 3078.

When an operation is performed on a PDF file, the file properties are stored in a dictionary variable. See [Using a dictionary variable for PDF properties](#) on page 3079.

Related reference

Review the updates in released versions of the PDF package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using the Encrypt document action

Use the **Encrypt document** action to encrypt a PDF file.

To encrypt a PDF file, follow these steps:

1. In the **Actions** palette, double-click or drag the **Encrypt document** action from the PDF package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file**: Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile**: Enables you to select a PDF file that is available on your device.
  - **Variable**: Enables you to specify the file variable that contains the location of the PDF file.
3. Optional: In the **User password** or **Owner password** field, enter a password to restrict access to the encrypted PDF file.
  - **User password**: Allow users to perform specific operations on the encrypted PDF file.
  - **Owner password**: Allow users to use a password to open the file.
4. In the **User Permissions to Apply** field, select the following operations:
  - **Print**: Allows users to print the document.
  - **Modify**: Allows users to edit the document.
  - **Copy**: Allows users to copy the document.
  - **Form Fill**: Allows users to fill a form in the document.
  - **Document Assembly**: Allows users to combine multiple PDF files, attach files, and so on.
  - **Annotation**: Allows users to apply annotations in the document.
  - **Accessibility**: Allows users to read text from the document using accessibility devices.
5. In the **Encryption level**, select the **RC4 40-bit**, **RC4 128-bit**, or **AES 128-bit** option to specify the encryption level.
6. In the **Save encrypted PDF as** field, specify a name and location for the encrypted file. You must include the .pdf extension in the name of the encrypted file. For example, if the file name is `June_Quarter_report`, the .pdf extension is `June_Quarter_report.pdf`.
7. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

---

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

8. Optional: From the **Assign PDF properties to a dictionary variable** list, select a dictionary variable to hold the file properties.

For more information, see [Using a dictionary variable for PDF properties](#) on page 3079.

9. Click **Save**.

Related tasks

[Using the Decrypt document action](#) on page 3076

Use the **Decrypt document** action to decrypt a PDF file that was previously encrypted using the **Encrypt document** action.

## Using the Extract field action

Use the **Extract field** action to extract fields from a PDF and assign it to variables.

---

### Important:

- When you extract fields from a PDF that contains 20 form fields, processing time might be 30 to 40 % longer than PDFs without form fields.
  - When you use this action to extract a radio button from a PDF file, the value generated might be -1 when no radio button is selected. Previously, when you did not select any radio button, the output was 0.
- 

To extract fields from a PDF file, follow these steps:

1. In the **Actions** palette, double-click or drag the **Extract field** action from the **PDF** package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file**: Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile**: Enables you to select a PDF file that is available on your device.
  - **Variable**: Enables you to specify the file variable that contains the location of the PDF file.
3. From the **File is protected** field, select **Yes** if the file is encrypted and provide the **User password** or **Owner password**.
4. Click **Open PDF viewer**.
5. In the **Select a PDF file** window, select a PDF file from Control Room file or Desktop file.
6. Optional: Enter the password.
7. Click **Load** to open the **PDF Viewer**.  
In the **PDF Viewer** window, the PDF is opened with all the structured fields highlighted in purple dotted rectangles.
8. Select the rectangular area of the field to be extracted and click **Add field** to add the field and its value under the **Extract fields** table.
9. Optional: You can add an unstructured field that are not highlighted in the PDF. Select the **Draw a region** option available at the top of the PDF viewer and draw a rectangle box around the required region.

A red colored dotted rectangle is highlighted with an option **Add custom region**

10. Click **Add custom region** to view the captured coordinates in the **Custom region** window. Enter the **Key name** that can be used in the output variable.
- 

**Note:** While extracting PDF text with the **Draw a region > Add custom region** option, ensure the PDF data is in sequential order and has standard font encoding for correct data extraction. Data without encoding such as data from scanned files and images will not be extracted.

---

11. Click **Close** to add the field in the **Extract fields** table.
-

The list of extracted fields appear under the **Extract fields** table on the right panel of **PDF viewer** window.

The extracted fields change to blue dotted rectangles in the PDF viewer. You can edit the extracted fields by selecting the blue rectangle around the field.

Use the vertical ellipse button next to the extracted field in the **Extract fields** table to **Edit**, **Move** or **Delete** the field.

12. Click **Close** to close the PDF viewer .
13. From the **Save the output to a variable** field, choose either a dictionary variable or multiple variables to hold the field values.
14. Click **Save**.

## Using Extract text action from PDF

Extract text from a PDF file and save it as a text file by using the **Extract text** action.

---

### Important:

- If the correct fonts are not embedded in the PDF file, the **Extract text** action does not extract the text correctly.
  - When you use this action to extract text from a PDF file, and if that text is a single line data but the PDF file has the same data in two lines, then the data might appear in two lines.
- 

**Note:** When you extract fields from a PDF that contains 20 form fields, processing time might be 30 to 40 % longer than PDFs without form fields.

---

To extract text from a PDF file, perform the following steps:

1. In the **Actions** palette, double-click or drag the **Extract text** action from the **PDF** package.
  2. In the **PDF path**, select one of the following options to specify the location of the PDF:
    - **Control Room file:** Enables you to select a PDF file that is available in a folder in the Control Room.
    - **Desktop profile:** Enables you to select a PDF file that is available on your device.
    - **Variable:** Enables you to specify the file variable that contains the location of the PDF file.
  3. Optional: In the **User password** or **Owner password** field, enter a password to restrict access to the encrypted PDF file.
    - **User password:** Allow users to perform specific operations on the encrypted PDF file.
    - **Owner password:** Allow users to use a password to open the file.
  4. In the **Text type** field, select one of the following options:
    - **Plain text:** Extract the text and copy it to a text file.

This works similar to copying and pasting text from a PDF file to a text file.
    - **Structured text:** Preserve the original formatting of the text extracted from the PDF file.

You can select the **Reduce Data Loss** option to ensure that the complete text is extracted with minimal overlap of characters. With this functionality, the number of characters overlapped by other characters is reduced.
-

**Note:** When you select this option to extract text, the extracted text might contain extra space characters.

---

5. In the **Page range** field, select one of the following options:
  - **All pages:** Enables you to save all the pages in the PDF file as an image.
  - **Pages:** Enables you to enter the page numbers of the pages that you want to save as an image.

6. In the **Export data to text file** field, specify a name and location for the text file.

**Note:** You must include the .txt extension in the name of the text file. For example, if the file name is `June_Quarter_report`, the .txt extension is `June_Quarter_report.txt`.

---

7. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

8. Optional: From the **Assign PDF properties to a dictionary variable** list, select a dictionary variable to hold the file properties.

For more information, see [Using a dictionary variable for PDF properties](#) on page 3079.

9. Click **Save**.

## Using the Extract image action

Use the **Using Extract image** action to save a PDF file as an image.

To save a PDF file as an image, follow these steps:

1. In the **Actions** palette, double-click or drag the **Extract image** action from the **PDF** package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file:** Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile:** Enables you to select a PDF file that is available on your device.
  - **Variable:** Enables you to specify the file variable that contains the location of the PDF file.
3. Optional: In the **User password** or **Owner password** field, enter a password to restrict access to the encrypted PDF file.
  - **User password:** Allow users to perform specific operations on the encrypted PDF file.
  - **Owner password:** Allow users to use a password to open the file.
4. In the **Page range** field, select one of the following options:
  - **All pages:** Enables you to save all the pages in the PDF file as an image.
  - **Pages:** Enables you to enter the page numbers of the pages that you want to save as an image.
5. In the **Type of image to be converted to** list, select one of the following options to specify the format:

- **TIFF:** If you selected this option, select an option from the **TIFF compression type** list.
    - **NONE**
    - **LZE**
    - **RLE**
    - **CCITT Group 3**
    - **CCITT Group 4**
  - **BMP**
  - **JPEG:** If you selected this option, in the **JPEG quality** field, enter a value (between 0 and 100) to specify the quality of the compressed image.
  - **GIF**
  - **PNG**
  - **WMF**
  - **EMF**
  - **EXIF**
6. In the **Folder path** field, specify the location.
7. In the **File prefix** field, enter a value.  
The image files are suffixed with index numbers. For example, if you have specified **Report** as the **File prefix**, the name of the image files will be **Report\_1**, **Report\_2**, and so on.
8. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

---

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

9. In the **X Resolution (dpi)** and **Y Resolution (dpi)** fields, specify the resolution.
10. In the **Image output** field, choose **Color** or **Grayscale** to specify the image output type:
- a) In the **Color property** list, select an option.
- **True color (32 bits)**
  - **True color (24 bits)**
  - **High color (16 bits)**
  - **56 color (8 bits)**
  - **16 color (4 bits)**
  - **2 color (1 bit, black/white)**

---

**Note:** This option is available only with the **Color** image output type. Select this option only if **RLE**, **CCITT Group 3**, or **CCITT Group 4** compression type is selected for the **TIFF** image format.

---

11. Optional: From the **Assign PDF properties to a dictionary variable** list, select a dictionary variable to hold the file properties.  
For more information, see [Using a dictionary variable for PDF properties](#) on page 3079.
12. Click **Save**.

## Using the Decrypt document action

Use the **Decrypt document** action to decrypt a PDF file that was previously encrypted using the **Encrypt document** action.

To decrypt an encrypted PDF file, follow these steps:

1. In the **Actions** palette, double-click or drag the **Decrypt document** action from the **PDF** package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file**: Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile**: Enables you to select a PDF file that is available on your device.
  - **Variable**: Enables you to specify the file variable that contains the location of the PDF file.
3. Optional: In the **User/Owner password** field, enter a password to restrict access to the decrypted PDF file.
4. In the **Save the decrypted PDF file as** field, specify a name and location for the decrypted file. You must include the .pdf extension in the name of the decrypted file. For example, if the file name is `June_Quarter_report`, the .pdf extension is `June_Quarter_report.pdf`.
5. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

---

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

6. Optional: From the **Assign PDF properties to a dictionary variable** list, select a dictionary variable to hold the file properties.  
For more information, see [Using a dictionary variable for PDF properties](#) on page 3079.
7. Click **Save**.

Related tasks

[Using the Encrypt document action](#) on page 3071

Use the **Encrypt document** action to encrypt a PDF file.

## Using the Get property action

Use the **Get property** action to obtain the properties of the PDF document.

1. In the **Actions** palette, double-click or drag the **Get property** action from the **PDF** package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file**: Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile**: Enables you to select a PDF file that is available on your device.
  - **Variable**: Enables you to specify the file variable that contains the location of the PDF file.
3. From the **File is protected** field, select **Yes** if the file is encrypted and provide the **User password** or **Owner password**.
4. From the **Assign PDF properties to a dictionary variable** field, choose either a dictionary variable or multiple variables to hold the field values.

To assign the output to a dictionary variable, map the PDF properties such as **File**, **Author**, **Title**, and **Subject** to the corresponding dictionary keys. See [Using a dictionary variable for PDF properties](#) on page 3079.

5. Click **Save**.

## Using the Merge documents action

Use the **Merge documents** action to merge multiple PDF files into a single PDF file.

1. In the **Actions** palette, double-click or drag the **Merge documents** action from the **PDF** package.
2. Click **Add PDF document** to provide details on the first PDF file.  
The **Add PDF document** window appears.
3. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file**: Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile**: Enables you to select a PDF file that is available on your device.
  - **Variable**: Enables you to specify the file variable that contains the location of the PDF file.
4. Optional: In the **User password** or **Owner password** field, enter a password to restrict access to the encrypted PDF file.
  - **User password**: Allow users to perform specific operations on the encrypted PDF file.
  - **Owner password**: Allow users to use a password to open the file.
5. In the **Page range** field, select one of the following options:
  - **All pages**: Selects all the pages in the PDF file.
  - **Pages**: Enter the page numbers of the pages that you want to merge.

---

**Note:** If you entered 1-3, 5-7, 8, 10 or 10, 8, 5-7, 1-3 in Enterprise 11, the output was pages 1,2,3,5,6,7,8,10. In Automation 360, if you enter the input as follows:

- In ascending order 1-3, 5-7, 8, 10, the output of the pages is 1,2,3,5,6,7,8,10
  - In descending order 10, 8, 5-7, 1-3, the output of pages is 10,8,5,6,7,1,2,3
- 

6. Click **Yes, Add**.
7. Repeat Steps 2 through 6 to provide details on additional PDF files.  
To modify the details of, or delete a PDF file, open the actions menu (the vertical ellipsis to the right of the file).
8. Place the files in the order that they should appear in the merged file.  
To move a file, open the actions menu. Then use the **Move up** or **Move down** options.
9. In the **Output file path** field, specify a name and location for the merged file.  
You must include the .pdf extension in the name of the decrypted file. For example, if the file name is `June_Quarter_report`, the .pdf extension is `June_Quarter_report.pdf`.
10. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

11. Click **Save**.

## Using the Split document action

Use the **Split document** action to split a PDF file into multiple files.

To split a PDF file into multiple files, follow these steps:

1. In the **Actions** palette, double-click or drag the **Split document** action from the **PDF** package.
2. In the **PDF path**, select one of the following options to specify the location of the PDF:
  - **Control Room file:** Enables you to select a PDF file that is available in a folder in the Control Room.
  - **Desktop profile:** Enables you to select a PDF file that is available on your device.
  - **Variable:** Enables you to specify the file variable that contains the location of the PDF file.
3. Optional: In the **User password** or **Owner password** field, enter a password to restrict access to the encrypted PDF file.
  - **User password:** Allow users to perform specific operations on the encrypted PDF file.
  - **Owner password:** Allow users to use a password to open the file.
4. In the **Output file creation options**, select one of the following options to specify how to split the PDF file:
  - **Number of pages per extracted PDF:** Enables you to specify the number of pages each new file will contain. For example, you can enter 8 if you want each output file to contain only 8 pages.
  - **Single file with selected pages:** Enables you to create a single output file that contains the pages you have specified from the original file.
  - **Blank page as a separator:** Creates a new output file whenever a blank page is encountered in the original PDF file.

PDF split separates a blank page from pages with scanned images.
  - **Bookmark level per file:** Enables you to split the PDF file according to the bookmark level available in the file. For example, if a file contains three bookmark levels, you can split the PDF file based on these three levels.

If you selected this option, specify the bookmark level in the **Bookmark Level** field.
5. In the **Folder path** field, specify the location.
6. In the **File prefix** field, enter a value.

The image files are suffixed with index numbers. For example, if you have specified **Report** as the **File prefix**, the name of the image files will be **Report\_1**, **Report\_2**, and so on.
7. Select the **Overwrite files with the same name** check box to overwrite existing files with the same name.

---

**Note:** If this option is not selected and the bot encounters a file with the same name at the specified location, the bot will fail.

---

8. Optional: From the **Assign PDF properties to a dictionary variable** list, select a dictionary variable to hold the file properties.  
For more information, see [Using a dictionary variable for PDF properties](#) on page 3079.
9. Click **Save**.

## Using a dictionary variable for PDF properties

When you automate a PDF-related task, Automation Workspace retrieves various properties of the file and stores the values of these properties in a dictionary variable.

Automation Workspace retrieves the PDF file name and extension, title, subject, and author. The file properties are stored in a dictionary variable within the following keys:

- pdfTitle
- pdfFilename
- pdfSubject
- pdfAuthor

The system automatically associates the properties of a PDF with the appropriate dictionary keys.

For example, if you create a dictionary variable Test and want to log the file name and author, you must enter `Test{pdfFilename}` and `Test{pdfAuthor}` in the appropriate fields.

## PGP package

Use the PGP (Pretty Good Privacy) package to automatically encrypt and decrypt files for security.

The PGP package supports two types of encryption, symmetric (single key) and asymmetric (pair of keys) :

- **PGP symmetric** : Requires a single key to encrypt and decrypt files.
- **PGP asymmetric**: Requires PGP public and private key to encrypt and decrypt files.

---

**Note:** The system outputs an error when the proper file extension is not present in the path.

- Public key: File name specified for Public Key is not valid.
  - Private key: File name specified for Private Key is not valid.
- 

## Actions in the PGP package

The PGP package includes the following actions:

Action	Description
Create keys	See <a href="#">Create keys action in PGP</a> on page 3080.
Decrypt files	Decrypts encrypted files. See <a href="#">Using the Decrypt files action</a> on page 3080

Action	Description
Encrypt files	Encrypts files to enable users to send them over the internet securely. See <a href="#">Using the Encrypt files action</a> on page 3081

Related reference

[PGP package updates](#) on page 1003

Review the updates in released versions of the PGP package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Create keys action in PGP

Use the **Create keys** action in the PGP package to create a pair of public and private encryption keys.

### Settings

- In the **Location to save public key file** field, specify the path to the text file where to save the public key.
- In the **Location to save private key file** field, specify the path to the text file where to save the private key.
- In the **Select key size** option, select a key size to create private and public encryption keys.

---

**Note:** The standard available key sizes are 512, 1024, 2048, 4096, and 8192.

---

- In the **Password to protect private key file** field, select a credential variable or enter a value.
- Select the **Overwrite files with the same file name** check box to replace files with the same name.

## Using the Decrypt files action

Use the **Decrypt files** action to retrieve the contents of encrypted files and folders.

To decrypt a file or folder, do the following steps:

1. Double-click or drag the **Decrypt** action from the PGP package.
2. Select either the **Passphrase** or **Public key file** encryption type.
  - If you have selected **Passphrase**, enter the value or select a credential variable.
  - If you have selected **Private key file**, provide the private key file path.

Optional: In the **Password to protect private key file** field, select a credential variable or enter a value.
3. In the **Source folder/file(s)** field, specify the folders or files to decrypt.  
This field supports wildcard characters in the file name and extension. Use an asterisk (\*) to substitute for one or more unknown alphanumeric characters or symbols.
4. In the **Destination folder/file(s)** field, specify the location where to save the decrypted folders and files.

This field supports wildcard characters in the file name and extension. Use an asterisk (\*) to substitute for one or more unknown alphanumeric characters or symbols.

5. Select the **Overwrite Files** option to replace files with the same name.
6. Select the **Remove file extension** option and specify the extension name.
7. Click **Save**.

## Using the Encrypt files action

Use the **Encrypt files** action to prepare files and folders to be shared securely.

To encrypt the files or folder using a public key, create a public-private key pair using the **Create keys** action.

To encrypt a file or folder, do the following steps:

1. Double-click or drag the **Encrypt** action from the PGP package.
2. Select either the **Passphrase** or **Public key file** encryption type.
  - If you have selected **Passphrase**, enter the value or select a credential variable.
  - If you have selected **Public key file**, provide the public key file path.
3. Select the **Encryption algorithm**.  
Choose from:
  - AES128
  - AES192
  - AES256
  - Blowfish
  - CAST5
  - Idea
  - TripleDES
  - TwoFish256
4. In the **Source folder/file(s)** field, specify the folders or files to encrypt.  
This field supports wildcard characters in the file name and extension. Use an asterisk (\*) to substitute for one or more unknown alphanumeric characters or symbols.  
For example:
  - Enter `C:\PGP\encrypt*.csv` to select the .csv files that start with the word encrypt.
  - Enter `C:\PGP\*encrypt*.*` to select files of any extension that contain the word encrypt.
5. In the **Destination folder/file(s)** field, specify the location where to save the encrypted folders and files.  
This field supports wildcard characters in the file name and extension. Use an asterisk (\*) to substitute for one or more unknown alphanumeric characters or symbols.
6. Enter a value to append to the extension of the destination file.
7. Select the **Overwrite Files** check box to replace files with the same name.
8. Select the **Compression type**.  
Choose from:
  - None

- zip
- bzip2
- zlib

9. Select the **Armor data (text output)** check box to enable ASCII Armor output.

10. Click **Save**.

## Play Sound package

The Play Sound package contains actions that enable you to play a beep sound and media file before or after an action is executed in a bot.

The Play Sound package includes the following actions:

Action	Description
Play beep	See <a href="#">Play beep action</a> on page 3082.
Play media file	See <a href="#">Play media file action</a> on page 3082.

Related reference

[Play Sound package updates](#) on page 1006

Review the updates in released versions of the Play Sound package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Play beep action

The **Play beep** action enables you to play a beep sound before or after an action is executed.

## Play media file action

The **Play media file** action enables you to play an audio file before or after an action is executed.

## Settings

From the **Select a file to play** field, select one of the following tabs to specify the location of the media file:

- **Control Room file:** Use a file that is available on the Control Room.
- **Desktop file:** Use a file that is available on a device.
- **Variable:** Use a variable to specify the file location.

---

**Note:** Only `.wav` and `.mp3` files are supported and do not require any media player installed on the device.

---

## Printer package

Use the actions in the Printer package to automate retrieving and setting the default printer and removing a printer from the list of available printers.

### Actions in the Printer package

The Printer package includes the following actions:

Action	Description
Get Default	See <a href="#">Get default action</a> on page 3083.
Remove	See <a href="#">Remove action</a> on page 3083.
Set Default	See <a href="#">Set default action</a> on page 3084.

Related reference

[Printer package updates](#) on page 1007

Review the updates in released versions of the Printer package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

### Get default action

The **Get default** action enables you to retrieve the default printer and assign a value to a string variable.

#### Settings

- Click the **Select the destination string variable****Choose a variable** drop-down menu to select a variable.
- (Optional) Click **Create variable** icon if you do not have an existing variable.

### Remove action

The **Remove** action enables you to delete or remove a printer.

#### Settings

- Click the **Enter the printer name** drop-down menu to view a list of available printers, and select a printer that you want to remove.
- (Optional) If the available printers are not listed, click the **Refresh options** icon.

## Set default action

The **Set default** action enables you to set a default printer.

### Settings

- Click the **Enter the printer name** drop-down menu to view a list of available printers, and select a printer that you want to set as the default one.
- (Optional) If the available printers are not listed, click the **Refresh options** icon.

## Process Composer package

Use the Process Composer package to automate actions in Process Composer that configure bots to process requests, tasks, and team members.

---

**Note:** The Process Composer package was previously known as AARI Web package.

---

Process Composer is an environment that leverages multiple products across the Automation 360 platform to deliver an Intelligent Automation experience. For more details, click [About Process Composer](#) on page 3647.

### Before you start

To run this package, you must meet one of the following conditions:

#### Condition 1

- Access to a process in an assigned team.
- Access to an Co-Pilot User license.
- A system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.

#### Condition 2

- Access to a Bot Runner license (Attended or Unattended) or Bot Creator license.
- A user-created role with the **View My Bots** and **Run My Bots** permissions.

### Actions in the Process Composer package

The Process Composer package includes the following actions:

Action	Description
Assign Human Task	See <a href="#">Assign Human Task action</a> on page 3085.
Cancel Human Task	See <a href="#">Cancel Human Task action</a> on page 3085.

---

Action	Description
Create a Request	See <a href="#">Create a Request action</a> on page 3086.
Get Storage file	See <a href="#">Get Storage file action</a> on page 3088.
Query Requests	See <a href="#">Query Requests action</a> on page 3088.
Query Human Tasks	See <a href="#">Query Human Tasks action</a> on page 3090.
Team Members	See <a href="#">Team Members action</a> on page 3091.
Upload Storage file	See <a href="#">Upload Storage file action</a> on page 3092.

## Assign Human Task action

Assigns a specific task to a specified user.

### Settings

- In the **Task ID to be assigned** field, select the variable of the Human Task. Find the Task ID as an output from the Query Task action.
- In the **User ID to assign to task** field, select the variable of the user. Find the User ID as an output from the Query Member action.

For the task and user ID, you can select a value from the **Variable** or **Global value** options.

- Optional: In the **Assign the result to variable** field, assign a variable to store as an output. The output is stored as a string value.

## Cancel Human Task action

This action cancels a human task. Some configuration is required.

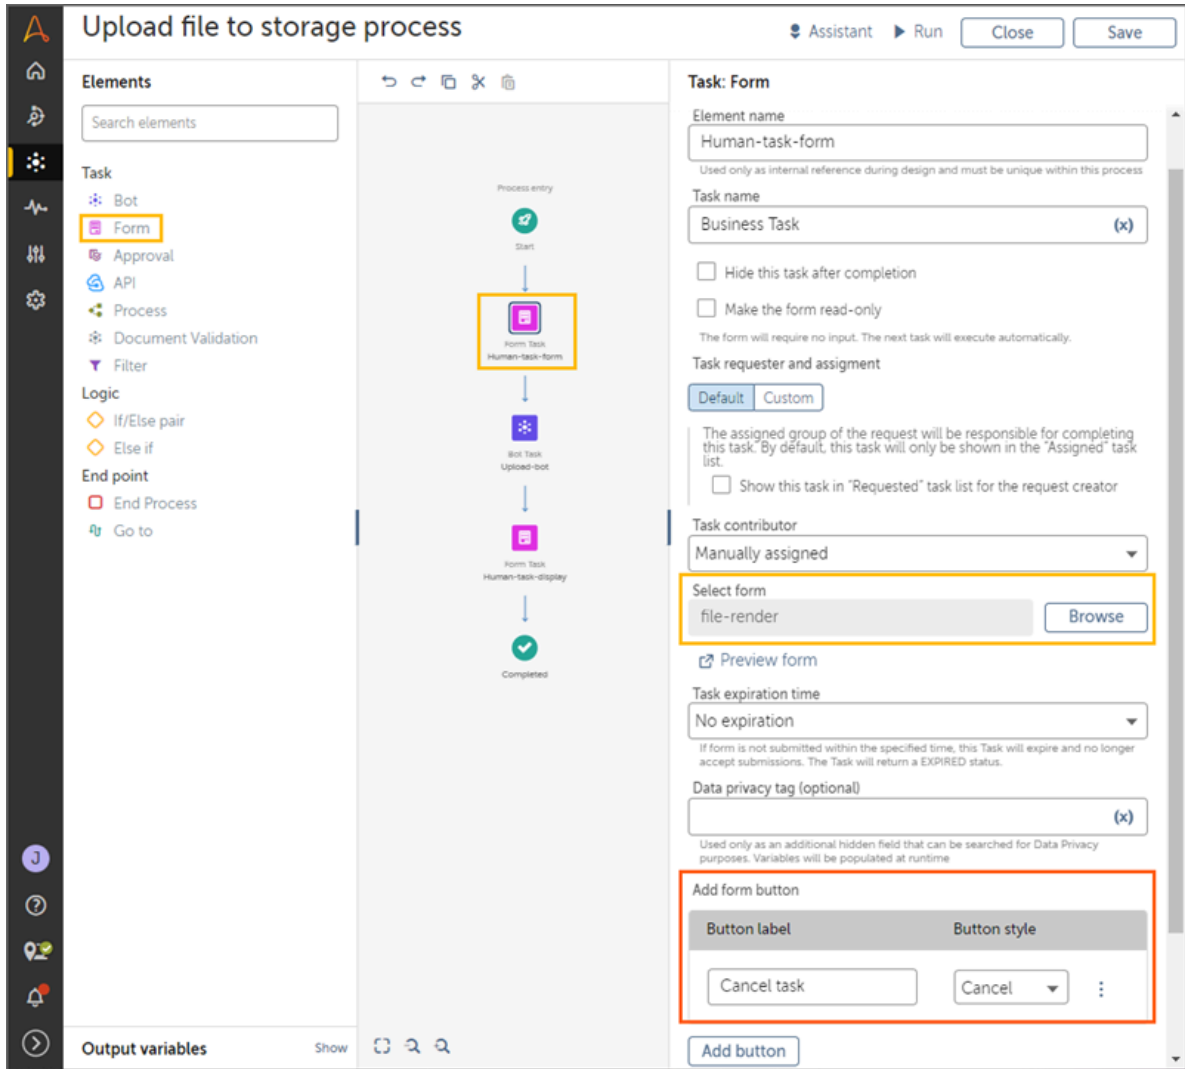

### Settings

The cancel action is only valid when the form of the human task has a button of type **Cancel**. The user then has the control when running the task to cancel the form.

---

**Note:** Although the cancel button ends the form, to cancel the process you should use if/else logic to move the process to the end point when cancel is selected.

---

- In the **Task ID to cancel** field, specify a value.  
For the task, you can select a value from the **Variable** or **Global value** options. The variable option enables you to add predefined variables.
- Optional: In the **Assign the result to variable** field, assign a variable to store as an output.  
The output is stored as a string value.

## Create a Request action

Creates a request with input values.

### Settings

- In the **Actions** palette, double-click or drag the **Create a Request** action from the **Process Composer** package.

- In the **Public Process** field, browse and select the public process. The initial form fields from the process are displayed in the **Input values** field. These fields are from supported interactive form elements.
- In the **Input values** field, enter the values or variables to complete the required information to the initial form.

**Note:** For passing the values through variables, create a custom variable of any type: **String**, **Number**, **Datetime**, **Boolean**, **Dictionary**, **Table**, or **File**. Use the **Dictionary** variable for completing the check box information in the initial form. Enter the variable information in the **Type**, **Subtype**, **Key**, and **Value** fields. In the **Subtype** field, choose **Boolean**. Follow the format convention while creating **Dictionary** variables.

For example, consider the check box attributes as San Jose, Atlanta, and Sacramento, and we want to select the value Atlanta in the initial form field. Create a **Dictionary** variable of subtype **Boolean** in the format as follows:

Name: CheckBoxGroup0

Attributes	Key	Value
San Jose	CheckBoxGroup0_0	false
Atlanta	CheckBoxGroup0_1	true
Sacramento	CheckBoxGroup0_2	false

**Note:** When passing values of a table, the schema of the input table and schema of the initial form (in the process) needs to be the same for the bot to execute.

- Optional: In the **Assign the Request ID to** field, assign a variable to store as output. This returns the ID of the created request.
- Optional: In the **Assign the Request Reference to** field, assign a variable to store as output. This returns the ID of the request that was created.
- Click **Save**.

**Note:**

To configure that the request be created by a bot or a user, you select the **Request creation** field. This field is available when you edit the process containing the request. To edit a process, navigate to **Manage > Process** and select the process you want to edit. This opens the **Edit Process** page in the **General** tab. Towards the bottom of the page, you can set to have the request created by a bot or a user. For more details, see [Configure a process](#) on page 3599.

To learn how to create a request action, click [Example of using Create a Request action](#) on page 3093.

## Get Storage file action

Downloads a storage file to a local device from a specified path.

### Settings

---

**Important:** The Get Storage file action requires the matching of versions between the process version and the package version. Processes created before Automation 360 v.25 must be used with package versions from before Automation 360 v.25. Similarly, processes created after Automation 360 v.25 must be used with package versions after Automation 360 v.25.

---

- Specify the storage file URI in the **Variable** field.

Enter your file input variable.

---

**Note:** You must only use the **Variable** option and the variable must be a file input that is populated from the process (**Select File** in **Human Task**). Do not use the **Control Room file** and **Desktop file** options.

---

- In the **Full path of file in local device to be saved to**, specify the path to store your file.

You can select from **Variable** or **Global value** option. The variable option enables you to add a user-defined value, clipboard, string (enter, newline, separate, etc), system (task name, control room URL, etc), predefined variable package (date, minute, day, time, IP address, operating system, etc), or table analytic value.

- Optional In the **Result** field, choose a variable.

The output is stored as a variable.

## Query Requests action

Create custom filters with sorting capabilities for requests.

### Settings

---

- Select a filter.
- 

**Note:** The filters for process and request titles, tags, IDs, team name, and PII tags have the same list of options.

---

- Specify the string value in the **List** or **Variable** field.
  - Specify your type in the **List** or **Variable** field.
  - **List:** Input your value information in the **Type** and **Value at 0** fields.
  - Optional: In the **Add** field, add more values.
  - **Variable:** Enter your custom variable.
- In the **Request Status** field, select a status.

You can choose **OPENED**, **SUCCESS**, **ERROR**, and **CANCELLED**
- In the **Page** field, specify a value.

- In the **Table start at offset of data** field, enter a value.
- In the **Number of rows per page** field, enter a value.

The default value is set **200** for number of rows.

- In the **Sort** field, specify the option.
  - In the **Direction** field, select **Descending** or **Ascending**.  
The default value is set to **Descending** for the direction.
  - In the **Select sort column** field, select an option.  
You can choose between process title or the request creation, ID, title, status, or PII tag.
  - Select the **Enable 2nd degree sort** and specify the **Direction** and **Select sort column** fields.
- In the **Assign the result to variable** field, assign a variable to store as an output.  
The output is stored as a table value.

As a result of the Query Requests action, a table is returned. The following table lists the table column names and the order in which they are returned for further extraction:

Table 5: Table column names

Index	Column name
0	Request-ID
1	Request-Status
2	Request-Title
3	Request-Pii-Tag
4	Request-Full-Name
5	Process-Title
6	Created-Date
7	Updated-Date
8	Request-Ref
9	Created-By
10	Created-By-User-Group
11	Team-Name

## Query Human Tasks action

Create custom filters with sorting capabilities for tasks.

### Settings

This action calls and displays the tasks from your instance of Automation Co-Pilot based on the filter you configure in this action. Select the options to configure the filter that will display your desired results.

- **Request titles:** filter results by matching titles to the entered value.
- **Names of Teams that handle the Request:** filter results by matching the name of Teams to the entered value.
- **Request Refs matching exact string:** filter results by matching the reference ID of the request to the exact entered value. Optionally, enter multiple values separated by commas.
- **Request Refs:** filter results by matching the reference ID of the request to any value of the entered sub-strings. Optionally, enter multiple values separated by commas.
- **Task IDs:** filter results by matching the task ID to any value of the entered numbers.
- **Task State:** filter results by matching the status of the task (in progress or complete).
- **Task Pii Tag:** filter results by matching the Pii tag to any value of the entered strings.
- **Assignee IDs:** filter results by matching the ID of the task assignee to any value of the entered numbers.
- **Task titles:** filter results by matching the title of the task to any value of the entered strings.
- **Page:** filter results by matching a table of a task page to the entered table structure.
- **Sort:** configure how the results should be sorted upon display.

As a result of the Query Human Tasks action, a table is returned. The following table lists the table column names and the order in which they are returned for further extraction:

Table 6: Table column names

Index	Column name
0	Task-ID
1	Task-Status
2	Task-Title
3	Task-Assignee
4	Task-Pii-Tag
5	Request-ID
6	Request-Title
7	Process-ID
8	Created-Date
9	Updated-Date
10	Task-Sub-Status

Index	Column name
11	Created-By
12	Task-Type
13	Task-Sub-Type
14	Created-By-User-Group
15	Team-Name
16	Workspace-Type
17	Request-Ref

## Team Members action

Retrieves a the list of members in a team.

### Settings

- In the **Supply team ID to query it's members** field, specify a value.

For the supply team ID, you can select a value from the **Variable** or **Global value** options. The variable option enables you to add predefined variables ranging from time (minute, hour, day, month, year, etc) or system usages (CPU and RAM).

- In the **Supply team reference to query its members** field, specify a value.

For the supply team reference, you can select a value from the **Variable** or **Global value** options. With the variable option, you can add predefined variables ranging from time (minute, hour, day, month, year, and so on) or system usages (CPU and RAM).

- In the **Assign the result to variable** field, assign a variable to store as an output.

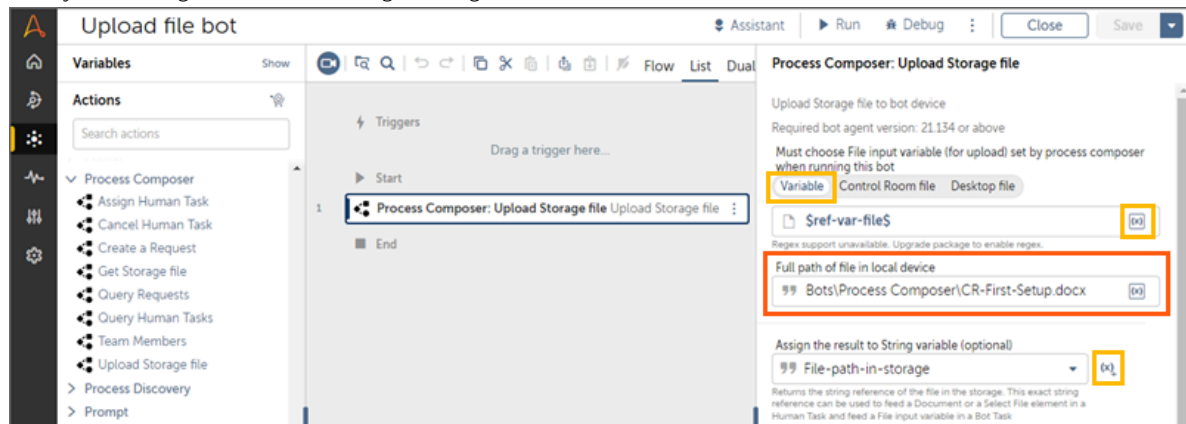

The output is stored as a table value.

## Upload Storage file action

Files can be uploaded to a bot for further processing using the **Upload Storage file** action.

### Recommended Configurations

When using the **Upload Storage file** action, we recommend that you configure the following settings and variables:

- Save the file as a variable using **File** type and mark as **input**. This variable is then selected as the **File input variable** for the action.

**Note:** **Variable** is the only valid option because the file is stored in the bot run device through this predefined variable.

- Enter the full path for the exact location of the file on the desktop or local device.
- Assign the result to a String variable that holds the storage path for the file after upload. This output variable must be a String and should be used to feed a Select File element of a form or another File input variable of a bot.

**Note:** Most major MIME types are supported such as: PNG, JPEG, CSV, XLS, PDF, EXE, and DLL.

### Example: Bot needs to attach a file in the middle of a process

To enable a bot to attach a file in the middle of a process:

1. Build a form using the **Document** element.
2. Build a bot that contains the following variables as shown:
  - File variable as input (such as File\_Reference\_In\_Storage)
  - String variable as output (such as File\_Path\_In\_Storage)

3. Include the bot as part of a Bot Task in the same process.

4. Select the **Upload** option for the File input variable (File\_Reference\_In\_Storage):

Input values

File\_Reference\_In\_Storage

Download Upload

5. Include the form as part of a Human Task in a process after the Bot Task.
6. Feed the String variable output (File\_Path\_In\_Storage) of the Bot Task into the Document element input of the Human Task:

Feed data into form

Document[Document0]

\$UploadBot.output[File\_Path\_In\_Storage]\$ (x)

7. Use the **Upload Storage file** command with the File input variable (File\_Reference\_In\_Storage):

**Process Composer: Upload Storage file**

Upload Storage file to bot device

Required bot agent version: 21.134 or above

**File variable that refers to Desktop file**

Control Room file Desktop file Variable

\$File\_Reference\_In\_Storage\$ (x)

Regex support unavailable. Upgrade package to enable regex.

**Full path of file in local device**

C:/Desktop/MyFile.pdf (x)

**Assign the result to variable (optional)**

File\_Path\_In\_Storage (x)

- The file located at the local path (c:/Desktop/MyFile.pdf) will be uploaded to the storage.
- The reference of that file in the storage will be stored in the String variable which can be used for further processing inside the process.
- In this example, the Document element will use that reference and render the file in a form.

## Example of using Create a Request action

The **Create a Request** action from the Process Composer package enables you to create a new request in Automation Co-Pilot on the web through a bot. In this example, use the **Create a Request** action to pass data through bot variables to initial form of the process.

- You must have a Bot Creator license and be assigned a custom role with the following permissions:

- Check-in and check-out permission
- Create folder permission
- Create a process and check-in the process to the public workspace
- Assign at least one team to the process with the default team selected
- Select the **by bot** option in the **Request creation** field

---

**Note:**

The **Request creation** field is available when you edit the process containing the request. To edit a process, navigate to **Manage > Process** and select the process you want to edit. This opens the **Edit Process** page in the **General** tab. Towards the bottom of the page, you can set to have the request created by a bot. For more details, see [Configure a process](#) on page 3599.

---

In this example, we will create a process to register new employee details in the company database. The initial form contains basic information such as Name, ID, Date of Birth, Gender, and Location. We will pass the initial form data through bot variables.

1. Log in to the Control Room as a Bot Creator user.
2. Create the initial form.
  - [Create a form](#) on page 3666.
  - a) On the left plane, click **Automation**.
  - b) Click **Create new > Form**.
  - c) Enter the form name `employee_register_initial_form`.
  - d) Enter the folder location `Bots\Employee Registration`.  
To change where your form is stored, click **Choose** and follow the prompts.
  - e) Click **Create & edit**.
  - f) Use the following **Elements** and **Element label** in the form.

Elements	Element label
<b>TextBox</b>	Full Name
<b>Number</b>	ID
<b>Date</b>	Date of Joining
<b>Dropdown</b>	Gender
<b>Checkbox</b>	Location
<b>Select File</b>	Resume

- For the **Dropdown** element, enter `Male, Female` in the **Enter list items separated by commas** field.
- For the **Checkbox** element, click the **plus** icon in **Checkbox content** field and add the locations `San Jose, Tokyo, India`.
- For the **Select File** element, you can limit the file type which can be uploaded by specifying it in the **Enter supported file format separated by commas** field. For example; `doc, gif, pdf, png, txt, xls`.

- g) Click **Save**.
- h) Click **Close**.
3. Create a new process.
- In the same folder location, click **Create new > Process**.  
[Create a process automation in Process Composer](#) on page 3684.
  - Enter the process name `employee_register`.
  - Click **Create & edit**.
  - Click **Start** to add an initial form to the process.
  - In the **Select initial data form** field, browse and select the initial form, `employee_register_initial_form`.
  - Select AARI Storage in the **File upload storage** dropdown.
  - Provide **Request title** as Employee Registration.
  - Click **Save**.
  - Click **Close**.
  - Check in this process to the public workspace.
4. Create a new bot.
- In the same folder location, click **Create new > Bot**.
  - Enter the bot name `employee_register_request_bot`.
  - Click **Create & edit**.
5. Create the following variables:
- `emp_name`: String type; use as input.
  - `emp_id`: Number type; use as input.
  - `emp_date_of_joining`: Datetime type; use as input.
  - `emp_gender`: String type; use as input.
  - `emp_location`: Dictionary type, Boolean subtype; use as input. From the check box attributes given above, if you want to select the value San Jose for the location attribute in the initial form field, click the **plus** and create the dictionary variable in the format as given below:
- Name: `emp_location`
- | Attributes | Key              | Value |
|------------|------------------|-------|
| San Jose   | CheckBoxGroup0_0 | True  |
| Tokyo      | CheckBoxGroup0_1 | False |
| India      | CheckBoxGroup0_2 | False |
- `emp_resume`: File type; use as input, select **Desktop folder or file** for the **Default value** and browse and select the file you want to upload.
  - `employee_registration_request_id`: Number type; use as output.
6. Use the **Create a Request** action from Automation Co-Pilot Web package.

- a) In the **Actions** palette, double-click or drag the **Create a Request** action from the **Process Composer** package.
- b) In the Public Process field, browse and select the public process `employee_register`. The initial form fields from the process are displayed in the **Input values** field. These fields are from supported interactive form elements.
- c) In the **Input values** field, enter the values or variables to complete the required information to the initial form as given below:
  - `emp_name: $emp_name$`
  - `emp_id: $emp_id$`
  - `emp_date_of_joining: $emp_date_of_joining$`
  - `emp_gender: $emp_genders$`
  - `emp_location: $emp_location$`. To select the location San Jose in the initial form field, add the key and value pair for the attributes as given below:

Attributes	Key	Value
San Jose	CheckBoxGroup0_0	True
Tokyo	CheckBoxGroup0_1	False
India	CheckBoxGroup0_2	False

- `emp_resume: $emp_resume$`
  - `employee_registration_request_id: $employee_registration_request_id$`
- d) Click **Save**.
  - e) Click **Close**.
7. Deploy the bot.
- a) Click **Run**.
  - b) In the **Set input variables** field, enter the values for the input variable.
  - c) Click **Confirm**.

The bot deploys successfully and a new request is created through the default team assigned to the process. The initial form fields are filled with the input provided through the bot. In the web interface, an Automation Co-Pilot admin can verify that a new request is created, and the data has been selected properly.

## Process package

The **Process** package contains a request action that enables the Control Room user to use this action and configure their bots.

### Before you start

**Note:** The **Process** package has been renamed to the AARI Web package in Enterprise A2019.18 with the **Create a Request** action and additional new actions. The AARI Web package is now

renamed to the `Process Composer` package with the same actions, in Enterprise A2019.28. See [Process Composer package](#) on page 3084.

Ensure you have met one of the following conditions in order to run this package:

Condition 1

- Access to a process in an assigned team.
- Access to Automation Co-Pilot User license.
- A system-created **AAE\_Robotic\_Interface User** role for the Automation Co-Pilot user.

Condition 2

- Access to a Bot Runner license (Attended or Unattended) or Bot Creator license.
- A user-created role with the **View My Bots** and **Run My Bots** permissions.

### Actions in the Process package

The **Process** package includes the following action:

Action	Description
Create a Request	<p>Creates a request.</p> <ul style="list-style-type: none"> <li>• In the <b>Select Process</b> field, select or upload your process.</li> <li>• Specify your variable in the <b>Dictionary</b> or <b>Variable</b> field. <ul style="list-style-type: none"> <li>• <b>Dictionary:</b> Input your variable information in the <b>Type</b>, <b>Key</b>, and <b>Value</b> fields.</li> </ul> <p>In the <b>Type</b> field, you can choose between <b>Any</b>, <b>String</b>, <b>Number</b>, <b>Datetime</b>, or <b>Boolean</b>.</p> <li>• Optional: In the <b>Add</b> field, add more dictionary variables.</li> <li>• <b>Variable:</b> Enter your custom variable.</li> </li></ul> <ul style="list-style-type: none"> <li>• Optional: In the <b>Assign the Request ID to</b> field, assign a variable to store as an output.</li> </ul> <p>The output is stored as an ID value.</p>

### Prompt package

Use the `Prompt` package to accept an input value, a yes/no response, or to open a file or folder.

### Actions in the Prompt package

The `Prompt` package includes the following actions:

Action	Description
For file	See <a href="#">For file action in Prompt</a> on page 3098.
For folder	See <a href="#">For folder action in Prompt</a> on page 3098.
For value	See <a href="#">For value action in Prompt</a> on page 3099.
For yes/no	See <a href="#">For yes/no action in Prompt</a> on page 3099.

Related reference

[Message box package](#) on page 2988

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: Web Form Filled and Complete.

[Prompt package updates](#) on page 1011

Review the updates in released versions of the Prompt package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## For file action in Prompt

The **For file** action in the **Prompt** package prompts you to select a single or multiple files on bot execution.

### Settings

- In the **Prompt window caption** field, enter a window caption.
- In the **Prompt message** field, enter a message.
- In the **Assign the value to a variable** field, specify a list variable.

## For folder action in Prompt

The **For folder** action in the **Prompt** package prompts you to choose a folder.

### Settings

- In the **Prompt window caption** field, enter a window caption.
- In the **Prompt message** field, enter a message.
- In the **Assign the value to a variable** field, specify a variable.

## For value action in Prompt

The **For value** action in the **Prompt** package prompts you to enter a value.

### Settings

- In the **Prompt window caption** field, enter a window caption.
- In the **Prompt message** field, enter a message.
- In the **Assign the value to a variable** field, specify a variable.

## For yes/no action in Prompt

The **For yes/no** action in the **Prompt** package prompts you to choose a Yes/No response.

### Settings

- In the **Prompt window caption** field, enter a window caption.
- In the **Prompt message** field, enter a message.
- In the **Assign the value to a variable** field, specify a variable.

## Python Script package

The Python Script package contains actions that enable Python Script functions in a task.

### Before you start

Ensure the following requirements are met before using the Python Script package:

- The appropriate version of Python is installed on the device on which you want to execute the script.

---

**Note:** Python versions 2.x and 3.x are supported.

---

- The "PATH" environment variable is updated to the path of the Python folder.

To verify if the Python environment variable is set correctly, enter `Python` in the command prompt. If it returns the Python version that is installed, the path environment is set up correctly.

Perform the following actions within the Python Script package as part of using the set of available actions:

1. Open a Python Script file, or manually enter the script you want to run using the **Open** action. You must associate the details of the file or script you want to run with a session name.
2. Run the script using the **Execute function** or the **Execute script** action. You must use the same Python Script session name established in the **Open** action.

3. Close the Python Script session after running the script.

---

**Note:** When you run a bot that contains Python Script actions, the script runs in the background.

To review the bot launcher logs, navigate to `C:\ProgramData\AutomationAnywhere\BotRunner\Logs\<current month>\Bot_Launcher-<today's date>.log.zip`. Each zipped folder contains a file with data on the code execution, which is useful for debugging.

---

## Actions in the Python Script package

The Python Script package includes the following actions:

---

**Note:** The **Open** action must be the first action to use the Python Script in a task. These actions can run a Python Script on Windows, Linux, and UNIX-based devices.

---

Action	Description
Close	See <a href="#">Close action</a> on page 3101.
Execute function	See <a href="#">Execute function action</a> on page 3101. For an example, see <a href="#">Example of using Python script to join a list</a> on page 3403.
Execute script	See <a href="#">Execute script action</a> on page 3101. For an example, see <a href="#">Create a PDF using Python script</a> on page 3103.
Open	See <a href="#">Open action</a> on page 3102.

Related reference

[Python Script package updates](#) on page 1012

Review the updates in released versions of the Python Script package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Close action

The Close action in the Python Script package closes the session.

### Settings

Specify the same session name from the **Open** action.

---

**Important:** It is mandatory to close the session after the script is executed.

---

## Execute function action

The Execute function action in the Python Script package enables you to execute a function within the Python Script package.

### Settings

- In the Python **session** field, specify a session name. Use the same session name from the **Open** action.
- Specify the function name to run the function.
- Optional: Provide the arguments required for the function while storing the returned values in a variable.

This field supports Boolean, dictionary, list, number, or string variables.

---

**Note:** The interface allows you to select only one argument. Use a list variable to concatenate multiple arguments into one variable.

---

- Optional: In the **Assign the output to variable** field, specify the string variable.

See the following examples to learn how to use the Python Script actions when building automations.

- [Build a hello world with a Python function](#)
- [Example of using Python script to join a list](#) on page 3403

## Execute script action

The Execute script action in the Python Script package enables you to execute a script within the Python Script package.

### Settings

- In the Python **session** field, specify a session name. Use the same session name from the **Open** action.

- Optional: In the **Assign the output to variable** field, specify the string variable.  
If the bot executes the script successfully, this action returns the string `True`. Otherwise an error message appears.

The following example shows the difference between the **Execute Script** and **Execute function** actions.

When you open a new Python session, you provide a Python script or file. The script might contain a few lines of code to be executed or might contain a file of functions used to perform certain operations, such as:

```
#executable code flow
file = open("abc.txt", "w")
file.write("Some text")
file.close()

#functions, not in executable flow
def function1():
 return 9+10

def function2():
 return "Some Text"

def add(a,b):
 return a+b
```

- When you use the **Execute script** action, it will only execute the lines of code in the executable flow of the script. Any functions that are defined but not called will not be executed.
- When you use the **Execute function** action, the session can call any function in the script or file, and provide the arguments required for the function while storing the returned values in a variable.

## Open action

The Open action in the Python Script package opens the session.

## Settings

- In the Python **session** field, specify a session name. Use this same session name for other Python Script actions.
- In the Python field, choose one of the following options:
  - In the **Import existing file** option, select an existing Python Script file.

---

**Note:** If you are uploading a script from a file on your desktop, the file and any dependencies must be in a standalone folder. When you select a file for upload, all files and folders at the same folder level are uploaded.

---

- In the **Manual input** option, enter the Python Script.
- In the **Python runtime version** field, select **2** or **3** to specify the runtime version.

---

**Note:** Select the runtime version based on the version of Python installed on the device.

---

## Create a PDF using Python script

Build a bot that runs Python script from a file and generates a PDF.

- To run Python script from Automation 360, you must already have the latest version of Python 3.x installed on your device.
- This example uses the FPDF library to generate the PDF. Therefore, install it before you start building this bot by copying and pasting the following line in the Windows command prompt:

```
pip install fpdf
```

See [FPDF project page](#).

1. Create a file in a standalone folder to hold the following Python script:  
Insert your device username in the angle brackets.

```
from fpdf import FPDF
pdf = FPDF()
pdf.add_page()
pdf.set_font("Arial", size=12)
pdf.cell(200, 10, txt="Go Be Great!", ln=1, align="C")
pdf.output("C:/Users/<yourusername>/Desktop/sample_demo.pdf")
```

---

**Note:** If you are uploading a script from a file on your desktop, the file and any dependencies must be in a standalone folder. When you select a file for upload, all files and folders at the same folder level are uploaded.

---

2. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: `\Bots\`  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
3. Provide the script with a **Python Script > Open** action:
  - a) Double-click or drag the **Python Script > Open**.
  - b) Select the **Import existing file** option.
  - c) Click **Browse** to select the .py file you created in Step 1.
4. Use a **Python Script > Execute script** action to tell the bot to run the script:
  - a) Double-click or drag **Python Script > Execute script**.
5. Close the script execution session with a **Python Script > Close** action:
  - a) Double-click or drag **Python Script > Close**.

b) Click **Save**.

6. Click the **Run** icon.

The bot creates a PDF on the desktop with the text Go Be Great!.

To review the bot launcher logs, navigate to C:\ProgramData\AutomationAnywhere\BotRunner\Logs\\Bot\_Launcher-<today's date>.log.zip. Each zipped folder contains a file with data on the code execution, which is useful for debugging.

If the bot does not create a file, change the last line in the Python script:

```
pdf.output(r"C:/Users/<yourusername>/Desktop/sample_demo.pdf")
```

## Record package

The **Record** package enables you to perform various operations on record-type variables. A record-type variable holds a row of data extracted from a database, spreadsheet, or table in name-field pairs. The fields can store values of Boolean, datetime, number, or string data type.

### Actions in the Record package

The **Record** package includes the following actions:

Add column	See <a href="#">Add column action in the Record package</a> on page 3104.
Assign	See <a href="#">Assign action in the Record package</a> on page 3106.
Delete column	See <a href="#">Delete column action in the Record package</a> on page 3106.
Update column	See <a href="#">Update column action in the Record package</a> on page 3107.

Related reference

[Record package updates](#) on page 1014

Review the updates in released versions of packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Add column action in the Record package

Use the **Add column** action to add a new column to an existing record variable at a specific index position, and store the output within a destination record variable. You can then insert this destination record variable into a Data table or Dictionary object.

### Settings

- In the Actions palette, double-click or drag the **Add column** action from the **Record** package.
- Click the **Source record variable** drop-down and select an existing source record variable.

If there are no existing record variables, create one.

- (Optional) Enter a name for the column you want to add in the **Column name** field.

---

**Note:** The column name is case sensitive. An error message is displayed if you try to add an existing column name. However, you can add a duplicate entry of an empty column name.

---

- Click the **Column type** drop-down and select one of the following options as the type for the column that you are adding:

Option	Description
<b>String</b>	Enter a string value that you want to set to the new column. To insert a variable into the <b>Value</b> field, click the <b>Insert a value</b> icon and select a variable.
<b>Number</b>	Enter a numeric value that you want to set to the new column in the <b>Value</b> field.
<b>Boolean</b>	Click <b>True</b> or <b>False</b> tab to select a Boolean value, or click the <b>Variable</b> tab to insert an existing Boolean variable.
<b>Datetime</b>	<p>Use the <b>Datetime</b> tab to select the following:</p> <ul style="list-style-type: none"> <li>• Select a date from the calendar.</li> <li>• Select the time.</li> <li>• Use the drop-down to select a time zone.</li> </ul> <p>The <b>Datetime</b> is empty by default. If you run the bot without changing the default value, the action will use the current date, time and time zone of the system.</p>

- Use the **Insert column at** field to select one of the following options to specify the index:
  - **first index:** to insert the column at the first position (0 index) in a record variable.
  - **last index:** to insert the column at the last position of the record variable.
  - **specific index:** to insert a column at a specific position in the record variable.

For example, to insert a column at index position 1, enter 0. The index number starts from 0. The first item in the record variable is at position 0, the second item at 1, and so on.

- Click the **Destination record variable** drop-down to select an existing destination record variable.

(Optional) Click the **Create variable** icon to create a record variable. For more information, see [Record variable](#) on page 2492.

## Assign action in the Record package

Use the **Assign** action to assign the value of source record variable to the destination record variable.

### Settings

- In the Actions palette, double-click or drag the **Assign** action from the **Record** package.
- Click the **Select the source record variable** drop-down and select an existing source record variable.

If there are no existing record variables, create one.

- Use the **Select the destination record variable** field to select one of the following tabs for the destination record variable:
  - Multiple variables:** To store the output in multiple variables by providing the key and the variable to which the key is mapped. This variable can be of any type, such as **String**, **Number**, **Datetime**, **Boolean** and so on. For example, if your source record variable contains two entries; name and contact number, you can store the output as given below:

Key	Map to variable
Name	StrName
Contact number	MobileNo

The variables StrName and MobileNo are **String** and **Number** type variables respectively.

- Record:** To store the output in a record-type variable.

Click the **Choose a variable** drop-down to select an existing variable or create one.

## Delete column action in the Record package

Use the **Delete column** action to delete a column from an existing record variable based on the column name or index.

### Settings

- In the Actions palette, double-click or drag the **Delete column** action from the **Record** package.
- Click the **Source record variable** drop-down and select an existing source record variable.

If there are no existing record variables, create one.

- Use the **Delete column by** field to select one of the following options to delete a column :
  - Column index:** to specify a column position in the record variable.  
Indexing starts at 0. For example, enter 5 to indicate the sixth column from the left.
  - Column name:** to specify the name of an existing column.

---

**Note:** The column name is case sensitive. Ensure that you provide the correct column name. If there are duplicate column names, then the first matching column from the left will be deleted.

---

- Click the **Destination record variable** drop-down to select an existing destination record variable.

(Optional) Click the **Create variable** icon to create a record variable. For more information, see [Record variable](#) on page 2492.

## Update column action in the Record package

Use the **Update column** action to update the value of a column within an existing record variable at the specified index or name, and store the output in the destination record variable.

### Settings

- In the Actions palette, double-click or drag the **Update column** action from the **Record** package.
- Click the **Source record variable** drop-down and select an existing source record variable. If there are no existing record variables, create one.
- Use the **Update column by** field to select one of the following options to update a column:

- Column index:** to specify the column number. Indexing starts from 0. Enter 5 to indicate the sixth column from the left.
- Column name:** to specify the name of a column.

---

**Note:** The column name is case sensitive. Ensure that you provide the correct column name. If there are duplicate column names, then the first matching column from the left will be updated.

---

- Click the **Column type** drop-down and select one of the following options as the data type for the column that you are updating:

Option	Description
<b>String</b>	Enter a string value that you want to set to the new column. To insert a variable into the <b>Value</b> field, click the <b>Insert a value</b> icon and select a variable.
<b>Number</b>	Enter a numeric value that you want to set to the new column in the <b>Value</b> field.
<b>Boolean</b>	Click <b>True</b> or <b>False</b> tab to select a Boolean value, or click the <b>Variable</b> tab to insert an existing Boolean variable.

Option	Description
<b>Datetime</b>	<p>Use the <b>Datetime</b> tab to select the following:</p> <ul style="list-style-type: none"> <li>• Select a date from the calendar.</li> <li>• Select the time.</li> <li>• Use the drop-down to select a time zone.</li> </ul> <p>The <b>Datetime</b> is empty by default. If you run the bot without changing the default value, the action will use the current date, time and time zone of the system.</p>

- Click the **Destination record variable** drop-down to select an existing destination record variable.

(Optional) Click the **Create variable** icon to create a record variable. For more information, see [Record variable](#) on page 2492.

## Recorder package

Recorder package captures a series of tasks in a process and then automates them. You can automate your business applications (for example, desktop, Web, SAP, and Java applications) using the Recorder to capture actions performed on application objects such as a text box, button, table, radio button, combo box, and list view.

### Automation 360 extension setting

If the bot execution takes longer when you use the Recorder to automate a static page running on the Google Chrome or Microsoft Edge browser, then follow these steps to enable the setting in the Automation 360 extension:

- Click the extensions icon at the top right corner of the browser window.
- Click the vertical ellipses next to the Automation 360 plugin and select **Manage extension**.
- Enable the **Allow access to file URLs** option.
- Restart the browser and run the bot.

### Benefits of using Recorder package instead of SAP package

We recommend that you use the Recorder to automate SAP applications. When you use the Recorder to automate SAP applications, you have the following benefits:

- You can automate objects without creating a session. When you use the SAP package you must create a session.
- You can automate the object directly without generating the field paths or having any prior knowledge of the field paths. When you use the SAP package, the package will execute actions directly on control field paths when properties in the search criteria match the object that the bot searches during execution.

- If the Recorder runtime window overlaps the object that you want to automate, then the Recorder hides the runtime window before you automate the object.
- Recorder supports actions in the If, Loop, and Wait packages that enables you to check if an object exists in the specific browser or window.

---

**Note:** When compared to the Recorder package, the SAP package enables you to automate an application without activating the application window.

---

## Capture using Recorder

Use the **Capture** action to capture an interaction with a user interface (UI) object. This action enables you to add a single interaction when you are building a bot.

---

**Note:**

- The Capture action replaces the Object Cloning command from Version 11.3.
- If you launch any supported browser or application with a user account that is different from the one used to log in to the computer, the Recorder might not capture and play the control actions accurately.
- When you use the Recorder package (version 2.3.0-20210806-215200 or earlier) with the Bot Agent (version 21.250 or later) released with Automation 360 v.29, you might encounter issues while capturing an object. We recommend you use Recorder package (version 2.4.0-20211118-080716 or later) with the Bot Agent (version 21.250 or later) to capture objects successfully.
- When the Bot Agent is installed at the user level, that is for user-specific installation type, Citrix, Java, and SAP will not be configured since the session in which the Bot Agent is running might not have the required privileges. Only VMWare plugin will be configured for the current user.

---

[Using the Capture action](#) on page 3133

When you are automating web pages running on Google Chrome and Microsoft Edge browsers, the **Recorder > Capture** action no longer scrolls down the web page if the target object is visible on the screen. This improves the user experience and the reliability of automation when there is a fixed top pane on the web page and if some physical actions such as mouse clicks do not work as expected.

Use the **Recorder > Capture** action to automate objects successfully when your device credentials are entered in the UPN format.

## Manual configuration of Silverlight technology

With the Recorder package (version 3.17.2 and later) and new Bot Agent (version 22.1.22) that was released with Automation 360 v.31, we will no longer configure Silverlight technology. If you want to configure Silverlight technology, perform the following steps to run the check.exe file manually.

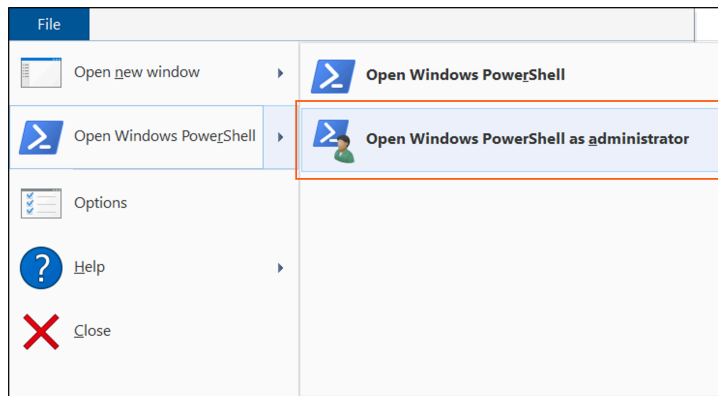

1. Navigate to `C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources`
2. Search for **ec0db824-25eb-4c57-ab44-f77ef67d2579**.

The search results display a list of Recorder packages.

3. Select the Recorder package that you use.
4. Run check.exe file as administrator from that folder.

Alternatively, you can also perform the following steps to run the check.exe file manually from **Windows PowerShell**.

1. Click the **File** menu.
2. Navigate to **Open Windows PowerShell > Open Windows PowerShell as administrator**.

3. Enter `.\check.exe` in the script and click **Enter**.

Perform the following steps to run the check.exe file manually from the **Command Prompt**.

1. Open the **Command Prompt** and run as administrator.
2. Enter `C:\ProgramData\AutomationAnywhere\GlobalCache\embedded-resources\` followed by the Recorder package version that you use.
3. Enter `check.exe` in the script and click **Enter**.

## Supported applications

You can automate the following applications running on Microsoft Edge Chromium with IE mode:

- Java web applications
- Applications that are accessed through the Citrix Workspace app.
- Citrix Virtual Apps

---

**Note:** Citrix Virtual Apps and Desktop Version 2303 is certified with Recorder package (version 2.16.0-20231101-165457 and later)

---

### Note:

- To accurately capture or automate objects on SAP applications, we recommend that you enable scripting. If scripting is not enabled, the following prompt message is displayed below the bot runtime window:

```
SAP scripting disabled: Enable scripting for more reliable captures
```

If you do not enable scripting, instead of using SAP technology, the Recorder uses MSAA technology for capturing objects.

- When automating an Electron application, the Recorder captures specific controls on the application using the Microsoft UI Automation (COM) technology by default. This enables you to automate Electron applications seamlessly without having to recapture the object with a specific technology.
- 

## Citrix XenApp support

You can now launch the Google Chrome or Microsoft Edge browser window from a Citrix XenApp application, access the Control Room from the specific browser, and automate other virtual applications which are run as XenApps. This enables reliable object-based automation when you deploy and launch both Control Room and business applications as virtual applications from the same system.

---

### Note:

- Ensure that you install the Bot Agent in the same Citrix XenApp server from where you launch your business applications.
  - When you launch the Control Room as a XenApp, Automation Anywhere remote agent for Citrix is not required.
- 

You can successfully execute parent and child bots that use different versions of the Recorder package in a Citrix XenApp environment.

---

**Note:** To use and execute multiple versions of the Recorder package in a bot effectively, ensure that your bots, both parent and child, use the Recorder package (version 2.16.0-20231101-165457 and later). Using earlier versions might not support this feature and could cause inconsistencies or errors during bot execution in Citrix environments.

---

## Supported control types

You can automate the following control types when you are automating a web page on a Google Chrome, Microsoft Edge Chromium, or Mozilla Firefox browser:

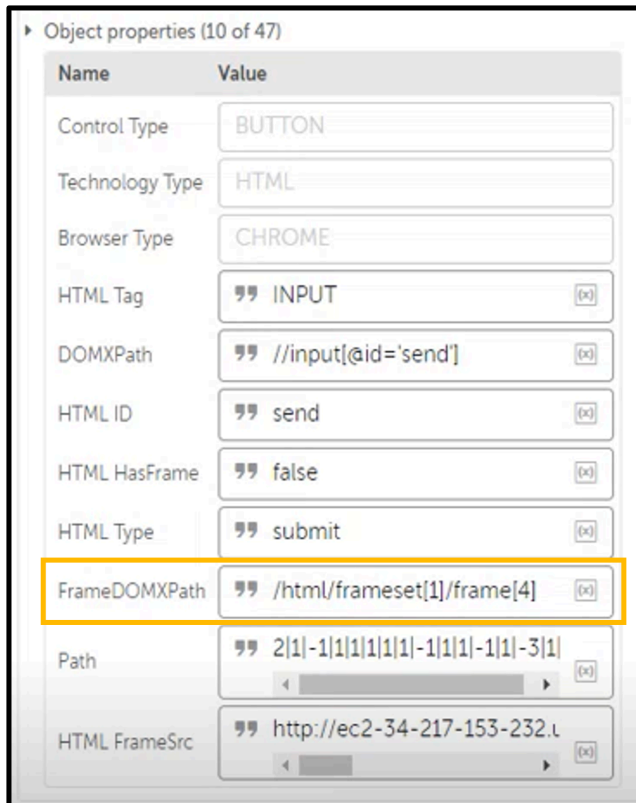

- Pop-up windows
  - Alert dialog boxes
  - Confirmation dialog boxes
  - Prompt dialog boxes
- 

**Note:** When you want to automate an alert dialog box on a web page, we recommend that you add a delay before the **Recorder > Capture** action because sometimes, the alert dialog box appears after a delay on the application window.

---

## Cross-domain support

You can capture and automate objects inside a cross-domain IFrame that has multiple IFrames with same frame source and IFrames that are loaded dynamically during runtime in Google Chrome and Microsoft Edge Chromium browsers. After you have captured an object inside a cross-domain IFrame, the frame path is stored in the **FrameDOMXPath** property, by default.

The new **FrameDOMXPath** property identifies the frame in which the object is located. You must select this property to run the bot successfully to automate objects on a cross-domain IFrame.

### Note:

- When you select the **FrameDOMXPath** property from the search criteria, do not change the value of this property.
- If you clear the **FrameDOMXPath** property from the search criteria, the Recorder fails to identify the frame.

**Important:** In the Google Chrome browser, you can capture and automate objects inside a cross-domain and use multiple frames with the same frame source.

## Automate applications running as an admin user

You can capture objects on applications that are running as an administrator by selecting the **Capture and run with admin privileges** option from the Bot editor.

Before you automate applications running as an admin user, ensure the following:

- Bot Agent is installed in system profile.
- Bot Creators and Bot Runners have admin rights on the device to automate the applications.

When you select the **Start recording** option in the Bot editor to record multiple applications, and switch applications running in elevated and non-elevated mode, the bot might not be able to identify the change between modes. In such cases, for all captures on applications in elevated mode, select the **Capture and run with admin privileges** option and then re-capture the object.

**Note:** Elevated mode gives you permission to run applications as an administrator.

**Important:** When you try to automate any Java or SAP application that is non-elevated by using the Recorder in elevated mode, the bot encounters an error.

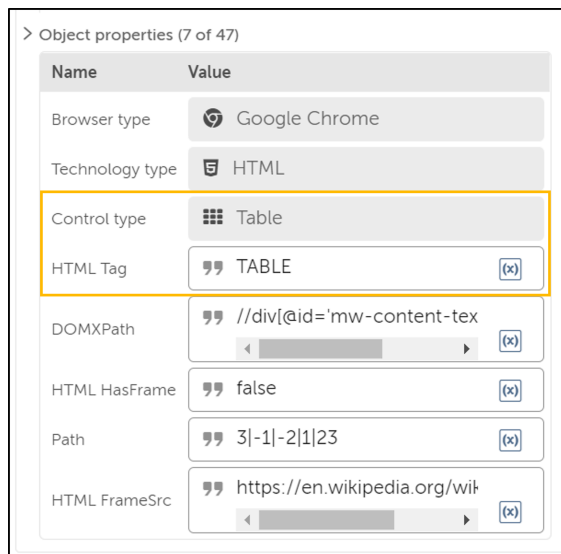

To avoid this error, de-select the **Capture and run with admin privileges** option from the Bot editor and run the Recorder in non-elevated mode to capture Java or SAP applications.

## Object properties

When you select an object to capture, the Universal Recorder collects data on the object's properties in order to identify the object during run time. You can do the following with the object properties:

- Verify that the captured object properties match your intended object.

For example, when capturing a table from a website, ensure the **Control Type** and **HTML Tag** values are **TABLE**.

- Retrieve a property value. Use the **Get property** action and enter the name of the property in the **Property name** field or select an object property from the list of available properties. The list includes suggested property values from the search criteria in the **Object Properties** table. To select an object property from the list of properties, move the mouse pointer to the right of the **Property name** field and click the arrow.

For example, to retrieve the text of a link, use the **Get property** action and enter `HTML InnerText` in the **Property name** field or select `HTML InnerText` from the list of properties.

- You can select a combination of properties for the bot to search the object in your business application window uniquely.

The search algorithm for the Recorder package ensures that when you run a bot an object is captured only if its properties match the exact search criterion that you selected in the **Object properties** table. If the properties of the object do not match the search criterion exactly, then the bot fails with an error message. However, if the search criterion includes a wildcard character, then the bot captures the first object that matches the criterion.

For example, to capture a text box from an application that has three text boxes named **firstname1**, **firstname2**, and **firstname3**, if you select **HTML name** as the search criterion, enter the value `firstname` in the HTML name field, and run the bot, then the bot fails with an error message because a text box with the HTML name `firstname` does not exist. However, in the **HTML name** field, if you enter `firstname*`, and run the bot, then the bot captures the first text box that matches the criterion.

---

**Note:** This functionality is available for the bots you create using the 2.4.0-20211016-070100 version of the Recorder package starting from Automation 360 v.23. If you have created bots using a previous version of the Recorder package, you must recapture the objects to use this functionality.

---

## Actions performed on captured objects

After capturing the object, specify the action for the bot to perform on the object at run time. For example, when you capture a hyperlink, you can select to click the link or to retrieve the link text. To see table of all objects and possible actions, see [Actions performed on objects captured with Universal Recorder](#) on page 3115.

---

**Note:** If you encounter an error when running a bot that captures an object from Internet Explorer and the error message is about Google Chrome, see [Your Chrome Plug-in is either not installed or disabled \(A-People login required\)](#).

---

## Background processing

Background processing enables an automation that involves interacting with an application in the foreground (such as mouse clicks) to run in the background. We recommend that you use the option to run in background to increase the visibility of the target object and improve bot accuracy. The following actions support background processing:

- Click
- Set Text
- Get Text

## Secure recording

When secure recording mode is enabled, bots do not display the target object images after capture. This ensures that sensitive data is not shown.

---

**Note:** Although the bots do not display the target images after capture, the images are still stored in the Control Room because they are required to run the bots.

---

When you record a task in secure recording mode, the **Preview** window temporarily shows an image of the captured area. This image is hidden after you navigate away from the Bot editor window or refresh it.

A user with admin privileges must enable this setting. See [Configure Settings](#) on page 1903.

## Proxy support

If your device is configured with a proxy, all outbound requests from this package are routed through the proxy server. See [Connect Bot Agent to a device with a proxy](#) on page 1455.

## Use cases on how to use recorder

Use these example tasks to become familiar with the use of the recorder in building bots.

- [Example of entering data into a web form from a spreadsheet](#) on page 3397
- [Example of extracting data from a web table](#) on page 3394

Related reference

[Universal Recorder for object-based automation](#) on page 2388

Use the Universal Recorder to record interactions, such as click, read (data extraction), and write (data entry), with user interface (UI) objects on the desktop, taskbar, or in an application or browser window.

[AISense for recording tasks from remote applications](#) on page 2405

AISense is the artificial intelligence (AI) powered capability of Automation 360 that helps you identify objects from an image or an application with a complex user interface (UI) and make automation in all environments faster and more accurate.

[Recorder package updates](#) on page 1016

Review the updates in released versions of the Recorder package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Actions performed on objects captured with Universal Recorder

After capturing the object, specify the action for the bot to do to the object at runtime. For example, if you capture a hyperlink, you can select an action to click the link or to retrieve the link text. Refer to the table below for the objects and their possible actions.

---

**Note:**

- After you have captured an object and open the **Action** drop-down list, the list might offer actions for an object that are not supported. Only use the actions for an object that are listed in the table below.
- You can capture any control type which is not yet supported by Microsoft UI Automation (COM) technology as **Client** control. You can perform all actions that are available in **Client** control type but only those actions that are supported for that specific control. For example, if you are capturing a slider control which is not yet supported by Microsoft UI Automation (COM) technology, it is captured as a **Client** control. You can perform only those actions that are supported by the slider control. For example, you can perform the **Click**, **Left click**, **Right click**, and **Double click** actions but you cannot perform the **Set text** action.

Object	Actions
Button	<ul style="list-style-type: none"><li>• <b>Get property</b>: retrieves the value of the specified object property (such as the link text) and optionally saves it to a variable. Object	Actions
Tree (Control is displayed as a ListView)	<ul style="list-style-type: none"> <li data-bbox="610 254 1412 348">• <b>Get property:</b> retrieves the value of the specified object property (such as the link text) and optionally saves it to a variable. For more information, see the Object properties section.</li> </ul> <hr/> <p data-bbox="646 380 1412 506"><b>Note:</b> When you use the Microsoft UI Automation (COM) technology to capture the control, the <b>Get property</b> action does not retrieve the property of the item element and returns a blank value.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="610 527 1333 558">• <b>Get total items:</b> retrieves the number of items in the tree.</li> <li data-bbox="610 562 1373 594">• <b>Get selected index:</b> retrieves the item's position in the menu.</li> </ul> <hr/> <p data-bbox="646 625 1057 657"><b>Note:</b> Item index counts start at 1.</p> <hr/> <p data-bbox="646 709 1412 835"><b>Note:</b> When you use the Microsoft UI Automation (COM) technology to capture the control, the <b>Get selected text</b> action returns a list of items instead of a single item in a string similar to other technologies.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="610 856 1357 888">• <b>Get selected text:</b> retrieves the data from the selected item.</li> </ul> <hr/> <p data-bbox="646 919 1412 1045"><b>Note:</b> When you use the Microsoft UI Automation (COM) technology to capture the control, the <b>Get selected text</b> action returns a list of items instead of a single item in a string similar to other technologies.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="610 1066 1349 1129">• <b>Select item by index:</b> selects the item that is located at the specified index.</li> </ul> <hr/> <p data-bbox="646 1161 1057 1192"><b>Note:</b> Item index counts start at 1.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="610 1213 1390 1276">• <b>Select item by text</b> selects the item that matches the specified text.</li> </ul> <hr/> <p data-bbox="646 1308 1195 1339"><b>Note:</b> The <b>Assign value</b> field is case-sensitive.</p> <hr/> <ul style="list-style-type: none"> <li data-bbox="610 1360 1406 1392">• <b>Left click:</b> use this action if the <b>Click</b> action fails during runtime.</li> <li data-bbox="610 1396 781 1428">• <b>Right click</b></li> <li data-bbox="610 1432 805 1463">• <b>Double click</b></li> </ul> <hr/> <p data-bbox="610 1518 1406 1644"><b>Note:</b> When you capture a Tree control using Microsoft UI Automation (COM) technology and perform <b>Left click</b>, <b>Right click</b>, or <b>Double click</b> actions on the control, the actions will click on the point of capture.</p>

## Search criteria used by the Recorder package

When you record a User Interface (UI) control with the Recorder package, a set of properties is captured; these properties are used to identify and interact with the recorded UI control during runtime.

The controls you capture using the Recorder are called objects. When the Recorder captures an object, it captures all possible properties that uniquely identify the object. The selected properties are used as "search criteria" to search and find the control from the target application during runtime.

During bot execution, the recorder goes through the target application control tree and selects the control that matches the saved properties, also known as search criteria.

By default, the recorder selects the best possible search criteria for a recorded control based on the technology. However, bots can encounter problems when trying to find previously recorded UI controls. Some of the common reasons for such failure include ,but are not limited to, the following:

- **Dynamic properties:** If the properties of the captured elements change with each session or page load, and if the search criteria include any of the dynamic properties, bot can fail during runtime.
- **Frequent UI changes:** If the target application is updated frequently with UI changes, and if the properties of the recorded UI controls change, bots can encounter problems when trying to recognize the recorded controls.
- **Controls with duplicate properties:** If there are multiple controls with the same properties, it can result in either unintended results or bot failing to recognize the controls.

In such situations, if your bots depend solely on the default search criteria captured by the recorder, they can face difficulties in recognizing the captured controls. The captured search criteria work consistently as long as there are no other objects that match the criteria or the objects themselves are not periodically updated. Therefore, after recording UI controls, you must consider these factors and try to configure search criteria that can help your bot uniquely identify the recorded controls at the time of bot execution.

## Search and validation properties for HTML technology

Search criteria is a combination of search object properties and validation properties.

Search object properties: These properties are used to locate the object from the HTML page. The following properties are used for searching the object.

- **HTML Class**
- **HTML ID**
- **HTML Name**
- **HTML FrameSrc**
- **HTML Tag**
- **HTML Type**
- **HTML InnerText**
- **HTML FramePath**
- **DOMXPath**
- **Path**
- **HTML HasFrame**

- **FrameDOMXPath**

Validation properties: These properties are validated only after the object is found. The following properties are used for validation.

- **HTML Class**
- **HTML Height**
- **HTML Href**
- **HTML ID**
- **HTML Left**
- **HTML Name**
- **HTML Parent**
- **HTML SourceIndex**
- **HTML Tag**
- **HTML Title**
- **HTML Top**
- **HTML Type**
- **HTML Value**
- **HTML Width**
- **HTML InnerText**
- **InnerHTML**
- **OuterHTML**
- **IsVisible**

### **Example of dynamic properties and using custom search criteria**

Suppose certain properties of a web page that you are trying to record change at every session. Including the properties that change will result in bot failing to recognize the controls. For example, consider the sample login page shown in the following video. The ID property of the Login button changes every time the page is loaded.

When you record the Login button on the page, the recorder captures the ID as one of the default properties.

The screenshot displays the Automation Anywhere interface for configuring a bot. On the left, a flowchart shows a sequence: Triggers (lightning bolt icon) → Start (play button icon) → Recorder: Capture (video camera icon) → End (stop icon). The 'Recorder: Capture' step is detailed with the instruction: 'Left click on button "btn16969...'. On the right, the 'Object properties' panel is open, showing a preview of a login form with an 'Enter password' field and a 'Login' button. Below the preview, the 'Action to take on object' is set to 'Left click'. The 'Object properties' table lists various attributes for the selected button:

Name	Value
Browser type	Google Chrome
Technology type	HTML
Control type	Button
HTML Tag	BUTTON
DOMXPath	/html/body/div[1]/button[:]
<b>HTML ID</b>	<b>btn1696911842030-8845</b>
HTML HasFrame	false
HTML Type	submit
Path	1 -1
HTML FrameSrc	https://aa2019packagesd...

At the bottom of the properties panel, there is a 'Keep trying for (seconds)' field set to 15.

If you run the bot without updating the search criteria, the bot fails during runtime because the ID of the login button keeps changing every time the page is loaded.

**⚠ There was a problem at line 4**

This may be due to the following reason:

Unable to find BUTTON. Search Criteria did not match.

Location: Recorder-Test (line 4)

To continue, edit the bot and fix the error. Then, try again.

If you continue to see this message, please contact your system administrator.

Code: bot.execution.error

**Close**

Since the ID property keeps changing, the bot fails because it is unable to find the Login button that has the previously captured ID. So using the ID property in this scenario will not work. The problem can be easily fixed by clearing the ID property and by selecting the **innerHTML** property as shown in the following video. That way the bot does not look for a control with the ID btn1696911842030-8845. Instead, it will depend on the combination of the **DOMXPath** and **innerHTML** properties to uniquely identify the control.

## Considerations for modifying object properties in HTML

Consider the following factors when you capture UI controls using the Recorder package:

- If the web page that you plan to record has dynamic properties, omit them from the recorded object properties. Instead, select properties that will not change during the run time.
- If there are multiple UI controls with the same properties, select properties that can identify a specific UI control uniquely. For example, if there are multiple buttons with the type button and if the innerHTML text (button labels) is different for each button, using the innerHTML as one of the property will help identify the control during runtime.
- Use a dynamic or relative DOMXPath that works with layout changes. Avoid using static DOMXPath if the layout changes or dynamic controls are added to the UI.
- Use wildcard (\*) if certain characters of the property values are dynamic.

## Using the Capture action

Use the **Capture** action to capture a single interaction (click, keystroke, or mouse movement) with an object control including a text box, button, table, menu, radio button, combo box, check box, list view, link, tree, or page tab.

- To use the Recorder, you must already have done the following:
  - [Install Bot Agent and register device](#) on page 1450
  - [Set user device credentials](#) on page 1457

- Configure device display and font scale to 100%.

If you are using Recorder package version 2.0.6-20200626-193519 or later, you can record tasks in Google Chrome, Internet Explorer, Java, Microsoft Active Accessibility, and Microsoft UI automation applications on a computer that has display scale configured to 100%, 125%, or 150%.

- If you are automating a task using a browser, configure the zoom level to 100%.

If you are using Recorder package version 2.0.6-20200626-193519 or later, you can record tasks in a Google Chrome browser that does not have a zoom level setting of 100%.

- If you are automating a task using a Google Chrome browser, ensure that the Automation Anywhere plug-in that corresponds with the Automation 360 build version is enabled.

[Browser requirements for Automation Workspace](#) on page 1312

- To automate web applications running on Microsoft Edge Chromium browser in Internet Explorer mode using the Universal Recorder, ensure that the Internet Explorer compatibility mode is enabled. The objects on the web applications are captured using HTML technology. To enable this mode, perform the following steps:

1. On the Microsoft Edge Chromium browser page, click **Settings**.
2. On the left panel, click **Default browser**.
3. Navigate to the **Allow sites to be reloaded in Internet Explorer mode** option and select **Allow**.
4. Click **Add** to add the URL of the page that you want to load in Internet Explorer mode.

---

**Note:** The pages that you add open in Internet Explorer mode for 30 days from the date when you add the page.

---

Considerations when recording a task:

- Use clicks when possible rather than shortcut keys.

When you click an object using the Recorder, it retrieves the object's properties that enable the bot to identify the object at runtime. Keyboard shortcuts are less reliable, so use them when it is not possible to automate the task by a clicking an object.

- If you are automating a task using a browser, do not use autofill to enter values into fields.
- Record the task at low speed.
- Avoid dragging windows during the recording process.
- Avoid clicking on applications that are not part of the process you are recording and automating.
- When Internet Explorer is used, the action waits until the browser is completely rendered and is in a ready state before executing the action.

To record a single interaction with an object control, follow these steps:

1. Double-click or drag **Recorder > Capture**.
2. Specify the window in which to capture an object.  
Choose from the **Application**, **Browser**, or **Variable** tab.

Option	Description
Application	Select from a list of currently active windows. This option shows a list of all the application and browser windows that are open on the Bot Creator device.
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers. For all other browsers, use the <b>Application</b> option.
Variable	Select an existing window variable to specify the title of the application window title.

3. Optional: Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value.

For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by - Notepad, you can enter the **String** value as \* -Notepad, or use **Pattern** value as ((\w)\s)\*document-Notepad for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

**Note:** During runtime, verify that the Task Bot identifies the correct window. If it does not, do the following:

- a) Open the application or browser window.
  - b) Drag a **Window > Get active window title** action above the **Recorder > Capture** action.
  - c) Insert a string variable into the **Assign the window title to variable** field.
  - d) Drag a **Window > Set title** action below the **Window > Get active window title** action.
  - e) In the **Window** field, insert the window variable generated by the **Recorder > Capture** action.
  - f) In the **New window title** field, insert the string variable from the **Get active window title** action.
  - g) Click **Save**.
- 

**4.** Optional: Select the **Resize window** option to specify the window dimensions.

This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, which enhances the ability of the bot to identify the target object.

- If the window is maximized when you record the task, this option is not selected.
  - If the window is not at the maximum size when you record the task, this option is selected, by default, and the width and height fields are automatically filled with the dimensions of the window.
- 

**Note:** This option is available only for windows that can be resized. It is not available for the **Desktop** or **Taskbar** options.

---

**5.** Click **Capture object**.

The selected window appears.

---

6. Move the mouse over the object you want to automate, for example, a button, form field, or a table.  
A red rectangular box appears around the object.

---

**Note:** If the box does not appear and you are capturing in either the Google Chrome, Microsoft Edge, or Mozilla Firefox browsers, verify that you have enabled the Automation Anywhere extensions for these browsers. See [Google Chrome browser extension requirements](#) on page 2399 for Google Chrome browser.

---

7. Click the object.
8. Review the **Object properties** table.  
Following are the list of object properties that are selected by default based on the technology type:

---

**Note:** You do not have an option to select Java or HTML technology explicitly. When you capture an application in auto-detect mode, the Recorder detects the technology automatically based on the application being captured. When the Recorder detects the specific technology, the technology type is displayed within the **Object properties**.

---

**Important:** The following list does not include all the properties and is restricted to the most commonly used and important properties based on the technology type.

---

Technology type	Object properties	Description
HTML Technology	Control type	This is a read-only property that shows the type of object captured, for example, text box or button.

Technology type	Object properties	Description
	DOMXPath	<p>It is the path that is used to locate the control or object that is captured. <b>DOMXPath</b> can be of two types: Relative XPath and Absolute XPath.</p> <ul style="list-style-type: none"> <li>• Absolute Xpath: It contains the complete path from the root element to the desired element. For example, an absolute Xpath for this topic would be <code>/html/body/div/div[1]/main/div[2]/div/div/div[2]/div/div/div[1]/div/article/main/article/div/p[1]</code></li> <li>• Relative Xpath: This is a shorter path that refers to an element you want to identify. A relative path starts with a <code>//</code> symbol. For example, the relative XPath for this topic would be <code>//*[@id="cloud-using-recorder-action"]/div/p[1]</code></li> </ul> <p>For example, if you want to find the <b>DOMXPath</b> of a particular element on Google Chrome browser, perform these steps:</p> <ol style="list-style-type: none"> <li>a) Select the element for which you want to extract the XPath.</li> <li>b) Right-click the element and select <b>Inspect</b>.</li> <li>c) Right-click the highlighted element in the <b>Element</b> tab.</li> <li>d) Go to <b>Copy &gt; Copy XPath</b> to copy the relative path and select <b>Copy &gt; Copy full XPath</b> to copy the absolute path.</li> </ol>
	Path	<p>It is a numeric representation of the position of a particular control in an application. For web applications, the best practise is to use <b>DOMXPath</b> from the search criteria when compared to <b>Path</b>.</p>
	HTML name and ID	<p>These properties are used to identify an HTML object</p>
	HTML inner text	<p>The DOM innerText Property is used to set or return the text content of a specified node and its descendants</p>

Technology type	Object properties	Description
	HTML tag	HTML tags are like keywords that define the way web browser formats and displays the content. For example, if the captured text has an HTML code: <code>&lt;h3 class="search_results-title"&gt;Search results for "string package"&lt;/h3&gt;</code> , then enter h3 in the HTML tag field.
Microsoft Active Accessibility	Control type	This property is used only as a reference to ensure that the correct object is captured
	Path	It is a numeric representation of the position of a particular control in an application
	Name	This specifies a name of an element and works as an identifier
	ID	This specifies the ID of an element and works as an identifier
Java Technology	Control type	This property is used only as a reference to ensure that the correct object is captured
	Path	It is a numeric representation of the position of a particular control in an application
Microsoft UI Automation	Control type	This property is used only as a reference to ensure that the correct object is captured
	Path	It is a numeric representation of the position of a particular control in an application
	Name	This specifies a name of an element and works as an identifier
	ID	This specifies the ID of an element and works as an identifier
	IsFirst	This property enables the bot to detect the first object based on your search criteria instead of traversing the entire tree. You can use this property when an object does not have a unique Automation ID and the object hierarchy changes in the application.
Microsoft UI Automation (COM)	Control type	This property is used only as a reference to ensure that the correct object is captured.
	Path	It is a numeric representation of the position of a particular control in an application.
	Name	This specifies a name of an element and works as an identifier.
	ID	This specifies the ID of an element and works as an identifier.

The bot uses the selected properties to identify the object control at runtime.

- a) Verify that the **Control Type** matches your intended object.

For example, when capturing a table from a website, ensure the **Control Type** and **HTML Tag** values are **Table**.

If the **Control Type** does not match your intended object, recapture the object control.

- b) Select and assign values to the object properties that you want to include in the object search.

For a more reliable bot, we recommend that you select only the properties that have static values (such as **Name**, **Class**, **Type**, **HTML ID**, and **DOMXPath**), and deselect the properties that have dynamic values (such as **HTML Href**, **Path** or **Value**), which are subject to change and cause bot errors.

It is a best practice to use the wildcard character (\*) or variable in object property values to search for objects whose properties are dynamic and changes frequently.

---

**Note:** Wildcard character matching is currently not supported for SAP technology. When you execute a bot with a wildcard character, it matches the property values exactly as specified in the search criteria.

---

9. Select the **Action** from the drop-down list.

For a full list of possible actions by object, see [Actions performed on objects captured with Universal Recorder](#) on page 3115.

- If you record a click and keystrokes in a text box with a **Control Type** of `Password text`, the **Recorder** does not capture the keystrokes entered into the field. Instead, the action selects the **Set text** option and offers options to securely input the password. We recommend that you store the password in the Credential Vault and insert it into the action as a credential.

See [Credentials and credential variables in the Bot editor](#) on page 2496.

If you navigate to the text box using the TAB keystroke instead of a click in an MSAA or SAP application, the **Recorder** is able to identify fields with a **Control Type** of `Password text`.

- If the selected **Action** supports background processing, a **Run in the background** option appears.

See [Background processing](#) on page 2389.

10. From the **Set system time out** field, select either `Basic` or `Advanced`.

- **Basic:** In the Wait for system response (in seconds) field, specify the number of seconds the bot must wait for object control to appear on the application window. This wait time includes the wait time for both page load and object search.

We recommend setting a delay time when using the Set text action to enter keystrokes into a text field.

---

**Note:** The timeout specified for the bot to wait for the control to appear on the application window applies only if the window in which the control is present exists. The Recorder first looks for the application window and only then searches for the object inside that window. The default time to search for the window is 30 seconds. Hence, even if you specify the wait time as 5 seconds, it still waits for 30 seconds by default if the window does not exist.

We recommend that you first use the **If > Window exists** condition, specify a wait time of zero second and ensure that the application window exists. If the window exists then use the Recorder, specify a wait time of 5 seconds, and run the bot to detect the object.

- **Advanced:** Use this option to automate websites that are constantly loading and updating with latest data such as a stocks website. These websites are never technically fully loaded on screen. In such cases, the bot does not need to wait for the web page to load completely and can directly proceed with automating the web page after a certain time.

In the Wait for browser response (in seconds) field, specify the number of seconds the bot must wait for the browser to load. Select one of the below options:

- **Stop the bot and display an error message:** If the web page has not loaded completely within the specified time out, select this option to stop the bot and display an error message.
- **Skip and proceed to the object:** Select this option to proceed to the object directly and capture it even if the web page has not loaded completely.

In the Wait for object response (in seconds) field, specify the number of seconds the bot must wait for object control to appear on the application window.

**11.** Optional: Assign the output to a variable.

The Control Room suggests a descriptive default variable name based on the action you selected in step 8. For example, if you selected **Get property**, the suggested output variable is `PropertyValue`. If you create several output variables, subsequent variable names are appended with a `-1` to avoid duplication.

**12.** Click **Save**.

The captured images are not added as dependencies and will not be displayed in the dependencies list when you check in your bot.

Link an object to a supporting anchor

---

**Note:** You can use object anchoring in Microsoft Active Accessibility, Microsoft UI Automation, or Java applications.

---

At runtime, if the bot cannot reliably identify an object, link it to a nearby object (such as a link or button) that is easier for the bot to find:

1. Open the **Capture** action.
2. Click the **Anchor** tab.
3. Click **Capture anchor**.

The browser or application window activates with the main object highlighted (the object that you previously captured). A dialog box appears, verifying whether the action has correctly identified the main object.

4. If the correct object is highlighted, click **Yes, Select anchor**.

Otherwise, click **No, I need to correct it** to select the correct object.

5. Select a nearby object to the target object that is easier for the bot to find.

The object is highlighted with an anchor icon on the right of the object.

6. Click **Save**.

## Capture using specific technology

In some applications, the **Capture** action might not work accurately if the technology for capturing is selected automatically. In such cases, based on the type of application that you want to automate, you can select a specific technology and use the **Capture** action to capture using that technology.

## Using the Capture action

To select a specific technology, click the drop-down next to **Capture object**.

You can select a specific technology and automate the following applications:

- Automate web applications that have nested iFrames with the same frame source or different frame sources.
- Capture and automate objects on applications where automatic selection of technology might not capture accurately.

---

**Note:** When you capture using a specific technology, the type and the number of object properties differ.

---

- Automate all objects and controls on the Google Chrome and Microsoft Edge browsers for local setting pages.

---

**Note:** This functionality is supported for Google Chrome and Microsoft Edge browsers.

---

## Technology types

You can capture objects with the following technologies:

- Microsoft Active Accessibility (MSAA)
- Microsoft UI Automation
- Microsoft UI Automation (COM)

## Microsoft Active Accessibility (MSAA)

Microsoft Active Accessibility is a legacy accessibility technology that was introduced as a platform add-in for Windows 95. MSAA is designed to help Assistive Technology (AT) products interact with standard and custom user interface elements of an application and also to access, identify, and manipulate an application's UI elements. MSAA is based on the Component Object Model (COM), which defines a mechanism for applications and operating systems to communicate. To know more about the most commonly used properties in this technology, see [Using the Capture action](#) on page 3133.

## Microsoft UI Automation

Microsoft UI Automation is an accessibility framework for Microsoft Windows, and it is available on all operating systems that support Windows Presentation Foundation (WPF). UI Automation

provides programmatic access to most user interface elements on the desktop, enabling AT products such as screen readers to provide information about the UI to end users and to manipulate the UI by means other than standard input. To know more about the most commonly used properties in this technology, see [Using the Capture action](#) on page 3133.

## Microsoft UI Automation (COM)

Microsoft UI Automation (COM) runs on unmanaged code and delivers automation faster than UI Automation. You can capture the following controls using the Microsoft UI Automation (COM) technology:

- Button
- Calendar
- Check box
- Client
- Combo box
- Label
- Link
- List view
- Menu
- Page Tab
- Password text
- Radio button
- Slider
- Table
- Text box
- Tree

When you select this technology to capture an object on an application, if that object is not supported for the technology, that is indicated by a gray highlight around the object.

---

**Note:** Microsoft UI Automation (COM) provides a search criterion (property) called **Automation ID**, which is unique to this technology.

---

## Automate applications running on remote machines

Sometimes business applications run on remote machines and are accessed over VMware Horizon VDIs. You can automate these business applications using our native Remote Agent installed over a VMware VDI device.

## Automate applications accessed over VMware

Our native Remote Agent enables secure communication between VMware VDI and the Bot Agent. It provides object level information for automation creation and play back thus enhancing the automation coverage for new use cases while providing a reliable native desktop user experience.

VMware-based automation is supported for all the VMware protocols such as: VMware Blast, PCoIP, and Microsoft RDP. This eliminates the need for any security exceptions by IT Administrators.

## Prerequisites

Before you automate, you must install and run the Remote Agent on VMware VDI.

---

**Note:** To automate web pages using HTML technology, you must enable the Google Chrome and Microsoft Edge extensions .

---

## Supported applications

VMware-based automation supports the following types of applications:

- Web applications
- Java applications
- Windows applications

## Supported technologies

VMware-based automation supports object detection on the applications built using the following technologies:

- Microsoft Active Accessibility (MSAA)
- Microsoft UI Automation
- Java
- HTML - Chrome, Edge, Edge with IE mode

## Known behavior

- You can only automate applications running inside VMware VDI using the **Capture** action.
- You can only capture applications running over VMware VDI in full screen mode.

---

**Note:** Ensure that you launch the VMware VDI from the VMware Horizon Client.

---

- If you have multiple monitors with full screen mode, then the left monitor must be your primary monitor.
- Anchor capture is currently not supported.
- Microsoft UI Automation (COM) technology is currently not supported.
- SAP technology is currently not supported.

## Automate right-click action on objects hidden behind runtime window

Sometimes the objects that you want to automate appear behind the bot runtime window. In such cases, the window is minimized and then reactivated after the action is executed enabling you to successfully automate such objects.

When you perform a right-click action on a browser window, the context menu opens. When you try to click any option in this menu, it disappears because after you execute the right-click action,

the active browser window changes to a runtime window. As a result, the context menu closes and the bot fails. To automate such scenarios, perform this procedure.

1. Create a window variable.
2. In the **Name** field, enter `RuntimeWindow`.
3. Select a window and in the **Window title** field, enter `Bot running*` and save the updates.
4. From the **Actions** pane, double-click or drag the **Window > Minimize** action.
5. In the **Window** field, select the variable `RuntimeWindow`.
6. Click **Start recording**.
7. From the **Recorder** window, select the specific browser window.
8. In the **Window** field, select the specific browser window.
9. Execute the **Right click** action on the specific browser page.
10. Select any option from the context menu.
11. From the **Actions** pane, double-click or drag the **Window > Restore** action.
12. In the **Window** field, select the variable `RuntimeWindow`.
13. Save and run the bot.

## Simplified recording experience

Professional and Citizen developers can use the Recorder to start a recording directly from a business application. You no longer need to identify the target business application from a list of applications opened. This enables a simpler and faster recording experience with real-time visibility and control of the automated actions.

---

### Important:

- The simplified Recorder feature is not available out of the box and can be enabled on an on-demand basis. Contact your Automation Anywhere account team for assistance.
- This feature is supported with Recorder package (version 2.15.2-20231004-180246 and later).

---

## Real-time feedback

- Simplified Recorder provides real-time feedback on the objects captured.  
For example, if you accidentally have any false clicks, missing clicks, or additional clicks, these are shown in the capture area in the Recorder window. This real-time feedback enables you to review the recorded actions, preview the images that you captured, and take actions in the midst of the recording. The captured object is also highlighted for better visibility.
- You can use the Delete icon to delete any captured object and recapture the object if required.
- You can use the arrow above the captured area to traverse through the objects you captured earlier.

## Using the simplified Recorder

1. Click **Start Recording** from the Bot editor.

2. Select the **Recorder type: Universal** or **AI Sense**.
3. Open the target application.
4. Navigate to the target window or browser tab.
5. Click **Record** to begin.

## Recorder actions supported in various SAP versions

Review the information about the various actions of the Recorder package that are supported with Automation 360 and which SAP GUI versions support them.

Control name	Automation 360 supported action	SAP Logon 730 (Patch 15)	SAP Logon 740 (Patch 19)	SAP Logon 750 (Patch 10)	SAP Logon 760 (Patch 5)	SAP Logon 770 (Patch 6)	SAP Logon 800
Text box  (It includes controls such as: GuiTextField, GuiTextField, GuiOkCodeField, GuiShell:TextEdit, GuiTextEdit and GuiPasswordField)	Set text	Yes	Yes	Yes	Yes	Yes	Yes
	Append text	Yes	Yes	Yes	Yes	Yes	Yes
	Get property	Yes	Yes	Yes	Yes	Yes	Yes
	Set focus	Yes	Yes	Yes	Yes	Yes	Yes
	Left-click	Yes	Yes	Yes	Yes	Yes	Yes

## REST Web Service package

Use the actions in the REST Web Service package as methods (DELETE, GET, PATCH, POST, or PUT) to send requests to and receive responses from an API.

### Working with REST Web Service actions

Provide the following information to send a REST request and receive a response. Not all parameters are required for all methods.

- **Enter the URI:** A unique address for an API resource.
- **Proxy configuration:** To set the proxy, select the **System** or **Custom** tab from Proxy configuration.

Option	Description
System	System proxy is the proxy configured on the bot runner machine where the bot is running.  If this option is selected, the Bot Agent uses the system proxy.

Option	Description
Custom	<p>This option allows you to configure custom proxy settings within the actions of REST Web Service. For example, if a REST API is required to be routed through a different proxy other than the system proxy, you can select the <b>Custom</b> option and provide proxy details within the REST actions.</p> <p>Provide the following details:</p> <ul style="list-style-type: none"> <li>• <b>Host:</b> The host name or IP address of the proxy</li> <li>• <b>Port:</b> The port number of the proxy</li> <li>• <b>Username (Optional):</b> The username used for the proxy authentication</li> <li>• <b>Password (Optional):</b> The password used for the proxy authentication</li> </ul> <hr/> <p><b>Note:</b> If the proxy to be configured is authenticated proxy, then you must provide authentication credentials in the <b>Username</b> and <b>Password</b> fields.</p> <hr/> <p>For <b>Host, Port, Username, and Password</b> fields, choose from <b>Credential, Variable, or Insecure string</b> tab :</p> <ul style="list-style-type: none"> <li>• <b>Credential:</b> Use a value available in the credential vault.</li> <li>• <b>Variable:</b> Use a variable that stores a credential value in a user-defined variable.</li> <li>• <b>Insecure string:</b> Manually specify the value that you want to use.</li> </ul>

- **Authentication Mode:** There are three supported authentication modes:
  - **No Authentication:** Use this option to access the endpoints that does not require authentication to access their servers.
  - **Control Room user token:** The REST Web Service actions uses the token generated while you logged in the Control Room to access the endpoints.
  - **Basic:** Basic is the simplest way to authenticate users. When you select this option, you will enter the username and password. This technique uses a header called Authorization, with a base64 encoded representation of the username and password entered.
  - **Logged-in AD User:** Active Directory (AD) users that are authorized to access the related API are authenticated through AD. No credentials are required in the request.
  - **Windows NT LAN Manager (NTLM) Authentication (AD User):** A challenge/response authentication method that allows clients to provide their user name and password as encrypted credentials or plain text. We recommend that you use credentials that are stored in the Automation Anywhere Credential Vault.

- **OAuth2 - Control Room managed:** When you integrate OAuth with the Control Room, you can centrally manage and securely store tokens that are used to authenticate with third-party providers. You must configure the web service and make note of the authentication details (such as client ID, client secret, authorization URL, and so on) to use the OAuth connection in the Control Room. For more details, see [Configure OAuth connections in Control Room](#) on page 2005

The following video shows how to use OAuth connection in REST Web Service:

- **Header:** Not all methods require a header. Headers represent the metadata associated with the request.
- **Content type:** When a header contains a content type, it defines the content negotiation between the client and the server. REST Web Service actions support the following content types:
  - `application/x-www-form-urlencoded`: Encode the parameters in the URL.
  - `JSON (application/json)`: Enter a JSON request body.
  - `XML (application/xml)`: Enter an XML request body.
  - `Text (text/plain)`
  - `XML (text/xml)`
  - `HTML (text/html)`
  - `multipart/form-data`: Send binary data, in most cases for uploading files to the server.
  - `Custom`

`Custom`: Add custom content that does not fall under the standard content type. For example, when you are migrating from v.11.x to Automation 360, the following value does not fall under any of the standard content types: `application/vnd.whispir.message-v1+json`

- **Add substitution:** Allows you to enter variables in the REST request body. A variable is a symbolic representation of data, and it enables you to access a value without having to enter it manually wherever you need it. For example, consider the following REST body request:

```
{
 "name": "{{name}}",
 "email": "{{email}}",
 "status": "Active"
}
```

In the above request body, you can replace the variables enclosed within double braces by clicking **Add substitution** and adding the required values.

- **Advanced options:**
  - **Capture failure response:** Select the check box to capture the failure response except for the `Success/Ok` response. The failure response details are captured in the response body.
  - **Allow insecure connection when using https:** Select the check box to allow insecure connection when using https.
  - **Accept Cookies:** Select the check box to automatically capture session cookies from server responses.
    - **Capture:** When enabled, the feature captures session cookies included in server responses.
    - **Secure Storage:** Captured cookies are encrypted within process memory, ensuring they are never permanently stored and are inaccessible outside your automation session.
    - **Reuse:** Cookies are automatically included in subsequent REST calls, eliminating manual cookie handling and improving automation reliability.

- **Multiple Cookie Handling:** The feature seamlessly handles multiple cookies returned by the server, ensuring all necessary authentication credentials are included.
- **Destruction:** Captured cookies are automatically destroyed when the automation session ends or the bot finishes execution, ensuring data security and privacy.

---

**Note:** The captured cookies are specific to the domain they originate from and will not be automatically used for subsequent REST calls made to different domains. This means cookies captured from `domainA.com` will not be utilized for requests to `domainB.com`.

---

- **Wait for action to complete:** You can set a time-out value when you send a REST request and receive a response. When performing actions such as POST, PUT, DELETE, PATCH, and GET, in the **Wait for action to complete** field, you can specify the wait time (in milliseconds). By default, the wait time is 60000 milliseconds.
- **Output variable:** The response output is captured in a dictionary variable. A dictionary variable is a key-value pair. Use the response header name as key to return the header value, or "Body" as the key to return the response body.

---

**Note:** The response key with its value is available in the dictionary variable to display the response status of the REST API.

---

To obtain a list of the header names for the API resource, perform these steps:

1. Insert a Loop action after the REST Web Service action.
2. Select the **For each key in the dictionary** iterator.
3. In the **Dictionary variable** field, select the variable that holds the REST Web Service action output.
4. Assign the value of each key to `$prompt-assignment$`.
5. Insert a Log To File action.
6. Provide the file path to a text file to hold the list of header names.
7. Insert `$prompt-assignment$` in the **Enter text to log** field.
8. Select the **Overwrite existing file** option.
9. Click **Save**.

When you run the bot, it prints the header names from the API resource to the selected file.

## Passing values securely

You can securely pass values from the Credential Vault to the web service by specifying the locker, credential, and attribute in the following supported action fields:

- URI
- Custom headers
- Body: For the `application/x-www-form-urlencoded` content type, click **Add parameter** to select the value from the Credential Vault.

For all other content types, select the **Select credential as parameters** option and click **Pick**.

## Actions in the REST Web Service package

Action	Description
Delete method	Removes the resource that is identified by the URI.
Get method	<p>Retrieves information identified by parameters included in the URI. There is no <b>Content type</b> for the GET method because all the parameters are passed as part of the URI.</p> <p>Limitations and characteristics of the <b>GET</b> method include the following:</p> <ul style="list-style-type: none"> <li>• URI length is limited to 2048 characters.</li> <li>• All parameters are passed in the URI.</li> <li>• The <b>GET</b> method exposes data that is in the URI, making it less secure than the <b>POST</b> method.</li> <li>• <b>GET</b> does not change any data, making it safe for all users regardless of authorization.</li> </ul> <p>See <a href="#">Using the Get method</a> on page 3159.</p>
Patch method	Modifies the resource that is identified by the URI.
Post method	<p>Creates a new resource in the URI.</p> <ul style="list-style-type: none"> <li>• Parameters are passed in request body.</li> <li>• There is no limit on length for a request body.</li> </ul> <p>See <a href="#">Using the Post method</a> on page 3161.</p>
Put method	Updates or replaces a resource based on parameters passed in the URI or body. See <a href="#">Using the Put method</a> on page 3165.

## Proxy support

If your device is configured with a proxy, all outbound requests from this package are routed through the proxy server. See [Connect Bot Agent to a device with a proxy](#) on page 1455.

### Related tasks

[Example of building a bot that uses credential variables](#) on page 2500

Securely pass values to a bot using credential variables to automate the process of logging in to a bank website.

### Related reference

[Credentials and credential variables in the Bot editor](#) on page 2496

Use credentials when building bots to pass sensitive information such as passwords and account numbers. Using credentials separates the sensitive information from the bots and Bot Runners, which reduces the risk of data spillage or unauthorized user access.

[Rest Web Services package updates](#) on page 1028

Review the updates in released versions of the Rest Web Services package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using the Get method

Use the **Get method** actions from the REST Web Service package to retrieve or get the information identified by parameters included in the URI .

This example uses endpoints from the Swagger Petstore sample API ([Petstore](#)) to demonstrate using Get method action to retrieve data from the Petstore database.

---

**Note:** GET method action does not take any request body.

---

1. Create a new .
  - a) Log in to your instance of the .
  - b) On the left panel, click **Automation**.
  - c) Click **Create new > Bot**.
  - d) In the **Create Task Bot** window, enter the name.
  - e) Accept the default folder location: \Bots\  
To change the default storage location, click **Choose** and follow the prompts.
  - f) Click **Create and edit**.
  
2. Use the **Get method** action to retrieve a list of all the available pets.
  - a) Double-click or drag the **REST Web Services > Get method** action.

The screenshot displays the Automation Anywhere interface for configuring a REST Web Service. The central flowchart shows a sequence of actions: a 'Start' trigger, followed by a 'REST Web Services: Get method' action (labeled 'a'), and then a 'Log To File' action (labeled 'b'). The right-hand configuration panel is titled 'REST Web Services: Get method' and includes the following settings:

- URI:** Enter the URI field contains the URL `https://petstore3.swagger.io/api/v3/pet/fin` (labeled 'b').
- Authentication Mode:** A drop-down menu is set to 'No Authentication' (labeled 'c').
- Assign the output to a variable:** The 'Output' variable is selected (labeled 'd').

b) Enter the following URI:

```
https://petstore3.swagger.io/api/v3/pet/findByStatus?
status=available
```

c) Under **Authentication Mode** drop-down, select **No Authentication** as this endpoint does not require authentication.

**Note:** Typically endpoint requires authentication to ensure that only authorized applications are able to access the data. Select an appropriate authentication mechanism to allow access to the endpoint you want to access.

d) Create the variable **Output** in the **Assign the output to a variable** field. For more information on creating a variable, see [Create a variable](#) on page 2488.

3. Insert a **Log to file** action to see the response body.

a) Double-click or drag the **Log to file** action.

b) Provide the file path to a text file.

c) In the **Enter text to log** field, enter `$Output {Body}$`.

4. Click **Save** and then click **Run**.

The bot retrieves the response body and saves it to the text file.

---

**Note:** You cannot use the download API endpoints to download an exported bot or file in the REST Web Service package.

---

## Using the Post method

Use the **Post method** actions from the REST Web Service package to create new resources in the URI.

This example uses endpoints from the Swagger Petstore sample API ([Petstore](#)) to demonstrate using Post method action to add data to the Petstore database.

1. Create a new .
  - a) Log in to your instance of the .
  - b) On the left panel, click **Automation**.
  - c) Click **Create new > Bot**.
  - d) In the **Create Task Bot** window, enter the name.
  - e) Accept the default folder location: `\Bots\`  
To change the default storage location, click **Choose** and follow the prompts.
  - f) Click **Create and edit**.
2. Use the **Post method** action to send data to a server. In this example, a new pet is added to the store.

- a) Double-click or drag the **REST Web Services > Post method**

The screenshot displays the Automation Anywhere configuration window for a REST Web Services Post method. The left sidebar shows the 'REST Web Services' folder expanded, with 'Post method' selected. The main workspace shows a flowchart with a 'REST Web Services: Post method' action (labeled 'a') connected to a 'Message box' action. The right-hand configuration pane is open, showing the following settings:

- URI:** `https://petstore.swagger.io/v2/store/order` (labeled 'b')
- Authentication Mode:** No Authentication (labeled 'c')
- Content type:** JSON (application/json) (labeled 'd')
- Custom parameters:** Enter the parameters (labeled 'e')

 "complete": true
}
```
- Wait for action to complete (in milliseconds):** 60000 (labeled 'f')
- Assign the output to a variable:** Output (labeled 'g')

action.

- b) Enter the following URI:

`https://petstore.swagger.io/v2/store/order`

- c) **Proxy Configuration:** Do one of the following:

- **System:** Under **Authentication Mode** select the authentication. In this example, select No Authentication as this endpoint does not require authentication.

---

**Note:** Typically endpoint requires authentication to ensure that only authorized applications are able to access the data. Select an appropriate authentication mechanism to allow access to the endpoint you want to access.

---

- **Custom:** This option allows you to configure custom proxy settings within the actions of REST Web Service. For more information, see [REST Web Service package](#) on page 3154 .

- d) Select the **Content type** that indicates in which format the data is sent to. An incoming request can have an entity attached to it. The Content type determines the type of the request. Some common Content types include such as: application/x-www-form-urlencoded, JSON (application/json), and XML (application/XML). In this example, select JSON (application/json), copy and paste the following into the **Custom parameters** field:

```
{
 "id": 0,
 "petId": 0,
 "quantity": 0,
 "shipDate": "2022-04-20T22:08:11.977Z",
 "status": "placed",
 "complete": true
}
```

- e) **Add substitution:** Allows you to enter variables in the REST request body. A variable is a symbolic representation of data, and it enables you to access a value without having to enter it manually wherever you need it. For example, consider the following REST body request:

```
{
 "name": "{name}",
 "email": "{email}",
 "status": "Active"
}
```

In the above request body, you can replace the variables enclosed within double braces by clicking **Add substitution** and adding the required values.

- f) Enter a time in milliseconds for the action to complete. You can leave it to the default 60,000.
- g) Create the variable `Output` in the **Assign the output to a variable** field. For more information on creating a variable, see [Create a variable](#) on page 2488.
3. Insert a **Message box** action to see the response body.
- a) Double-click or drag the **Log to file** action.
- b) In the **Enter the message to display** field, enter `$Output {Body} $`.
4. Click **Save** and then click **Run**.  
The bot displays the response in the message box.

## Upload file with Post method

Use the **Post method** action in the REST Web Service package to upload a file or text.

This example uses endpoints from the Petstore sample API ([Petstore](#)) to demonstrate uploading a new file or text using a multipart/form-data.

1. Use the **Post method** action in conjunction with an API that allows uploading a file.
  - a) Double-click or drag the **REST Web Services > Post method** action.
  - b) Enter the following URI:

```
https://petstore.swagger.io/v2/pet/112/uploadImage
```

- c) From the **Content type** drop-down, select **multipart/form-data**.

The screenshot shows the configuration of the REST Web Services Post method action. The configuration pane includes the following sections:

- Enter the URI:** Selected radio button. URI input field contains `https://petstore.swagger.io/v2/pet/112/uploadImage`.
- Select credential as URI:** Unselected radio button.
- Authentication Mode:** Dropdown menu set to `No Authentication`.
- Header:** Table with columns `Enabled`, `Name`, and `Value`. The table is empty, showing `No headers`.
- Content type:** Dropdown menu set to `multipart/form-data`.
- Parameters (2):** Table with columns `Enabled`, `Name`, `Type`, and `Value`.
 

Enabled	Name	Type	Value
Yes	file	File	"C:\Temp\icon.png"
Yes	additionalMetadata	Text	"*****"

- d) Add the `file` parameter and provide the path of the file to be uploaded.
  - e) Add any other required parameters. For instance, this API takes `additionalMetadata` (for example, "hello"), which is a text input parameter. The additional parameter will also be uploaded.
2. Assign the output to a variable, for example, `Test123`.

1. REST Web Services: Post met... request for URI "https://petsto..."

2. Message box <Test123(Body)>

Allow insecure connection when using https  
Warning: Transferred data may be visible to attackers

Wait for action to complete (in milliseconds)  
# 60000 (x)

Increase this value if POST action times out

Assign the output to a variable  
Multiple variables Dictionary (x)

Test123 (x)

Use response header name as key to fetch header value and 'Body' as key to fetch body of response

3. Print the output in a message box.

Message box

Displays a message box  
Required bot agent version: 20.11 or above

Enter the message box window title  
Automation Anywhere Enterprise Client (x)

Enter the message to display  
\$Test123(Body)\$ (x)

Scrollbar after lines  
# 30 (x)

Close message box after

## Using the Put method

Use the **Put method** actions from the REST Web Service package to update or replace existing resource.

This example uses endpoints from the Swagger Petstore sample API ([Petstore](#)) to demonstrate using Put method action to update data to the Petstore database.

1. Use the **Put method** action to update the pet name to "Pluto" and pet status to "sold".

- a) Double-click or drag the **REST Web Services > Put method** action.
- b) Enter the following URI:

```
https://petstore.swagger.io/v2/pet
```

- c) Open the log file saved in [Using the Get method](#) on page 3159 and copy the Pet ID of the first entry.
- d) Copy and paste the following into the **Custom parameters** field, replacing the text in the angle brackets with the value that you copied from the file:

```
{
 "petId": 0,
 "name": "Pluto",
 "status": "sold"
}
```

- e) Insert the variable output in the **Assign the output to a variable** field.

2. Move the **Message box** action below the **Put method** action:
  - a) Double-click or drag the **Message box** action.
  - b) In the **Enter text to log** field, enter `$Output {Body} $`.
3. Click **Save** and then click **Run**.

The bot retrieves the response body and prints it to the Message box. A successful response includes `"name": "Pluto", "status": "sold"`.

## Delete method

Use the **Delete** method action in the REST Web Service package to remove a resource that is identified by the URI.

## Patch method

Use the **Patch** method action in the REST Web Service package to action modify the resource that is identified by the URI.

## Salesforce package

Salesforce is a cloud-based platform that provides software and services to create relevant customer experiences. Use the bot actions developed for the Salesforce package to automate Salesforce processes.

---

### Note:

The Salesforce mark and logo are trademarks or registered trademarks of Salesforce Inc. and are used for identification purposes only.

---

Salesforce is based on a multi-tenant architecture with benefits such as API integration, configuration, scalability, free capacity, platform support, and more. The Salesforce package uses the Lightning Platform APIs to integrate Automation 360 with Salesforce. RPA developers need to authenticate to build automation processes in Salesforce. After authentication, with the Salesforce Connected App, you can upload or download files, perform CRUD (Create/Insert, Read, Update/ Upsert, Delete) operations on Objects (Salesforce stores data as Objects), and query using SOQL.

The following video shows the initial authentication and command actions from Automation 360:

Two types of objects are available in Salesforce, Standard Objects and Custom Objects. Standard Objects include the configuration and default data types. Custom Objects are the objects that are defined according to business requirements. In this topic, sample CRUD operations will be based on the Case Object, which is a Standard Object. A Case Object is typically used to gather customer data (queries, feedback, or problems). All the samples are based on manipulating the fields of the Case Object. For more information on the Case Object, see [Salesforce Case object](#). All the CRUD operations are initiated from the Automation 360 side and will update data on the Salesforce side.

Related reference

[Salesforce package updates](#) on page 1031

Review the updates in released versions of the Salesforce package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Salesforce Authentication action

Salesforce Authentication is the first command action that you need to call to get authenticated with Salesforce.

---

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

Authenticate access to Salesforce by getting the authentication parameters from the Salesforce connected app and using them in Automation 360.

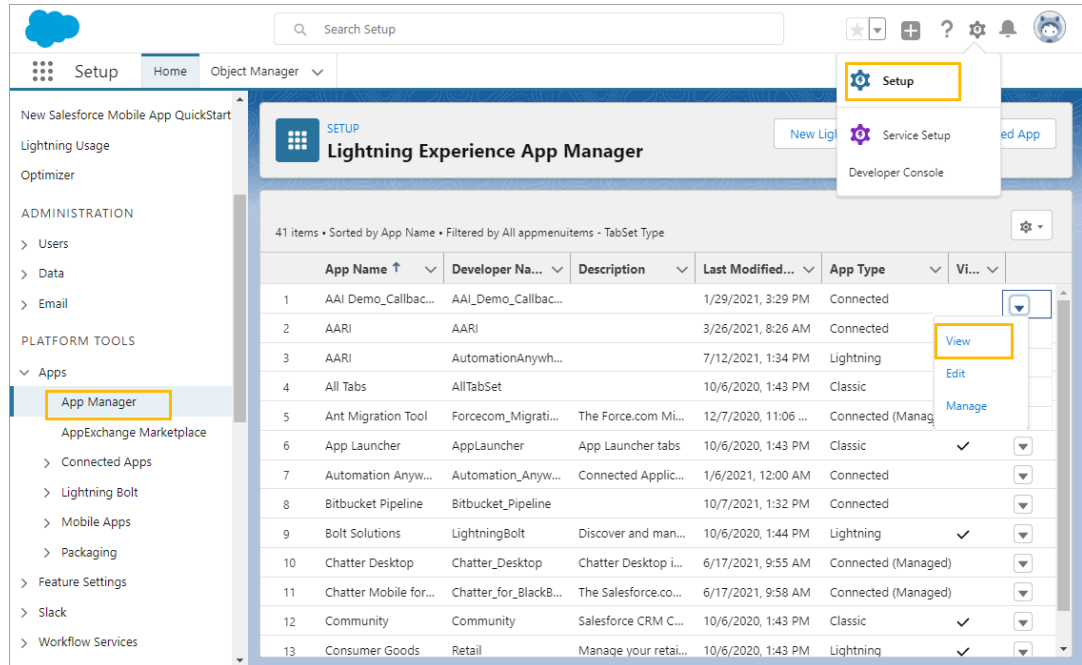

---

**Note:** Recently, Salesforce implemented the following: OAuth 2.0 Username-Password Flow Blocked by Default in New Orgs. Ensure you **allow** these flows in your Salesforce environment to use the Salesforce package. See [OAuth and OpenID Connect Settings](#).

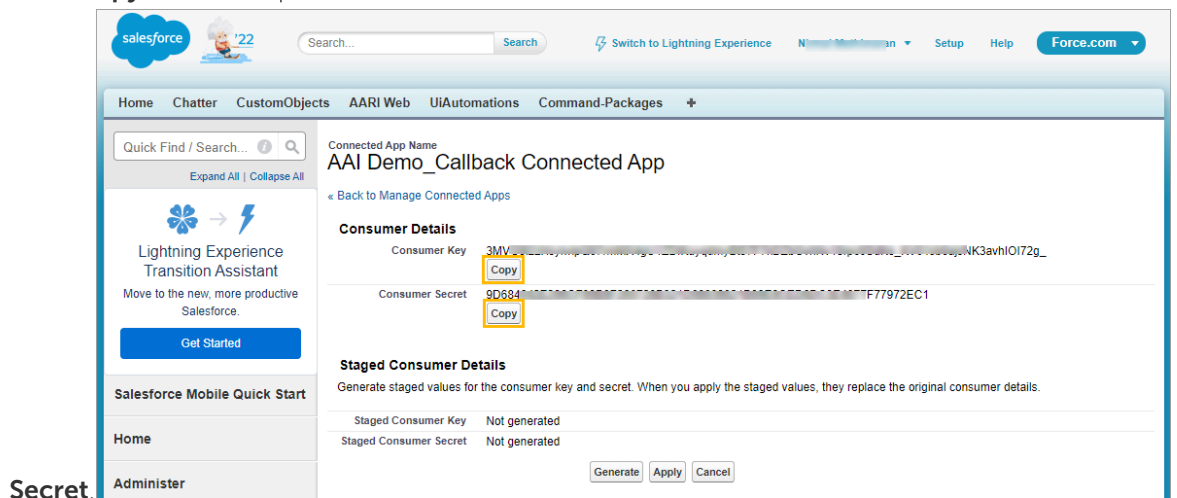

---

You can use different connection methods to connect to Salesforce:

- **OAuth2 - Client Credentials:** Use this connection method by providing the Salesforce account credentials. You need a Salesforce username and password to establish a connection.
  - **Control room OAuth connection:** Use this connection method by creating an OAuth connection and storing it in the Control Room.
1. Log in to the Control Room.
  2. Create a new bot or modify an existing bot. For more details, see [Create your first bot](#) on page 1595.
  3. From the Actions pane, select **Salesforce > Authentication** and place it under the **Start** of the bot flow.
  4. In the **Authentication Type** field, select the authentication method from the drop down.
  5. To view client ID and client secret details for **OAuth2 - Client Credentials** authentication, complete the following steps:
    - a) Log in to the Salesforce Enterprise Edition (Lightning Experience - [Salesforce Login](#)), click , and select **Setup** on your connected app. For more information about creating a new connected app, see [Salesforce Connected Apps](#).
    - b) In the Lightning Experience App Manager, click **App Manager**.

- c) Click the down arrow next to app name and select **View**.  
The **Manage Connected Apps** screen appears. For more information about managing connected apps, see [Salesforce Manage Connected Apps](#).
- d) Click **Manage Consumer Details**.
- e) Click **Copy** that corresponds to **Consumer Key**.
- f) Click **Copy** that corresponds to **Consumer Secret**.

- 6. To connect using OAuth2 - Client Credentials, complete the following steps:
  - a) In the **Client ID** field, paste the **Consumer Key** copied from the Salesforce Connected App. In this illustration **Insecure string** is used, while you can use **Credential** or **Variable** options for better security.

- b) In the **Client Secret** field, paste the **Consumer Key** copied from the Salesforce Connected App.

### Salesforce: Authentication 📄

Salesforce Authentication is the first command action that you need to call to get authenticated with the Salesforce.

Required bot agent version: 21.222 or above

Authentication type  
OAuth2 - Client Credentials ▼

Client ID  
Credential Variable Insecure string

**a** " [redacted] 🟢 (x)

Client secret  
Credential Variable Insecure string

**b** " [redacted] 🟢 (x)

Salesforce username  
Credential Variable Insecure string

**c** " [redacted]@aasd-foundation-int.com 🟢 (x)

Salesforce password  
Credential Variable Insecure string

**d** " [redacted] 🟢 (x)

Environment  
 Production  
 Sandbox

API version  
" 55 🟢 (x)

Session name  
" Default (x)

---

Save the outcome to a variable (optional)  
Multiple variables Dictionary

str-authresponse ▼ (x)

e.g. 'Authorization' as Credential type, 'InstanceUrl' as String type

- c) Enter the Salesforce username.
- d) Enter the Salesforce password.

---

**Note:** You can use one of the following options to specify the **Client ID/Client secret/Salesforce username/ Salesforce password**:

- **Credential:** Enables you to use a value in the Credential Vault that contains information about the Client ID/Client secret/salesforce username/salesforce password.
- **Variable:** Enables you to use a credential variable that contains information about the Client ID/Client secret/salesforce username/salesforce password.
- **Insecure string:** Enables you to enter the Client ID/Client secret/salesforce username/salesforce password manually.

- 
- e) Select **Production** to log into a live environment or **Sandbox** to log into a testing environment.

7. To configure a **Control room OAuth connection** in Salesforce, complete the following steps:

- a) Complete step 1 to step 5 in [Create OAuth connection](#) on page 2010.
- b) Log in to Salesforce as an Admin and navigate to **App Manager** to create a new connected app.
- c) Enter the following details:
  - Connected App name
  - API name
  - Contact email
  - Select the **Enable OAuth Settings** check box.
  - Add the Callback URL from [Create OAuth connection](#) on page 2010 as an authorized redirect URI.
  - Select the **OAuth scopes** as `Manage user data via APIs (API)` and `Perform requests at any time (refresh_token, offline_access)`.

---

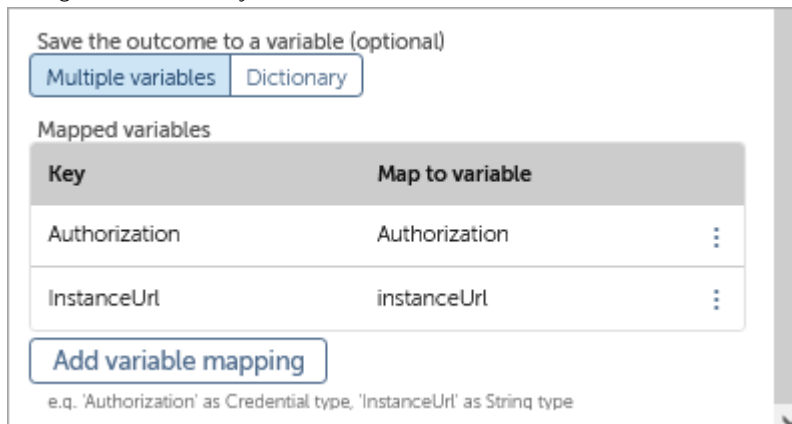

**Note:** For the Control Room OAuth connection to work, you must ensure to add the appropriate scopes when configuring Salesforce and the appropriate Control Room OAuth connection in the Control Room for Salesforce. For more information, see [Create OAuth connection](#) on page 2010.

- 
- Select the **Authorization Code** and **Credentials Flow** check box.
  - d) Click **Save**.
  - e) Click **Manage Consumer Details**. Copy the client key and secret.
  - f) Go to [Create OAuth connection](#) on page 2010 and complete the remaining steps to create an OAuth connection with the above details.

8. To connect using **Control room OAuth connection**, pick a Salesforce OAuth connection you have created and stored in the Control Room. For more details, see [Configure OAuth connections in Control Room](#) on page 2005.

9. Enter the API version. You can find the API version in your Salesforce Enterprise Edition setup. For more details, see [Find Salesforce API version](#).

10. Enter **Default** as the Session name.
11. Create either a **Multiple** or **Dictionary** variable to store the response. You can do one of the following:
  - The authentication command returns a dictionary with 2 key-value pairs. `Authorization` (credential type) and `InstanceUrl` (String type). The `Authorization` is hidden, but you will be able to read the `InstanceUrl`. For example, you can use a message box to print of the value of `, $str_Authresponse{InstanceUrl}$`, this returns the Salesforce URL.
  - You can select Multiple variable as shown below and map to a credential variable and a string variable as keys.

Authorization returns a token, which is hidden as it is a credential type, this token can be passed directly in the [Rest Web Services](#) command.

12. Click **Run** to save and run your bot. Once authenticated, you will be able to use the token to call other Salesforce API services.

## Salesforce Insert record action

Use the Salesforce Insert record action to insert a new record into a Salesforce object along with values of the fields that should be mapped to the object's fields.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

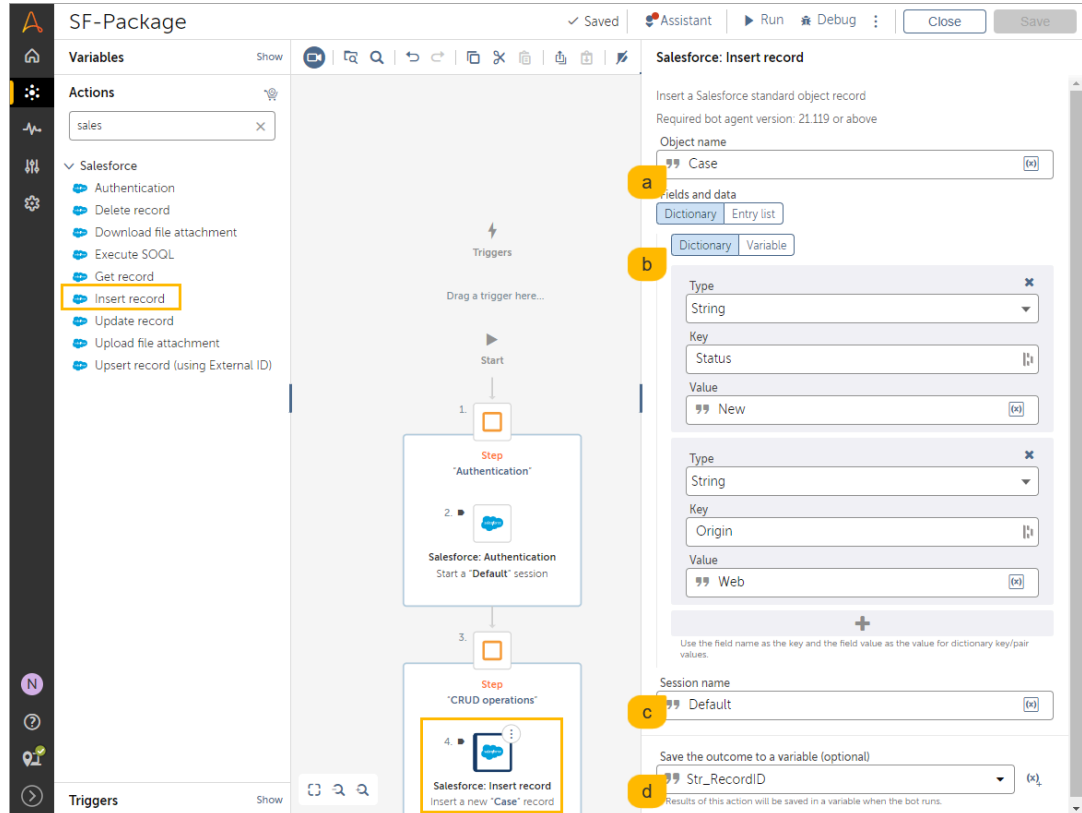

In this tutorial, you will insert a few fields into a Salesforce object by using the **Insert record** action.

1. From the **Actions** pane, select **Salesforce > Insert record** and place it in the canvas.
2. Enter the following fields:
  - a) Enter the **Object name**, for example, Case.

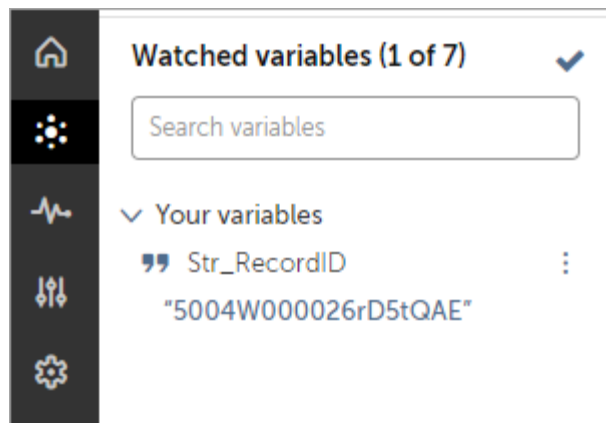

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: `AAIRPA__Salesforce_Connection__c` and not the display name: [Salesforce Connection](#)

" For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

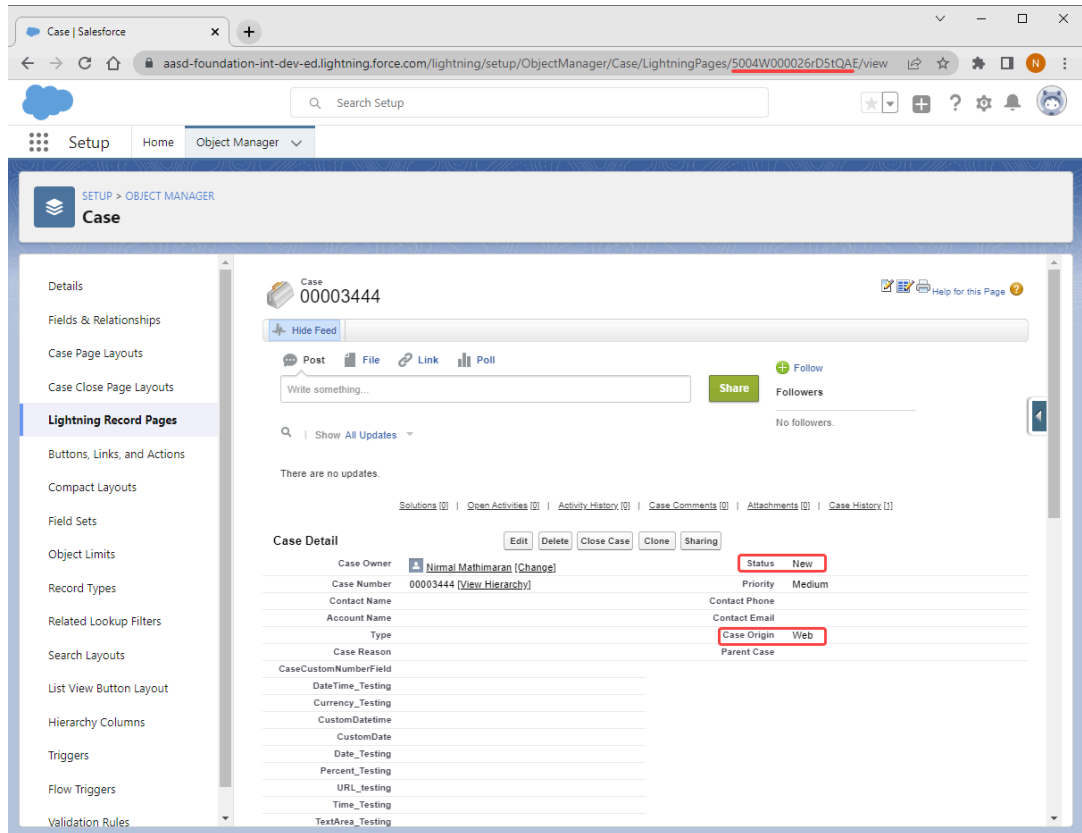

- b) Enter the **Fields and data** that you want to insert. Choose either **Dictionary** or **Entry list**. In this sample, **Dictionary** is selected and a few fields in Case object are modified. For example, Status is set to New and Origin is set to Web.

- c) Enter Default as the session name.  
 d) Save the outcome to a variable. For example, the object ID is saved to Str\_RecordID.
3. Verify whether the value is inserted into Salesforce.  
 a) Find the value of the Str\_RecordID variable in the **Debug** mode.

- b) In Salesforce, go to the Case object with the record ID (for example, 5004W000026rD5tQAE) that you received as the response.

Verify whether the field's values match the input that you sent from Automation 360. For example, in this case, the Status is New and Case Origin is Web.

## Salesforce Get record action

The Salesforce Get record action is used to read the fields of a Salesforce object.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

To read the field of a Salesforce object by using the **Get record** action, perform the following steps:

1. From the **Actions** pane, select **Salesforce > Get record** and place it in the canvas.
2. Enter the following fields:
  - a) Enter the **Object name**, for example, Case.

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: AAIRPA\_\_Salesforce\_Connection\_\_c and not the display name: [Salesforce Connection](#) " For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

- b) Enter the **Record ID** that you want to read. You will also be able to read data using the **External ID**. For more information on **External ID**, see [Salesforce Upsert record action](#) on page 3177.

The screenshot displays the Salesforce automation interface. On the left, the 'Actions' panel shows 'Get record' selected. The central workspace shows a workflow with three steps: 1. 'Salesforce: Authentication', 2. 'Salesforce: Get record' (highlighted with a yellow box and labeled 'a'), and 3. 'Message box' with the text '\$SFDC\_Res{Status}\$'. The right-hand panel is titled 'Salesforce: Get record' and contains the following configuration:

- Object name:** Case (labeled 'a')
- Record ID / External ID:** Record ID (selected), External ID
- Record ID / External ID value:** 5004W000026rD5tQAE (labeled 'b')
- Fields and data (optional):** List (selected), Variable
- Value at 0:** Status (labeled 'c')
- Session name:** Default
- Save the outcome to a variable:** Dictionary (selected)
- Variable name:** SFDC\_Res (labeled 'd')

- c) Select **List** for the **Fields and data (Optional)** field. Enter all the fields that you want to read. In this sample, the field Status is read.
- d) Save the outcome to a variable. For example, the object ID is saved to SFDC\_Res. Output is retrieved as a Dictionary that consists of the field name and field value. Field name is identical to the name specified in the Salesforce object. It is recommended to use the Debugger tool and watch the output variable to view the retrieved record.
3. Click **Run** to start the bot. You will be able to read the value of the field by simply printing the value in a Message box action. For example, in this sample, `$$SFDC_Res{Status}$` will print New

## Salesforce Update record action

Update the fields of Salesforce Objects by using the Salesforce Update record action.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

To update a field in a Salesforce Object by using the **Update record** action, perform the following steps:

1. From the **Actions** pane, select **Salesforce > Update record** and place it in the canvas.
2. Enter the following fields:

The screenshot displays the Automation Anywhere interface for configuring a Salesforce automation. On the left, the 'Actions' pane shows the 'Update record' action selected. The central canvas shows a flow starting with 'Start', followed by 'Salesforce: Authentication', 'Salesforce: Get record', and 'Salesforce: Update record'. The 'Update record' action is highlighted with a yellow box. On the right, the configuration panel for 'Salesforce: Update record' is shown, with fields for 'Object name' (Case), 'Record ID' (5004W000026rD5tQAE), and 'Fields and data' (Entry list). A table shows the field 'Status' with the value 'In progress'. A yellow box highlights the 'Add new field/value pair to update' button.

- a) Enter the **Object name**, for example, Case.

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: AAIRPA\_\_Salesforce\_Connection\_\_c and not the display name: [Salesforce Connection](#) " For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

- b) Enter the **Record ID** that you want to update.
- c) In the **Fields and data (Optional)** field, select **Entry List**. Click **Add new field/value pair to update** and enter the **Field name** that you want to update and the **Field value (optional)** that you want the field to be updated with. For example, enter Status as **Field name** and In progress as **Field value (optional)** in **Fields and data**. You can also choose **Dictionary** and enter the values as a key/value pair.
- d) Save the outcome to a variable. For example, the object ID is saved to SFDC\_Res.

- e) Enter the **Record ID** that you want to update.
3. To start the bot, click **Run**. You can verify the update by checking it in the Salesforce side. The following video shows the process:

## Salesforce Delete record action

Delete records from Salesforce by using the Salesforce Delete record action.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

To delete a field of a Salesforce object, use the **Delete record** action.

1. From the **Actions** pane, select **Salesforce > Delete record** and place it in the canvas.
2. Enter the following fields:
  - a) Enter the **Object name**, for example, Case.

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: AAIRPA\_\_Salesforce\_Connection\_\_c and not the display name: [Salesforce Connection](#) " For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

- b) Enter the **Record ID** that you want to delete.

The screenshot displays the Automation Anywhere interface for configuring a 'Salesforce: Delete record' action. The 'Actions' pane on the left shows the 'Delete record' action selected under the 'Salesforce' category. The main canvas shows a flow diagram with two steps: 1. 'Salesforce: Authentication' (Start a 'Default' session) and 2. 'Salesforce: Delete record' (Delete a 'Case' record with ID ...). The configuration panel on the right is titled 'Salesforce: Delete record' and includes the following fields:

- Object name for deletion: Case (labeled 'a')
- Record ID: 5004W000026rD5tQAE (labeled 'b')
- Session name: Default

3. Click **Run** to start the bot. You will be able to verify the deletion by checking it on the Salesforce side. The following video shows the process:

## Salesforce Upsert record action

Insert or update a record by using the Salesforce Upsert record action. The Upsert action uses a custom external ID as the key to identify a record.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

1. From the **Actions** pane, select **Salesforce > Upsert record (using External ID)** and place it in the canvas.

The screenshot displays the configuration for the 'Salesforce: Upsert record (using External ID)' action. The configuration panel includes the following fields and options:

- Object name:** Case
- External field name:** AAIRPA\_\_CustomFieldForExternal
- External ID:** \$ExternalID\$
- Fields and data:**
  - Field 1: Type String, Key Status, Value New
  - Field 2: Type String, Key Origin, Value Email
- Session name:** Default
- Save the outcome to a variable (optional):** Dict\_ExternalID-Insert

2. Enter the **Object name**, for example, Case.
3. Enter the field name that will store the ExternalID.

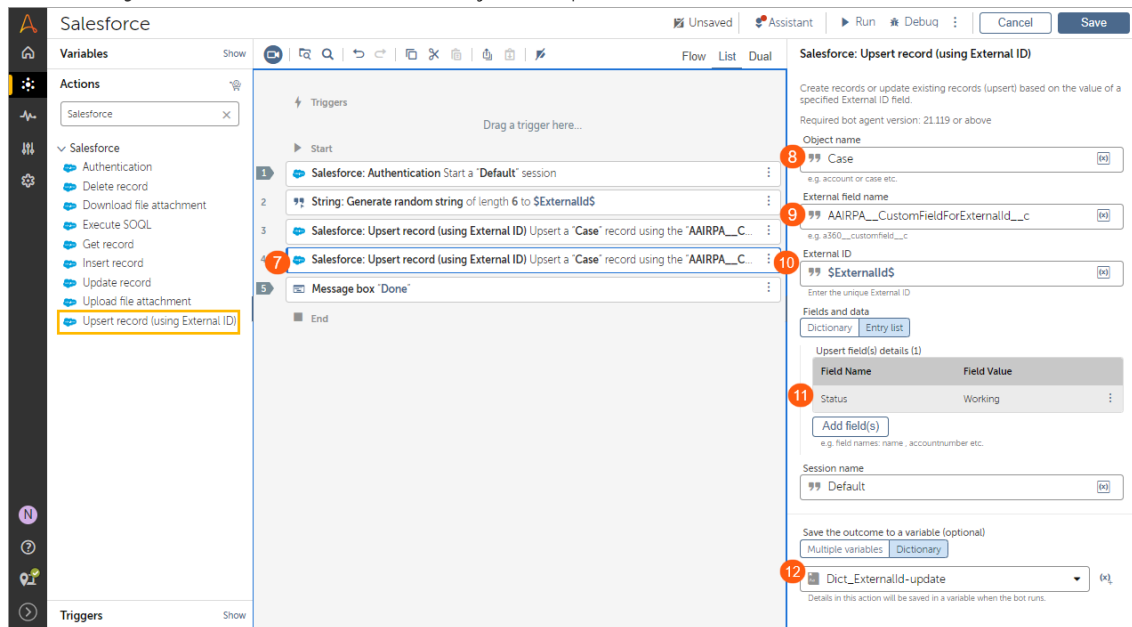

**Note:** In this sample, the ExternalID is generated by using the **Generate random string** action.

4. Enter the ExternalID generated.
5. Enter the fields that you want to update.
6. To verify, you can store the generated recordID in a variable. The following video demonstrates how to inserting fields to a record created in Salesforce.

- To update a field by using the Upsert record action, from the **Actions** pane, select **Salesforce > Upsert record (using External ID)** and place it in the canvas.
- Enter the **Object name**, for example, Case.

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: AAIRPA\_\_Salesforce\_Connection\_\_c and not the display name: [Salesforce Connection](#) " For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

- Enter the same field name that will store the ExternalID.
- Enter the same ExternalID to refer to the same record.
- Enter the **Field Name** and new **Field Value** to update in **Fields and data**. You can also choose **Dictionary** and enter the values as a key/value pair.

- To verify, you can store the outcome to a variable, for example, Dict\_ExternalId-update.

## Salesforce Execute SOQL action

To search your Salesforce data for specific information, run the Salesforce Object Query Language (SOQL) command from Automation 360 by using the Salesforce Execute SOQL action.

SOQL is similar to Structured Query Language (SQL) but is tailored for Salesforce data. For more information about SOQL, see [Salesforce Execute SOQL](#).

To get specific information from Salesforce data, execute a query from Automation 360.

To send an SOQL query to Salesforce by using the **Execute SOQL** action, perform the following steps:

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

- From the **Actions** pane, select **Salesforce > Execute SOQL** and place it in the canvas.

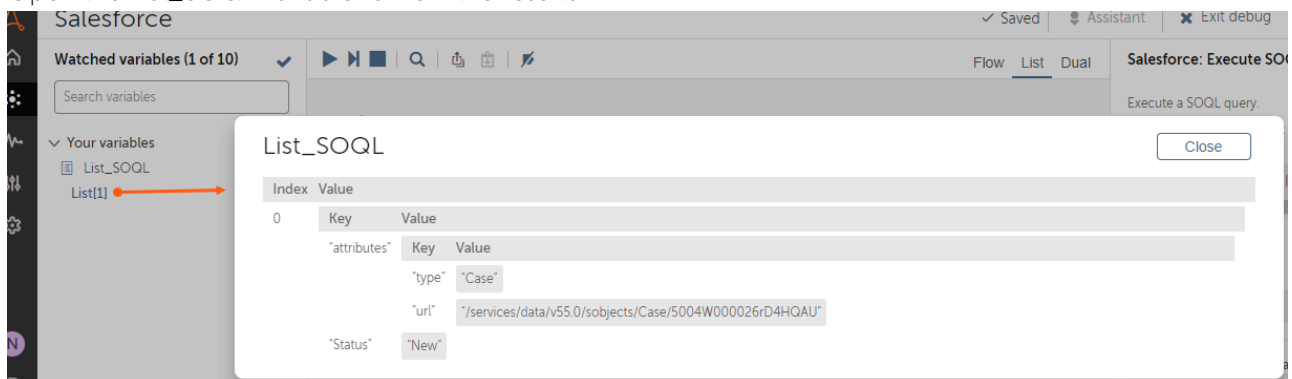

2. Enter the following fields:

- a) Enter the **SOQL query to execute**, for example, `Select Status From Case Where Id = '5004W000026rD4HQAU'`.

**Note:** For Salesforce Custom objects, ensure that you provide the API name instead of the Display name of the object. For example, provide API name: `AAIRPA__Salesforce__Connection__c` and not the display name: `Salesforce Connection`. For more information on how to find the API name, see <https://help.salesforce.com/s/articleView?id=000327123&type=1>.

- b) Select one of the following options:
  - If you want to include the deleted records, select **Yes**.
  - If you do not want to include the deleted records, select **No**.
- c) Enter `Default` as the session name.
- d) Save the outcome to a variable. For example, all the fields of the records can be stored in a list (`List_SOQL`)

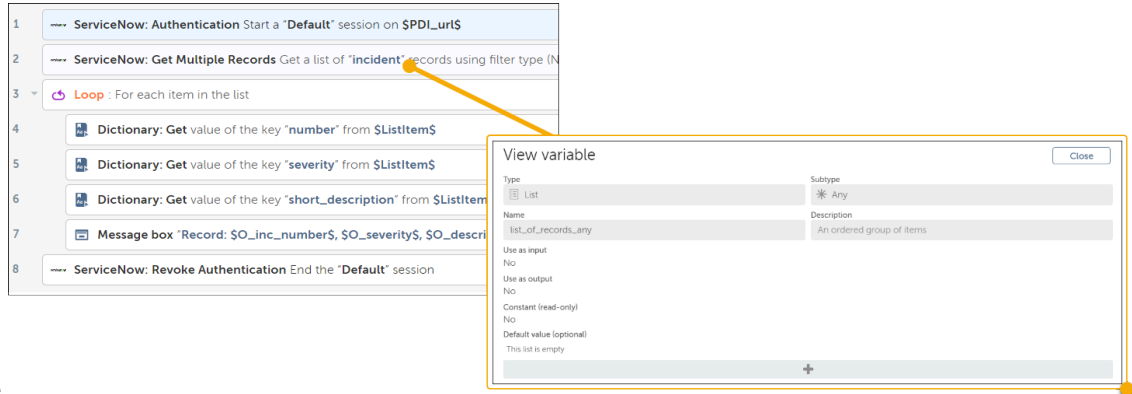

3. Verify that you can run the bot in Debug mode with a breakpoint set to an action next to Execute SOQL. For example, in the sample provided previously, there is a Message box action. Open the `List_SOQL` variable to view the results.

The entire result set is returned as a response of the Salesforce Execute SOQL action and there is no limitation to the number of records returned.

**Note:** The response can have a high volume of data which might potentially degrade the performance of your automation.

**Note:** The output is retrieved as a list of type . To read an individual record (row) in this list, you need to loop through all the dictionary items using the action and read or extract the records (rows) individually. For example, the output of get multiple records is saved in the variable list\_of\_records\_any. If the variable contains five records, then each record is passed to the Loop action to be processed one at a

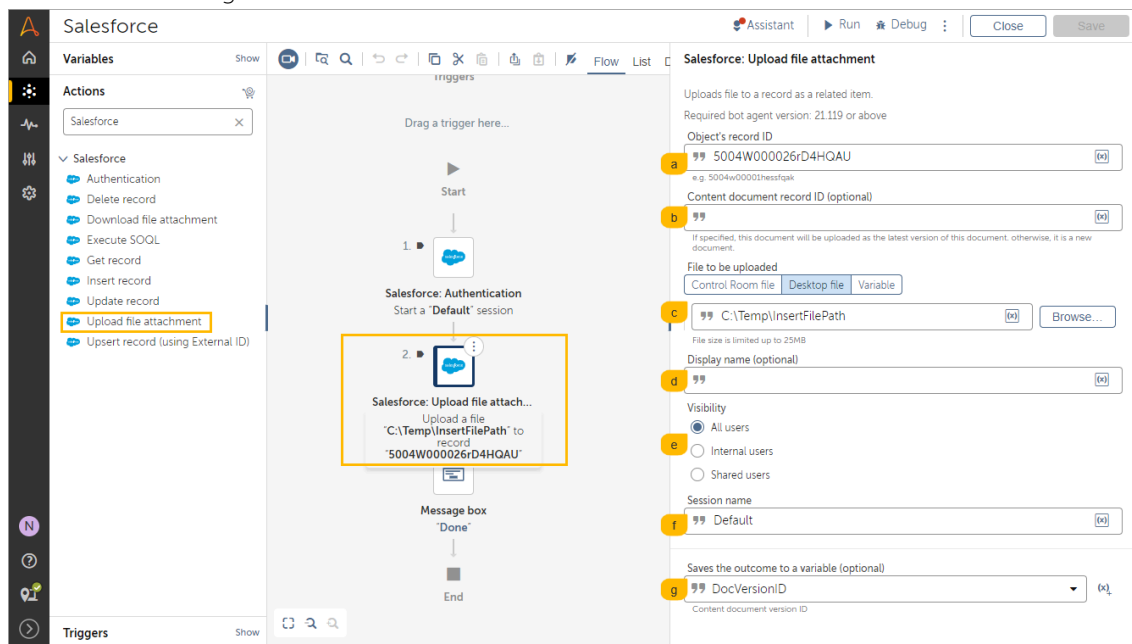

time.

## Salesforce Upload file attachment action

You can upload a file to a record in Salesforce with the Salesforce Upload file attachment action.

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

1. From the **Actions** pane, select **Salesforce > Upload file attachment** and place it in the canvas.
2. Enter the following fields:

- a) Enter the **Object's record ID** to which you want to upload the file. For example: '5004W000026rD4HQAU'.
- b) Enter a **Content document record ID (optional)**.  
It is necessary only when you want to upload a newer version of an existing file.
- c) Select a location from where you want to upload the file. You will be able to select one of the following:  
**Control Room file:** When you select this option, you can select a file from your Control Room.  
**Desktop file:** When you select this option, you can select a file from your computer. In this sample, a file is uploaded from a folder in the computer.  
**Variable:** When you select this option, you can select variable that points to a file.

---

**Note:** Make sure that the file path that you are referring to contains the file with the exact name as entered in this field.

---

- d) Enter the **Display name (Optional)** to save the uploaded file in this name.
  - e) Set the **Visibility** as required.
    - **AllUsers:** The file is available to all users who have permission to see the file.
    - **InternalUsers:** The file is available only to internal users who have permission to see the file.
    - **SharedUsers:** The file is available to all users who can see the feed to which the file is posted. **SharedUsers** is used only for files shared with users and is available only when an org has private org-wide sharing on by default. The **SharedUsers** value is available in API version 32.0 and later.
  - f) Enter Default as the session name.
  - g) Save the outcome to a variable. For example, the version of the saved document can be saved in a variable, such as DocVersionID.
3. To verify, you can run the bot and see whether the file is uploaded to the record in the Salesforce. The following video demonstrates uploading a file from a computer to Salesforce.

## Salesforce Download file attachment action

You can download a file from a record in Salesforce by using the Salesforce Download file attachment action.

---

**Note:** Ensure that you are authenticated before calling any Salesforce action. For more information about authentication, see [Salesforce Authentication action](#) on page 3167.

---

1. From the **Actions** pane, select **Salesforce > Download file attachment** and place it in the canvas.
2. Enter the following fields:

The screenshot displays the Automation Anywhere configuration window for the 'Salesforce: Download file attachment' action. The interface is divided into several sections:

- Left Sidebar:** Contains 'Variables', 'Actions', and 'Triggers' sections. The 'Actions' section is expanded to show 'Salesforce' actions, with 'Download file attachment' highlighted.
- Main Workspace:** Shows a flowchart with three steps: 'Start', 'Salesforce: Authentication', and 'Salesforce: Download file attachment'. The 'Salesforce: Download file attachment' step is highlighted with a yellow box.
- Right Sidebar:** Shows the configuration for the 'Salesforce: Download file attachment' action. It includes fields for 'Object's record ID', 'Destination folder', 'Download all files/filter by', 'Session name', and 'Save the outcome to a variable (optional)'. Five callouts (a-e) point to these fields.

- a) Enter the **Object's record ID** from which you want to download the file. For example: '5004W000026rD4HQAU'
  - b) Enter the **Destination folder** where you want to save the file.
  - c) Set **Download all files/filter by** to one of the following options:
    - All files:** Download all the attached files from a record.
    - File name:** Download a file by entering a file name.
    - File extension:** Download all the files with the same extension that you enter.
    - Content document ID:** Download a particular version of a file.
  - d) Enter Default as the session name.
  - e) Save the outcome to a variable. For example, the details of the downloaded files can be saved in a variable, such as ListResponse
3. To verify, you can run the bot and whether the file is downloaded to the specified location. The following video demonstrates how to download a file from Salesforce to a location on a local system.

#### Note:

- The file is downloaded from the ContentDocument Object.
- File names are limited to 50 alphanumeric characters and any special characters are filtered when you download the file. The downloaded file name includes a document version ID that is appended before the file name, this ensures that the file name is unique. For example, if the file name is TEST\_a\_quick\_brown\_fox then the downloaded file name is 0684W00000c30XFQA2-TEST\_a\_quick\_brown\_fox.

**Note:** The output is retrieved as a list of type `List`. To read an individual record (row) in this list, you need to loop through all the dictionary items using the `Loop` action and read or extract the records (rows) individually. For example, the output of `get multiple records` is saved in the variable `list_of_records_any`. If the variable contains five records, then each record is passed to the `Loop` action to be processed one at a

The screenshot shows an automation workflow with the following steps:

- ServiceNow: Authentication Start a "Default" session on SPDI\_urls
- ServiceNow: Get Multiple Records Get a list of "Incident" records using filter type (N
- Loop : For each item in the list
- Dictionary: Get value of the key "number" from \$ListItem\$
- Dictionary: Get value of the key "severity" from \$ListItem\$
- Dictionary: Get value of the key "short\_description" from \$ListItem\$
- Message box "Record: \$O\_inc\_number\$, \$O\_severity\$, \$O\_descri
- ServiceNow: Revoke Authentication End the "Default" session

An orange arrow points from the "Get Multiple Records" step to a "View variable" dialog box. The dialog box shows the following details for the variable `list_of_records_any`:

Type	Subtype
List	Any
Name	Description
list_of_records_any	An ordered group of items
Use as input	No
Use as output	No
Constant (read-only)	No
Default value (optional)	This list is empty

time.

The output contains information such as document title, content document ID, file path, file extension, download status and error message if any of the downloaded file.

## SAP package

The SAP package contains actions to automate tasks and processes on a SAP application.

The SAP package enables you to perform the following tasks:

- Reduce the time required to combine data from disparate systems.
- Eliminate human error and increase efficiency.
- Increase the number of transactions processed.
- Deliver real-time information to various stakeholders.
- Enhance decision-making through comprehensive reports.

**Note:** In SAP **Connect** action, the **Session name** field cannot be shared with Task Bots or any other bots.

## Prerequisites

- Log in to the SAP GUI before capturing objects because the SAP Logon screen is not supported for object capture.
- Enable GUI scripting and accessibility.

See [Enabling Scripting on the Client Side](#), [Enabling Scripting on the Server Side](#), and [Enabling Accessibility settings](#).

- Ensure that one of the following SAP GUI for Windows is installed on the devices that you use to automate SAP-related tasks and to run these tasks:
  - SAP GUI 800 with patch 4
  - SAP GUI 770 with patch 6

- SAP GUI 760 with patch 5
- SAP GUI 760 with patch 1
- SAP GUI 760 with patch 0
- SAP GUI 750 with patch 9

---

**Note:** If SAP GUI 760 with patch 0 is installed on your device, you cannot use the SAP Grid view control **Set Table cell text** and **Get Table Cell Text** actions because of an issue with SAP GUI 760 with patch 0.

---

- Install a Scripting Tracker or a similar tool to retrieve the field path of the SAP object.

## Before you start

- Multiple sessions are supported in the SAP. However, ensure that while creating a bot that uses multiple sessions, you enter the exact or complete name of the session that you intend to use in the **Control field** path.

For example, `/app/con[0]/ses[0]/userid`.

- Perform the following actions within the `SAP` package as part of using the set of available actions:

1. Establish a connection with the SAP application using the **Connect** action.

Log in to the SAP application using the SAP GUI application. Then use the **Connect** action from the `SAP` package to use this connection and assign a session name. Use this same session name for the other actions.

2. Use the actions to automate a task.
3. After you have automated all the SAP-related tasks, terminate the connection to the SAP application using the **Disconnect** action.

## Actions in the SAP package

The `SAP` package includes the following actions:

---

**Note:** The `SAP` and the Recorder package can detect SAP elements in the application. However, from a usability standpoint, the Recorder package is preferred over the `SAP` package as it is more intuitive when compared to the `SAP` package, such as detecting SAP Object paths automatically. See [Benefits of using Recorder package instead of SAP package](#) on page 3108

[SAP package updates](#) on page 1034

Review the updates in released versions of packages such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Check/uncheck check box action

The Check/uncheck check box action in the SAP package enables you to select or clear a check box in a SAP window.

### Settings

- In the **Session name** field, enter the session name you used to connect to the SAP application in the **Connect** action.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Action** option, select **Check**, **Uncheck**, or **Toggle**.

## Click action

The **Click** action enables you to include the click operation in the SAP application.

### Settings

- Double-click or drag the **Click** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- Click **Save**

## Click menu action

The **Click menu** action enables you to click a menu item by text or index within a SAP window.

### Settings

- Double-click or drag the **Click menu** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- Use the **Select** field to select one of the following options:

- **Name:** to retrieve the value using the field name.

For example, you want to use the **Click menu** action on the new file menu in SAP window. In the **Name** field, enter **New**.

(Optional) Click the **Insert a value** icon to insert an existing variable for the **Name** field.

- **Index:** to retrieve the value using the index.

For example, there is a user log-in form that has a drop-down menu called **User type** with the following options:

- **New user**
- **Existing user**

You want to use the **Click menu** action on the **Existing user**. To select **Existing user** from the drop-down, ensure that you enter **2** in the **Index** field.

- Click **Save**.

## Using Connect action for SAP

Use the **Connect** action to establish a connection with a SAP system that you want to use to automate SAP-related tasks. This must be the first action you use to automate an SAP-related task.

1. In the **Actions** palette, double-click or drag the **Connect** action from the **SAP** package.
2. Enter a name for the session in the **Session name** field.
3. Select one of the following options to specify the connection type:

- **Automatic**

No additional information is required to connect to the SAP application. You must be already logged in to SAP application as the system uses the available SAP session to connect to a SAP system.

- **SAP SSO**

In the **Name** field, enter the value that is displayed in the **Name** column of the SAP Logon screen.

---

**Note:** While creating a new entry, the value that you have entered in the **System Connection Parameters > Description** field is displayed under the **Name** field in the SAP Logon screen.

---

- **SAP GUI**

Enter the following details:

- **Name:** Enter the **Connection Name > Description Property Value** that is entered in the SAP Logon screen at the time of creating a new connection using **System Entry Properties**.

(Optional) Click the **Insert a value** icon or press 'F2' from the keyboard to select an existing variable.

- **Client:** Enter a client identifier value.

For example, you can specify any number from 0 through 999.

- **User name:** Click one of the following tabs:

- **Credential:** Enables you to use a value available in the Credential Vault. Click the **Pick** button to select a credential.
- **Variable:** Enables you to use a value that is stored as a credential variable.
- **Insecure string:** Enables you to specify the values.
  
- **Password:** Click one of the following tabs:
  - **Credential:** Enables you to use a value available in the Credential Vault. Click the **Pick** button to select a credential.
  - **Variable:** Enables you to use a value that is stored as a credential variable.
  - **Insecure string:** Enables you to specify the values.
  
- **Language:** Specify the two-letter code for the language set on the SAP server. For example, EN for English.  
  
(Optional) Click the **Insert a value** icon or press 'F2' from the keyboard to select an existing variable.

#### 4. Click **Save**.

##### Related tasks

[Using Export table action](#) on page 3189

Use the **Export table** action to export a table to a datatable or CSV file.

[Using Set table cell text action](#) on page 3195

Use the **Set table cell text** action to set the text in a specific cell of a table or a grid.

##### Related reference

[SAP package](#) on page 3183

The **SAP** package contains actions to automate tasks and processes on a SAP application.

## Disconnect action

The Disconnect action in the SAP package enables you to terminate the connection to the SAP application.

### Settings

In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .

## Double click action

The **Double click** action enables you to perform a double-click operation in a SAP window.

### Settings

- Double-click or drag the **Double click** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .

- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- Click **Save**

## Expand action

The Expand action in the SAP package enables you to expand the item by text or index on a SAP window.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Select** option, select **Text** or **Index** to specify the text or index of the item.

## Using Export table action

Use the **Export table** action to export a table to a datatable or CSV file.

To export a table, follow these steps:

1. In the Actions palette, double-click or drag the **Export table** action from the SAP package.
2. In the **Session name** field, enter the session name you used to connect to the SAP application in the **Connect** action.
3. In the **Field path** field, specify the location or a string variable that contains the location of the object.

You can use Recorder capture action to capture SAP controls and retrieve the field path or install a Scripting Tracker or a similar tool to retrieve the field path of the SAP object.

4. In the **Export As** option, select **CSV** or **Datatable** to specify the export option of the table cell:

Choice	Steps
<b>CSV</b>	<ol style="list-style-type: none"> <li>a) In the <b>File Path</b> field, specify the location or file variable.</li> <li>b) Optional: In the <b>Encoding</b> field, specify the value.</li> <li>c) Select the <b>Export data with header</b> check box to export with header.</li> <li>d) In the <b>When saving</b> field, select <b>Append to existing log file</b> or <b>Overwrite existing log file</b> to append the log file or overwrite the content within the log file.</li> </ol>
<b>Datatable</b>	In the <b>Datatable</b> field, specify the value.

5. Click **Save**.

## Get cell count action

The Get cell count action in the SAP package enables you to get number of cells in a table or grid.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get children names action

The Get children names action in the SAP package enables you to get children control names.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to list variable** field, specify the list variable.

## Get children text action

The Get children text action in the SAP package enables you to get the text associated with children control.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to list variable** field, specify the list variable.

## Get column count action

The Get column count action in the SAP package enables you to get number of columns in a table or grid.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get row count action

The Get row count action in the SAP package enables you to get number of rows in a table or grid.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get selected item action

The Get selected item action in the SAP package enables you to get selected item index from a combo box, page tab, or a tree view control.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get status action

The Get status action in the SAP package enables you to get status of a radio button or check box.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get table cell index action

The Get table cell index action in the SAP package enables you to get table cell index for text.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Search text** field, specify the text.
- Select the **Case sensitive search** option to specify a case-sensitive search.
- Select the **All occurrences** check box.
- In the **Assign the output to a variable** field, specify the variable.

## Get table cell text action

The **Get table cell text** action in the SAP package enables you to get table cell text by index.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- In the **Row** field, specify the row number from where you want to get the text.

For example, if you want to get text in tenth row, enter 10 in the **Row** field.

(Optional) Click the **Insert a value** icon to select an existing variable for the **Row** field.

- In the **Column** field, specify the column number from where you want to get the text.

For example, if you want to get text from the third column, enter 3 in the **Column** field.

- (Optional) Click the **Insert a value** icon to select an existing variable for the **Column** field.
- Click the **Assign the output to a variable** drop-down menu and select the variable to which you want to assign the output.
- (Optional) Click the **Create variable** icon if there is no existing variable.

## Get text action

The Get text action in the SAP package enables you to get text from a text box, label, or status bar.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Get item count action

The Get item count action in the SAP package enables you to get the count of items in a combo box, page tab, or tree view control.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Assign the output to a variable** field, specify the variable.

## Left click action

The **Left click** action enables you to perform a left-click operation.

### Settings

- Double-click or drag the **Left click** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- Click **Save**

## Right click action

The **Right click** action enables you to perform a right-click operation.

### Settings

- Double-click or drag the **Click menu** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

- Click **Save**.

## Select item action

The Select item action in the SAP package enables you to select an item by text or index.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.
- In the **Select** option, select **Text** or **Index** to specify the text or index of the item.

## Select radio option action

The Select radio option action in the SAP package enables you to select the radio button in a SAP window.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

## Send virtual key action

The Send virtual key action in the SAP package enables you to send a virtual key.

### Settings

- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Select** list, select a key.

See [Virtual keys in SAP GUI](#).

## Using Set table cell text action

Use the **Set table cell text** action to set the text in a specific cell of a table or a grid.

To set a value in a table cell, follow these steps:

1. In the **Actions** palette, double-click or drag the **Set table cell text** action from the SAP package.
2. In the **Session name** field, enter the session name you used to connect to the SAP application in the **Connect** action.
3. In the **Field path** field, specify the location or a string variable that contains the location of the object.
4. In the **Select** option, select **Text** or **Index** to specify the text or index of the table cell:
  - **Text**: In the **Find Text** field, specify the value.  
The system searches for the cell that contains the value.
  - **Index**: In the **Row** and **Column** fields, specify the value.
5. In the **Set Text** field, enter the text to set the table cell.
6. Click **Save**.

## Set text action

The **Set text** action in the SAP package enables you to set the text in an editable field (such as textbox).

### Settings

- Double-click or drag the **Set text** action from the SAP package in the **Actions** palette.
- In the **Session name** field, enter the session name you used to connect to the application in the **Connect**.
- In the **Field path** field, specify the location or a string variable that contains the location of the object.

For example, you can install a tool (such as Scripting Tracker or similar) to retrieve the field path of the SAP object.

(Optional) If you have stored the location of the object as a variable, click the **Insert a variable** icon to select that variable.

- (Optional) In the **Field value** field, enter the text that you want to specify or set.

Alternately, click the **Insert a variable** icon to select an existing variable that contains the text you want to set.

---

**Note:** You can set the fields to any value, including blank values. For example, text field or date field.

- (Optional) Select the **Append text** check box if you want to add or append the text with any existing text in the editable field.

If you do not select the check box, the content in the editable field will be overwritten.

## SAP BAPI package

The SAP BAPI package contains actions to automate tasks and processes using SAP Business Application Programming Interface (BAPI). BAPI is a standardized method that enables a third-party application to interact with an SAP system.

### Overview of SAP BAPIs

[Business Application Programming Interfaces \(BAPIs\)](#) are APIs that enable external applications to access SAP business objects.

Typically, a BAPI consists of the following parameters:

- Import parameters: Used to receive data from the calling applications.
- Export parameters: Used to return data to the calling application.
- Import/export table parameters: Tables used for both receiving data and returning data.

A parameter can be of the following type:

- Data element: Scalar data type
- Structure: Typically contains multiple fields

If an import parameter is of the type structure, you can pass multiple values as key-value pairs.

- Table: A data structure that contains more than one row

For a BAPI method to work, the calling application can call the method in a BAPI using the following:

- BAPI name
- Import parameters (scalar, structure, table)
- Export parameters (scalar, structure, table)

## Before you start

**Note:** Download the SAP Java connector package and DLL from the SAP website. This is required when using the **Connect** action.

Perform the following actions within the SAP BAPI package as part of using the set of available actions:

1. Establish a connection with the SAP application using the **Connect** action.
2. Use the **Create function** action to create a user-defined function for the specified SAP BAPI function.  
Select the **Begin sequence** option to mark the start of a process followed by the actions to automate a task.
3. Use the **Run function** action to run the function you have created using the **Create function** action.  
Select the **End sequence** option to mark the end of a process and the **Commit transaction** option to commit the changes.

## Actions in the SAP BAPI package

The SAP BAPI package includes the following actions:

Action	Description
Connect	<a href="#">Using Connect action for SAP BAPI</a> on page 3198.
Create function	<a href="#">Create function action</a> on page 3200.
Get field value	<a href="#">Get field value action</a> on page 3200.
Get structure	<a href="#">Get structure action</a> on page 3201.
Get table	<a href="#">Get table action</a> on page 3201.
Run function	<a href="#">Run function action</a> on page 3201.
Set field value	<a href="#">Set field value action</a> on page 3202.
Run standard workflow	<a href="#">Run standard workflow action</a> on page 3202.
Run custom workflow	<a href="#">Run custom workflow action</a> on page 3203.

## Build sample bots using the SAP BAPI package

If you are getting started with the SAP BAPI package, a good place to start is to build some sample bots with the help of the following tutorials. The tutorials are intended to train you on how to use various actions from the SAP BAPI package to invoke SAP BAPIs, pass import parameters, and retrieve data from export parameters.

- [Example of using Get structure command from SAP BAPI package](#) on page 3437: In this tutorial, you will build a bot that invokes BAPI\_FLIGHT\_GETLIST from the SAP demo Flight

Data application. When executed, the `calls` the BAPI function by inputting an airline ID and destination details, gets a list of flights, and writes the response data to a CSV file.

- [Example of writing data to SAP using SAP BAPI package](#) on page 3439: In this tutorial, you will build a `that` invokes `BAPI_FLFCUST_CREATEFROMDATA` from the SAP demo Flight Data application. You will use the `CUSTOMER_DATA` import parameter to pass the customer data to the BAPI. When executed, the `creates` a new customer record in SAP database and displays the customer number returned by the BAPI.
- [Example of using Run standard workflow from SAP BAPI package](#) on page 3441: In this tutorial, you will build a bot that uses a single action to select a BAPI from a list of function modules, to set import parameters, and to get the response data. When executed, the bot gets flight availability data based on the input data, and writes it to a CSV file.

[SAP BAPI package updates](#) on page 1033

Review the updates in released versions of SAP BAPI package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using Connect action for SAP BAPI

Use the **Connect** action to establish a connection with a SAP system that you want to use to automate SAP-related tasks using SAP Business Application Programming Interface (BAPI).

This must be the first action you use to automate an SAP-related task using SAP BAPI.

Download the SAP Java connector package and DLL from the SAP website.

1. In the `Actions` palette, double-click or drag the **Connect** action from the `SAP` package.
2. In the **SAP BAPI Session** field, specify a name for the session.
3. In the **JCo: SAP Java Connector package** field, specify the location of the SAP Java connector package as credential, variable, or an insecure string.

---

**Note:** The credential, variable, and insecure string fields mentioned in this topic are defined as follows:

- **Credential:** Enables you to use a value available in the Credential Vault.
  - **Variable:** Enables you to use a value that is stored as a credential variable.
  - **Insecure string:** Enables you to manually specify the values.
- 
4. In the **JCo DLL dependency** field, specify the location of the SAP JCo DLL dependency as a credential, variable, or an insecure string.
  5. In the **Connection type**, select one of the following options:
    - **Custom Application Server:**  
Specify the SAP server hostname as a credential, variable, or an insecure string.
    - **Group/Server:**
      - a) Specify the SAP message server hostname as a credential, variable, or an insecure string.
      - b) Optional: Specify the gateway host you want to use to connect to the server in the **Gateway host** field.

- c) Optional: Specify the logon group you want to use to connect to the server in the **Logon group** field.
6. In the **System number** field, specify the two digit instance number.
7. Optional: In the **SAP instance system ID** field, specify the unique three character code of your SAP instance.
8. In the **Client number** field, specify the three digit client number.
9. In the **Logon language code** field, specify the two-character language code based on ISO 639-1. For example: EN (for English).
10. Optional: In the **Router string** field, specify the SAP router path when the target server is behind a firewall.
11. In the **Authentication type** field, select one of the following options:
- **Username and password:**  
Specify the username and password of your SAP BAPI account.
  - **SNC:**  
Secure Network Communications (SNC) integrates SAP NetWeaver Single Sign-On (SSO) or an external security product with SAP systems. SNC secures the data communication paths between the various SAP system client and server components. Select this option to strengthen security by using additional security functions that are not directly available with SAP systems.
    - a) Specify the SNC name of the communication partner.
    - b) In the **Protection level** field, select the required data protection level to apply from the drop-down list.
      - When using **Authentication only** protection level, the system verifies the identity of the communication partners. This is the minimal protection level offered by SNC.
      - When using **Integrity Protection**, the system detects any changes or manipulation of the data which might have occurred between the two endpoints of a communication.
      - When using **Privacy Protection**, the system encrypts the messages being transferred. Privacy protection also includes integrity protection of the data.
      - **Default Protection** applies the global default protection level.
      - **Maximum security settings available** is the maximum value that the current security product supports.
    - c) In the **SNC library** field, specify the path and file name of the external security product library as a credential, variable, or an insecure string.
    - d) Select the **Login with username and password** check box and specify the username and password as a credential, variable, or an insecure string.

---

**Note:** For SSO authentication login, you do not have to provide the username and password. To authenticate without SSO, you must provide the username and password.

---

## Create function action

The Create function action in the SAP BAPI package enables you to create an alias for a SAP BAPI function and saves it with an alias name.

### Settings

You can use the alias name in other actions to use that BAPI function in those actions.

- In the **Session name** field, enter the session name you used to connect to the SAP application in the **Connect** action.
- In the **Function alias name** field, enter the alias that you want to use for the BAPI function.
- In the **BAPI name** field, enter name of the SAP BAPI function for which you want to create the alias.
- Select the **Begin sequence** option if you want to execute the BAPI in a particular sequence to mark the start of a process.

## Get field value action

The Get field value action in the SAP BAPI package enables you to obtain data of a specific field from a function, table, or structure.

### Settings

- In the **BAPI function alias** field, enter the alias you have provided for SAB BAPI function using the **Create function** action.
- Select one of the following option to specify whether you want to obtain data from a function, table, or structure:

- **Function:** Enables you to get the value of a field from a function.
- **Table:** Enables you to get the value of a field from a table in a SAP BAPI function.

You must specify the **Table alias** from which you want to obtain data.

You must use the **Get table** action before you use the **Get field** action to obtain the value of a field from a table in a SAP BAPI function. You must also specify the **Table alias** from which you want to get data.

- **Structure:** Enables you to obtain data from a structure in a SAP application.

You must use the **Get structure** action before you use the **Get field** action to obtain the value of a field from a structure in a SAP BAPI function. You must also specify the **Table alias** from which you want to obtain data.

- In the **Field name** field, enter the name of the field from which you want to get data.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the SAP application in the **Connect** action.
- In the **Save the output to a variable** field, specify a string variable.

## Get structure action

The Get structure action in the SAP BAPI package enables you to obtain table data from a structure using the function alias.

### Settings

- In the **BAPI function alias** field, enter the alias you have provided for SAB BAPI function using the **Create function** .
- In the **Structure name** field, enter the name of the structure from which you want to get data.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .
- Select one of the following options to specify how you want to save the data retrieved from the structure:
  - **Alias**: Enables you to provide an alias for the structure and use the alias in other actions.
  - **Variable**: Enables you to store the data retrieved from the structure in a table variable.

## Get table action

The Get table action in the SAP BAPI package enables you to get tabular data from a table using the function alias.

### Settings

- In the **BAPI function alias** field, enter the alias you have provided for SAB BAPI function using the **Create function** .
- In the **Table name** field, enter the name of the table from which you want to obtain data.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .
- Select one of the following options to specify how you want to save the data retrieved from the table:
  - **Alias**: Enables you to provide an alias for the table and use the alias in other actions.
  - **Variable**: Enables you to store the data retrieved from the table in a table variable.

## Run function action

The Run function action in the SAP BAPI package enables you to run the SAP BAPI function.

### Settings

- In the **BAPI function alias** field, enter the alias you have provided for SAB BAPI function using the **Create function** .
- Select the **End sequence** option to mark the end of a process and the **Commit transaction** option to commit the changes made during the process.

If you want to end a sequence, you must select the **Begin sequence** option from the **Create function** action. If you have used queued Remote Function Call (qRFC), you must select the **Commit transaction** option to commit the changes you have made.

- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .

## Set field value action

The Set field value action in the SAP BAPI package enables you to set data into a function, table, or structure using the function alias.

### Settings

- In the **BAPI function alias** field, enter the alias you have provided for SAB BAPI function using the **Create function** .
- Select one of the following options to specify whether you want to set data in a function, table, or structure:

- **Function**: Enables you to set data in a function.
- **Table**: Enables you to set data in a table in a SAP application.

You must use the **Get table** action before you use the **Get field** action to obtain the value of a field from a table in a SAP BAPI function. You must specify the **Table alias** in which you want to set data. You can also select the **Create new row** option if you want to create a new row in the table and set value in that row.

- **Structure**: Enables you to set data in a structure in a SAP application.

You must use the **Get structure** action before you use the **Get field** action to obtain the value of a field from a structure in a SAP BAPI function. You must also specify the **Structure alias** from which you want to get data.

- In the **Field name** field, enter the name of the field in which you want to set data.
- In the **Field Value** field, enter the value that you want to set.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .

## Run standard workflow action

The **Run standard workflow** action in the SAP BAPI package enables you to run existing workflow.

### Settings

You can use the remote function call as an alternate workflow and specify all the required import, export & table parameters. For more information , see [Example of using remote function call in SAP](#) on page 3456.

- Use the **Select workflow** option to select the workflow from the **Standard BAPI Selector** dialog box.

- The **Import to BAPI** section displays the import parameters for the selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to specify a value for the parameters.
  - Select the **Include** option if you want to use that import parameter.
  - Select the **Table** tab to select a table variable containing the values you want to import to BAPI. Alternatively, select the **Strings** tab to specify the value manually.
- The **Export to BAPI** section displays the export parameters for the selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to retrieve existing parameters.

Select the **Include** option if you want to use that export parameter.
- The **Tables** section displays the tables you can use as export or import parameters for your selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to specify a value for the tables.
  - Select the **Include** option if you want to use that table as an export or import parameter.
  - Select either the **Import** tab to use a table as an import parameter or select the **Export** tab to use a table as an export parameter.
  - Select the **Table** tab to select a table variable containing the values you want to import to BAPI. Alternatively, select the **Strings** tab to specify the value manually.
- Select the **Begin sequence** option if you want to execute the BAPI in a particular sequence to mark the start of a process.
- Select the **End sequence** option to mark the end of a process.
- Select the **Commit transaction** option to commit the changes made during the process.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Save exported structures and scalars** field, specify a dictionary variable.
- In the **Save exported tables** field, specify a dictionary variable.

## Run custom workflow action

The **Run custom workflow** action enables you to run a custom workflow in SAP BAPI.

### Settings

---

**Note:** Adding a custom workflow is not supported in Automation 360. You can use the Remote function call (RFC) to execute the custom BAPI.

---

- Use the **Select Custom workflow** drop-down menu to select one of the following custom workflows that you want to run:
  - **Create Sales Order - VA01**
  - **Update Sales Agreement - VA32**

---

**Note:** There are only two predefined custom workflows available and cannot be edited.

---

- The **Import to BAPI** section displays the import parameters for the selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to specify a value for the parameters.

- Select the **Include** option if you want to use that import parameter.
- Select the **Table** tab to select a table variable containing the values you want to import to BAPI. Alternatively, select the **Strings** tab to specify the value manually.
- The **Export to BAPI** section displays the export parameters for the selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to specify a value for the parameters.
  - Select the **Include** option if you want to use that export parameter.
- The **Tables** section displays the tables you can use as export or import parameters for your selected workflow. You can select the **Edit** option from the action menu (vertical ellipsis) to specify a value for the tables.
  - Select the **Include** option if you want to use that table as an export or import parameter.
  - Select either the **Import** tab to use a table as an import parameter or select the **Export** tab to use a table as an export parameter.
  - Select the **Table** tab to select a table variable containing the values you want to import to BAPI. Alternatively, select the **Strings** tab to specify the value manually.
- Select the **Begin sequence** option if you want to execute the BAPI in a particular sequence to mark the start of a process.
- Select the **End sequence** option to mark the end of a process.
- Select the **Commit transaction** option to commit the changes made during the process.
- In the **SAP BAPI Session** field, enter the session name you used to connect to the application in the **Connect** .
- In the **Save exported structures and scalars** field, specify a dictionary variable.
- In the **Save exported tables** field, specify a dictionary variable.

## Screen package

Use the `Screen` package to automate the process of capturing screenshots. Using the actions in this package, you can capture an area of an application window, the entire computer screen, or an active open window and save it in a specified location in an image format.

### Actions in the Screen package

The `Screen` package includes the following actions:

Action	Description
Capture area	See <a href="#">Using Capture area action from Screen package</a> on page 3205.
Capture desktop	See <a href="#">Capture desktop action in Screen</a> on page 3207.
Capture window	See <a href="#">Using Capture window action from Screen package</a> on page 3207.

## Secure recording

When secure recording mode is enabled, bots do not display the target object images after capture. This ensures that sensitive data is not shown.

**Note:** Although the bots do not display the target images after capture, the images are still stored in the Control Room because they are required to run the bots.

When you record a task in secure recording mode, the **Preview** window temporarily shows an image of the captured area. This image is hidden after you navigate away from the Bot editor window or refresh it.

A user with admin privileges must enable this setting. See [Configure Settings](#) on page 1903.

Related reference

[Screen resolution dependent packages](#) on page 1917

The screen resolution between the Bot Runner and Bot Creator device should be consistent as when resolution-dependent packages are used to build bots, any screen resolution difference between the Bot Creator and Bot Runner device will impact the bots during runtime.

[Screen package updates](#) on page 1036

Review the updates in released versions of the Screen package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using Capture area action from Screen package

Use the **Capture area** action in the Screen package to capture a screenshot of the application window area.

To capture a specified area of an application window, perform these steps:

1. In the **Actions** palette, double-click or drag the **Capture area** action from the Screen package.
2. Specify the window in which to capture an object.  
Choose from the **Application**, **Browser**, or **Variable** tab.

Option	Description
Application	Select from a list of currently active windows. This option shows a list of all the application and browser windows that are open on the Bot Creator device.
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers. For all other browsers, use the <b>Application</b> option.
Variable	Select an existing window variable to specify the title of the application window title.

3. Optional: Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value.

For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `-Notepad`, you can enter the **String** value as `*-Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

**Note:** During runtime, verify that the Task Bot identifies the correct window. If it does not, do the following:

- a) Open the application or browser window.
  - b) Drag a **Window > Get active window title** action above the **Recorder > Capture** action.
  - c) Insert a string variable into the **Assign the window title to variable** field.
  - d) Drag a **Window > Set title** action below the **Window > Get active window title** action.
  - e) In the **Window** field, insert the window variable generated by the **Recorder > Capture** action.
  - f) In the **New window title** field, insert the string variable from the **Get active window title** action.
  - g) Click **Save**.
- 

**4.** Optional: Select the **Resize window** option to specify the window dimensions.

This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, which enhances the ability of the bot to identify the target object.

- If the window is maximized when you record the task, this option is not selected.
-

- If the window is not at the maximum size when you record the task, this option is selected, by default, and the width and height fields are automatically filled with the dimensions of the window.

---

**Note:** This option is available only for windows that can be resized. It is not available for the **Desktop** or **Taskbar** options.

---

5. Click the **Capture region**.  
The pixel coordinates of the captured area are displayed in the **X**, **Y**, **Width**, and **Height** fields. You can modify these values.
6. Browse to select the **File path to save image**.  
The following file extensions are supported: png, bmp, jpeg, tiff, gif, and wmf.
7. Click **Overwrite file** to replace an existing file with the same name.
8. Click **Save**.

## Capture desktop action in Screen

The **Capture desktop** action in the Screen package enables you to capture an image of the entire desktop.

### Settings

- In the **File path to save image** field, specify the path where you want to save the captured image.  
The following file extensions are supported: png, bmp, jpeg, jpg, tiff, gif, and wmf.
- Select **Overwrite File** check box to overwrite an existing file with the same name.

## Using Capture window action from Screen package

Use the **Capture window** action of the Screen package to capture an open application window.

To capture an application window, perform these steps:

1. In the **Actions** palette, double-click or drag the **Capture window** action from the Screen package.
2. Specify the window in which to capture an object.

Choose from the **Application**, **Browser**, or **Variable** tab.

Option	Description
Application	Select from a list of currently active windows. This option shows a list of all the application and browser windows that are open on the Bot Creator device.

Option	Description
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers. For all other browsers, use the <b>Application</b> option.
Variable	Select an existing window variable to specify the title of the application window title.

3. Optional: Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value.

For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

For example, to match all window title names beginning with a word followed by `-Notepad`, you can enter the **String** value as `*-Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

**Note:** During runtime, verify that the Task Bot identifies the correct window. If it does not, do the following:

- Open the application or browser window.
- Drag a **Window > Get active window title** action above the **Recorder > Capture** action.
- Insert a string variable into the **Assign the window title to variable** field.
- Drag a **Window > Set title** action below the **Window > Get active window title** action.

- e) In the **Window** field, insert the window variable generated by the **Recorder > Capture** action.
- f) In the **New window title** field, insert the string variable from the **Get active window title** action.
- g) Click **Save**.

- 
4. Optional: Select the **Resize window** option to specify the window dimensions. This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, which enhances the ability of the bot to identify the target object.
- If the window is maximized when you record the task, this option is not selected.
  - If the window is not at the maximum size when you record the task, this option is selected, by default, and the width and height fields are automatically filled with the dimensions of the window.

---

**Note:** This option is available only for windows that can be resized. It is not available for the **Desktop** or **Taskbar** options.

---

5. Browse to select the **File path to save image**.  
The following file extensions are supported: png, bmp, jpeg, tiff, gif, and wmf.
6. Click **Overwrite file** to replace an existing file with the same name.
7. Click **Save**.

## Service package

Use the Service package to automate operations in Windows and application services including starting, stopping, pausing, resuming, or getting the status of services.

---

**Note:** You must have administrator privileges to start, stop, pause, or resume service operations.

---

### Actions in the Services package

The Services package includes the following actions:

Action	Description
Get service status	See <a href="#">Get service status action in Services</a> on page 3211
Pause service	See <a href="#">Pause service action in Services</a> on page 3210
Resume service	See <a href="#">Resume service action in Services</a> on page 3210
Start service	See <a href="#">Start service action in Services</a> on page 3210

---

Action	Description
Stop service	See <a href="#">Stop service action in Services</a> on page 3211 .

Related reference

[Service package updates](#) on page 1038

Review the updates in released versions of packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Pause service action in Services

The **Pause service** action in the Services package enables you to pause a Windows or application service that is currently running.

### Settings

Select the **Service list** or **Variable** option to enter the name of the service that you want to pause.

## Resume service action in Services

The **Resume service** action in the Services enables you to resume a selected Windows or application service that was previously paused.

### Settings

Select the **Service list** or **Variable** option to enter the name of the service that you want to resume the services for.

## Start service action in Services

The **Start service** action in the Services package enables you to start a selected Windows or application service that is not running.

### Settings

Select the **Service list** or **Variable** option to enter the name of the service that you want to start the service for.

## Get service status action in Services

The **Get service status** action in the Services enables you to retrieve the current status of a Windows or application service.

### Settings

- Select either the **Service list** or the **Variable** option and to enter the name of the service that you want to get the status for.
- Select an appropriate variable that you can assign the status value to from the **Assign the output to an existing variable** option.

Example: The Windows Audio service status might be running.

## Stop service action in Services

The **Stop service** action in the Services package enables you to stop a selected Windows or application service that is currently running.

### Settings

Select the **Service list** or **Variable** option to enter the name of the service that you want to stop the service for.

## ServiceNow package

ServiceNow is a leading software provider of digital work flows for enterprise operations. The Automation 360 ServiceNow command package uses the ServiceNow APIs to let you build and deploy bots in Automation 360 that work with records and triggers in ServiceNow.

---

### Note:

The ServiceNow mark and logo are trademarks or registered trademarks of ServiceNow and are used for identification purposes only.

---

This package provides actions to authenticate with ServiceNow and perform several actions with records and attachments. To perform these actions in ServiceNow, Automation 360 uses these APIs:

- [Table API](#)
- [Attachment API](#)

Automation 360 bots can increase process efficiency for these types of work flows: customer account creation and management, customer verification, employee on-boarding and off-boarding, data extraction and migration, and claims and invoice processing. Automation 360 helps extend the core work flow capabilities of ServiceNow so that you can automate repetitive tasks for intelligent, end-to-end automation. This Automation 360 command package enables Automation 360 bots and processes to use ServiceNow API features natively within the Automation 360 platform.

## ServiceNow Triggers

You can use the ServiceNow triggers to start Automation 360 bots to respond to the events in ServiceNow such as incident creation, updates, and so on. For more information on ServiceNow triggers, see [ServiceNow New Record trigger](#) on page 2449 and [ServiceNow Updated Record trigger](#) on page 2450.

The following video shows the interaction between Automation 360 and ServiceNow when you use ServiceNow command package:

## Use cases

The key use cases for this package include:

- Create, read, update, and delete records from a ServiceNow table.
- Add, download, and delete attachments on ServiceNow records.
- Streamline Incident responses.
- Trigger specific automations from the creation of new Incidents or Incident updates.

## Prerequisites

- The bot creator must have access to a ServiceNow account with required permissions to perform tasks enabled by this package. See [Roles](#).
- Follow ServiceNow guidelines for authenticating to external client with OAuth 2.0. See [Setup OAuth](#).
- Create a Developer account and Developer instance in ServiceNow. See [Personal Developer Instances](#).

Related reference

[ServiceNow package updates](#) on page 1040

Review the updates in released versions of ServiceNow packages such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Authentication

Use the **Authentication** and **Revoke Authentication** action to connect or disconnect from your ServiceNow instance.

### ServiceNow authentication action

Use the **Authentication** action to connect to your ServiceNow instance. After the authentication is successful, you can use other command actions to perform various operations in ServiceNow.

- You must have the Client ID and Client secret generated in your ServiceNow instance. To generate the Client details, see [Create an OAuth API endpoint for external clients](#).
- You must have the **Bot creator role** for your Automation Anywhere Control Room to use the ServiceNow package in a bot.

You can use different connection methods to connect to ServiceNow:

- **OAuth2 - Client Credentials:** Use this connection method by providing the Salesforce account credentials. You need a Salesforce username and password to establish a connection.
  - **Control room OAuth connection:** Use this connection method by creating an OAuth connection and storing it in the Control Room. You must configure an OAuth connection in ServiceNow before creating the OAuth connection in Control Room. For more details, see [Create an endpoint for clients to access the instance](#).
1. Log in to the Control Room.
  2. Create a new bot or edit an existing bot. See [Create your first bot](#) on page 1595.
  3. From the Actions pane, select **ServiceNow > Authentication** and place it under the start of the bot flow.
  4. In the **Authentication Type** field, select the authentication method from the drop down.
  5. To view client ID and client secret details in ServiceNow for **OAuth2 - Client Credentials** authentication, complete the following steps:
    - a) Log in to your ServiceNow instance.
    - b) Click **All > Application Registry**.
    - c) Select the OAuth you created.
    - d) Use the Client ID and Client Secret in your Authentication action from the Control Room.
  6. To connect using OAuth2 - Client Credentials, complete the following steps:
    - a) In the **ServiceNow URL** field, enter your ServiceNow instance URL.
    - b) (Optional) Enter the API version.
    - c) In the **Client ID** field, enter the Client ID copied from ServiceNow. In the example video below an Insecure string is used, while you can use Credential or Variable options for better security.
    - d) In the **Client Secret** field, enter the Client Secret copied from ServiceNow.
    - e) Enter the ServiceNow user name.
    - f) Enter the ServiceNow password.

---

**Note:** You can use one of the following options to specify the **Client ID/Client secret/username/ password**:

- **Credential:** Enables you to use a value in the Credential Vault that contains information about the Client ID/Client secret/username/password.
  - **Variable:** Enables you to use a credential variable that contains information about the Client ID/Client secret/username/password.
  - **Insecure string:** Enables you to enter the Client ID/Client secret/username/password manually.
- 

7. To configure a **Control room OAuth connection** in ServiceNow, complete the following steps:
  - a) Complete step 1 to step 5 in [Create OAuth connection](#) on page 2010.
  - b) Log in to your ServiceNow instance.
  - c) Click **New > Create an OAuth API endpoint for external clients**.

- d) Enter the following details:
    1. **Name:** A unique name.
    2. **Client ID:** Client ID is automatically generated by the ServiceNow OAuth server.
    3. **Client Secret:** Client secret is automatically generated.
    4. **Refresh Token Lifespan:** Validity of refresh token in seconds.
    5. **Access Token Lifespan:** Validity of access token in seconds.
    6. **Redirect URL:** Add the Callback URL from [Create OAuth connection](#) on page 2010 as an authorized redirect URI.
    7. **Enforce Token Restriction:** Restricts the access token usage to the API 's defined in the REST API Access Policies. If this option is not selected, access token usage across other REST API's is allowed.
  - e) Click **Submit**.
  - f) Go to **Application Registry**. Click the info icon and copy the client ID and client secret.
  - g) Go to [Create OAuth connection](#) on page 2010 and complete the remaining steps to create an Oauth connection with the above details.
8. To connect using **Control room OAuth connection**, pick a custom connection you have created and stored in the Control Room. For more details, see [Configure OAuth connections in Control Room](#) on page 2005.
  9. Enter **Default** as the Session name.
  10. You can assign the authorization header to a variable by creating either a Multiple or Dictionary variable.
  11. Click **Run** to save and run your bot. Once authenticated, you can use the token to call other ServiceNow API services.

## ServiceNow revoke authentication action

Use the **Revoke Authentication** action to securely discard the refresh token and access token when you do not need them anymore.

1. From the **Actions** pane, select **ServiceNow > Authentication > Revoke Authentication** and place it under the bot flow.
2. Enter the session name and click Run.
3. After the bot runs, your ServiceNow access token is revoked.

## Records

Use the **Records** action to perform various operations in your ServiceNow instance. You can create, update, delete, or get records from a ServiceNow Table.

### ServiceNow create record action

Use the **Create Record** action to create a new data record in the ServiceNow Table app.

- Ensure that you are authenticated before calling any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

- You must create a table in your ServiceNow instance as this action only creates a new record for an existing table entry with the data provided. For more details, see [Creating a table](#).

1. From the Actions pane, select **ServiceNow > Records > Create Record** and place it in the canvas.

2. Specify details in the following fields:

- a) Enter the Table name. You can use a standard table name available in ServiceNow, for example: Incident. Or you can use a custom user defined table name, for example: u\_test\_table.

---

**Note:** For ServiceNow tables, ensure that you provide the Table name instead of the Label name.

---

- b) Enter the Fields and data to insert. Choose either Dictionary or Entry list. For this example, Dictionary is selected.

1. Select the Type as String, Number, Datetime, or Boolean based on the data you want to insert in the table.

2. Enter a key-value pair, where key is the ServiceNow field name and value is the data you want to update in the field.

---

**Note:** The key name for a field is different from the displayed label name. You can view the key name of the file by using one of the following options:

- In your ServiceNow developer instance, navigate to **System Definition > Language File**. You can use the filter option to view fields for specific Tables. For example: Incident.
- Right-click on the field name (as shown below) to display the key name. For example: caller\_id is the key name for the field **Caller**.

c) Enter Default as the session name.

d) Save the record ID to a variable. For example, the record ID is saved to sys\_id.

**ServiceNow: Create Record**

Inserts one record in the specified table  
Required bot agent version: 21.119 or above

Table name

a)  (x)

Fields and data (optional)

Dictionary

b)

Type	Key	Value
String	caller_id	Jane-1234

+  
Field names and values must be provided for required fields in the specified Table

Session name

c)  (x)

Assign record id to a string variable (optional)

d)  (x)

3. Click **Run** to save and run your bot.
4. Verify whether the record is created in the ServiceNow table.
  - a) Find the sys\_id variable value in the Debug mode.
  - b) Replace the ID in the ServiceNow URL (as shown below) to view the latest record created.

https://dev85435.service-now.com/now/nav/ui/classic/params/target/incident.do%3Fsys\_id%3D10256e5307669110efb1f1e08c1ed011%26s...

## ServiceNow delete record action

Use the **Delete Record** action to delete a record from a ServiceNow table.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the **Actions** pane, select **ServiceNow > Records > Get Record** and place it in the canvas.
2. Specify details in the following fields:
  - a) **Table name**: Enter the ServiceNow table name.
  - b) **Record Sys\_id**: Enter the sys\_id of the record. If the record ID is captured in a variable, you can provide the variable name.
  - c) The session name displays as **Default**.

The screenshot shows the configuration interface for the 'ServiceNow: Delete Record' action. The title is 'ServiceNow: Delete Record'. Below the title, it says 'Deletes a record from the specified table' and 'Required bot agent version: 21.119 or above'. There are three input fields, each with a yellow circle and a letter (a, b, c) to its left. The first field is labeled 'Table name' and contains the text '\$str\_TableName\$'. The second field is labeled 'Record sys\_id' and contains the text '\$str\_Sys\_id\$'. The third field is labeled 'Session name' and contains the text 'Default'. Each field has a small blue icon with an 'x' in a square to its right, indicating it can be cleared.

3. Click **Run** to save and run your bot. When the bot is run successfully, your record in the ServiceNow table is deleted.

## ServiceNow get record action

Use the **Get Record** action to retrieve a record using the record ID stored in sys\_id variable from ServiceNow.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the **Actions** pane, select **ServiceNow > Records > Get Record** and place it in the canvas.
2. Specify details in the following fields:
  - a) **Table name**: Enter the ServiceNow table name.
  - b) **Record sys\_id**: Enter the sys\_id of the record. If the record ID is captured in a variable you can provide the variable name.
  - c) Select **List** for the **Field names (Optional)** field. Enter all the fields that you want to read.

- d) The session name displays as **Default**.
- e) Save the outcome to a variable. For example, the object ID is saved to dict\_GetRecordResults.

**ServiceNow: Get Record**

Multiple variables Dictionary

e)  (x)

3. Click **Run** to save and run your bot. When the bot is run successfully, the retrieved record is stored in the specified variable.

## ServiceNow get multiple records action

Use the **Get Multiple Records** action to retrieve multiple records from a ServiceNow table.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the **Actions** pane, select **ServiceNow > Records > Get Multiple Records** and place it in the canvas.
2. Specify details in the following fields:
  - a) **Table name:** Enter the ServiceNow table name.
  - b) Select **List** in the **List of fields to return in the response (Optional)** field. Enter the **Type** and **Value** for the fields you want to view in the response.
  - c) You can optionally filter the records by using name-value pair or query. For example, select **Query** and specify a query parameter to retrieve records for only the queried fields. For example, you can map the sys\_id to a variable and add it as a query.
  - d) Specify a limit of records to view. If the **Limit** field is blank or set to 0, all records are returned. Response time might vary depending on the volume of the specified Table.

- e) The session name displays as **Default**.
- f) Save the outcome to a variable. For example, the object ID is saved to list\_GetMultipleRecordsResult.

**ServiceNow: Get Multiple Records**

Retrieves multiple records from the specified table

Required bot agent version: 21.119 or above

+

Filter records by

Name-value pair **Query** None

Query (optional)

c  (x)

Limit (optional)

d  (x)

If limit is left blank or set to 0, all records will be returned. Response time may vary depending on the volume of the specified Table

Session name

e  (x)

Assign matched records to a list variable

f  (x)

3. Click **Run** to save and run your bot. When the bot is run successfully, you will retrieve all the records from ServiceNow.

**Note:** The output is retrieved as a list of type `list`. To read an individual record (row) in this list, you need to loop through all the dictionary items using the `loop` action and read or extract the records (rows) individually. For example, the output of get multiple records is saved in the variable `list_of_records_any`. If the variable contains five

records, then each record is passed to the Loop action to be processed one at a

time.

## ServiceNow update record action

Use the **Update Record** action to update a record in ServiceNow with name-value pairs.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

- From the **Actions** pane, select **ServiceNow > Records > Get Record** and place it in the canvas.
- Specify details in the following fields:
  - Table name:** Enter the ServiceNow table name.
  - Sys\_id:** Enter the sys\_id of the record. If the record ID is captured in a variable, you can provide the variable name.
  - In **Fields and data**, select **Dictionary** or **Entry list**. In the example, **Dictionary** is selected and the name-value pair is specified to update the record.
  - The session name displays as **Default**.

**ServiceNow: Update a Record**

Updates the specified record with the name-value pairs included in the request body

Required bot agent version: 21.119 or above

3. Click **Run** to save and run your bot. When the bot is run successfully, your record is updated with the specified details.

## Attachments

Use the Attachments action to upload or delete an attachment from a record in the ServiceNow table. You can also download an attachment from a ServiceNow record.

### ServiceNow add attachment action

Use the **Add Attachment** action to add a new attachment to the specified record in a ServiceNow Table app.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the Actions pane, select **ServiceNow > Attachments > Add Attachment** and place it in the canvas.
2. Specify details in the following fields:
  - a) Enter the Table name.

---

**Note:** For ServiceNow tables, ensure that you provide the Table name instead of the Label name.

---

- b) Select the File to be uploaded by using one of the following options:

- **Control Room file:** If the file exists within the Control Room folders, select this option.
- **Desktop file:** If the file exists in your local system desktop, select this option and browse the file path.
- **Variable:** You can also store the file path as a variable.

**Note:** Maximum size of the file to upload cannot exceed 25 MB.

- (Optional) You can enter a name in the New file name field.
- The session name displays as **Default**.
- You can assign the attachment ID to a string variable. For example, the attachment ID is saved to str\_AttachmentSysId.

**ServiceNow: Add Attachment**

Adds an attachment to the specified record  
Required bot agent version: 21.119 or above

Table name

Control Room file Desktop file Variable  
c  (x) Browse...

New file name (optional)  
d  (x)

Session name  
e  (x)

Assign attachment sys\_id to a string variable (optional)  
f  (x)

3. Click **Run** to save and run your bot.
4. Verify whether the attachment is added in the ServiceNow record as shown below:

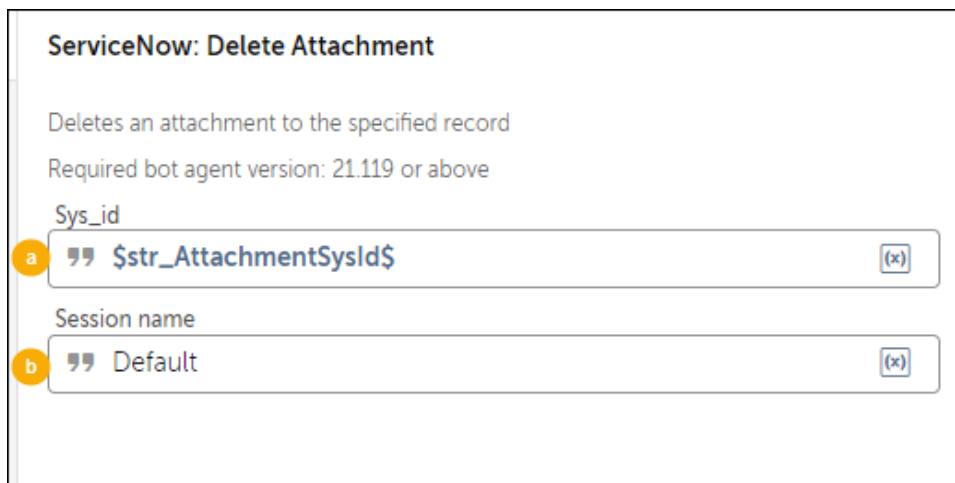

### ServiceNow delete attachment action

Use the **Delete Attachment** action to delete an attachment from a ServiceNow record.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the **Actions** pane, select **ServiceNow > Attachments > Delete Attachment** and place it in the canvas.
2. Specify details in the following fields:
  - a) **Sys\_id**: Enter the attachment ID or select the variable where you stored the attachment ID.
  - b) The session name displays as **Default**.

3. Click **Run** to save and run your bot. When the bot is run successfully, your attachment in the ServiceNow record is deleted.

## ServiceNow get attachment action

Use the Get Attachment action to download a new attachment from the specified record in a ServiceNow Table app.

Ensure that you are authenticated before initiating any ServiceNow action. For more details, see [ServiceNow authentication action](#) on page 3212.

1. From the Actions pane, select **ServiceNow > Attachments > Get Attachment** and place it in the canvas.
2. Specify details in the following fields:
  - a) **Filter attachment by.**
    - **Sys\_id:** Specify the attachment ID or select a variable where the attachment ID is stored.
    - **Associated record:** Specify details of the associated record, to download the associated attachment. You must enter the table name and the table ID.
    - **Query:** Specify a query parameter to download the attachments. For example, you can map the sys\_id to a variable and add it as a query.
  - b) Enter a Destination folder path, or select a variable if the path is stored in a variable.
  - c) The session name displays as **Default**.
  - d) You can assign the attachment ID to a string variable. For example, the attachment ID is saved to list\_GetAttachmentResults.

**ServiceNow: Get Attachment**

Downloads attachment(s) to the specified folder location

Required bot agent version: 21.119 or above

Filter attachment by

a) Sys\_id Associated record Query

Sys\_id

» \$str\_AttachmentSysId\$ (x)

Destination folder path

b) » \$str\_DestinationFolderPath\$ (x)

e.g C:\Users\...\attachment-download-folder

Session name

c) » Default (x)

Assign file metadata to a list variable (optional)

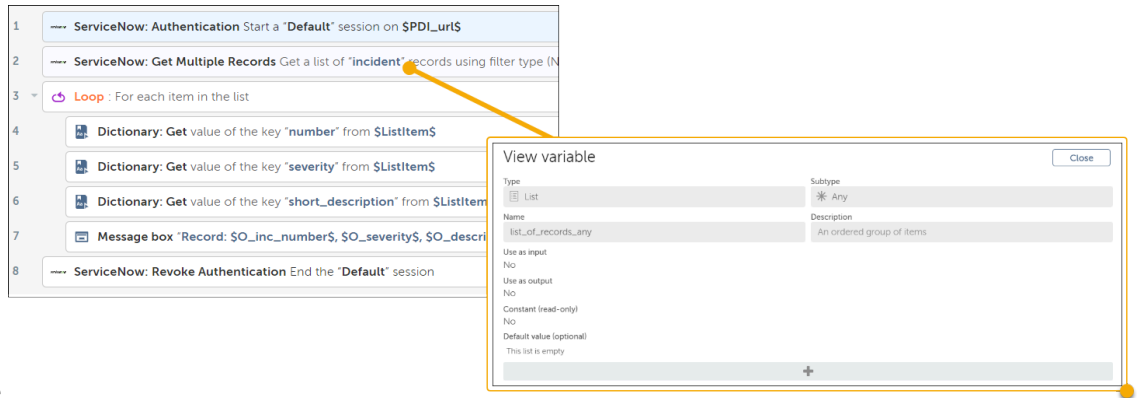

d) list\_GetAttachmentResults (x)

3. Click **Run** to save and run your bot.
4. The attachment is downloaded to the specified folder path.

**Note:** The output is retrieved as a list of type . To read an individual record (row) in this list, you need to loop through all the dictionary items using the action and read or extract the records (rows) individually. For example, the output of get multiple records is saved in the variable list\_of\_records\_any. If the variable contains five

records, then each record is passed to the Loop action to be processed one at a

time.

## ServiceNow field types: Table API

The ServiceNow schema contains various fields that you can modify by using the Automation 360 ServiceNow command package. The following table lists alphabetically the supported field types and their corresponding Automation 360 to ServiceNow actions.

Field Type	Create / Update Record	Get Record
Audio	Not supported	Supported
Choice	Supported	Supported
Collection	Not supported	Not supported

## SharePoint package

SharePoint is a web-based platform that is used for collaboration and document management. You can use the Automation 360 SharePoint command package to manage your documents, sites, and data.

---

### Note:

The SharePoint mark and logo are trademarks or registered trademarks of Microsoft and are used for identification purposes only.

---

SharePoint is a collaborative platform that integrates natively with Microsoft Office. You can use the SharePoint package to securely store, organize, share, and access information. You can streamline processes and reduce manual work using the automated SharePoint operations in Automation 360. You can quickly and easily manage your documents, sites, and data. Automation 360 platform provides automation capabilities for other Microsoft products such as Microsoft Office, Outlook, and Windows. By adding the SharePoint package, you can leverage the full potential of the Microsoft platform from Automation 360.

---

**Note:** This package is based on the SharePoint REST v1 API.

---

You can use the SharePoint package to perform the following CRUD (create, read, update, and delete) actions in a SharePoint site:

- [CRUD operations for folder and file](#)
- [CRUD operations for list and list items](#)

### SharePoint workflow

### Actions in SharePoint package

You can perform the following actions in the SharePoint package:

Action	Description
<a href="#">Configuring SharePoint domain and sites</a>	The SharePoint package connects to a particular SharePoint domain using app-based permissions. You must configure your SharePoint domain and add relevant app permissions.
<a href="#">SharePoint authenticate action</a>	Use the <b>Authenticate</b> action to connect to your SharePoint domain. After the authentication is successful, you can use the other command actions to perform various operations in SharePoint.
<a href="#">SharePoint folder and file</a>	Use the <b>Folder and file</b> actions to perform various operations in your SharePoint site. You can create, get details, delete, or rename folders in a specific SharePoint site. You can also upload, delete, download, and get files in a specified folder.
<a href="#">SharePoint list and list items</a>	Use the <b>List and list item</b> actions to perform various operations in your SharePoint site. You can create, get, delete, or update list and list items in a specific SharePoint site.

If you have trouble with any SharePoint actions, here are some troubleshooting steps to follow:

1. **Permissions Check:** Double-check your user permissions to ensure you have the necessary access for working with SharePoint in the Control Room.
2. **API Client Test:** Consider testing the operation using an API client like Postman. This can help isolate the issue to the Control Room environment or your specific configuration. If it works in Postman, the problem likely lies within the Control Room.
3. **Error Details:** If you still encounter issues, then sharing the full error message would be incredibly helpful in diagnosing the issue further. Additional details like the SharePoint package version, deployment type, and your app creation process can also provide valuable context.

Related reference

[SharePoint package updates](#) on page 1042

Review the updates in released versions of SharePoint packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Configuring SharePoint app, sites, and app permissions

The SharePoint package connects to a particular SharePoint domain using app-based permissions. You must configure your SharePoint domain and add relevant app permissions.

---

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

To register and configure a new app in SharePoint, you must complete the following steps before using the SharePoint package. You can use the client ID and client secret of the newly registered app to log in to SharePoint through the Automation 360 SharePoint package.

### Configure new app

1. To register a new app, go to: [https://{your\\_sharepoint\\_domain}/\\_layouts/15/appregnew.aspx](https://{your_sharepoint_domain}/_layouts/15/appregnew.aspx). Replace {your\_sharepoint\_domain} with your specific SharePoint domain (for example: automationanywhere.sharepoint.com).
2. Click Generate to generate a new client ID and client secret.
3. You can view the app details in the confirmation page. Copy and save the details to use in the package.

---

**Note:** You must have the SharePoint Administrator role to access the registration link.

---

SharePoint

Home Documents Pages Recent

**App Information**  
The app's information, including app id, secret, title, hosting uri and redirect uri.

Client Id:  Generate

Client Secret:  Generate

Title:

App Domain:   
Example: "www.contoso.com"

Redirect URL:   
Example: "https://www.contoso.com/default.aspx"

Create Cancel

Create Cancel

## Configure app permissions

Once you have registered the app, you must configure the app-based permission.

1. To configure app permission, go to: [https://{your\\_sharepoint\\_domain}/\\_layouts/15/appinv.aspx](https://{your_sharepoint_domain}/_layouts/15/appinv.aspx). Replace {your\_sharepoint\_domain} with your specific SharePoint domain (for example: automationanywhere.sharepoint.com).
2. Enter the client ID for the newly created app and click **Lookup**. Your app details will be displayed. Copy the following XML snippet and paste it in the **Permission Request XML** box:

```
<AppPermissionRequests AllowAppOnlyPolicy="true">
 <AppPermissionRequest Scope="http://sharepoint/content/
sitecollection" Right="FullControl" /> </AppPermissionRequests>
```

3. Click **Create** to save your changes.

4. In the next screen, click **Trust It** to grant the required permissions.

## Configure individual SharePoint sites

You must configure individual SharePoint sites. If you have multiple SharePoint sites in your organization, repeat this process for each individual site you want to connect to.

1. To configure individual sites, go to: `https://{your_sharepoint_domain}/sites/{sitename}/_layouts/15/appinv.aspx`. Replace `{your_sharepoint_domain}` with your specific SharePoint domain (for example: `automationanywhere.sharepoint.com`) and `{sitename}` with the site name you have created.
2. Follow the instructions provided in [Configure app permissions](#) on page 3230, to add the app based permissions to your SharePoint site.

---

**Important:** You need the **Full Control** permission to access the configuration link. It is recommended that you contact the owner of the SharePoint site, your SharePoint admin, or Microsoft 365 admin to get the **Full Control** permission. If you have Edit, Contribute, or Design permissions to the SharePoint site, you cannot access the configuration link.

---

## Configure OAuth connection in SharePoint

You must configure an OAuth connection in SharePoint before creating the OAuth connection in Control Room.

1. Complete step 1 to step 5 in [Create OAuth connection](#) on page 2010.
2. Log into [Azure portal](#) and navigate to **App Registration**.
3. Click **New registration** and enter the following details:

- a) Enter a name for the app.
- b) Select **Single Tenant**.
- c) In the **Redirect URI** field, select **Web** from the drop-down and enter the callback URL from [Create OAuth connection](#) on page 2010.

---

**Note:** For the OAuth connection to be successful you must enter the callback URL.

---

- d) Click **Register**.
4. Go to **App Overview**.
  5. Copy the client ID from the Application (client) ID.
  6. Click **Add a certificate or secret** in the **Client credentials** field.
  7. Click **New client secret**.
  8. Copy the client secret from the **Value** field.
  9. Go to [Create OAuth connection](#) on page 2010 and complete the remaining steps to create an OAuth connection with the above details.

## SharePoint authenticate action

Use the **Authenticate** action to connect to your cloud SharePoint domain. After the authentication is successful, you can use the other command actions to perform various operations in SharePoint.

---

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

- You must have the client ID and client secret generated for your SharePoint domain. To generate the client details, see [SharePoint package](#) on page 3227.
- You must have the Bot Creator role for your Automation Anywhere Control Room to use the SharePoint package in a bot.

You can use different connection methods to connect to SharePoint:

- **OAuth2 - Client Credentials:** Use this connection method by providing the SharePoint credentials.
  - **Control room OAuth connection:** Use this connection method by creating an OAuth connection and storing it in the Control Room.
1. Log in to the Automation Anywhere Control Room.
  2. You can create a new bot or modify an existing bot. For more details, see [Create your first bot](#) on page 1595.
  3. From the **Actions** pane, select **SharePoint > Authenticate** and place it under the start of the bot flow.
  4. In the **Authentication Type** field, select the authentication method from the drop down.

**Note:** To connect using **Control room OAuth connection**, pick a custom connection you have created and stored in the Control Room. For more details, see [Configure OAuth connections in Control Room](#) on page 2005.

The screenshot shows the Automation Anywhere interface for configuring a SharePoint automation. The workflow is titled "SharePoint-rename-folder" and consists of three steps:

- SharePoint: Authenticate** (Step 1): Start a "automationanywheres..."
- SharePoint: Get folder(s)** (Step 2): Get all folders from "Shared D..."
- SharePoint: Rename folder** (Step 3): Rename the folder from "Shar..."

The configuration panel for the "SharePoint: Authenticate" step is shown on the right, with yellow circles 4 through 8 highlighting the following fields:

- Authentication type:** OAuth2 - Client Credentials (SharePoint App-Only)
- Client ID:** Credential, Variable, Insecure string (Selected: Insecure string)
- Client secret:** Credential, Variable, Insecure string (Selected: Insecure string)
- Tenant ID:** Credential, Variable, Insecure string (Selected: Insecure string)
- Domain:** Cloud, Custom (Selected: Custom)
- Subdomain:** automationanywherestore
- Site name (optional):** CDEVTest
- Teams site:**
- Create SharePoint session:** Local session, Global session, Variable (Selected: Local session)

5. To connect using **OAuth2 - Client Credentials**, complete the following steps:
  - a) In the **Client ID** field, enter the client ID copied from SharePoint. This example uses **Insecure string** however, you can use **Credential** or **Variable** options for better security.
  - b) In the **Client secret** field, enter the client secret copied from SharePoint.
  - c) In the **Tenant ID** field, enter the tenant ID copied from SharePoint. To view the tenant ID, go to `https://{your_sharepoint_domain}/_layouts/15/AppPrincipals.aspx`. Replace `{your_sharepoint_domain}` with your SharePoint domain name. In the **App identifier** column, the tenant ID is displayed after the @ symbol as shown in the following image:

**Note:** You can use one of the following options to specify the **Client ID/Client secret/Tenant ID**:

- **Credential:** Enables you to use a value in the Credential Vault that contains information about the client ID/client secret/tenant ID.
- **Variable:** Enables you to use a credential variable that contains information about the client ID/client secret/tenant ID.
- **Insecure string:** Enables you to enter the client ID/client secret/tenant ID as a string.

**6.** In the **Domain** field.

- Enter the SharePoint subdomain name.
- Enter the site name.

**Note:** The site name you provide in the authentication action will be the default site selected for the other actions in this package. You can provide a different site name for the individual actions as well.

**7.** Select the **Teams site** check box to connect to a SharePoint teams site. By enabling the Teams site checkbox, you can connect to Sharepoint's Team based managed paths and perform operations.

**Note:**

A managed path is a location within a SharePoint web application in which you can have site collections. Managed paths allow you to specify a path users will use to access your site contents. By default, SharePoint Online provides two managed paths:

- **sites:** This managed path is used for creating site collections, and the URLs for site collections created using this path follow this format: `https://<yourdomain>.sharepoint.com/sites/<sitename>`.
- **teams:** This managed path is used for creating modern team sites, and the URLs for team sites created using this path follow this format: `https://<yourdomain>.sharepoint.com/teams/<sitename>`.

**8.** In the **Create SharePoint session** field, select one of the following options:

- **Local session:** You can use the local session name only for the current bot.

- **Global session:** You can use the global session name in other parent and child bots.
- 
- Recommendation:** The parent and child bots should have the same package version.
- 
- **Variable:** You can add the session name to a variable and use the variable in other actions.

You are successfully authenticated to the SharePoint domain.

## SharePoint folder and file

Use the **Folder and file** actions to perform various operations in your SharePoint site. You can create, get details, delete, or rename folders in a specific SharePoint site. You can also upload, delete, download, and get files in a specified folder.

### Folder and file actions in SharePoint package

The SharePoint package includes the following folder and file actions:

Action	Description
<a href="#">SharePoint create folder Action</a>	Use the <b>Create folder</b> action to create a new folder in the specified path in your SharePoint site.
<a href="#">SharePoint delete folder Action</a>	Use the <b>Delete folder</b> action to delete a folder from the specified path in your SharePoint site.
<a href="#">SharePoint get folder Action</a>	Use the <b>Get folder</b> action to retrieve details of a specific folder or all folders in the specified path in your SharePoint site.
<a href="#">SharePoint rename folder Action</a>	Use the <b>Rename folder</b> action to retrieve details of a specific folder or all folders in the specified path in your SharePoint site.
<a href="#">SharePoint delete file Action</a>	Use the <b>Delete file</b> action to delete a file from the specified path in your SharePoint site.
<a href="#">SharePoint download file Action</a>	Use the <b>Download file</b> action to download a file from a folder in your SharePoint site.
<a href="#">SharePoint get files Action</a>	Use the <b>Get file(s)</b> action to retrieve one or more file details from your SharePoint site.
<a href="#">SharePoint upload file Action</a>	Use the <b>Upload file</b> action to upload a file to a folder in your SharePoint site.

### SharePoint create folder action

Use the **Create folder** action to create a new folder in the specified path in your SharePoint site.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

- Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

- You must create a SharePoint site to store the folder and file data. For more details, see [Create new app in SharePoint](#).
- From the **Actions** pane, select **SharePoint > Folder and file > Create folder** and place it in the canvas.

**SharePoint: Create folder**

Creates a folder in the path provided when the correct information is entered

Required bot agent version: 21.250 or above

Site

2 Default site Other site

Document library path

3 SiteAssets (x)

Folder path must not be greater than 400 chars

Folder name

4 Docs\_Test (x)

Folder name must not be greater than 260 chars

Session

Session name Variable

5 Default (x)

The name you gave the session when you opened it.

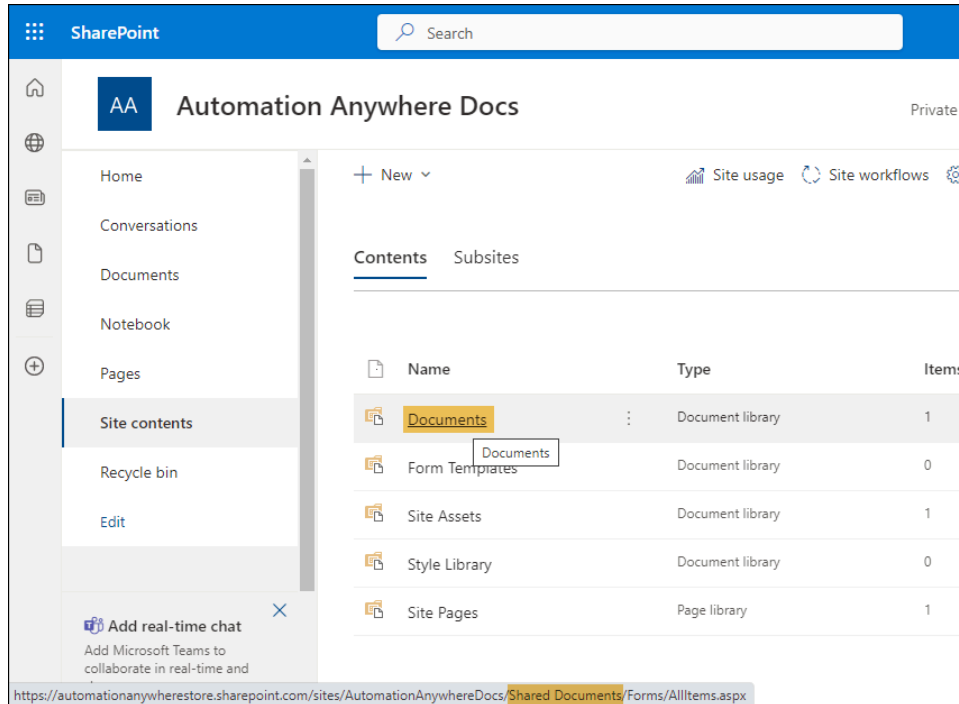

Folder path

6 folder\_path (x)

- In the **Site** field, select one of the following options:
  - Default site:** The site name used during authentication is considered the default site.
  - Other site:** If you want to choose a different site to create a folder, specify the different site name.
- In the **Document library field**, specify the path where the folder must be created.

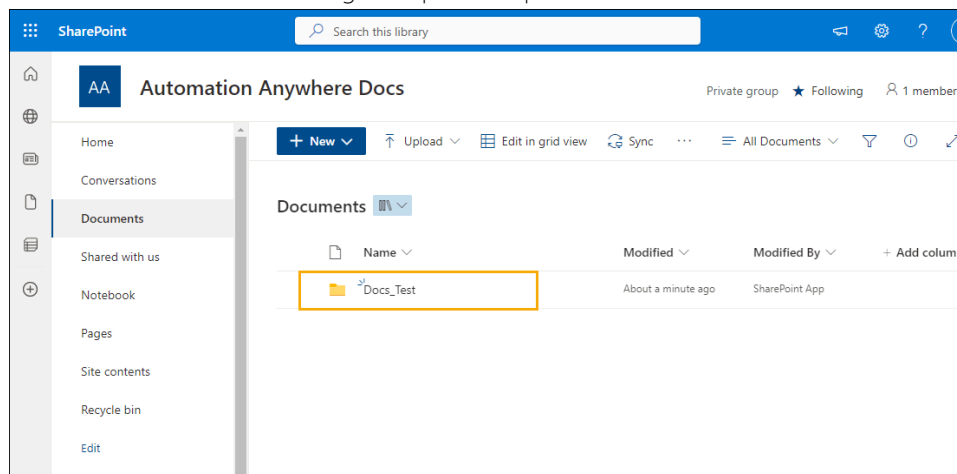

---

**Note:** You can create folders only within the **Document library** type of the site contents. To view the path name, hover over one of the document library names and view the folder path as shown in the following image:

4. In the **Folder name** field, specify the folder name you want to create.
5. In the **Session** field, select one of the following options:
  - **Session name**: The name you provided for the session during authentication.
  - **Variable**: Select a variable which contains the session name.
6. In the **Folder path** field, select a variable to store the created folder path name.

A new folder is created using the specified path.

## SharePoint delete folder action

Use the **Delete folder** action to delete a folder in the specified path in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Delete folder** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered as the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **Folder path** field, specify the folder path followed by the folder name.
4. In the **Session** field, select one of the following options:
  - **Session name:** The name you have provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The specified folder is deleted.

## SharePoint get folder action

Use the **Get folder** action to retrieve details of a specific folder or all folders in the specified path in your SharePoint site.

---

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Get folder** and place it in the canvas.

**SharePoint: Get folder(s)**

The action should return a list of folders from SharePoint when the correct inputs have been entered

Required bot agent version: 21.250 or above

Site

2  Default site  Other site

Folder path

3  (x)

Example: SiteAssets/FolderName

Get all / filter by

4  ▼

Session

Session name  Variable

5  (x)

The name you gave the session when you opened it.

List of folders

7  ▼ (x) <sub>+</sub>

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different, specify the different site name.
3. In the **Folder path** field, specify the folder path followed by the folder name.

---

**Note:** You can view the folder path in your SharePoint site. To view the root folder name, hover over one of the document library names and view the folder path as shown in the following image:

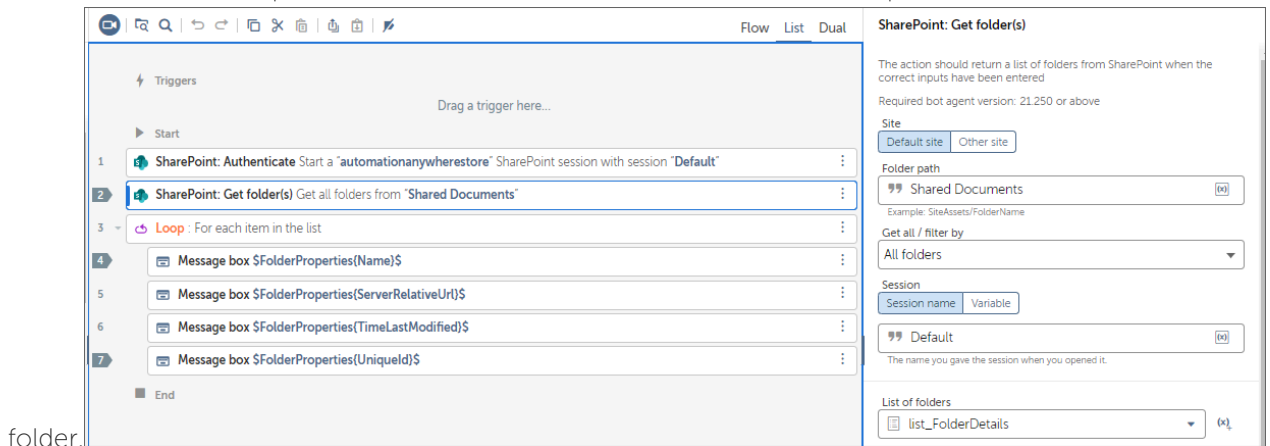

4. In the **Get all / filter by** field, select one of the following options:
  - **All folders:** Retrieve details of all the folders in the specified path.
  - **Folder name:** Specify a folder name to retrieve details of this folder.
5. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.
6. In the **List of folders** field, select a variable to store the retrieved folder data.

The specified folder details is retrieved and stored in the variable.

**Note:** The output is retrieved as a list of type `.` To read an individual record (row) in this list, you need to loop through all the dictionary items using the `action` and read or extract the records (rows) individually. For example, if the list is stored in the variable `list_FolderDetails` and it contains five records, then each record is passed to the `Loop` action to be processed

one at a time. The loop reads the Name, URL, last modified time and Unique Id of each

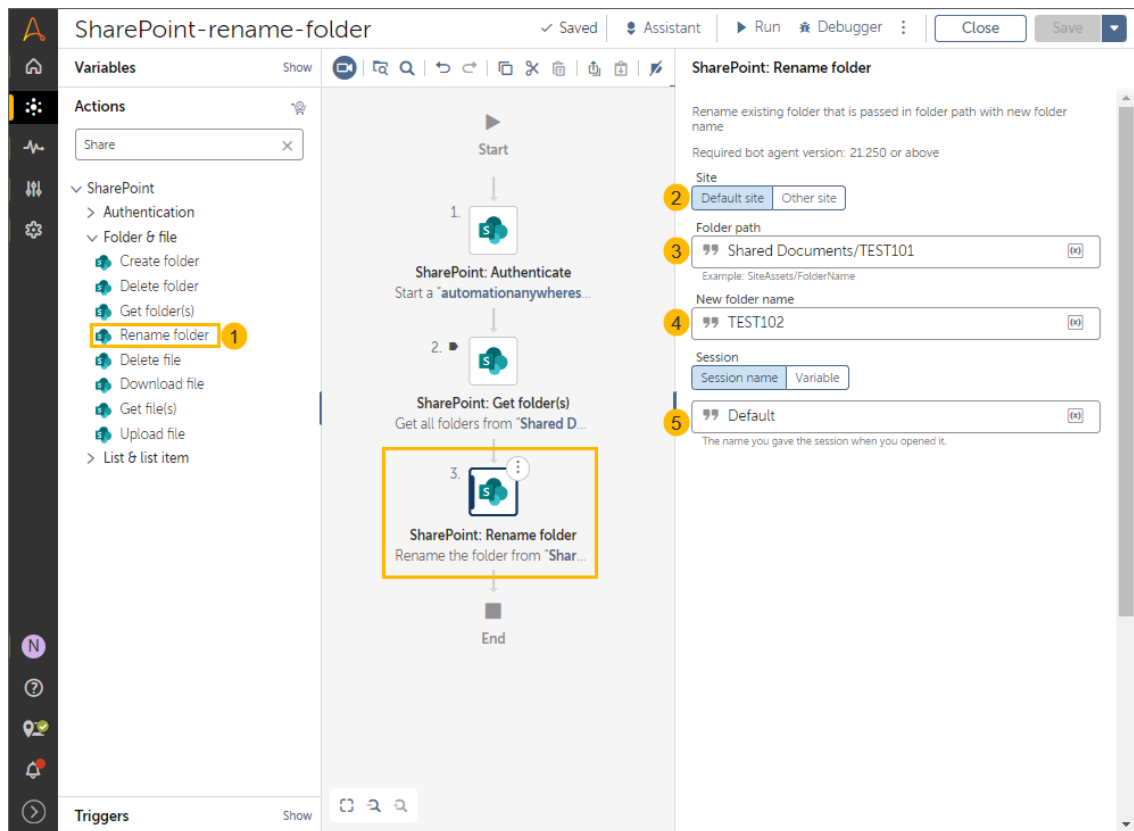

folder.

## SharePoint rename folder action

Use the **Rename folder** action to rename a specific folder in the specified path in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Rename folder** and place it in the canvas.

2. In the **Site** field, select one of the following options:

- **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **Folder path** field, specify the folder path followed by the folder name you want to rename.
  4. In the **New folder name** field, specify the new folder name you want to rename the folder to.
  5. In the **Session** field, select one of the following options:
    - **Session name:** The name you provided for the session during authentication.
    - **Variable:** Select a variable which contains the session name.

The specified folder is renamed with the new folder name.

Related tasks

[Create your first bot](#) on page 1595

Perform the following steps to create your first bot that prints the message, Go be great!, the Automation Anywhere version of Hello World!

## SharePoint delete file action

Use the **Delete file** action to delete a file in the specified path in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Delete file** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **File path** field, specify the folder path followed by the file name.
4. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The specified file is deleted from the folder.

## SharePoint download file action

Use the **Download file** action to download a file from a folder in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Download file** and place it in the canvas.

**SharePoint: Download file**

Download the file to the destination folder provided when the correct information is entered

Required bot agent version: 21.250 or above

Site

2 Default site Other site

File path

3 " Shared Documents/Test\_docs/Test File (x)

Example: SiteAssets/FileName.txt

Destination folder

4 " C:\Users\prarthana.reddy\Downloads (x)

Session

Session name Variable

5 " Default (x)

The name you gave the session when you opened it.

File details

Multiple variables Dictionary

6 " filedownload (x)

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **File path** field, specify the file path followed by the file name.

---

**Note:** The file path must contain the main **Document Library** folder name followed by the parent folder (if any) and the file name (for example: `Shared Documents/Test_docs/Test File`). You must specify the file extension only if the file name contains the extension in SharePoint.

---

4. In the **Destination folder** field, specify the local folder path where you want to download the file.
5. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.
6. In the **File details** field, select one of the following options:
  - **Multiple variables:** Add a key-value pair to store the file details.
  - **Dictionary:** Select a dictionary variable to store the file details.

The specified file is downloaded to the destination folder.

## SharePoint get files action

Use the **Get file(s)** action to retrieve one or more file details from your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > Folder and file > Get file(s)** and place it in the canvas.

**SharePoint: Get file(s)**

Get list of files from SharePoint when the correct inputs have been entered

Required bot agent version: 21.250 or above

**Site**

2  Default site  Other site

**Folder path**

3

Example: SiteAssets/FolderName

**Get all / filter by**

4

**File name (optional)**

**Session**

Session name  Variable

5

The name you gave the session when you opened it.

---

**List of files**

6

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **Folder path** field, specify the main **Document Library** folder name followed by the parent folder.
4. In the **Get all / filter by** field, select one of the following options:

- **All files:** Select this option to retrieve all file details available in your SharePoint site.
  - **File name:** Specify a file name to retrieve the file details.
  - **File extension:** Specify a file extension to retrieve all file details with the specified extension.
5. In the **Session** field, select one of the following options:
    - **Session name:** The name you provided for the session during authentication.
    - **Variable:** Select a variable which contains the session name.
  6. In the **List of files** field, select a variable to store the file details.

One or more file details are retrieved and stored in the variable.

**Note:** The output is retrieved as a list of type . To read an individual record (row) in this list, you need to loop through all the dictionary items using the action and read or extract the records (rows) individually. For example, if the list is stored in the variable list\_FileDetails and it contains five records, then each record is passed to the Loop action to be processed one at a time. The loop reads the filename, URL, last modified time and Unique Id of each

file.

## SharePoint upload file action

Use the **Upload file** action to upload a file to a folder in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

**Note:** The maximum file size allowed for upload is 250 MB.

1. From the **Actions** pane, select **SharePoint > Folder and file > Upload file** and place it in the canvas.

### SharePoint: Upload file

Creates a file in the path provided when the correct information is entered

Required bot agent version: 21.250 or above

6  (x)

The name you gave the session when you opened it.

---

File path

7  (x)

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **Folder path** field, specify the main **Document Library** folder name followed by the parent folder.
4. In the **File name** field, specify the name of the file that will be displayed in SharePoint. You can provide the file name with or without an extension.
5. In the **File content** field, select one of the following options:
  - **Control room file:** Choose a file that is available in the Control Room.
  - **Desktop file:** Browse and select a file from your local system.
  - **Variable:** Insert a variable that contains the file path.
6. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.

- **Variable:** Select a variable which contains the session name.

7. In the **File path** field, select a variable to store the file path details.

The specified file is uploaded to the destination folder.

## SharePoint list and list items

Use the **List and list item** actions to perform various operations in your SharePoint site. You can create, get, delete, or update list and list items in a specific SharePoint site.

### List and list item actions in SharePoint package

The SharePoint package includes the following list and list item actions:

Action	Description
<a href="#">SharePoint create list Action</a>	Use the <b>Create list</b> action to create a new list in your SharePoint site.
<a href="#">SharePoint delete list Action</a>	Use the <b>Delete list</b> action to delete a list from your SharePoint site.
<a href="#">SharePoint get list Action</a>	Use the <b>Get list</b> action to retrieve the list details from your SharePoint site.
<a href="#">SharePoint update list Action</a>	Use the <b>Update list</b> action to update a list name in your SharePoint site.
<a href="#">SharePoint create list item Action</a>	Use the <b>Create list item</b> action to create a list item within a list in your SharePoint site.
<a href="#">SharePoint delete list item Action</a>	Use the <b>Delete list item</b> action to delete a list item from a list in your SharePoint site.
<a href="#">SharePoint get list item Action</a>	Use the <b>Get list item</b> action to retrieve the list item details from a list in your SharePoint site.
<a href="#">SharePoint update list item Action</a>	Use the <b>Update list item</b> action to update a list item value within a list in your SharePoint site.
<a href="#">SharePoint upload list image Action</a>	Use the <b>Upload list image</b> action to upload an image file to a list item in your SharePoint site.
<a href="#">SharePoint delete list attachment Action</a>	Use the <b>Delete list attachment</b> action to delete an attachment from a list item in your SharePoint site.
<a href="#">SharePoint download list attachment Action</a>	Use the <b>Download list attachment</b> action to download an attachment from a list item in your SharePoint site.
<a href="#">SharePoint upload list attachment Action</a>	Use the <b>Upload list attachment</b> action to upload an attachment to a list item in your SharePoint site.

## SharePoint create list action

Use the **Create list** action to create a new list in your SharePoint site.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

- Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.
- You must create a SharePoint site to store the list. For more details, see [Create new app in SharePoint](#).

1. From the **Actions** pane, select **SharePoint > List and list items > Create list** and place it in the canvas.

**SharePoint: Create list**

Creates a list with template selected

Required bot agent version: 21.250 or above

The name you gave the session when you opened it.

List ID (optional)

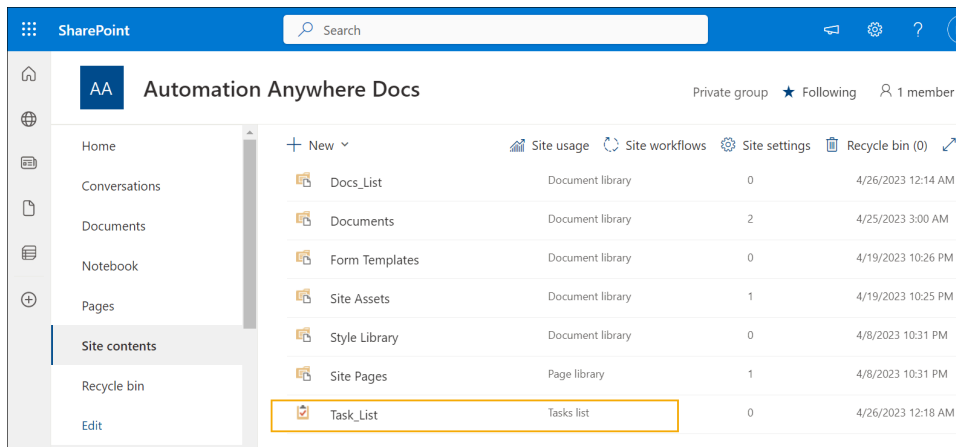

7 List\_ID

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.

- **Other site:** If you want to choose a different site to create a folder, specify the different site name.
3. In the **List name** field, specify a name for the new list.
  4. In the **Template** field, select a template from the drop-down list. For more information, see [SharePoint templates](#).
  5. In the **Description** field, provide a description for the list.
  6. In the **Session** field, select one of the following options:
    - **Session name:** The name you provided for the session during authentication.
    - **Variable:** Select a variable which contains the session name.
  7. In the **List ID** field, select a variable to store the created list ID.

A new list is created in SharePoint.

## SharePoint delete list action

Use the **Delete list** action to delete a list from your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > List and list item > Delete list** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify the list name you want to delete.
4. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The specified list is deleted.

## SharePoint get list action

Use the **Get list** action to retrieve the list details from your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

- From the **Actions** pane, select **SharePoint > List and list items > Get list** and place it in the canvas.

**SharePoint: Get list(s)**

Get list(s) using filters

Required bot agent version: 21.250 or above

**Site**

2 Default site Other site

**Filter**

3 Name

List name (optional)

Test\_list (x)

**Session**

Session name Variable

4 Default (x)

The name you gave the session when you opened it.

**Matched records**

5 \* ListItem (x)₊

- In the **Site** field, select one of the following options:
  - Default site:** The site name used during authentication is considered the default site.
  - Other site:** If you want to choose a different site, specify the different site name.
- In the **Filter** field, select one of the following options:
  - All lists:** Retrieve details of all the lists in your SharePoint site.
  - ID:** Specify the list ID to retrieve details of this specific list.
  - Name:** Specify a list name to retrieve details of this specific list.
- In the **Session** field, select one of the following options:
  - Session name:** The name you provided for the session during authentication.
  - Variable:** Select a variable which contains the session name.

- In the **Matched records** field, select a variable to store the list details.

The specified list details are retrieved and stored in the variable.

**Note:** The output is retrieved as a list of type `Folder`. To read an individual record (row) in this list, you need to loop through all the dictionary items using the `Loop` action and read or extract the records (rows) individually. For example, if the list is stored in the variable `list_FolderDetails` and it contains five records, then each record is passed to the `Loop` action to be processed one at a time. The loop reads the Name, URL, last modified time and Unique Id of each

folder.

## SharePoint update list action

Use the **Update list** action to update a list name in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

- From the **Actions** pane, select **SharePoint > List and list items > Update list** and place it in the canvas.
- In the **Site** field, select one of the following options:
  - Default site:** The site name used during authentication is considered the default site.
  - Other site:** If you want to choose a different site, specify the different site name.
- In the **Current list name** field, specify the existing name for the list.
- In the **New list name** field, specify a new name for the list.
- In the **Description** field, add a description for the list.
- In the **Session** field, select one of the following options:
  - Session name:** The name you provided for the session during authentication.
  - Variable:** Select a variable which contains the session name.

The list is updated with the specified new name.

## SharePoint create list item action

Use the **Create list item** action to create a list item within a list in your SharePoint site.

- Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

- You must create a list in your SharePoint site. For more details, see [SharePoint create list action](#) on page 3248.
- From the **Actions** pane, select **SharePoint > List and list items > Create list item** and place it in the canvas.

- In the **Site** field, select one of the following options:
  - Default site:** The site name used during authentication is considered the default site.
  - Other site:** If you want to choose a different site, specify the different site name.
- In the **List name/List Id** field, specify a list name or list ID. If you have used SharePoint discovery to connect and select a list, the list name is automatically displayed. You must manually input the list ID or pick a variable that contains the list ID.
- In the **Columns** field, click **Add entry** to manually add the column name and value pairs to create a list item. If you used SharePoint discovery to connect and select a list, then the list items are automatically populated.
- In the **Session** field, select one of the following options:
  - Session name:** The name you provided for the session during authentication.
  - Variable:** Select a variable which contains the session name.
- In the **List item ID** field, select a variable to store the list item ID after the list item is created.

The list item is successfully created in the specified SharePoint list.

## SharePoint delete list item action

Use the **Delete list item** action to delete a list item from a list in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > List and list item > Delete list item** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify the list name.
4. In the **List item ID** field, specify the ID of the list item.
5. In the **Delete image** field, select if an image that is attached to the list item must be deleted or not.
6. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The specified list item is deleted.

## SharePoint get list item action

Use the **Get list item** action to retrieve the list item details from a list in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > List and list items > Get list item** and place it in the canvas.

**SharePoint: Get list item(s)**

2. In the **Site** field, select one of the following options:

- **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify the list name.
  4. In the **Filter** field, choose one of the following options:
    - **All list items:** Retrieve details of all the list items in the SharePoint list.
    - **List item ID:** Specify the list item ID to retrieve details of this specific list item.
    - **List item title:** Specify a list item title to retrieve details of this specific list item that contains the title.
  5. In the **Download image(s)** field, select one of the following options:
    - **No:** Select this option if you do not want to download the image attached to the list item.
    - **Yes:** Select this option and specify a destination folder path to download the image attached to the list item.
  6. In the **Session** field, select one of the following options:
    - **Session name:** The name you provided for the session during authentication.
    - **Variable:** Select a variable which contains the session name.
  7. In the **Matched records** field, select a variable to store the list item details.

The specified list item details are retrieved and stored in the variable.

**Note:** The output is retrieved as a list of type . To read an individual record (row) in this list, you need to loop through all the dictionary items using the action and read or extract the records (rows) individually. For example, the output of get multiple records is saved in the variable list\_of\_records\_any. If the variable contains five records, then each record is passed to the Loop action to be processed one at a

The screenshot shows an automation workflow with the following steps:

1. ServiceNow: Authentication Start a "Default" session on \$PDI\_url\$
2. ServiceNow: Get Multiple Records Get a list of "incident" records using filter type (N
3. Loop : For each item in the list
4. Dictionary: Get value of the key "number" from \$ListItem\$
5. Dictionary: Get value of the key "severity" from \$ListItem\$
6. Dictionary: Get value of the key "short\_description" from \$ListItem\$
7. Message box "Record: \$O\_inc\_number\$, \$O\_severity\$, \$O\_descri
8. ServiceNow: Revoke Authentication End the "Default" session

An orange arrow points from the "Get Multiple Records" step to a "View variable" window. The window displays the following details:

Type	Subtype

- In the **Site** field, select one of the following options:
  - Default site:** The site name used during authentication is considered the default site.
  - Other site:** If you want to choose a different site, specify the different site name.
- In the **List name** field, specify a list name. If you have used SharePoint discovery assistant to connect and select a list, the list name is automatically displayed.
- In the **List item ID** field, specify a list item ID or select a variable that contains the list item ID.

---

**Note:** You can update only one list item at a time. Even if you use the SharePoint discovery assistant to populate the list items in the table, you must provide the individual list item ID to update the values.

- In the **Columns** field, click **Add entry** to manually add the column name and value pairs to create a list item. If you have used SharePoint discovery assistant to connect and select a list, then the list items are automatically populated.
- In the **Session** field, select one of the following options:
  - Session name:** The name you provided for the session during authentication.

- **Variable:** Select a variable which contains the session name.

The list item is successfully updated with the values in the specified SharePoint list.

## SharePoint upload list image action

Use the **Upload list image** action to upload an image file to a list item in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

**Note:** The maximum allowable size for list images is 250 MB.

1. From the **Actions** pane, select **SharePoint > List and list items > Upload list image** and place it in the canvas.

### SharePoint: Upload list image

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify a list name or select a variable that contains the list name.
4. In the **List item ID** field, specify a list item ID or select a variable that contains the list item ID.
5. In the **Image file** field, select one of the following options:
  - **Control Room file:** Choose an image file that is available in the Control Room.
  - **Desktop file:** Browse and select an image file from your local system.
  - **Variable:** Insert a variable that contains the image file path.
6. In the **Column name** field, specify the column name where the image must be uploaded. Or, select a variable that contains the column name.

---

**Note:** You must upload an image only in the **Image** column type. The **Column name** is the name you have defined while creating the column.

---

7. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The list image is successfully uploaded to the specified column in your SharePoint list.

## SharePoint delete list attachment action

Use the **Delete list attachment** action to delete an attachment from a list item in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > List and list items > Delete list attachment** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify a list name or select a variable that contains the list name.
4. In the **List item ID** field, specify a list item ID or select a variable that contains the list item ID.
5. In the **Attachment name** field, specify the attachment name or select a variable that contains the attachment name.
6. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The attachment is successfully deleted from the specified list in your SharePoint site.

## SharePoint download list attachment action

Use the **Download list attachment** action to download an attachment from a list item in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

1. From the **Actions** pane, select **SharePoint > List and list items > Download list attachment** and place it in the canvas.
2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify a list name or select a variable that contains the list name.
4. In the **List item ID** field, specify a list item ID or select a variable that contains the list item ID.
5. In the **Destination folder** field, specify the folder path where you want to download the attachment.
6. In the **Session** field, select one of the following options:
  - **Session name:** The name you provided for the session during authentication.
  - **Variable:** Select a variable which contains the session name.

The attachment is successfully downloaded from the specified list in your SharePoint site.

## SharePoint upload list attachment action

Use the **Upload list attachment** action to upload an attachment to a list item in your SharePoint site.

Ensure that you are authenticated before initiating any SharePoint action. For more details, see [SharePoint authenticate action](#) on page 3232.

---

**Note:** The maximum uploadable attachment size is 250 MB.

---

1. From the **Actions** pane, select **SharePoint > List and list items > Upload list attachment** and place it in the canvas.

## SharePoint: Upload list attachment

2. In the **Site** field, select one of the following options:
  - **Default site:** The site name used during authentication is considered the default site.
  - **Other site:** If you want to choose a different site, specify the different site name.
3. In the **List name** field, specify a list name or select a variable that contains the list name.
4. In the **List item ID** field, specify a list item ID or select a variable that contains the list item ID.
5. In the **Attachment file** field, select one of the following options:
  - **Control Room file:** Choose an attachment file that is available in the Control Room.
  - **Desktop file:** Browse and select an attachment file from your local system.
  - **Variable:** Insert a variable that contains the attachment file path.

6. In the **Session** field, select one of the following options:
- **Session name**: The name you provided for the session during authentication.
  - **Variable**: Select a variable which contains the session name.

The attachment is successfully uploaded to the specified list in your SharePoint list.

## Simulate keystrokes package

Use the Simulate keystrokes package to simulate keystrokes in Chinese (simplified and traditional), English, French, German, Japanese, Korean, Italian, or Spanish characters.

### Automation 360 extension setting

If the bot execution takes longer when you use the Simulate keystrokes package to simulate keystrokes in a static page running on the Google Chrome or Microsoft Edge browser, then follow these steps to enable the setting in the Automation 360 extension:

- Click the extensions icon at the top right corner of the browser window.
- Click the vertical ellipses next to the plugin and select **Manage extension**.
- Enable the **Allow access to file URLs** option.
- Restart the browser and run the .

### Action in the Simulate keystrokes package

The Simulate keystrokes package includes the following action:

Action	Description
Keystrokes	See <a href="#">Using Keystrokes action</a> on page 3263.

#### Related tasks

[Build a basic bot that uses a desktop application](#) on page 3393

Build a bot that uses a conditional statement to verify that the calculator is open, then uses the calculator to multiply two numbers. This example uses actions from the Application, If, Simulate keystrokes, Message Box, and Window packages.

#### Related reference

[Simulate keystrokes package updates](#) on page 1046

Review the updates in released versions of the Simulate keystrokes package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using Keystrokes action

Use the **Keystrokes** action to simulate keystrokes.

Follow these steps to add a **Keystrokes** action:

1. In the Actions palette, double-click or drag the **Keystrokes** action from the **Keystrokes** package.
2. Specify the window in which to capture an object.  
Choose from the **Application**, **Browser**, or **Variable** tab.

Option	Description
Application	Select from a list of currently active windows. This option shows a list of all the application and browser windows that are open on the Bot Creator device.
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers. For all other browsers, use the <b>Application</b> option.
Variable	Select an existing window variable to specify the title of the application window title.

Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `- Notepad`, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

3. Optional: Select the **Resize window** option to specify the window dimensions.
-

This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, which enhances the ability of the bot to identify the target object.

- If the window is maximized when you record the task, this option is not selected.
- If the window is not at the maximum size when you record the task, this option is selected, by default, and the width and height fields are automatically filled with the dimensions of the window.

---

**Note:** This option is available only for windows that can be resized. It is not available for the **Desktop** or **Taskbar** options.

---

4. In the **Keystrokes**, select a radio button:

- **Enter keystrokes here or use the on-screen keyboard:** Type or use the keyboard to enter keystrokes.
- **Select a credential:** Uses a password stored in the Credential Vault.

---

**Note:** A new key named **Return** has been added to the virtual keyboard to replace the Enter functionality and the Enter key in the Number pad has been renamed to **Num Enter**. As a result, the Return key is the main Enter key on the keyboard.

---

5. Optional: : In the **Delay between each keystroke in ms** field, the delay time.

---

**Note:** The default is set to 10 milliseconds.

---

6. Click **Save**.

## SNMP package

The SNMP package allows you to automate network management tasks, such as retrieving and modifying data, and sending notification messages.

Simple Network Management Protocol (SNMP) is used to find the network management component on one or more computers and the managed component on multiple network devices.

The Automation Anywhere SNMP action offers powerful network management. Using this action, users can easily monitor network devices configured with SNMP agent software. Network devices such as servers, workstations, printers, routers, bridges, and hubs, as well as services such as Dynamic Host Configuration Protocol (DHCP) or Windows Internet Name Service (WINS) can be monitored.

### Actions in the SNMP package

The SNMP package includes the following actions:

Action	Description
Get	See <a href="#">Get action</a> on page 3266
Get next	See <a href="#">Get next action</a> on page 3268
Send trap	See <a href="#">Send trap action</a> on page 3270

Action	Description
Set	See <a href="#">Set action</a> on page 3272
Walk	See <a href="#">Set action</a> on page 3272

Related reference

## Get action

Use the **Get** action in the [SNMP](#) package to retrieve data of an object that is managed by SNMP agent.

1. In the [Actions](#) palette, double-click or drag the **Get** action from the [SNMP](#) package.
2. In the **Agent** field, enter details of the device on which the SNMP agent is available.
3. Click the **SNMP Version** drop-down menu to select one of the following options to specify the SNMP version that must be used:

Option	Action
V1	Specify the community string you want to use in the <b>Community</b> field.
V2C	Specify the community string you want to use in the <b>Community</b> field.

Option	Action
V3	<p>Specify the community string you want to use in the <b>Community</b> field.</p> <p>Click the <b>Authentication level</b> drop-down menu to specify one of the following level of authentication:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Authentication will not be used.</li> <li>• <b>Authentication Only</b>: Enables you to use authentication only. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> <li>• <b>Authentication and privacy</b>: Enables you to use authentication and privacy. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> <li>c) Click <b>Privacy method</b> drop-down menu and select <b>DES</b> or <b>AES</b> to specify the privacy method you want to use.</li> <li>d) In the <b>Private key</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> </ul>

4. In the **Object ID** field, specify the ID of the object for which you want to retrieve details.
5. Use the **Data type** field to select one of the following options to specify the format in which you want to retrieve details of the object:
  - **ASCII**
  - **Hex**
6. Click the **SNMP advanced options** drop-down menu and enter the values in the following fields:
  - **Timeout(ms)**: Specify the time (in milliseconds) for the action to wait before generating an error.
  - **Remote port**: Specify the port number of the remote device.
  - **Retries**: Specify the maximum number of times the action must try to retrieve the details.
7. In the **Log file** field, click one of the following tabs:
  - **Control Room file**: To select a file that is available on the Control Room to store the result.  
Click **Choose** to select a file.
  - **Desktop file**: To select a file that is available on a device to store the result.  
Click **Browse** to locate and select a file.
  - **Variable**: To select a variable by specifying the file location that you want to use to store the result.
8. Select a string variable from the **Assigned to** list.
9. Click **Save**.

## Get next action

Use the **Get next** action in the SNMP package to retrieve data of the next object that is managed by an SNMP agent.

1. In the **Actions** palette, double-click or drag the **Get next** action from the SNMP package.
2. In the **Agent** field, enter details of the device on which the SNMP agent is available.
3. Click the **SNMP Version** drop-down menu to select one of the following options to specify the SNMP version that must be used:

Option	Action
V1	Specify the community string you want to use in the <b>Community</b> field.
V2C	Specify the community string you want to use in the <b>Community</b> field.

Option	Action
V3	<p>Specify the community string you want to use in the <b>Community</b> field.</p> <p>Click the <b>Authentication level</b> drop-down menu to specify one of the following level of authentication:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Authentication will not be used.</li> <li>• <b>Authentication Only</b>: Enables you to use authentication only. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> <li>• <b>Authentication and privacy</b>: Enables you to use authentication and privacy. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> <li>c) Click <b>Privacy method</b> drop-down menu and select <b>DES</b> or <b>AES</b> to specify the privacy method you want to use.</li> <li>d) In the <b>Private key</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> </ul>

4. In the **Object ID** field, specify the ID of the object for which you want to retrieve details.
5. Use the **Data type** field to select one of the following options to specify the format in which you want to retrieve details of the object:
  - **ASCII**
  - **Hex**
6. Click the **SNMP advanced options** drop-down menu and enter the values in the following fields:
  - **Timeout(ms)**: Specify the time (in milliseconds) for the action to wait before generating an error.
  - **Remote port**: Specify the port number of the remote device.
  - **Retries**: Specify the maximum number of times the action must try to retrieve the details.
7. In the **Log file** field, click one of the following tabs:
  - **Control Room file**: To select a file that is available on the Control Room to store the result.  
Click **Choose** to select a file.
  - **Desktop file**: To select a file that is available on a device to store the result.  
Click **Browse** to locate and select a file.
  - **Variable**: To select a variable by specifying the file location that you want to use to store the result.
8. Select a string variable from the **Assigned to** list.
9. Click **Save**.

## Send trap action

Use the **Send trap** action in the SNMP package to send messages to the SNMP manager from an SNMP agent. These messages are sent by an SNMP agent whenever certain events occur, such as a system restart.

1. In the **Actions** palette, double-click or drag the **Send trap** action from the SNMP package.
2. In the **Agent** field, enter details of the device on which the SNMP agent is available.
3. Click the **SNMP Version** drop-down menu to select one of the following options to specify the SNMP version that must be used:

Option	Action
V1	Specify the community string you want to use in the <b>Community</b> field.
V2C	Specify the community string you want to use in the <b>Community</b> field.

Option	Action
V3	<p>Specify the community string you want to use in the <b>Community</b> field.</p> <p>Click the <b>Authentication level</b> drop-down menu to specify one of the following level of authentication:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Authentication will not be used.</li> <li>• <b>Authentication Only</b>: Enables you to use authentication only. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> <li>• <b>Authentication and privacy</b>: Enables you to use authentication and privacy. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> <li>c) Click <b>Privacy method</b> drop-down menu and select <b>DES</b> or <b>AES</b> to specify the privacy method you want to use.</li> <li>d) In the <b>Private key</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> </ul>

4. In the **Object ID** field, specify the ID of the object for which you want to retrieve details.
5. Optional: In the **Authorative ID** field, specify the ID of the SNMP manager that will receive the notification.

---

**Important:** If you have selected **V3** from the **SNMP Version** list, you must provide a value for **Authorative ID**.

---

6. Select an option from the **Select trap type** list to specify the type of trap you want to send.
  - **Cold start:** Occurs when the SNMP agent initializes its configuration tables.
  - **Warm start:** Occurs when the SNMP agent reinitializes its configuration tables.
  - **Link down:** Occurs when the state of a network adapter on the SNMP agent changes from up to down.
  - **Link up:** Occurs when the state of a network adapter on the SNMP agent changes from down to up.
  - **Authentication fail:** Occurs when the SNMP agent receives a message from an SNMP manager with an invalid community name.
  - **EGP neighbour loss:** Occurs when the SNMP agent cannot communicate with its Exterior Gateway Protocol (EGP) peer.
  - **Enterprise specific:** Occurs when specific error conditions and error codes are defined in the system. The user provides a trap-specific number for this option.
7. Click the **SNMP advanced options** drop-down menu and enter the values in the following fields:
  - **Timeout(ms):** Specify the time (in milliseconds) for the action to wait before generating an error.
  - **Remote port:** Specify the port number of the remote device.
  - **Retries:** Specify the maximum number of times the action must try to retrieve the details.
8. In the **Log file** field, click one of the following tabs:
  - **Control Room file:** To select a file that is available on the Control Room to store the result.  
Click **Choose** to select a file.
  - **Desktop file:** To select a file that is available on a device to store the result.  
Click **Browse** to locate and select a file.
  - **Variable:** To select a variable by specifying the file location that you want to use to store the result.
9. Click **Save**.

## Set action

Use the **Set** action in the SNMP package to set a value for an object managed by the SNMP agent.

1. In the **Actions** palette, double-click or drag the **Set** action from the SNMP package.
2. In the **Agent** field, enter details of the device on which the SNMP agent is available.
3. Click the **SNMP Version** drop-down menu to select one of the following options to specify the SNMP version that must be used:

Option	Action
V1	Specify the community string you want to use in the <b>Community</b> field.
V2C	Specify the community string you want to use in the <b>Community</b> field.

Option	Action
V3	<p>Specify the community string you want to use in the <b>Community</b> field.</p> <p>Click the <b>Authentication level</b> drop-down menu to specify one of the following level of authentication:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Authentication will not be used.</li> <li>• <b>Authentication Only</b>: Enables you to use authentication only.                             <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs:                                     <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> <li>• <b>Authentication and privacy</b>: Enables you to use authentication and privacy.                             <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs:                                     <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> <li>c) Click <b>Privacy method</b> drop-down menu and select <b>DES</b> or <b>AES</b> to specify the privacy method you want to use.</li> <li>d) In the <b>Private key</b> field, click one of the following tabs:                                     <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> </ul>

4. In the **Object ID** field, specify the ID of the object for which you want to retrieve details.
5. From the **Value type** list, select an option to specify the value you want to set.
  - **OctetString**
  - **Integer**
  - **Gauge**
  - **TimeTicks**
  - **IP**
  - **ObjectID**
  - **OctetByteString**
  - **OctetDecimalByteString**
  - **NULL**
6. In the **Set value** field, specify the value you want to set.
7. Click the **SNMP advanced options** drop-down menu and enter the values in the following fields:
  - **Timeout(ms)**: Specify the time (in milliseconds) for the action to wait before generating an error.
  - **Remote port**: Specify the port number of the remote device.
  - **Retries**: Specify the maximum number of times the action must try to retrieve the details.
8. In the **Log file** field, click one of the following tabs:
  - **Control Room file**: To select a file that is available on the Control Room to store the result.  
Click **Choose** to select a file.
  - **Desktop file**: To select a file that is available on a device to store the result.  
Click **Browse** to locate and select a file.
  - **Variable**: To select a variable by specifying the file location that you want to use to store the result.
9. Click **Save**.

## Walk action

Use the **Walk** action in the SNMP package to set up a collection of information about all the devices available on all the connected nodes or subtree.

1. In the **Actions** palette, double-click or drag the **Walk** action from the SNMP package.
2. In the **Agent** field, enter details of the device on which the SNMP agent is available.
3. Click the **SNMP Version** drop-down menu to select one of the following options to specify the SNMP version that must be used:

Option	Action
V1	Specify the community string you want to use in the <b>Community</b> field.
V2C	Specify the community string you want to use in the <b>Community</b> field.

Option	Action
V3	<p>Specify the community string you want to use in the <b>Community</b> field.</p> <p>Click the <b>Authentication level</b> drop-down menu to specify one of the following level of authentication:</p> <ul style="list-style-type: none"> <li>• <b>None</b>: Authentication will not be used.</li> <li>• <b>Authentication Only</b>: Enables you to use authentication only. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> <li>• <b>Authentication and privacy</b>: Enables you to use authentication and privacy. <ul style="list-style-type: none"> <li>a) Select <b>MD5</b> or <b>SHA</b> from the <b>Authentication method</b> list to specify the authentication method you want to use.</li> <li>b) In the <b>Password</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> <li>c) Click <b>Privacy method</b> drop-down menu and select <b>DES</b> or <b>AES</b> to specify the privacy method you want to use.</li> <li>d) In the <b>Private key</b> field, click one of the following tabs: <ul style="list-style-type: none"> <li>• <b>Credential</b>: To use a value from the Credential Vault. (Optional) Click <b>Pick</b> to choose a credential.</li> <li>• <b>Variable</b>: To use a credential variable.</li> <li>• <b>Insecure string</b>: To manually specify the value you want to use.</li> </ul> </li> </ul> </li> </ul>

4. In the **Object ID** field, specify the ID of the object for which you want to retrieve details.
5. Use the **Data type** field to select one of the following options to specify the format in which you want to retrieve details of the object:
  - **ASCII**
  - **Hex**
6. In the **Walk type** section, select an option to specify the scope from which to collect information.
  - **All**: Displays the variables that are equal to the specified OID for the given tree type structure.
  - **Within**: All variables in the sub-tree below the given OID are queried.
7. Click the **SNMP advanced options** drop-down menu and enter the values in the following fields:
  - **Timeout(ms)**: Specify the time (in milliseconds) for the action to wait before generating an error.
  - **Remote port**: Specify the port number of the remote device.
  - **Retries**: Specify the maximum number of times the action must try to retrieve the details.
8. In the **Log file** field, click one of the following tabs:
  - **Control Room file**: To select a file that is available on the Control Room to store the result.  
Click **Choose** to select a file.
  - **Desktop file**: To select a file that is available on a device to store the result.  
Click **Browse** to locate and select a file.
  - **Variable**: To select a variable by specifying the file location that you want to use to store the result.
9. Select a string variable from the **Assigned to** list.
10. Click **Save**.

## SOAP Web Service package

Use the **SOAP web service** action from the SOAP Web Service package to access and exchange information between two systems in XML format.

With SOAP Web Service, you can perform these actions:

- Consume SOAP web services written to provide structured data for further business processing, such as currency conversion, weather reports, and language translation.
- Connect to different existing applications and different platforms, irrespective of any underlying infrastructure requirements.

The SOAP Web Service establishes complete interoperability between clients or applications and the internet, supporting XML-based open standards, such as Web Services Description Language (WSDL), Simple Object Access Protocol (SOAP), and Universal Description Discovery and Integration (UDDI).

**Note:** Windows Authentication is currently not supported for SOAP Web Service package in Automation 360.

---

## Passing values securely

You can securely pass values from the Credential Vault to the web service by specifying the locker, credential, and attribute in the following supported action fields:

- Custom headers
- Operation parameters
- Raw data: You must select a Credential Vault value that contains the entire parameter as the value.

## Proxy support

If your device is configured with a proxy, all outbound requests from this package are routed through the proxy server. See [Connect Bot Agent to a device with a proxy](#) on page 1455.

---

**Note:** For an example task about using the SOAP Web Service action, see [Example of using the SOAP web service action](#) on page 3433.

---

### Related tasks

[Example of building a bot that uses credential variables](#) on page 2500

Securely pass values to a bot using credential variables to automate the process of logging in to a bank website.

### Related reference

[Credentials and credential variables in the Bot editor](#) on page 2496

Use credentials when building bots to pass sensitive information such as passwords and account numbers. Using credentials separates the sensitive information from the bots and Bot Runners, which reduces the risk of data spillage or unauthorized user access.

[SOAP Web Services package updates](#) on page 1049

Review the updates in released versions of packages such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Step package

The `Step` package groups various actions together and runs them in a specific order. You can provide a relevant name for a step to identify the operation performed by the actions included in that step.

## Action in the Step package

The `Step` package includes the following action:

Action	Description
Step	<p>Runs a sequence of actions.</p> <ul style="list-style-type: none"> <li>Creates a container for actions without impacting the bot run.</li> <li>Configures actions within the Step action.</li> <li>Runs the arranged actions in a sequential order.</li> <li>Groups various actions for better management.</li> <li>Optional: In the <b>Title</b> field, specify the title.</li> </ul>

**Note:**

- To download an individual package (updated in an Automation 360 release where you want only the package), use this URL:  
<https://aai-artifacts.my.automationanywhere.digital/packages/<package-file-name>-<version.number>.jar>
- For Step package, the naming convention is: `bot-command-step-<version.number>.jar`  
For example, `bot-command-step-2.5.0-20230105-135537.jar`

For detailed steps on downloading a package and manually adding it to the Control Room, see [Add packages to the Control Room](#) on page 2026.

## String package

Use the String package to perform various operations such as comparing two strings, retrieving the string length, or converting a string to uppercase or lowercase.

### Actions in the String package

The String package includes the following actions:

Action	Description
Assign	<a href="#">Assign action</a> on page 3280
Extract text	<a href="#">Using Extract text action of String package</a> on page 3282
Compare	<a href="#">Compare action</a> on page 3285
Evaluate variable	<a href="#">Evaluate variable action</a> on page 3285
Find	<a href="#">Using Find action of String package</a> on page 3286
Length	<a href="#">Length action</a> on page 3287
Lowercase	<a href="#">Lowercase action</a> on page 3287

Action	Description
Generate random string	<a href="#">Generate random string action</a> on page 3288
Replace	<a href="#">Using Replace action</a> on page 3288
Reverse	<a href="#">Reverse action</a> on page 3289
Split	<a href="#">Using Split action</a> on page 3289
Substring	<a href="#">Substring action</a> on page 3292
To boolean	<a href="#">To boolean action</a> on page 3294
To locale number	<a href="#">To locale number action</a> on page 3294
To number	<a href="#">To number action</a> on page 3295
Trim	<a href="#">Trim action</a> on page 3297
Uppercase	<a href="#">Uppercase action</a> on page 3297

#### Related tasks

[Using Extract text action of String package](#) on page 3282

Use the **Extract text** action to extract a range of text using logical operators from the source string.

[Using Find action of String package](#) on page 3286

Use the **Find** action to find a substring within the specified string.

[Using Replace action](#) on page 3288

Use the **Replace** action to find a piece of text from the source string and replace it with another text.

[Using Split action](#) on page 3289

Use the **Split** action to split the specified string into multiple strings and store the output in a list variable.

#### Related reference

[String package updates](#) on page 1051

Review the updates in released versions of the String package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Assign action

The **Assign** action in the `String` package enables you to assign or concatenate strings.

### Settings

- Optional: In the **Select the source string variable(s)/value** field, specify the variable or values. This field holds up to 65535 alphanumeric, character, and empty values.

**Note:**

- To provide a string that includes a dollar sign (\$), you must enter two dollar signs. For example, if you enter `Pay $$5.00`, the output will be `Pay $5.00`.
- The values or variables that you can specify for the String package are predefined. See [Predefined variables](#) on page 2479

- In the **Select the destination string variable** field, specify the variable.

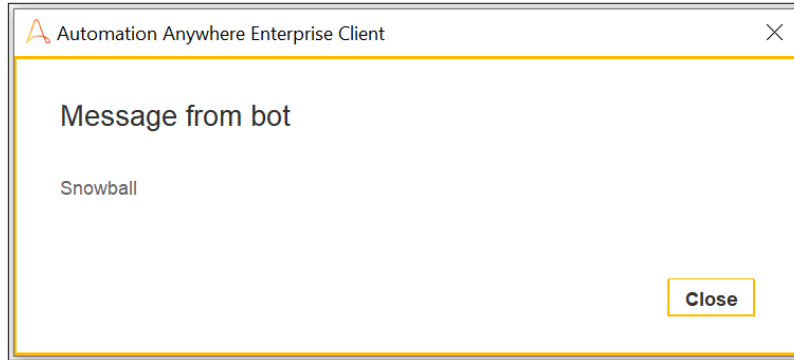

**Example**

Create a sample bot and perform the following steps to concatenate two strings:

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name: `String_assign`.
  - d) Click **Create and Edit**.
2. Create the user-defined variables using the **Create variable (+)** icon at the top of the **Variables** menu.
  - a) Create a variables of String to hold the values.
  - b) In the Edit variable window, enter the **Name**, select the **Type** and enter the following values:

Name	Type	Value
var1	String	Snow
var2	String	ball

3. To concatenate two strings, from the **Actions** pane, double-click or drag the **String > Assign** action.
  - a) In the **Select the source string variable(s)/ value (optional)** field, select `$var1$$var2$`.
  - b) In the **Select the destination string variable** field, click the **Create variable** icon to create a variable.
  - c) On the **Create variable** window, enter `vassign` in the **Name** field.
  - d) Click **Create and select**.
4. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter `$vassign$`.
5. Click **Save** and then **Run**.  
The bot concatenates two strings and displays the output as **Snowball**.

## Using Extract text action of String package

Use the **Extract text** action to extract a range of text using logical operators from the source string.

Review examples of using **Before**, **After**, and **Before and/or After** options in [Examples of using Extract text action](#) on page 3284.

To extract a substring from the specified source string, do the following:

1. In the **Actions** palette, double-click or drag the **Extract text** action from the **String** package.
2. In the **Source string** field, specify the source string.
3. Specify the text to extract by selecting from the following options:

Option	Steps
<b>Before</b>	<p>Extracts the entire text followed by the value that you have provided in the <b>Start after text</b> field.</p> <p><b>a)</b> In the <b>Start after text</b> field, enter a string to use as the starting point.</p> <p><b>b)</b> In the <b>Occurrence</b> field, enter a value to specify the number of occurrences.</p> <p>For example, if the source string is <code>This is a test string which is used to extract specific sub-string</code> and you want to extract the entire text after <code>This</code>. To extract the required text, you must enter <code>This</code> in the <b>Start after text</b> field and <code>1</code> in the <b>Occurrence</b> field. This indicates to the system to extract the text that is available after the first occurrence of <code>This</code> in the source string.</p>

Option	Steps
<b>Before and/or after</b>	<p>Extracts the text between the values provided in the <b>Start after text</b> and the <b>End before text</b> fields.</p> <p><b>a)</b> In the <b>Start after text</b> field, enter a string to use as the starting point.</p> <p><b>b)</b> In the <b>OR</b> or <b>AND</b> field, select one of the options:</p> <ul style="list-style-type: none"> <li>• <b>OR</b>: Select to extract text if either of the values specified in the <b>Start after text</b> or the <b>End before text</b> field are available in the source string.</li> <li>• <b>AND</b>: Select to extract text if both the values specified in the <b>Start after text</b> and the <b>End before text</b> fields are available in the source string.</li> </ul> <p><b>c)</b> In the <b>End before text</b> field, specify a string to use as the endpoint for extracting the text.</p> <p><b>d)</b> In the <b>Occurrence</b> field, enter a value to specify the number of occurrences of the string you have provided in the <b>End before text</b> field.</p> <p>For example, if the source string is <code>This is a test string which is used to extract specific substring and you want to extract the entire text before specific</code>. To extract the required text, you must enter <code>specific</code> in the <b>End before text</b> field and <code>1</code> in the <b>Occurrence</b> field. This indicates to the system to extract the text available before the first occurrence of <code>specific</code> in the source string.</p>
<b>After</b>	<p>Extracts the entire text preceding the value you have provided in the <b>End before text</b> field.</p> <p><b>a)</b> In the <b>End before text</b> field, specify a string to use as the endpoint for extracting the text.</p> <p><b>b)</b> In the <b>Occurrence</b> field, enter a value to specify the number of occurrences of the string you have provided in the <b>End before text</b> field.</p> <p>For example, if the source string is <code>This is a test string which is used to extract specific substring and you want to extract the entire text before specific</code>. To extract the required text, you must enter <code>specific</code> in the <b>End before text</b> field and <code>1</code> in the <b>Occurrence</b> field. This indicates to the system to extract the text available before the first occurrence of <code>specific</code> in the source string.</p>

4. In the **If no match found, return** field, select one of the options:
  - **Source String**: Return the source string.
  - **Empty (null) String**: Return the null string if no match is found.
5. In the **When extracting** field, select one of the following options:

- **Match case:** Matches the case of the text in the source string
- **Do not match case:** Does not match the case of the text in the source string

---

**Note:** By default, the **Match case** option is selected for all the new and existing bots.

---

6. In the **Number of characters to get** field, select one of the options:

- **All:** Extracts all characters from the source string.
- **Only:** Specify the exact number of characters to extract from the source string.
- **Up to:** Specify the maximum number of characters that you want to extract from the source string.

---

**Note:** This option enables you to provide a maximum limit of the characters that you want to extract. However, it is not mandatory that the source string contain the number of characters that you enter in this field.

---

For example, the source string has Date+8 as its value and you want to extract the characters after the string Date. You enter 10 in the **Up to** field, to extract 10 characters from the source string that appears after the string Date. When you run the bot, the output is +8 and it returns all the values after the string Date.

---

**Note:** The value 10 only depicts the maximum number of characters that you want to extract.

---

7. In the **Trim the extracted text (remove blank spaces)** check box, select to remove blank spaces from the extracted text.

For example, you extract an email from a website and then add it to an Excel sheet. To remove any unwanted spaces from this extracted email text, you can use the **Trim the extracted text (remove blank spaces)** option. Alternatively, you can use the [Trim action](#) on page 3297 to remove any space before and after this extracted email text.

8. In the **Remove Enter from the extracted text** check box, select to remove carriage returns from the extracted text.

9. In the **Assign the output to variable** list, specify the variable.

10. Click **Save**.

## Examples of using Extract text action

The **Extract text** action enables you to extract text from a source string. You can extract text that occurs in the range of 1 to 999999 times in a file before, after, or between two strings.

### Before option

This option enables you to extract the entire text followed by the value you have provided in the **Start after text** field. You can also extract the text based on the occurrence of the value you have provided in the field.

For example, a:123a:123b:123c: is the source string, you can specify : in the **Start after text** field and 2 in the **Occurrence** field to extract the string followed by the second occurrence of : in the source string. In this example, the extracted text is 123b:123c:.

## After option

This option enables you to extract the entire text preceding the value you have provided in the **End before text** field. You can also extract the text based on the occurrence of the value you have provided in the field.

---

**Note:** You can extract text that occurs more than 1000 times in a file and up to a maximum of 999999 times.

---

For example, `a:123a:123b:123c:` is the source string, you can specify `:` in the **End before text** field and 3 in the **Occurrence** field to extract the string preceding the third occurrence of `:` in the source string. In this example, the extracted text is `a:123a:123b`.

## Before and/or after option

This option enables you to extract the text between the values you have provided in the **Start after text** and the **End before text** fields. You can also apply the **AND** or **OR** logical operator. You can select the **AND** operator to extract text only when both conditions specified for the **Before** and **After** options are satisfied. Otherwise, you can select the **OR** operator to extract text only when either of the conditions specified for the **Before** or the **After** option is satisfied.

For example, `a:123a:123b:123c:` is the source string, you can specify `:` in the **Start after text** and **End before text** fields and 2 in the **Occurrence** fields to extract the string after the second and before the fourth occurrence of `:` in the source string. In this example, the extracted text is `123b:123c`.

## Compare action

The **Compare** action in the `String` package enables you to compare two strings.

### Settings

- In the **Source string** field, specify the source string.
- In the **Compare to string** field, specify the string that the source has to be compared with.
- In the **When comparing** field, select an option:
  - **Match case:** Matches capitalization.
  - **Do not match case:** Does not match capitalization.
- In the **Assign the output to variable** list, specify the Boolean variable.

## Evaluate variable action

Use the **Evaluate variable** action in the `String` package to compare the user-specified string variable with the string variables in the bot. If a match is found, the action returns the value of the matching variable.

## Settings

- Enter the string variable that you want to find.
  - In the **Assign the value to a variable** field, select a string variable to hold the returned value.
- 

### Note:

- Only user defined string variables without expressions are supported. Fields with expressions such as `$$SampleNumber.Number.toString$` or `$$SampleString.String.lowercase$` are not supported.
  - System string variables such as `$$System:AATaskName$` are not supported.
  - Variable data types other than string type are not supported. For example, `$$SampleNumber$` is not supported.
  - Case insensitive variable names are not supported.
- 

## Example

Assume you have a bot where you defined a string variable named `$$cityname$`. The value of the variable `$$cityname$` is set to `Paris`. You can now build a bot and use the **Evaluate variable** action to compare the variable that you create, with an already existing string variable in the bot. If a match is found, then the action returns the value of the matched variable.

1. Create a variable of type string whose value you want to evaluate and name it `var1`.
  2. In the Default value field, enter `$$cityname$`.
- 

**Note:** `$$cityname$` is the string variable that you have used in the bot.

---

3. Enter `$$var1$` in the **Variable expression** field.
4. On bot execution, the user specified string variable `$$var1$` now searches among the variables defined in the bot for the string variable `$$cityname$` and if the match is found then the action returns the output value of the matched variable `$$cityname$`, that is, `Paris`.

## Using Find action of String package

Use the **Find** action to find a substring within the specified string.

This action also enables you to perform a search based on a regular expression. A regular expression is a sequence of characters that define a search pattern. For example, to find all email addresses in the source string, specify the following as a regular expression: `\b[A-Z0-9._%~]+@[A-Z0-9.-]+\.[A-Z]{2,4}\b`.

---

**Note:** To search for strings that contain the dollar sign (\$), you must enter the sign twice. Otherwise, the bot interprets the dollar sign as a regular expression character.

---

To find a substring from the specified string, follow these steps:

1. In the **Actions** palette, double-click or drag the **Find** action from the **String** package.
  2. In the **Source string** field, specify the source string.
-

3. In the **Find string** field, specify the substring.
  4. In the **When finding** field, select one of the options:
    - **Match case:** Matches the case of the text.
    - **Do not match case:** Does not match the case of the text.
  5. In the **The "find string" is** field, select one of the options:
    - **A regular expression:** The substring is a regular expression
    - **Not a regular expression:** The substring is not a regular expression.
  6. Optional: In the **Start from** field, specify the starting point.  
For example, you want to replace `Red` in the source string with `B1ue` in a paragraph. `Red` is in 10 instances in the paragraph and you want to replace only the third occurrence. Enter 3 in the **Start from** field to identify the third occurrence.
- 
- Note:** If the specified substring is not found, then the output will return as **0**.
- 
7. In the **Assign the output to variable** list, specify the number variable.
  8. Click **Save**.

## Length action

The **Length** action in the String package enables you to retrieve the string length.

### Settings

- In the **Source string** field, specify the source string.
- In the **Assign the output to variable** list, specify the number variable.

## Lowercase action

The **Lowercase** action in the String package enables you to convert the source string to lowercase.

### Settings

- In the **Source string** field, specify the source string.
- In the **Assign the output to variable** list, specify the variable.

## Generate random string action

The **Generate random string** action in the String package enables you to generate a string of uppercase and lowercase alphanumeric characters and assign it to a string variable.

### Settings

- In the **String length** field, enter the number of characters in the generated string.

---

**Note:** The maximum number of characters is 300.

---

- In the **Enter the destination variable to assign the random string** field, specify the string variable.

## Using Replace action

Use the **Replace** action to find a piece of text from the source string and replace it with another text.

A regular expression is a sequence of characters that define a search pattern. For example, to find all email addresses in the source string, specify the following as a regular expression: `\b[A-Z0-9._%]+@[A-Z0-9.-]+\.[A-Z]{2,4}\b`.

---

### Note:

- The **Replace** action might not replace the Carriage Return and Line Feed (CRLF) characters in a string when you use the Enter variable. To ensure that the characters are replaced, instead of the Enter variable, use the Newline variable.
- When you use the \$ character in your regular expression pattern, the regular expression field might show an error as \$ is considered as the start of a variable specification. Hence, we recommend you use \$\$ instead.

---

To replace text from the specified string, follow these steps:

1. In the Actions palette, double-click or drag the **Replace** action from the **String** package.
2. In the **Source string** field, specify the source string.
3. In the **Find string** field, specify the substring.
4. In the **When finding** field, select one of the options:
  - **Match case:** Matches the case of the text.
  - **Do not match case:** Does not match the case of the text.
5. In the **The "find string" is** field, select one of the options:
  - **A regular expression:** The substring is a regular expression
  - **Not a regular expression:** The substring is not a regular expression.
6. Optional: In the **Start from** field, specify the starting position.

The action then starts from the value you specify in this field. For example, if you specify 5 in the **Start from** field for the source string "Big blue ocean", when the bot runs, the action ignores the four preceding characters ("Big", including the space character) and searches for the substring in "blue ocean".

- Optional: In the **Count** field, specify the number of times the found string must be replaced. For example, in the source string "Big blue ocean, blue fish, blue sky", you want to replace the first two instances of "blue" with "green". Enter 2 in the **Count** field, 5 in the **Start from** field, and green in the **Replace with** field. When the bot runs, the action produces the output green ocean, green fish, blue sky.

---

**Note:** By default, the value in the **Count** field is set to -1, which means that all the instances of the found string will be replaced.

---

- In the **Replace with** field, specify the text to replace the string.
- In the **Assign the output to variable** list, specify the variable that will hold the new string.
- Click **Save**.

## Reverse action

The **Reverse** action in the String package enables you to reverse the source string.

### Settings

- In the **Source string** field, specify the source string.
- In the **Assign the output to variable** list, specify the variable.

## Using Split action

Use the **Split** action to split the specified string into multiple strings and store the output in a list variable.

To split a string into multiple strings, perform these steps:

- In the **Actions** palette, double-click or drag the **Split** action from the **String** package.
- In the **Source string** field, specify the source string.
- In the **Delimiter** field, specify the character to split the string.  
For example, comma (,), semicolon (;), pipe (|), slash (/ \), newline character (\n), or space.  
In the delimiter text box, the newline character is not accepted for the Enter key as a line break. In that case, you can either press **F2** and select **Enter - String** from String section or input the `$String:Enter$` variable.
- In the **Delimiter is** field, select one of the options:
  - Case sensitive:** The delimiter is case-sensitive.
  - Not case sensitive:** The delimiter is not case-sensitive.
- In the **Split into substrings** field, select one of the options:
  - All possible:** Splits the source string into as many substrings as possible.  
For example, if the original string is a,b,c,d, each character becomes a substring.
  - Only:** Limits the number of substrings.  
For example, if the original string is a,b,c,d, and you enter 3, the output is three strings: a, b, and c,d.

6. In the **Assign the output to list variable** field, specify the list variable.
7. Click **Save**.

## Example of using Split action

In this example, you will build a bot to read a CSV file, split a specified string into multiple strings.

## Prerequisites

Before you start building the bot, create a file in .CSV format using the data in the following table and save it as **String\_datatable.csv**

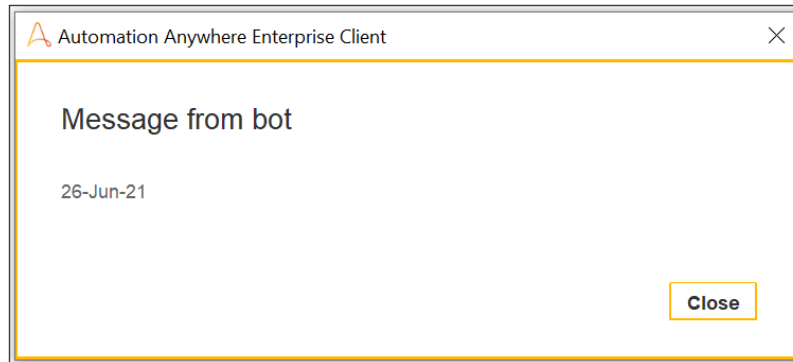

Name	Location	Joining date
Savio	Bangalore	26-Jun-21
Rene	Bangalore	15-Oct-21

## Procedure

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name: `String_split`.
  - d) Click **Create and Edit**.
2. Open and read data from the CSV file.
  - a) Double-click or drag the **Excel advanced > Open** action.
  - b) From the **File** option, in the **Desktop file** field, click **Browse** to select your file.
  - c) Select the **Sheet contains a header** checkbox.
  - d) Open the file in **Read-write** mode.
  - e) In the **Create Excel session** field, select **Local session**.
  - f) Double-click or drag the **Excel advanced > Read row** action.
  - g) From the **Cell option** tab, select **From specific cell** and enter C2 in the **Cell address** field.
  - h) From the **Read option** tab, select **Read visible text in cell** option.
  - i) In the **Session name** field, enter the session that you used to open the file.
  - j) In the **Assign value to the variable** field, click the **Create variable** icon to create a variable.
  - k) On the **Create variable** window, enter `list_outputdata` in the **Name** field.
  - l) Click **Create and select**.
  - m) Double-click or drag the **Excel advanced > Close** action to close the .txt file.

- n) In the **Session name** field, enter the session name that you used in the **Open** action to open the file.
3. To print the values of the specified row, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter `$list_outputdata[0]$`.

When you run the bot, the bot displays the string in row C2 as **26-**

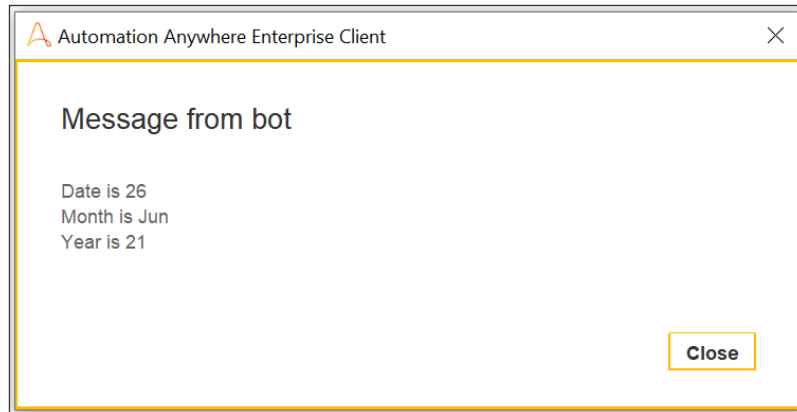

Jun-21.

4. To split the specified string into multiple strings, double-click or drag the **String > Split** action.
- In the **Source string** field, enter `$list_outputdata[0]$`
  - In the **Delimiter** field, enter `-`.
  - From the **Delimiter is** tab, select **Not case sensitive**.
  - From the **Split into substrings** tab, select **All possible**
  - In the **Assign value to the variable** field, click the **Create variable** icon to create a variable.
  - On the **Create variable** window, enter `substrings_split` in the **Name** field.
  - Click **Create and select**.
5. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter the following data:

```
Date is $substrings_split[0]$
Month is $substrings_split[1]$
Year is $substrings_split[2]$
```

6. Click **Save** and then **Run**.

The bot splits the specified string into multiple substrings and displays the output as follows:

## Substring action

The **Substring** action in the String package enables you to extract a substring from a string.

### Settings

- In the **Source string** field, specify the source string.
- In the **Start from** field, specify the starting point.
- In the **Length** field, specify the length.
- Select the **Return blank if the range is not found** option to have the output to show a blank value when the value in the **Start from** index field is greater than the source string.

---

**Note:** The index count starts from 1.

---

- In the **Assign the output to variable** list, specify the variable.

### Example

Before you start building a bot, create a file in .txt format and save it as `extract_substring.txt` in the `C:\Bot testing` folder. Open the `extract_substring.txt` file and enter the text: `Welcome to the Automation 360 platform` and save it.

Create a sample bot and perform the following steps to extract a substring from a source string:

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name: `String_assign`.
  - d) Click **Create and Edit**.
2. Open and read data from the .txt file.

- a) Double-click or drag the **CSV/TXT > Open** action.

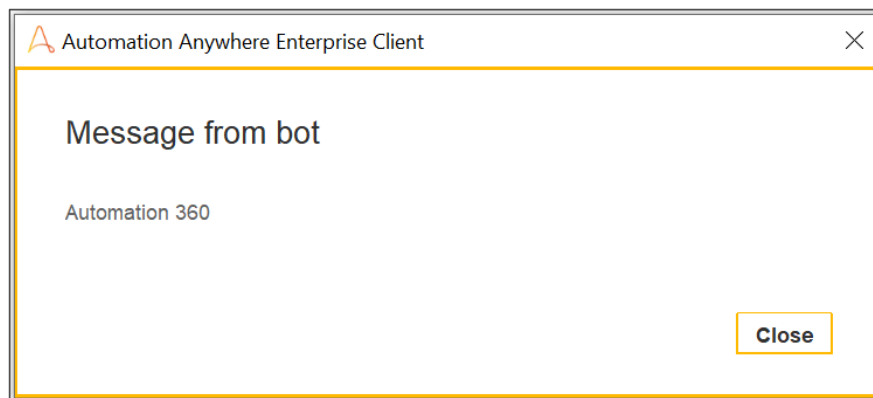

---

**Note:** The session name will be set to default.

---

- b) In the **File path** field, select the **Desktop file** option and click **Browse** to select your file.
  - c) In the **Delimiter** tab, select the **Comma** check box.
  - d) Double-click or drag the **CSV/TXT > Read** action.
  - e) In the **Assign value to the variable** field, click the **Create variable** icon to create a variable.
  - f) On the **Create variable** window, enter `table_data` in the **Name** field.
  - g) Click **Create and select**.
  - h) Double-click or drag the **CSV/TXT > Close** action to close the .txt file.
  - i) In the **Session name** field, enter the session name that you used in the **Open** action to open the file.
3. To extract a substring from the source string, double-click or drag the **String > Substring** action.
    - a) In the **Source string** field, select `$table_data[0][0]$`.
    - b) In the **Start from** field, enter 16.
    - c) In the **Length** field, enter 14.
    - d) In the **Assign the output to variable** field, click the **Create variable** icon to create a variable.
    - e) On the **Create variable** window, enter `substring_output` in the **Name** field.
    - f) Click **Create and select**.
  4. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter `$substring_output$`.
  5. Click **Save** and then **Run**.

The bot extracts the specific substring from the source string and displays the output as **Automation 360**.

## To boolean action

The **To boolean** action in the String package enables you to convert a string to a Boolean.

### Settings

- In the **Select string variable** variable field, specify the source string variable.
- In the **Select the boolean variable to store the result** field, specify the Boolean variable.

## To locale number action

The **To locale number** action in the String package enables you to convert a string to a locale-formatted number.

### Settings

- In the **Source value** field, specify the source string.
- Select any of the following tab to specify locale:
  - **Specify**: Manually specify the two letter ISO codes for the locale you want to use in the **Locale** field.
  - **Device**: Use the default locale configured for the device.
- In the **Save the outcome to a variable** list, specify the variable.

You can also use the action in an expression. For example, `$prompt-assignment.String:toLocaleNumber("en-US")$`.

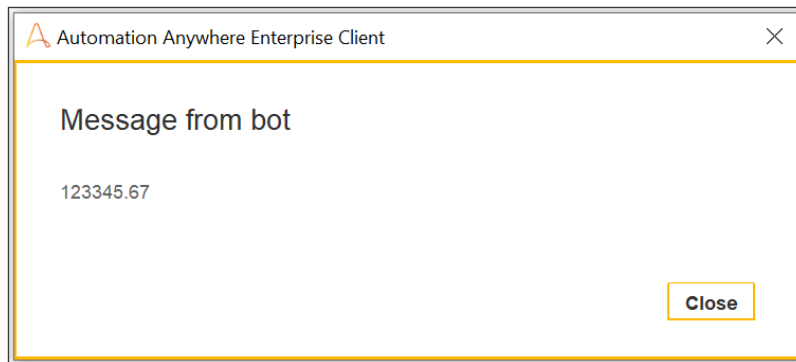

## Example

Create a sample bot and perform the following steps to convert a string to a locale-formatted number:

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name: `String_localenumber`.
  - d) Click **Create and Edit**.
2. To convert a string to a locale-formatted number, from the **Actions** pane, double-click or drag the **String > To locale number** action.
  - a) In the **Source value** field, enter `1,23,345.67`
  - b) Select the **Specify** option and enter `en-US` in the **Locale** field.

- c) In the **Save the outcome to a variable** field, click the **Create variable** icon to create a variable.
  - d) On the **Create variable** window, enter Num\_output in the **Name** field.
3. To convert the number to a string, from the **Actions** pane, double-click or drag the **Number > To string** action.
  - a) In the **Enter a number** field, select \$Num\_output\$ variable.
  - b) In the **Enter number of digits after decimal (number format)** field, enter 2.
  - c) In the **Assign the output to variable** field, click the **Create variable** icon to create a variable.
  - d) On the **Create variable** window, enter locale\_output in the **Name** field.
  - e) Click **Create and select**.
4. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter \$locale\_output\$.
5. Click **Save** and then **Run**.

The bot now displays the value as **123345.67**

## To number action

The **To number** action in the String package enables you to convert a string to a number.

### Settings

This action supports positive, negative, and decimal numbers.

---

**Note:** If the string contains commas, remove them by using the **Replace** action to replace each comma with an empty string.

---

- In the **Enter the string** field, specify the source string.
- In the **Assign the output to variable** field, specify the number variable.

## Example

Create a bot to convert a string to a decimal number.

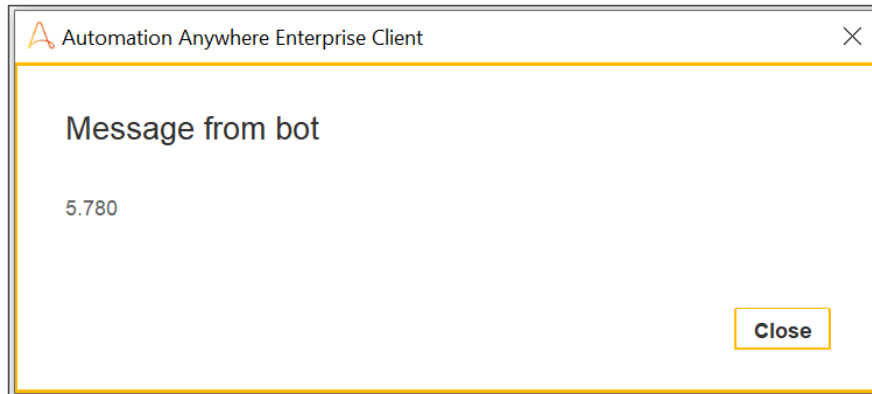

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name: `String_to_number`.
  - d) Click **Create and Edit**.
  
2. To assign the string to a variable, double-click or drag the **String > Assign** action.
  - a) In the **Select the source string variable(s)/value** field, select `5.78`.
  - b) In the **Select the source string variable(s)/ value (optional)** field, click the **Create variable** icon to create a variable.
  - c) On the **Create variable** window, enter `stringtest` in the **Name** field.
  - d) Click **Create and select**.
  
3. To convert string to a number, double-click or drag the **String > To number** action.
  - a) In the **Enter the string** field, select `$string_test$` variable.
  - b) In the **Assign the output to variable** field, click the **Create variable** icon to create a variable.
  - c) On the **Create variable** window, enter `numtest` in the **Name** field.
  - d) Click **Create and select**.
  
4. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter `$numtest.Number:toString$`.
5. Click **Save** and then **Run**.

You now observe that the bot truncates the values after the decimal points and displays the output as **5**. Hence, you must again convert this number value to a string value to generate an output that would include the value with the decimal point.
  
6. To convert the number to a string, from the **Actions** pane, double-click or drag the **Number > To string** action.
  - a) In the **Enter a number** field, select `$numtest$` variable.
  - b) In the **Enter number of digits after decimal (number format)** field, enter `3`.
  - c) In the **Assign the output to variable** field, click the **Create variable** icon to create a variable.
  - d) On the **Create variable** window, enter `numtostring_output` in the **Name** field.
  - e) Click **Create and select**.
  
7. To print the values, double-click or drag the **Message box** action. In the **Enter the message to display** field, enter `$numtostring_output$`.

- Click **Save** and then **Run**.

The bot now displays the value as **5.78**.

## Trim action

The **Trim** action in the String package enables you to trim blanks, whitespaces, tabs, and line breaks from a string.

### Settings

- In the **Source string** field, specify the source string.
- In **Trim from the beginning** and **Trim from the end**, select options.
- In the **Assign the output to variable** field, specify the variable.

## Uppercase action

The **Uppercase** action in the String package enables you to convert the source string to uppercase.

### Settings

- In the **Source string** field, specify the source string.
- In the **Assign the output to variable** list, specify the variable.

## Import string from text file (Legacy) action

**Note:** This action is no longer available for new bots. Instead, use the **Text file > Read Variables** action with enhanced capabilities. Existing bots using the legacy action will not be impacted and will continue to run.

See

- [Read variables action](#) on page 3328

- [Support and deprecation policy for packages](#) on page 1176 (for package lifecycle and deprecation policy)

## System package

Use the actions in the `System` package to automate locking, logging off, restarting, and shutting down the computer. Use these actions at the end of a task.

The `System` package includes the following actions:

**Note:** If you are on Automation 360 v.22 (Build 10526) or a later version, we recommend that you use the Automation 360 v.22 or a later `System` package version to run your bots seamlessly.

Action	Description
Lock computer	See <a href="#">Lock computer action</a> on page 3299.
Logoff	See <a href="#">Logoff action</a> on page 3299.
Restart	See <a href="#">Restart action</a> on page 3299.
Shutdown	See <a href="#">Shutdown action</a> on page 3299.
Get environment variable	See <a href="#">Get environment variable action</a> on page 3299.

Related tasks

[Using Log text to file action](#) on page 2973

The **Log text to file** action in the `Log To File` package enables you to create a log file with data about the events that occur when a Task Bot runs.

Related reference

[Application package](#) on page 2583

Use the `Open Program/File` action in the `Application` package to launch an application or a file. This action supports `.exe`, `.bat`, script files, or shortcut paths.

[System package updates](#) on page 1053

Review the updates in released versions of the System package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Lock computer action

The **Lock computer** action enables you to lock the local machine on which the bot is run.

## Logoff action

The **Logoff** action enables you to log off from the current user session of the local machine on which the bot is run.

## Restart action

The **Restart** action enables you to restart the local machine on which the bot is run.

## Shutdown action

The **Shutdown** action enables you to turn off the local machine on which the bot is run .

## Get environment variable action

The **Get environment variable** action enables you to get all the environment variables from the specified local machine and assign it to a variable.

## Settings

- (Optional) In the **Environment variable list** tab, click the drop-down menu and select one of the variables.

The following table lists the variable details:

Variable	Description	Example value
ALLUSERSPROFILE	Returns the path to the directory that contains resources and settings used by all system accounts.  <b>Note:</b> Use ProgramData for devices that run Windows Vista and later OS.	C:\ProgramData
APPDATA	Returns the file path to the application data directory. This directory contains the settings for applications shared across multiple devices.	C:\Users\ \<user> \AppData \Roaming

Variable	Description	Example value
COMPUTERNAME	Returns the device name without the domain.	AA-NY-FRANKSINATRA
CommonProgramFiles	Returns the file path to the Common Files directory.	C:\Program Files\Common Files
CommonProgramFiles(x86)	Returns the file path to the Common Files directory. <b>Note:</b> This is only available for devices that run 64-bit version.	C:\Program Files (x86)\Common Files
CommonProgramW6432	Returns the file path to the Common Files directory. <b>Note:</b> <ul style="list-style-type: none"> <li>This is only available for devices that run 64-bit version.</li> <li>Only use CommonProgramW6432 for devices that run Windows Vista and later OS</li> </ul>	C:\Program Files\Common Files
ComSpec	Returns the file path to the command processor	C:\Windows\system32\cmd.exe
DriverData	Returns the file path to the Driver Data directory.	C:\Windows\System32\Drivers\DriverData
HOMEDRIVE	Returns the home drive of the device.	C:
HOMEPath	Returns the homedir of the device without the system drive.	\Users\ <user&gt;< td=""> </user&gt;<>
LOCALAPPDATA	Returns the file path to the application data directory. This directory contains the settings for applications shared across multiple devices.	C:\Users\ <user&gt;\appdata\local< td=""> </user&gt;\appdata\local<>
LOGONSERVER	Returns the name of the group or domain to which the device is connected	\\SJC SRV BKP
NUMBER_OF_PROCESSORS	Returns the number of processors in the device.	4

Variable	Description	Example value
OneDrive	Returns the path to the OneDrive folder.	C:\Users \<user> \OneDrive
OS	Returns the device operating system name.	Windows_NT
Path	Returns a semicolon-delimited list of directories that contain executable programs.	C:\Windows \system32;C: \Windows;C: \Windows \System32\Wbem;C: \Windows \System32\WindowsPowerShell \v1.0\
PATHEXT	Returns a semicolon-delimited list of file extensions that the system can execute.	.COM;.EXE;.BAT;.CMD;.VBS;.VBE
PROCESSOR_ARCHITECTURE	Returns the process architecture of the device.	AMD64
ProgramData	Returns the path to the directory that contains resources and settings used by all system accounts.  <b>Note:</b> Use ALLUSERSPROFILE for devices that run the Windows XP and earlier OS.	C: \ProgramData
ProgramFiles	Returns the path to the directory that stores installed programs.	C:\Program Files
ProgramFiles(x86)	Returns the path to the directory that stores installed programs.  <b>Note:</b> This is only available for devices that run 64-bit version.	C:\Program Files (x86)
ProgramW6432	Returns the path to the directory that stores installed programs.	C:\Program Files
PSModulePath	Returns file paths to the modules that are installed on the disk.	%ProgramFiles % \WindowsPowerShell \Modules;C: \Windows \system32\WindowsPowerShell \v1.0\Modules
PUBLIC	Returns the Public folder path.	C:\Users\Public
SystemDrive	Returns the device system drive.	C:

Variable	Description	Example value
SystemRoot	Returns the system root folder.	C:\Windows
TMP	Returns the path to the directory that stores temporary files.	C:\Users\ \<user> \AppData\Local \Temp
TEMP	Returns the path to the directory that stores temporary files.	C:\Users\ \<user> \AppData\Local \Temp
USERDNSDOMAIN	Returns the DNS domain of the user.	AAI.AASPL- BRD.COM
USERDOMAIN	Returns the domain of the user.	AAI.AASPL- BRD.COM
USERDOMAIN_ROAMINGPROFILE	Returns the domain of the user profile.	AAI
USERNAME	Returns the logged-in user name.	bob.ross
USERPROFILE	Returns the user profile path.	C:\Users \<user>
windir	Returns the Windows directory path.	C:\Windows

- (Optional) Use the **Variable** tab to add a value for the variable.  
Click **Insert a value** icon if there is no existing variable.
- Click the **Assign the output to an existing variable** drop-down menu and select an existing variable.  
Click the **Create variable** icon for new variable.

## Task Bot package

Use the **Run**, **Pause**, and **Stop** actions in the Task Bot package to manage running one or more child bots from a parent bot or with a third-party software using an API.

Build smaller bots that automate a single task and run them from a parent bot. For example, build a `Login` child bot to enter the username and password into a web form and click submit. The `Login` child bot accepts credentials from the parent bot and returns a success message, and then the parent bot can call the subsequent `CreateInvoice` child bot. The `Login` child bot should also contain error handling logic in case the credentials are incorrect.

This practice of building smaller, self-contained bots enables a user to reuse the bot logic in a greater number of tasks, and makes error handling and troubleshooting easier. This also decreases the amount of time spent building and maintaining bots. As a result, an organization is able to rapidly scale their automation initiatives. The `Login` child bot from this example can be reused in any task that involves providing credentials to a login page on a website.

When you run a Task Bot that calls itself repeatedly until you choose to stop it, the bot runs infinitely and, as a result, encounters an error related to stack memory issues. We recommend that you create a parent and a child bot with different names and then run the child bot from the parent bot.

---

**Note:**

- When you create a Task Bot, ensure that the parent and child bots should have the same package version.
  - CSV/text file and Recorder sessions cannot be shared across bots. You can share Excel sessions across bots by using a session variable. See [Example for sharing an Excel session between bots](#) on page 3307.
  - When you use a file type variable in the Run Task, ensure you have set the default value in the variable. Without default value, the bot displays an error on execution.
- 

In addition, running child bots from a parent bot offers greater control over data in the following ways:

- Users can configure the variables in the child bot to control the direction in which information can be exchanged by selecting from the following options:
  - **Use as input:** The variable holds a value that the child bot accepts from a parent bot or third-party software.
  - **Use as output:** The variable holds a value that the child bot passes to the parent bot or third-party software.
  - **Both:** The value can be passed in both directions.
  - **Neither:** The variable is confined to this bot; it cannot be shared across other bots.

See [Create a variable](#) on page 2488

- Other users can reuse child bots without viewing their contents.

The Task Bot package includes the following actions:

Action	Description
Pause	See <a href="#">Pause action</a> on page 3304.
Run	<ul style="list-style-type: none"> <li>• See <a href="#">Using the Run action</a> on page 3304..</li> <li>• For an example, see <a href="#">Example of using the Run action</a> on page 3431.</li> </ul>
Stop	See <a href="#">Stop action</a> on page 3307.

[Task Bot package updates](#) on page 1055

Review the updates in released versions of the Task Bot package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Pause action

The **Pause** action in the Task Bot package enables you to temporarily pause the running bot.

### Settings

Temporarily pauses the running bot. Use the **Pause** action to modify data or to verify the status of a relevant component.

When the bot reaches the **Pause** action during run time, a **Resume** button appears. You must click **Resume** for the bot to continue to the next action.

## Using the Run action

The **Run** action from the Task Bot package enables you to run one or more child bots. Configure the action to run the child bots repeatedly or with a delay, and to pass and retrieve values.

The action runs the selected task multiple times for a specified number of times or for a number of hours. The task can be repeated until the user chooses to stop it. You can save the output values to a dictionary variable, where each key in the dictionary is the variable name and corresponding value from the child bot. Or, you can map each dictionary key to a variable to store the corresponding value.

---

**Note:** When you create a Task Bot with dependencies, ensure that the both the parent and child bot are in the same workspace (public or private). You cannot call a public bot from a private bot. To do so, you should first either check-out or clone the public bot into the private workspace and then check-in both the bots to the public workspace.

---

1. In the **Actions** palette, double-click or drag the **Run** action from the **Task Bot** package.
2. In the **Task Bot to run** field, select the child bot:

Option	Description
Current Task Bot	Runs the current bot recursively.

Option	Description
Control Room file	<p>Select a bot that you want to run:</p> <ul style="list-style-type: none"> <li>Click the <b>Browse</b> tab if you want to select a bot from your private workspace.</li> </ul> <p>The location of the selected bot in the private repository is also displayed.</p> <ul style="list-style-type: none"> <li>Click the <b>Search</b> tab if you want to search for a bot from the public workspace and your private workspace.</li> </ul> <p>Suggestions about the bots available in the public and private workspaces are displayed when you start typing the name of the bot you want to run. The location of the selected bot in the public and the private workspaces is also displayed.</p>
Variable	<p>Select from the following options:</p> <ul style="list-style-type: none"> <li><b>File:</b> Insert a file variable that contains a bot.</li> <li><b>Control Room path:</b> Enter an expression beginning with <code>Bots</code> that contains a string variable to specify the bot. For example <code>Bots/\$department\$/PTOReport</code>.</li> </ul> <hr/> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>The file path is case-sensitive.</li> <li>The bot must be in the same workspace as the parent bot.</li> </ul> <hr/>

3. In the **Input values** fields, enter the values or variables to pass to the child bot:

**Note:** You can pass a Window type variable from a parent bot to a child bot.

- a) Select an input variable to activate the text field.
- b) Enter a value of the required data type.  
The icon on the left-side of the text field indicates the data type.

If you are configuring a bot with many input variables, use the **Quick map** option to automatically map variables that share the same name and data type. If the child bot contains variables for which there are no corresponding variables in the parent bot, the **Quick map** option creates new variables and maps them.

4. Optional: Select the repetition.  
See [Repeating a bot](#) on page 3307.
5. Optional: Select the **Delay between repetitions** option and enter the delay time in the **Minutes** and **Seconds** fields.

6. Optional: Select the **Upon error continue with next repetition or action in this bot** option. For alternative error-handling options, use actions from the Error handler package.

[Error handler package](#) on page 2709

7. In the **Save outcome to a variable** field, select either the **Multiple variables** or **Dictionary** option:

Option	Description
Multiple variables	<p>Click <b>Add variable mapping</b> to associate each dictionary key with a variable in the parent bot.</p> <p>Use this option if you do not want to use actions to extract the dictionary values.</p> <p>Use the <b>Multiple Variables</b> option to assign the output of the child bot to multiple variables directly. Using this option, you can set the multiple values returned by the child bot into the dictionary variable of the parent bot. You no longer need to assign the multiple outputs of the child bot to the individual variables of the parent bot using variable assignment commands. You can use the Dictionary package in the parent bot to extract the individual value assigned to the dictionary variable of the parent bot.</p> <p>For example, when you migrate Enterprise 11 bots, many output variables need to be assigned individually after the <b>Run</b> task action, which increases the size of the bot. You can directly set parent bot variables within the <b>Run</b> task action using the multiple variables option.</p>
Dictionary	<p>Insert or create a dictionary variable to hold the output variables and values in key-value pairs.</p> <p>Each key in the dictionary is the variable name and corresponding value from the child bot.</p>

8. Click **Save**.

For an example of using this action:

- [Example of using the Run action](#) on page 3431
- [Example for sharing an Excel session between bots](#) on page 3307

## Repeating a bot

Use the repeat option in the **Run** action of the Task Bot package to enable the repeat setting in a bot. You can use this option to repeat a bot after a run failure or to run routine bots.

### Options for repeating a bot

Do not repeat	Default. The bot runs once.
Repeat N times	Repeats the bot specified number of times.
Repeat for time unit	Repeats the bot for a time period (hh:mm:ss).
<hr/>	
	<b>Note:</b> Specify up to 99 hours, 59 minutes, or 59 seconds.
<hr/>	
Repeat until stopped by user	Repeats the bot until being stopped manually by clicking the <b>stop</b> button or by pressing the <b>ESC</b> key.
Delay between repetitions	Sets a duration of time to wait before repeating a bot (mm:ss).
Upon error continue with next repetition or action in this bot	The bot is repeated regardless of run failure.
<hr/>	
	<b>Note:</b> Error handling cannot capture the error when this option is enabled.
<hr/>	

## Stop action

The **Stop** action in the Task Bot package enables you to stop the running bot.

### Settings

For example, use the **Stop** action to terminate the bot if a condition is met, such as if the bot encounters a file larger than 100 MB.

## Example for sharing an Excel session between bots

Build two bots to update the employee salaries in a worksheet. In this example, one bot opens an Excel worksheet and passes the session name as a variable to the second bot, which iterates through the worksheet, calculates each employee's new salary, and updates the value in the worksheet.

Create a worksheet with the following data:

Employee ID	Start date	Salary
200	1/12/2020	50000
233	3/15/2018	75000

---

Employee ID	Start date	Salary
500	6/6/2020	60000
555	7/9/2019	65000

Build the child to iterate through the table of employees and update each salary to reflect the raise.

1. Open a new bot.
  - a) From Automation Anywhere web interface, on the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name `RaiseSalaries`.
  - d) Enter the folder location `\Bots\TaskBotExample`.  
To change where your bot is stored, click **Choose** and follow the prompts.
  - e) Click **Create and Edit**.
2. Create the following variables:
  - `sessionVariable`: session type; MS Excel subtype; use as input
  - `sCellAddress`: string type; default value of `C2`
  - `sSalary`: string type
  - `nSalary`: number type
3. Use a **Loop** action to iterate through all the rows in the worksheet.
  - a) Double-click or drag the **Loop** action.
  - b) Select the **For each row in worksheet** iterator.
  - c) Select the **Shared session** tab and insert `$sessionVariable$`.
  - d) Select the **Read cell value** option.
  - e) In the **Assign the current value to this variable** field, create a record variable.
4. Retrieve the employee's salary.
  - a) Drag into the Loop container the **Excel Advanced > Get single cell** action.
  - b) Select the **Shared session** tab and insert `$sessionVariable$`.
  - c) Select the **Specific cell** option and insert `$sCellAddress$`.
  - d) Select the **Read cell value** option.
  - e) In the **Store cell contents to** field, insert `$sSalary$`.
5. Convert the salary value to a number data type.
  - a) Drag into the Loop container the **String > To number** action.
  - b) In the **Enter the string** field, insert `$sSalary$`.
  - c) In the **Assign the output to variable** field, insert `$nSalary$`.
6. Calculate the new salary to be five percent greater than the current salary.

- a) Drag into the Loop container the **Number > Assign** action.
  - b) In the **Select source variable** field, enter `$nSalary$*1.05`.
  - c) In the **Select destination variable** field, insert `$nSalary$`.
7. Update the salary in the worksheet.
- a) Drag into the Loop container the **Excel Advanced > Set cell** action.
  - b) Select the **Shared session** tab and insert `$sessionVariable$`.
  - c) Select the **Specific cell** option and insert `$sCellAddress$`.
  - d) In the **Cell value** field enter `$nSalary.Number:toString$`.

---

**Note:** You must convert the value to a string data type before the bot can enter it into the worksheet. Use type casting as an alternative to the **Number > To string** action. [Type conversion](#) on page 2490

---

8. Move the cursor down by a single cell and assign that cell address to `sCellAddress`.
- a) Drag into the Loop container the **Excel Advanced > Go to cell** action.
  - b) Select the **Shared session** tab and insert `$sessionVariable$`.
  - c) Select the **Active cell** and **One cell below** options.
  - d) Drag into the Loop container the **Excel Advanced > Get cell address** action.
  - e) Select the **Shared session** tab and insert `$sessionVariable$`.
  - f) Select the **Active cell** option.
  - g) In the **Save active cell address** field, insert `$sCellAddress$`.

9. Click **Save** and **Close**.

Build the parent bot.

10. Open a new bot.
- a) Click **Create a bot**.
  - b) Enter the bot name `ExcelParentBot`.
  - c) Enter the folder location `\Bots\TaskBotExample`.  
To change where your bot is stored, click **Choose** and follow the prompts.
  - d) Click **Create and Edit**.

11. Create the following variable:

`sessionVariable`: session type; MS Excel subtype

12. Double-click or drag the **Excel Advanced > Open** action.
13. Within the **File > Desktop file** tab, click **Browse** to upload a file:
14. Select the **Sheet contains header** check box.
15. In the **Create Excel session** field, click **Global session** tab and use the **Insert a value** icon to select `sessionVariable`.
16. Select the child bot that you have created.
- a) Double-click or drag the **Task Bot > Run** action.
  - b) In the **Control Room file** tab, click **Choose** to select the `RaiseSalaries` bot.

- c) In the **Input values** section, select the **Global session** option and insert `$sessionVariable$`.

**17. Click Save and Run.**

The Excel worksheet opens and the value of each cell in the third column increases by five percent.

## Terminal Emulator package

The **Terminal Emulator** package contains actions that enable you to connect to and automate tasks on another machine. Use these actions to access and control operations on a remote machine. For example, you can run applications and access files on a different operating system.

The Terminal Emulator enables a machine to connect to and communicate with another machine using a command-line or graphical interface. The Terminal Emulator uses the Telnet or SSH protocol to communicate with other machines.

The Terminal Emulator supports ANSI, TN3270E, TN5250E, and VT100 terminal types.

---

**Important:** If you use different versions of the Terminal Emulator package in a parent bot and a child bot, the capability to share a session across bots is currently not supported. To share a session across parent and child bots, ensure that you use the same version of the package in both the parent and child bots.

---

### Before you start

---

**Important:** Before you establish a connection to a different terminal type, ensure that you have Visual C++ 2019 Redistributable Package installed on your system. If you are on an Automation 360 version earlier than A2019.14 (Build 5322), you must install Visual C++ 2013 Redistributable Package or Visual C++ 2015 Redistributable Package on your system.

---

Perform the following actions within the **Terminal Emulator** package as part of using the set of available actions:

1. Establish a connection with a host machine using the **Connect** action.

You must first establish a connection with a host machine to automate any Terminal Emulator related task. When establishing the connection, specify the details of the host machine and associate it with a session name. Use the session name provided in this action in the other actions so that you do not have to provide details of the host machine in those actions again. See [Using Connect action for Terminal Emulator](#) on page 3312.

---

**Important:** If you use any other action from this package before establishing the connection, you will encounter an error.

---

2. Use the Terminal Emulator actions to automate a task. For example, use the **Get field** action to retrieve the value from a particular field.
3. After you have automated all the Terminal Emulator related tasks, terminate the connection to the host machine using the **Disconnect** action.

## Actions in the Terminal Emulator package

The **Terminal Emulator** package includes the following actions:

Action	Description
Clear terminal	<a href="#">Clear terminal action</a> on page 3311
Connect	<a href="#">Using Connect action for Terminal Emulator</a> on page 3312
Disconnect	<a href="#">Disconnect action</a> on page 3317
Get all fields	<a href="#">Get all fields action</a> on page 3317
Get field	<a href="#">Get field action</a> on page 3318
Get text	<a href="#">Using Get text action for Terminal Emulator</a> on page 3318
Hide terminal	<a href="#">Hide terminal action</a> on page 3319
Search field	<a href="#">Search field action</a> on page 3319
Send key	<a href="#">Using Send key action</a> on page 3320
Send text	<a href="#">Using Send text action</a> on page 3322
Set key mappings	<a href="#">Using Set key mappings</a> on page 3323
Set cursor position	<a href="#">Set cursor position action</a> on page 3324
Set field	<a href="#">Using Set field action</a> on page 3324
Show terminal	<a href="#">Show terminal action</a> on page 3325
Wait	<a href="#">Using Wait action</a> on page 3325

[Terminal Emulator package updates](#) on page 1056

Review the updates in released versions of the Terminal Emulator package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Clear terminal action

The Clear terminal action in the Terminal Emulator package enables you to clear the screen of the terminal.

## Settings

Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect** action.

## Using Connect action for Terminal Emulator

Use the **Connect** action to establish a connection with a host machine on which you want to automate a task. You can use this action to establish a connection with the TN3270E, TN5250E, ANSI, VT220, and VT100 terminal types.

This action enables you to specify the details of the host machine and associate it with a session name. Use the session name provided in this action in the other actions, so that you do not have to provide details of the host machine in those actions again.

---

**Important:** If you use any other action from this package before establishing the connection, you will encounter an error.

---

To establish a connection with a host machine, perform the following steps:

1. Double-click or drag the **Connect** action from the **Terminal Emulator** node in the **Actions** palette.
2. Specify a name for the session in the **Terminal emulator session name** field.

---

**Note:** Use the different session name to open multiple terminal windows. If you want to use the same session name, you must first close the session of the first terminal window before using the same session name for another terminal window.

---

3. Specify the **Host name** of the machine you want to connect to:
  - a) Click the **Credential** tab to select an entry from the Credential Vault.
  - b) Click the **Variable** tab to use a variable to specify the host name.
4. Enter a value in the **Port** field to specify the port you want to use to connect to the host.
5. Select one of the following options to specify the terminal type:

Option	Steps
ANSI	<p>Select an option from the <b>Connection type</b> list to specify the type of connection you want to establish:</p> <ul style="list-style-type: none"><li>• <b>Telnet</b></li><li>• <b>SSH2</b></li></ul> <p>For <b>SSH2</b> connection type:</p> <ul style="list-style-type: none"><li>• For <b>User authentication</b>:<ul style="list-style-type: none"><li>• <b>User name</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li><li>• For <b>Password</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li></ul></li><li>• For <b>Key file authentication</b>: Click one of the following options to specify the location of the file:<ul style="list-style-type: none"><li>• <b>Control Room file</b>: Enables you to select a PDF file that is available in a folder.</li><li>• <b>Desktop profile</b>: Enables you to select a PDF file that is available on your device.</li><li>• <b>Variable</b>: Enables you to specify the file variable that contains the location of the PDF file.</li></ul></li><li>• For <b>User name</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li></ul>

Option	Steps
TN3270E	<p>a) Select an option from the <b>Host name security</b> list to specify the security you want to use:</p> <ul style="list-style-type: none"><li>• <b>NONE</b></li><li>• <b>SSL</b></li><li>• <b>TLS</b></li></ul> <p>b) Select the <b>Enable TN3270E support</b> check box if you want to choose a connection method.</p> <p>Select an option from the <b>Connection method</b> list:</p> <ul style="list-style-type: none"><li>• <b>GENERIC</b>: Enables you to specify the <b>Device name</b>.</li><li>• <b>SPECIFIC</b>: Enables you to specify the <b>Device name</b> and <b>Resource (LU) Name</b>.</li></ul> <p>c) Select an option from the <b>Terminal model</b> list to specify the terminal workstation you want to connect to.</p> <p>d) Select the check box to enable extended attributes on the TN3270E terminal.</p> <p>e) Select an option from the <b>Code page</b> list to specify the encoding you want to use for the terminal.</p>
TN5250E	<p>a) Select an option from the <b>Host name security</b> list to specify the security you want to use:</p> <ul style="list-style-type: none"><li>• <b>NONE</b></li><li>• <b>SSL</b></li><li>• <b>TLS</b></li></ul> <p>b) Select the <b>Enable TN5250E support</b> check box if you want to specify details about the device and resource.</p> <p>Enter a value in the <b>Device name</b> and <b>Resource (LU) Name</b> fields.</p> <p>c) Select an option from the <b>Terminal model</b> list to specify the terminal workstation you want to connect to.</p> <p>d) Select an option from the <b>Code page</b> list to specify the encoding you want to use for the terminal.</p>

Option	Steps
VT Series <ul style="list-style-type: none"> <li>• VT100</li> <li>• VT220</li> </ul>	<p><b>a)</b> Select an option from the <b>Terminal model</b> list to specify the terminal type you want to connect to.</p> <p><b>b)</b> Select an option from the <b>Encoding</b> list to specify the encoding you want to use for the terminal:</p> <ul style="list-style-type: none"> <li>• ANSI</li> <li>• DBCS</li> <li>• UTF-8</li> </ul> <p>The <b>CodePage</b> field appears when DBCS option is selected. The CodePage supports only Japanese Shift-JIS (932).</p> <p><b>c)</b> Select an option from the <b>Connection type</b> list to specify the type of connection you want to establish:</p> <ul style="list-style-type: none"> <li>• <b>Telnet</b></li> <li>• <b>SSH2</b></li> </ul> <p>For <b>SSH2</b> connection type:</p> <ul style="list-style-type: none"> <li>• For <b>User authentication</b>:           <ul style="list-style-type: none"> <li>• <b>User name</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li> </ul> <p><b>d)</b> To determine the device attribute response that the terminal sends on request from the host, select the <b>Custom DA string</b> check box and enter the DA (Device Attributes) response of type string.</p>

Option	Steps
Linux	<p>Select an option from the <b>Connection type</b> list to specify the type of connection you want to establish:</p> <ul style="list-style-type: none"> <li>• <b>Telnet</b></li> <li>• <b>SSH2</b></li> </ul> <p>For <b>SSH2</b> connection type:</p> <ul style="list-style-type: none"> <li>• For <b>User authentication</b>: <ul style="list-style-type: none"> <li>• <b>User name</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li> <li>• For <b>Password</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li> </ul> </li> <li>• For <b>Key file authentication</b>: Click one of the following options to specify the location of the file: <ul style="list-style-type: none"> <li>• <b>Control Room file</b>: Enables you to select a PDF file that is available in a folder.</li> <li>• <b>Desktop profile</b>: Enables you to select a PDF file that is available on your device.</li> <li>• <b>Variable</b>: Enables you to specify the file variable that contains the location of the PDF file.</li> </ul> </li> <li>• For <b>User name</b>: Click the <b>Credential</b> tab to select an entry from the Credential Vault. You can also click the <b>String</b> tab to enter a value manually.</li> </ul>

**Note:** When you connect with the SSH2 server using public key authentication, the SSH client uses the private key file associated with the public key that has been authorized on the server.

Depending on the software used to generate SSH2 private keys, you can store SSH2 private keys using any of the file formats:

- Java KeyStore (JKS) format: Used by Java applications to store private keys, certificates, and other cryptographic data. The private key is stored in a file with a `.jks` extension.
- OpenSSH format(default format): Used by the OpenSSH suite of tools, including the `ssh-keygen` utility. The private key is stored in a file with no extension, typically named `id_rsa`, `id_dsa`, or `id_ecdsa` (based on the key type).
- OpenSSL format: Used by the OpenSSL library and other software that uses OpenSSL, such as Apache and NGINX. The private key is stored in a file with a `.pem` or `.key` extension.
- PKCS8 key format: Used as a standard format for securely storing private keys using the PKCS#8 standard. The private key is stored in a file with a `.pem` or `.key` extension.
- PuTTY format: Used by the PuTTY SSH client for Windows. The private key is stored in a file with a `.ppk` extension.

6. Select the **Show terminal window** check box to show the terminal window when the bot runs this action.

7. Select the **Set cursor position to the beginning** check box to edit the screen of the Terminal emulator session manually and set the focus to the first editable field.
8. Select the **Wait for the terminal prompt to appear while connected** check box to wait for the terminal prompt to appear on the screen of the terminal after the connection is established.
  - a) Enter the text you want to display when you connect to the terminal in the **Terminal prompt** field.
  - b) Enter a value in the **Wait time out** field to specify the period in (milliseconds) the system must wait before the connection request is timed out.
9. Select any of the following tabs to create a terminal emulator session:
  - **Local session**: Specify a session name that can be used only in the current bot.
  - **Global session**: Specify a session name that can be used across multiple bots such as parent bots, child bots, and other child bots of the parent bots.

---

**Recommendation:** The parent and child bots should have the same package version.

---

  - **Variable**: Specify a session variable that can be used to share that session with other child bots.

## Disconnect action

The Disconnect action in the Terminal Emulator package enables you to terminate the connection with the terminal.

### Settings

Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect** .

## Get all fields action

The Get all fields action in the Terminal Emulator package enables you to retrieve the values of all fields and assigns them to a table variable.

### Settings

- Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect** .
- Select a table variable to store the retrieved data from the **Assign the value to an existing table variable** list. The table stores each field as a row, with the values of each field organized in the following columns:
  - Field index
  - Field name
  - Field value
  - Is Editable (yes/no)

- Is Hidden (yes/no)

---

**Note:** You can use this action with the TN3270E and TN5250E terminal types.

---

## Get field action

The Get field action in the Terminal Emulator package enables you to retrieve the value of a field based on the index or name of the field and assigns it to a string variable.

### Settings

- Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect** .
- Select the **By index** option to retrieve the value of a field based on its index, or select the **By name** option to retrieve the value of a field based on its name.
- Select a string variable to store the retrieved data from the **Assign the value to an existing variable** list.

---

**Note:** You can use this action with the TN3270E and TN5250E terminal types.

---

## Using Get text action for Terminal Emulator

Use the **Get text** action to retrieve text from the terminal and store it in a string variable. This action enables you to retrieve text from the last line, all lines, or a range of lines. You can use this action with the TN3270E, TN5250E, ANSI, and VT100 terminal types.

To retrieve text from the terminal, do the following:

1. Double-click or drag the **Get text** action from the **Terminal Emulator** node in the **Actions** palette.
2. Enter the name of the session that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
3. Select an option from the **Get text** list to specify the lines from which you want to retrieve text:
  - **Last line:** Retrieves text from the last line of the terminal.
  - **All lines:** Retrieves text from all lines of the terminal.

Select from the following options to extract text from a specific area, viewable area, or the entire page displayed on the screen.

- **Viewport:** Retrieves text from the visible area of the Terminal Emulator window.
- **Number of lines from top:** To retrieve text corresponding to a specific number of lines from the top of the screen.
- **Full page capture (with scroll):** Retrieves all the lines on the screen, including the content that needs to be scrolled to access it.

---

**Note:** The **Full page capture (with scroll)** and **Number of lines from the top** options are supported only for **ANSI** and **VT Series** terminals. If you connect with other terminal types,

regardless of the option selected, the extracted text displays the results similar to how they are displayed for the **Viewport** option.

- **Lines from-to**: Retrieves text from the specified range of lines of the terminal. You must enter values in the **Start row** and **End row** fields to specify the range.

---

**Note:** You can specify a value of 1 through 999.

---

4. Select a string variable from the **Assign the value to an existing variable** list to assign the retrieved text to that variable.
5. In the **Assign value to variable** list, select a string variable.

## Hide terminal action

The Hide terminal action in the Terminal Emulator package enables you to hide the terminal screen.

### Settings

This action enables you to hide the terminal screen when the **Show terminal window** option from the **Connect** action is selected. It is useful when you do not want to display the terminal screen when a bot is performing certain tasks. Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect**.

## Search field action

The search field action in the Terminal Emulator package enables you to search for the field based on the text it contains.

### Settings

- From the **Terminal emulator session name** field, choose one of the following options:
  - **Local name** to establish a connection with the terminal using the **Connect** action
  - **Shared session** to share the variable from **Set session variable** or from the parent bot
- Specify the text based on which you want to search the field.
- Select an option from **Select field** to specify whether to retrieve the index or name of the field.
- Assign and save the output to a variable.

---

**Note:** The search text you enter must be a complete match and is not case-sensitive.

---

## Using Send key action

Use the **Send key** action to send a key to the terminal. You can use these keys to perform various operations on the terminal. You can use this action with the TN3270E, TN5250E, ANSI, and VT100 terminal types.

To send a key to the terminal, do the following:

1. Double-click or drag the **Send key** action from the **Terminal Emulator** node in the **Actions** palette.
2. Enter the name of the session that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
3. Select an option from the **Select key to be send** list to specify the key you want to send.
4. Enter a value in the **Delay after send key command** field to specify the period the system must wait (in milliseconds) after the selected key is sent.
5. Select the **Wait for text or prompt to appear** check box if you want the system to wait for the prompt or certain text to appear on the terminal.
  - a) Select the **Prompt** option if you want the system to wait till the prompt appears on the terminal.
  - b) Select the **Text** option if you want the system to wait till the specific text appears on the terminal.  
You must provide the text you want to appear on the terminal in the **Text value to be appear on screen** field.
  - c) Select the **Wait before send key for prompt or text appear** check box if you want the system to wait for the prompt or the specified text to appear on the terminal before sending the selected key.
  - d) Select the **Wait after send key for prompt or text appear** check box if you want the system to wait for the prompt or the specified text to appear on the terminal after sending the selected key.
  - e) Enter a value in the **Time out for prompt or text to appear** field to specify the period (in seconds) the system must wait before the operation times out.
6. In the **Assign value to variable** list, select a string variable.

## How send key works in Send text action

Learn how keys work in the **Send Text** action in the Terminal Emulator.

**Note:** Behavior of the keys that are marked with the asterisk (\*) sign in the following tables is defined by the terminal host. The behavior might vary on different terminals.

The following table shows the behavior of the keys in the terminal types TN3270 and TN5250:

Keys	Behavior
KEY_BACKSPACE	Same behavior as the Backspace key on the keyboard.
KEY_BACKTAB	If the cursor is on the first position of a field, it moves to the previous field. Otherwise, it moves to the start of the current field.
KEY_CLEAR	Clears the entire text on the terminal screen.

Keys	Behavior
KEY_ERASEINPUT	Deletes all the text in the field.
KEY_NEXTFIELD	Moves the cursor to the next field on the terminal screen.
KEY_ENTER	Sends Enter key to the terminal host.
KEY_HOME	Moves the cursor to the first editable field on the screen.
KEY_RESET	The reset key only clears the Keyboard lock, such as releasing the terminal if the terminal screen is not working. The screen text and input field values remain the same.
KEY_LEFT	Moves the cursor to the left by one position.
KEY_RIGHT	Moves the cursor to the right by one position.
KEY_UP	Moves the cursor up by one position.
KEY_DOWN	Moves the cursor down by one position.
KEY_PGLEFT	Nothing happens.
KEY_PGRIGHT	Nothing happens.
KEY_PGUP	Page Up key
KEY_PGDOWN	Page Down key
KEY_TABFORWARD	Performs a tab key action on the terminal screen to move the cursor to the next field.
KEY_PF1 *	Same behavior as F1 key on the keyboard.
KEY_PF2 *	Same behavior as F2 key on the keyboard.
KEY_PF3 *	Same behavior as F3 key on the keyboard.
KEY_PF4 *	Same behavior as F4 key on the keyboard.
KEY_PF5 *	Same behavior as F5 key on the keyboard.
KEY_PF6 *	Same behavior as F6 key on the keyboard.
KEY_PF7 *	Same behavior as F7 key on the keyboard.
KEY_PF8 *	Same behavior as F8 key on the keyboard.
KEY_PF9 *	Same behavior as F9 key on the keyboard.
KEY_PF10 *	Same behavior as F10 key on the keyboard.
KEY_PF11 *	Same behavior as F11 key on the keyboard.
KEY_PF12 *	Same behavior as F12 key on the keyboard
KEY_PF13 *	Same behavior as Shift + F1 keys on the keyboard.
KEY_PF14 *	Same behavior as Shift + F2 keys on the keyboard.
KEY_PF15 *	Same behavior as Shift + F3 keys on the keyboard.
KEY_PF16 *	Same behavior as Shift + F4 keys on the keyboard.
KEY_PF17 *	Same behavior as Shift + F5 keys on the keyboard.

Keys	Behavior
KEY_PF18 *	Same behavior as Shift + F6 keys on the keyboard.
KEY_PF19 *	Same behavior as Shift + F7 keys on the keyboard.
KEY_PF20 *	Same behavior as Shift + F8 keys on the keyboard.
KEY_PF21 *	Same behavior as Shift + F9 keys on the keyboard.
KEY_PF22 *	Same behavior as Shift + F10 keys on the keyboard.
KEY_PF23 *	Same behavior as Shift + F11 keys on the keyboard.
KEY_PF24 *	Same behavior as Shift + F12 keys on the keyboard.

## Using Send text action

Use the **Send text** action to send text to the terminal. This action also enables you to send predefined keys after the text to perform various operations in the terminal. You can use this action with the TN3270E, TN5250E, ANSI, and VT100 terminal types.

You can use the following keyboard shortcuts to send a key on the terminal window using Simulate keystroke action:

**Note:** The keyboard shortcuts are supported in TN3270 and TN5250.

Key entry	Command
Shift + Control + A	Select all
Shift + Control + C	Copy
Shift + Control + X	Cut
Shift + Control + V	Paste

To send a text to the terminal, follow these steps.

1. Double-click or drag the **Send text** action from the **Terminal Emulator** node in the **Actions** palette.
2. Enter the name of the session that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
3. Specify the **Text** you want to send to the terminal:
  - a) Click the **Credential** tab to select an entry from the Credential Vault.
  - b) Click the **Variable** tab to use a variable that contains the text you want to send.
4. Select the **Send a key after sending the above text** check box if you want to send a key after sending the text.
  - a) Select the key you want to send from the list.
  - b) Enter a value in the **Delay after send key command** field to specify the period (in milliseconds) the system must wait after sending the selected key.

5. Select the **Wait for text or prompt to appear** check box if you want the system to wait for the prompt or certain text to appear on the terminal.
  - a) Select the **Prompt** option if you want the system to wait till the prompt appears on the terminal.
  - b) Select the **Text** option if you want the system to wait till the specific text appears on the terminal.  
You must provide the text you want to appear on the terminal in the **Text value to be appear on screen** field.
  - c) Select the **Wait before send key for prompt or text appear** check box if you want the system to wait for the prompt or the specified text to appear on the terminal before sending the selected key.
  - d) Select the **Wait after send key for prompt or text appear** check box if you want the system to wait for the prompt or the specified text to appear on the terminal after sending the selected key.
  - e) Enter a value in the **Time out for prompt or text to appear** field to specify the period (in seconds) the system must wait before the operation times out.
  
6. In the **Assign value to variable** list, select a string variable.

## Using Set key mappings

You can use the **Set key mappings** action to overwrite the default mapping of keys to perform various operations on the terminal.

The set key mapping is instrumental to developers as it enables them to map from key lists, especially when keys behave differently on different terminals. For example, you can map `KEY_PAGEUP` to `{Page Up}`, `{Roll Down}`, or `\\x1b[5~` based on the terminal host you connected with.

1. Enter the name of the session or select an existing variable that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
2. Select the **Add key mapping** button to set a key and map it to a custom string or macro. The **Add key mapping** window opens:
  - a) Select the key to map from the drop-down list.
  - b) Add the custom string or macro to send it to the terminal.
  - c) Click **Add**.  
The custom key value is added. The following table provide examples of custom values set for function keys.

Key	Custom string or macro
F1	{F1} or \\x1b[11~
F2	\\x1b[12~
F3	\\x1b[13~
ENTER	{Return}

**Note:**

- In the automation, if you have set custom key values and used subsequent actions such as **Send key** or **Send text**, the default values of keys are overridden with the new set of values.
  - You can set and use the custom key values in a particular session. If you create a new session and want to use the custom key values, you must set the keys and map them to a custom string or macro.
- 

3. Click **Save**.

## Set cursor position action

The Set cursor position field action in the Terminal Emulator package enables you to set the position of the cursor on the screen of the terminal.

### Settings

- Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect**.
  - Specify the row number in which to set the cursor in the **Set row** field.
  - Specify the column number in which to set the cursor in the **Set column** field.
- 

**Note:** You can enter a value of 1 through 999 to specify the row and column number where the cursor is set.

---

## Using Set field action

Use the **Set field** action to set a value in a particular field in the terminal. This action also enables you to send predefined keys after the value to perform various operations in the terminal. You can use this action with the TN3270E, TN5250E, ANSI, and VT100 terminal types.

To set a value for a field in the terminal, do the following:

1. Double-click or drag the **Set field** action from the **Terminal Emulator** node in the **Actions** palette.
  2. Enter the name of the session that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
  3. Specify the field for which you want to set a value:
    - a) Select the **By index** option to specify the field based on its index.  
The index value starts from zero and ends at 99999. For example, if you want to set the value for the third field, you must specify 2 in this field.
    - b) Select the **By name** option to specify the location of the field.  
For example, if you want to set the value for a field in the fifth column of the third row, you must specify R3C5 in the field.
  4. Specify the **Plain text value** you want to set in the specified field:
-

- a) Click the **Credential** tab to select an entry from the Credential Vault.
  - b) Click the **Variable** tab to use a variable that contains the text you want to send.
5. Select the **Send enter key after setting field** check box if you want to send the enter key after setting the field.  
This option performs the operation similar to pressing the Enter key after setting the value in the field.
6. Select the **Send a key after sending the above text** check box if you want to send a key after sending the text.
  - a) Select the key you want to send from the list.
  - b) Enter a value in the **Delay after send key command** field to specify the period (in milliseconds) the system must wait after sending the selected key.
7. In the **Assign value to variable** list, select a string variable.

## Set session variable action

---

**Note:** This action is no longer available for new bots. Existing bots using this action will not be impacted and will continue to run.

You can use a global session to specify a session name for use across multiple bots.

---

See

- [Sharing sessions across bots](#) on page 2659
- [Support and deprecation policy for packages](#) on page 1176 (for package lifecycle and deprecation policy)

## Show terminal action

The Show terminal action in the Terminal Emulator package enables you to show the terminal screen.

### Settings

This action enables you to show the terminal screen when the **Show terminal window** option from the **Connect** action is not selected. It is useful when you want to display the terminal screen when a bot is performing certain tasks. You must specify Specify the **Terminal emulator session name** that you used to establish a connection with the terminal using the **Connect** .

## Using Wait action

Use the **Wait** action to introduce a delay till specific conditions are met in the terminal. You can use this action to wait before executing the next action till the specific text appears on the screen, the cursor moves to the specified location, and so on. You can use this action with the TN3270E, TN5250E, ANSI, and VT100 terminal types.

To wait till specific conditions are met in the terminal, do the following:

1. Double-click or drag the **Wait** action from the **Terminal Emulator** node in the **Actions** palette.
2. Enter the name of the session that you have used to establish a connection with the terminal using the **Connect** action in the **Terminal emulator session name** field.
3. Select an option from the **Terminal event** list to specify a condition the system should wait till it is met.

The following table provides information about the options available in the list and the input required for each option:

Option	Input required
Wait till text appears	Waits until the text you specified in the <b>Text</b> field matches with the last line of the screen in the terminal.
Wait till text disappears	Waits until the text you specified in the <b>Text</b> field does not match or disappears on the last line of the screen in the terminal.
Wait till cursor moves to position	Waits till the cursor moves to the position you have specified in the <b>Move to row</b> and <b>Move to column</b> fields.  <b>Note:</b> You can enter a value of 1 through 999 to specify the row and column number where the cursor is set.
Wait till cursor moves out of position	Waits till the cursor moves out of the position you have specified in the <b>Move out of row</b> and <b>Move out of column</b> fields.  <b>Note:</b> You can enter a value of 1 through 999 to specify the row and column number where the cursor is set.
Wait till screen gets blank	No input required.
Wait till screen contains text	Waits till the text you have specified in the <b>Text</b> field is available on the screen of the terminal.
Wait till terminal prompt appears	No input required.
Wait till terminal ready state	No input required.

4. Enter a value in the **How long you would like to wait?** field to specify the period (in milliseconds) the system must wait before the operation times out.
5. In the **Assign value to variable** list, select a string variable.

## Share session between Task Bot logic

Use the **Shared Session** option in the Terminal Emulator package to pass the exact state of an application to the concurrently occurring Task Bot logic.

Shared session enables you to reuse actions between Task Bots that run concurrently, for example, connecting to the same application.

To use shared session, create a hierarchy of Task Bot logic that are connected by the **Shared Session** option. As a result, large Task Bot logic are trimmed by removing repetitive commands for connecting and disconnecting.

1. Create a parent bot such as TE\_Share\_Main that connects to an application on the Terminal Emulator.
2. Use the **Set session variable** action in the TE\_Share\_Main to assign the current session to a variable such as \$te\_session\$ of Terminal Emulator session type.
3. Create a child bot such as TE\_BMIS to perform any actions such as **Get text** and **Set field**.
4. Add a Run Task action in the TE\_Share\_Main to call the TE\_BMIS.
5. To pass a session variable from the TE\_Share\_Main to TE\_BMIS, select \$te\_session\$ as an input value in the **Set SessionVariable**.
6. In the TE\_BMIS, use **Shared session** tab and insert \$te\_session\$ as a session variable to obtain data or perform task.
7. In the main task, add an action to disconnect from the application.

## Text file package

Open a text file, read data from that file, and save the data to a string variable by using the **Text file** package. This package supports text files encoded in Shift-JIS, ANSI, UTF-16LE, UTF-16BE, Win 1521, Unicode, and UTF-8 and can extract content up to 64kb from text files.

### Actions in the Text file package

The Text file package includes the following actions:

Action	Description
Get text	See <a href="#">Using Get text action of Text file package</a> on page 3328
Read variables	See <a href="#">Read variables action</a> on page 3328

Related reference

[Text file package updates](#) on page 1059

Review the updates in released versions of packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using Get text action of Text file package

Extract content from a text file and save that content to a string variable by using the **Get text** action.

To extract text from a text file, perform the following steps:

1. In the **Actions** palette, double-click or drag the **Get text** action from the **Text file** package.
2. In the **Source file** field, select an option to specify the location of the text file:
  - **Control Room file** to open a file from the Control Room.
  - **Desktop file** to open a file from the device. This field also accepts the file path input as a string variable or global value.
  - **Variable** to open a file by specifying a file variable.
3. In the **Text encoding** field, select an encoding to specify the encoding that is applied on the text file. Data from the text file will be retrieved based on the selected encoding option even if the input file has a different encoding.
  - **ANSI**
  - **UTF8**
  - **UTF8 with BOM**
  - **UNICODE**
  - **Win1251**
  - **UTF-16LE**
  - **UTF-16BE**
  - **Shift-JIS**
  - **Detect automatically**: identifies file encoding. This option supports UTF-8 with BOM, ANSI, UTF-16LE, and UTF-16BE file encoding.
4. Select the **Trim leading spaces** and **Trim trailing spaces** check boxes to remove the leading and trailing spaces from the data extracted from the text file.
5. In **Save the outcome to variable** field, select a string variable to hold the output.

## Read variables action

Use the **Read variables** action in the Text file package to read the values of variables from the text file.

The layout of the text file that can be imported must be like one of the following samples:

- Var1=This is sample English text
- Var2 = test
- Var3 = Tst3

## Settings

- In the **Source file** field, click one of the following tabs to specify the location of the text file:

- **Variable:** To open the source text file using a variable.
- **Control Room file:** To open the source text file from the Control Room.

Click **Choose** to **Search**, **Browse** or **Upload** a text file from Control Room.

- **Desktop file:** To open the source text file from your local device.

Click **Browse** to upload the text file. This field also accepts the file path input as a string variable or global value.

- Click the **Text encoding** drop-down menu and select one of the following encoding type to apply on the text file:
  - **Detect automatically:** Identifies the file encoding. This option supports UTF-8 with BOM, ANSI, UTF-16LE, and UTF-16BE file encoding.
  - **ANSI**
  - **UTF-8**
  - **UTF-8 with BOM**
  - **UTF-16LE**
  - **UTF-16BE**
  - **Unicode**
  - **Shift-JIS**
  - **Windows 1251**

Data from the text file is retrieved based on the selected encoding option even if the input file has a different encoding.

- Select the **Trim leading spaces** check box to remove the leading space in the data extracted from the text file.
- Select the **Trim trailing spaces** check box to remove the trailing space in the data extracted from the text file.
- Select the **Convert dictionary keys to lower case before assignment to variables** check box to convert all the keys to lower case.

---

**Note:** When you select this option, ensure that you enter the key in lower case in the **Mapped variables** table.

---

- From the **Save the outcome to variable** field, click one of the following tabs to contain the output:
  - **Multiple variables:** Click **Add variable mapping** to associate each dictionary key with a variable.  
Use this option to avoid using actions to extract the dictionary values.
  - **Dictionary:** Insert or create a dictionary variable to contain the output variables and values in key-value pairs.

## Trigger loop package

The **Trigger loop** package enables you to run a series of actions when a trigger event occurs. You can insert multiple trigger loops within a bot or nest one trigger loop within another trigger loop.

### Actions in the Trigger loop package

Action	Description
<b>Trigger loop</b>	<p>Opens the loop to run a series of actions when a trigger event occurs.</p> <hr/> <p><b>Note:</b> Events within the <b>Trigger loop</b> follow a sequential order and any parallel events that occur during this time are queued.</p> <hr/>
<b>Handle</b>	<p>Specifies the trigger event and runs the actions that are inside the container when that event occurs.</p> <p>Drag the <b>Handle</b> action into the <b>Trigger loop</b> (in <b>Flow</b> view) or below the <b>Trigger loop</b> (in <b>List</b> view).</p>
<b>Break</b>	<p>Terminates the trigger loop for bot to continue with other actions in the trigger event. If there is no <b>Break</b> action after a trigger loop handle, the bot will go back to the start of the trigger loop and wait for the next configured action. So ensure you add the <b>Break</b> action to exit the trigger loop and move on to next action or else the bot will run indefinitely. For example, the <b>Break</b> action in a bot can be used when the user must close or cancel a form.</p> <p>Drag the <b>Break</b> action into the trigger handle container.</p>

### Triggers in the Handle action

Triggers	Description	Options
Email Trigger	Triggers that starts the bot when an email is sent or received.	<a href="#">Using Email Trigger in Trigger loop Handle</a> on page 3332
File Trigger	Triggers on a file event.	<a href="#">Using File Trigger in Trigger loop Handle</a> on page 3335
Folder Trigger	Triggers on a folder event.	<a href="#">Using Folder Trigger in Trigger loop Handle</a> on page 3336
Hot key Trigger	Triggers on a key press event.	<a href="#">Using Hot key Trigger in Trigger loop Handle</a> on page 3336

Triggers	Description	Options
Form Trigger	<p>Trigger on form element events.</p> <p><a href="#">Using interactive forms</a> on page 3491</p> <hr/> <p><b>Note:</b> If an active form is terminated using the <b>Close</b> button from the task bar, it will not terminate the associated bot containing <b>Trigger loop</b> and <b>Interactive forms</b> packages.</p> <hr/>	<a href="#">Using Form Trigger in Trigger loop Handle</a> on page 3337
Object Trigger	<p>Trigger for the bot to start when the Select main event takes place on the trigger interface element. (Users click a button)</p> <hr/> <p><b>Note:</b> Interface triggers for objects are available only for native Windows applications.</p> <hr/>	<a href="#">Using Object Trigger in Trigger loop Handle</a> on page 3337
Microsoft 365 Outlook Email Trigger	Trigger that starts the bot when an email is received by connecting to the Microsoft 365 Outlook server with OAuth2 authentication.	<a href="#">Using Microsoft 365 Outlook trigger in Trigger loop: Handle</a> on page 3338
Process Trigger	Trigger that starts the bot on a process event.	<a href="#">Use Process Trigger in Trigger loop Handle</a> on page 3339
Service Trigger	Trigger that starts the bot when service start, stop, pause, and resume.	<a href="#">Using Service Trigger in Trigger loop Handle</a> on page 3339
ServiceNow New Record Trigger	New record trigger for ServiceNow .	<a href="#">Using ServiceNow New Record Trigger in Trigger loop Handle</a> on page 3340
ServiceNow Updated Record Trigger	Update record trigger for ServiceNow .	<a href="#">Using ServiceNow Updated Record Trigger in Trigger loop Handle</a> on page 3341
Window Trigger	Trigger that starts the bot based on window actions.	<a href="#">Using Window Trigger in Trigger loop Handle</a> on page 3342

## Related tasks

[Add a form to bot](#) on page 3491

Adding an existing form to a bot enables users to collaborate with bots. Use the necessary action items to create a bot and build a task logic.

## Using Email Trigger in Trigger loop Handle

You can use the email trigger to start the bot when an email is sent or received.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Email** in the **Trigger on** field.  
A list of options for the email trigger will appear for you to configure.
2. Choose one of the following server types as the trigger for your incoming emails:

Server type	Steps
Microsoft Outlook	Click <b>Outlook</b> .  Microsoft Outlook is set as the email service and the bot is triggered when you receive a new email.

Email server

Click **Email server**.

- a) Enter the email service **Host** information.

For example, if you are using Office365 as your email service, enter `Outlook.office365.com`.

- b) Select **IMAP** or **POP3**.

IMAP and POP3 are protocols used to connect to the mail server that enables you to read your emails through an email client. By default **IMAP** is selected.

---

**Note:** The POP3 protocol has a known limitation where any new calendar invite can also trigger the bot.

---

- c) **Use secure connection (SSL/TLS):**

This option is selected by default. This option enables you to use a secure connection with the mail server.

- d) Enter the configured port number for your email server in the **Port** field.

- e) Select one of the following user authentication methods to sign in to the email server:

- **Basic**

- **Credential:** Click **Pick** to select the stored **Username** and **Password**.
- **Variable:** Specify a variable.
- **Insecure string:** Enter the username and password.

- **OAuth 2.0 - Client credentials**

- Specify the unique client and tenant IDs generated when you registered the application in the Microsoft Azure portal.
- Specify the username you want to use to access the mail server.
- Specify the client secret that you generated for your app in the app registration portal.

For **Client ID**, **Tenant ID**, **Username** and **Client Secret**

- **Credential:** Use a value available in the credential

EWS server

Click **EWS server**.

a) From the **Microsoft Exchange Version** drop-down menu, select the version that your organization is using.

- Exchange Server 2013  
The Microsoft Exchange Server 2019 is now supported. Therefore, if your organization is using the Exchange Server 2013, 2016 or 2019 versions of the Microsoft Exchange Server, select **Exchange Server 2013**.
- Exchange2010\_SP2
- Exchange2010\_SP1
- Exchange2010
- Exchange2007\_SP1

For example, if you are using Microsoft Exchange Service Pack 2, select **Exchange2010\_SP2** as your email service.

b) Enter the domain name, for example, `smtp.office365.com`

c) Select one of the following user authentication methods to sign in to the email server:

- **Basic**
  - **Credential:** Click **Pick** to select the stored **Username** and **Password**.
  - **Variable:** Specify a variable.
  - **Insecure string:** Enter the username and password.
- **OAuth 2.0 - Client credentials**
  - Specify the unique client and tenant IDs generated when you registered the application in the Microsoft Azure portal.
  - Specify the username you want to use to access the mail server.
  - Specify the client secret that you generated for your app in the app registration portal.

For **Client ID**, **Tenant ID**, **Username** and **Client Secret** fields, choose from the following:

3. Specify a time in the **Check every** field for all the server types to set the trigger interval.  
The trigger interval for the bot is set to 120 seconds by default. You can also specify the minutes.

---

**Note:** The trigger interval that you have configured using the **Check every** drop-down menu does not depend on the number of emails received during the scheduled interval.

---

4. Specify an email event for the selected server type in the **Select Conditions** fields.
  - **Email from:** Specify the email addresses.
  - **Email subject contains:** Specify that an email contains a condition.
  - **Email without an attachment**
  - **Email with an attachment**
  - **Email in folder:** Specify an email in a folder.

---

**Note:** When you select the **Email subject contains** check box, the email trigger is executed depending on the following subject conditions:

- When the subject line is provided within double quotation marks (""), for example, "ABC spreadsheet", the trigger is executed only when the email subject has an exact match for the string provided within quotation marks.
- When multiple subject lines are separated by semicolons, for example, ABC spreadsheet; ABC project logs, the trigger is executed when the email subject matches any of the subject lines mentioned.

- 
5. Specify your variable in the **Assigned to** field.  
You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.  
You can select from the following:
    - **Multiple variables**
    - **Record**
  6. Click **Save** to save your configuration.  
You have configured the email trigger for use with the trigger loop handle.

## Using File Trigger in Trigger loop Handle

You can use the file trigger to trigger on file events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **File** in the **Trigger on** field.  
A list of options for the file trigger will appear for you to configure.
2. Select your file in the **File** field.
3. Specify the action in the **Start the bot when the file is** field.  
This option allows you to specify when your bot starts based on the modifications to your file.  
You can choose from when the file is **created**, **deleted**, **renamed**, or **modified**.
4. Optional: Select the **Also start if it already exists** to start an existing bot.

5. Optional: In the **Assigned to** field, specify a variable to assign variable to this file.
6. Click **Save** to save your configuration.  
You have configured the file trigger for use with the trigger loop handle.

## Using Folder Trigger in Trigger loop Handle

You can use the folder trigger to trigger on folder events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Folder** in the **Trigger on** field.  
A list of options for the folder trigger will appear for you to configure.
2. Select your folder in the **Folder** field.
3. Specify the action in the **Start the bot when** field.  
This option allows you to specify when your bot starts based on the modifications to your folder.  
You can choose from when the folder is **created**, **renamed**, or **deleted**. In addition, you can also select a file when it is **created**, **changed**, or **renamed**.
4. Optional: Select the **Monitor all folders under the folder path** option to monitor your folder.
5. Optional: Select the **Also start if it already exists** to start an existing bot.

---

**Note:** This additional option will only show for folders.

---

6. Optional: In the **Assigned to** field, specify a variable to assign variable to this folder.
7. Click **Save** to save your configuration.  
You have configured the folder trigger for use with the trigger loop handle.

## Using Hot key Trigger in Trigger loop Handle

You can use the Hot key trigger to trigger on key press events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Hot key** in the **Trigger on** field.  
A list of options for the Hot key trigger will appear for you to configure.
2. Select a modifier and key in the **Hot key** field.  
You can specify hot key with a list of available modifiers and keys that you can select.  
For modifiers

- **Win**
- **Ctrl**
- **Shift**
- **Alt**
- **AltGr**

For hot keys

- **Letters:** This spans from letters A to Z.
- **Numbers:** This spans from numbers 0 to 9.

- **Special Characters:** This is a variety of special characters.
  - **Controls:** This is a variety of keyboard controls from Esc key to volume controls.
  - **Numpad:** This is a variety of numpad keys.
  - **Function Keys:** This spans from F1 to F12 keys.
  - **Arrows:** This is a variety of directional keys.
  - **Multimedia Keys:** This is a variety of functions for the browser and volume.
3. Click **Save** to save your configuration.  
You have configured the hot key trigger for use with the trigger loop handle.

## Using Form Trigger in Trigger loop Handle

You can use the form trigger to trigger on form element events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Form** in the **Trigger on** field.  
A list of options for the form trigger will appear for you to configure.
2. Select a variable in the **Form name** field.  
You can create a new variable as well, where you specify the variable name, its use as in input or output, and upload an existing form.
3. Select a element variable in the **Form element** field.  
The list should be available for you to select when there is an element in your form.
4. Select an action in the **Select action trigger** field.
  - **Lost focus:** Button is clicked.
  - **Got focus:** Input field is clicked.
  - **Lost focus:** User leaves the input field.
  - **Changed value:** Check box or radio button status is changed.
  - **Value selected:** Check box is selected.
  - **Value unselected:** Check box is deselected.
5. Optional: In the **Assigned to** field, specify a variable to assign variable to this form.  
This assigns the value from the specified form element to this variable
6. Click **Save** to save your configuration.  
You have configured the form trigger for use with the trigger loop handle.

## Using Object Trigger in Trigger loop Handle

You can use the object trigger to start the bot when the Select main event takes place on the trigger interface element.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Object** in the **Trigger on** field.  
A list of options for the object trigger will appear for you to configure.
2. Specify the window details the **Window detail**.  
There are three options you can choose.

- **Variable:** Select a window variable.

---

**Note:** This is the default option.

---

- **Application:** Select a preset, this can be your **Currently active**, **Desktop**, and **Taskbar**.
- **Browser:** Select a browser tab.

3. Select **Capture object** to start the capture.

4. Select an event type.

5. Click **Save** to save your configuration.

You have configured the object trigger for use with the trigger loop handle.

## Using Microsoft 365 Outlook trigger in Trigger loop: Handle

You can use the email trigger to start a bot when you receive an email after connecting to the Microsoft 365 Outlook server using the OAuth 2.0 authentication.

Ensure that in Automation Workspace, you have used the **Trigger loop** package to add the **Trigger loop** to your bot.

1. In the **Trigger loop**, select **Trigger loop: Handle**.

2. Click the **Trigger on** drop-down menu and select **Microsoft 365 Outlook Trigger > Email**.

3. Click the **Azure Cloud** drop-down menu and select one of the following options:

- **Azure Global:** For the Microsoft 365 Commercial version (login.microsoftonline.com)
- **Azure GCC High:** For the Microsoft 365 Government version (login.microsoftonline.us)

4. Use the **Check every** field to specify or set the trigger interval time.

The trigger interval for the bot is set to **120** minutes by default.

(Optional) Click the **Minutes** drop-down menu to change the value to **Seconds**.

5. Click the **Authentication mode** drop-down menu and select **Client Credentials**.

For more information on setting up OAuth 2.0 to use client credentials, see [Set up OAuth 2.0 using client credentials](#) on page 3050.

6. For the **Client ID**, **Tenant ID**, **Username** and **Client Secret** fields, select one of the following tabs:

- **Credential:** Click **Pick** to select a value from the credential vault.
- **Variable:** Specify a variable.
- **Insecure String:** Enter a value or click the **Insert a value** icon to select an existing variable.

7. (Optional) Use the **Select Conditions** field to select any or all of the following options for email events from the selected server type:

- **Email from:** Enter the email addresses or click the **Insert a value** icon to select an existing variable.
- **Email subject contains:** Enter a condition for the email subject line.

For example, you can enter 'Sales report' as a condition to trigger a bot when you receive any email that contains the subject line as 'Sales report'. You can also click the **Insert a value** icon to select an existing variable.

• **Email attachment:** Select one of the following email attachment options:

- **With attachment**

- **Without attachment**

- **Email in folder:** Enter the filepath of the email folder.

For example, if you want to trigger a bot when you receive an email in Microsoft 365 Outlook folder called 'Sales', enter `inbox/sales`. You can also click the **Insert a value** icon to select an existing variable.

8. Use the **Assigned to (optional)** field to select one of the following tabs:

- **Multiple variables:** Click **Add variable mapping** to associate a key with a variable.
- **Record:** Use the **Assigned to** drop-down menu to assign an existing variable or click the **Create variable** icon to create a variable that you want to assign.

---

**Note:** You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.

---

9. Click **Save** to save your configuration.

Microsoft 365 Outlook is now configured within the trigger loop handle of a bot.

## Use Process Trigger in Trigger loop Handle

You can use the process trigger to trigger on process events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Process** in the **Trigger on** field.  
A list of options for the process trigger will appear for you to configure.
2. Select your process in the **Process** field.
3. Specify the action in the **Start the bot when the process** field.  
This option allows you to specify when your bot starts based on the modifications to your file.
  - **Starts**
  - **Stops**
4. Optional: In the **Assigned to** field, specify a variable to assign variable to this process.
5. Click **Save** to save your configuration.  
You have configured the process trigger for use with the trigger loop handle.

## Using Service Trigger in Trigger loop Handle

You can use the service trigger to start the bot when service start, stop, pause, or resume.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Service** in the **Trigger on** field.  
A list of options for the service trigger will appear for you to configure.
2. Select your bot in the first field.
3. Specify the action in the **Start the bot when the service** field.

This option allows you to specify when your bot starts based on the modifications to your service.

- **Starts**
- **Stops**
- **Resumes**
- **Pauses**
- **Is running**
- **Has stopped**
- **Is paused**

4. Optional: In the **Assigned to** field, specify a variable to assign variable to this service.

5. Click **Save** to save your configuration.

You have configured the service trigger for use with the trigger loop handle.

## Using ServiceNow New Record Trigger in Trigger loop Handle

You can use the ServiceNow new record trigger to monitor a ServiceNow table for new records.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **ServiceNow > New Record Trigger** in the **Trigger on** field.

A list of options for the processServiceNow new record trigger will appear for you to configure.

2. Optional: Enter the API version in the **API version** field.

3. Specify the credential fields for **Client ID**, **Client secret**, **Username**, and **Password** fields.

- **Credential**: Select a credential in the credential vault.
- **Variable**: Specify a variable.
- **Insecure string**: Enter a string.

4. Enter the **Table name** to monitor for new records.

A query is sent, and ServiceNow returns data for this table. When a new record is returned in the data, then this trigger is invoked.

5. Optional: Select an input where the ServiceNow response is stored in the **Field names** field.

For **Variable**, specify a variable.

For **List**, the following can be selected:

- **Any**: Specify a value.
- **String**: Specify a value.
- **Number**: Specify a value.
- **Datetime**: Select the date, time, and time zone, or choose a **Variable**.
- **Boolean**: Select a **True** or **False** option, or choose a **Variable**.
- **File**: Specify a value for **Variable**, **Control room file**, or **Desktop file**

6. Optional: Specify the filter in the **Filter by records** field.

For **Query**, specify a query.

For **Number-value pair**, specify a dictionary or variable for **Dictionary** or add an entry for **Entry list**.

7. Specify a time in the **Check every** field to set the trigger interval.

The trigger interval for the bot is set to 120 seconds.

8. Specify your variable in the **Assigned to** field.

You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.

You can select from the following:

- **Multiple variables**
- **Record**

9. Click **Save** to save your configuration.

You have configured the ServiceNow new record trigger for use with the trigger loop handle.

## Using ServiceNow Updated Record Trigger in Trigger loop Handle

You can use the ServiceNow updated record trigger to monitor a ServiceNow table for updated records.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **ServiceNow > Updated Record Trigger** in the **Trigger on** field.

A list of options for the processServiceNow new record trigger will appear for you to configure.

2. Optional: Enter the API version in the **API version** field.

3. Specify the credential fields for **Client ID**, **Client secret**, **Username**, and **Password** fields.

- **Credential**: Select a credential in the credential vault.
- **Variable**: Specify a variable.
- **Insecure string**: Enter a string.

4. Enter the **Table name** to monitor for new records.

A query is sent, and ServiceNow returns data for this table. When a new record is returned in the data, then this trigger is invoked.

5. Optional: Select an input where the ServiceNow response is stored in the **File names** field.

For **Variable**, specify a variable.

For **List**, the following can be selected:

- **Any**: Specify a value.
- **String**: Specify a value.
- **Number**: Specify a value.
- **Datetime**: Select the date, time, and time zone, or choose a **Variable**.
- **Boolean**: Select a **True** or **False** option, or choose a **Variable**.
- **File**: Specify a value for **Variable**, **Control room file**, or **Desktop file**

6. Optional: Specify the filter in the **Filter by records** field.

For **Sys\_id**, specify the ID

For **Query**, specify a query.

For **Number-value pair**, specify a dictionary or variable for **Dictionary** or add an entry for **Entry list**.

7. Specify a time in the **Check every** field to set the trigger interval.  
The trigger interval for the bot is set to 120 seconds.
8. Specify your variable in the **Assigned to** field.  
You can use this variable to retrieve various details about the email that triggered the bot, such as sender, recipient, subject, email content, date, action information, email server host, and port data.  
You can select from the following:
  - **Multiple variables**
  - **Record**
9. Click **Save** to save your configuration.  
You have configured the ServiceNow new record trigger for use with the trigger loop handle.

## Using Window Trigger in Trigger loop Handle

You can use the window trigger to start the bot base on window events.

In Automation Workspace, you added the **Trigger loop Handle** to your bot.

1. In the **Trigger loop Handle**, select **Window** in the **Trigger on** field.  
A list of options for the window trigger will appear for you to configure.
2. Select your application or variable in the **Window** field.
3. Specify the action in the **Window action that starts the bot** field.  
This option allows you to specify when your bot starts based on the modifications to your window.
  - **Open**
  - **Close**
4. Optional: In the **Assigned to** field, specify a variable to assign variable to this window.
5. Click **Save** to save your configuration.  
You have configured the window trigger for use with the trigger loop handle.

## V11 Task Bot package

The V11 Task Bot package enables you to run an Enterprise 11 bot from Automation 360 in the Enterprise 11 Control Room.

### Actions in the V11 Task Bot package

The package includes the following action:

Action	Description
Run	See <a href="#">Using Run action</a> on page 3343.

Related reference

[V11 Task Bot package updates](#) on page 1061

Review the updates in released versions of packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Using Run action

Use the **Run** action to run an Enterprise 11 bot from Automation 360 in the Enterprise 11 Control Room.

Ensure that the Enterprise 11 user credential that you want to use to run the Enterprise 11 bot includes the following:

- Access to the Enterprise 11 Bot Runner device on which you want to run the Enterprise 11 bots
- **Run my bots** and **View my scheduled bots** permissions

To use the **Send callback status to A2019** option, ensure the following:

- The IP address of the Automation 360 Bot Runner device on which you want to run the Automation 360 bot is a static IP address
- The IP address is available in the callback URL of the Enterprise 11 Control Room

[Callback URLs for bot deployment](#)

1. Double-click or drag the **Run** action from the **V11 Task Bot** node in the **Actions** palette.
2. Provide the Enterprise 11 Control Room URL in which you want to run the bot.
3. Click the **Credential** tab to use a value from the Credential Vault and the **Variable** to use a credential variable.

Alternatively, click the **Insecure string** tab to manually specify the value you want to use as the **Username** and **Password** to log in the Control Room you have specified.

4. Specify the location of the bot you want to run in the **Task relative path** field.
5. Optional: Specify the device on which you want to run the bot in the **Bot Runner device name** field.

You can specify multiple devices separated by a semicolon. Ensure that the names of the devices you have provided are the same as those on the **My Devices** page of the Enterprise 11 Control Room.

If you do not provide any value in the field, the system runs the bot on any connected devices (device for which the user specified in the Step 3).

6. Select the **Run bot runner session on Control Room** check box to deploy the bot using the remote desktop process.
7. Select the **Wait for task to complete** check box if you want the system to wait for the task to complete before performing the next action in the bot.
  - a) Specify the period you want the system to wait before the bot is timed out in the **Total wait time** field.
  - b) Select the version of the Control Room on which you want to run the bot.

- 11.3.2 or later (includes 11.3.3.x releases):

Click **Advanced settings** to expand and update the polling attributes.

Field	Description
Wait time before start polling the status	Period (in seconds) you want the system to wait before it starts polling the status after the bot is deployed on the device.
Polling interval for non-started execution	Time interval at which you want the system to poll for status for the Enterprise 11 bot you have set to run but has not started execution.
Polling interval for pending execution	Time interval at which you want the system to poll for status for the bot that you have set to run and is pending execution.
Polling interval for paused execution	Time interval at which you want the system to poll for status for the bot that has started execution and is paused.
Polling interval for in-progress execution	Time interval at which you want the system to poll for status for the bot that has started execution and is currently in progress.
Polling interval for unknown execution	Time interval at which you want the system to poll for status for the bot that has started execution and the current status is unknown.

- 11.3.4 or later:
  - Select the **Send callback status to A2019** option to specify a range for the TCP port that you want to use to send the callback status to Automation 360.

Field	Description
From available TCP port	Starting value in the range for the TCP port that you want to use to send the callback status.
To available TCP port	End value in the range for the TCP port that you want to use to send the callback status.

---

**Note:** The IP address of the Automation 360 Bot Runner must be reachable from Enterprise 11 Control Room on the range for the TCP port you have provided.

---

- Select the **Poll status from 11.x Control Room** option. Click **Advanced settings** to update the polling status from the Enterprise 11 Control Room:

Field	Description
Wait time before start polling the status	Period (in seconds) you want the system to wait before it starts polling the status after the bot is deployed on the device.
Polling interval for non-started execution	Time interval at which you want the system to poll for status for the Enterprise 11 bot you have set to run but has not started execution.
Polling interval for pending execution	Time interval at which you want the system to poll for status for the bot that you have set to run and is pending execution.
Polling interval for paused execution	Time interval at which you want the system to poll for status for the bot that has started execution and is paused.
Polling interval for in-progress execution	Time interval at which you want the system to poll for status for the bot that has started execution and is currently in progress.
Polling interval for unknown execution	Time interval at which you want the system to poll for status for the bot that has started execution and the current status is unknown.

8. Select the dictionary variable from the **Input parameters** list that you want to use to pass input parameters for the bot.

The input variables that you want to pass for the bot are contained as keys in the dictionary variable with their corresponding values.

9. Select the dictionary variable that you want to use to store the output from the **Assign the output to** list.

The dictionary variable stores the output parameters of the Enterprise 11 bot as keys.

Additionally, the following keys are added in the dictionary variable by default:

Key	Value
COMMAND	Name of the command that was last executed by the Enterprise 11 bot.
STATUS	Status of the Enterprise 11 bot execution.
START_TIME	Time when execution of the Enterprise 11 bot started.

Key	Value
END_TIME	Time when execution of the Enterprise 11 bot ended.
AUTOMATION_NAME	Name of the automation

10. Click **Save**.

## VBScript package

The VBScript package contains actions that enable VBScript functions in a task.

### Before you start

1. Verify that the device on which you want to run the VBScript has Windows operating system installed.
2. Open a VBScript file, or input the script you want to run using the **Open** action. You must associate the details of the file or script you want to run with a session name. Use this same session name for other VBScript actions.
3. Use the **Run function** action to execute a function within the script or execute the entire script. You must use the VBScript session name you established in the previous step.
4. After you have executed the script, close the VBScript session.

To review the bot launcher logs, navigate to `C:\ProgramData\AutomationAnywhere\BotRunner\Logs\<current month>\Bot_Launcher-<today's date>.log.zip`. Each zipped folder contains a file with data on the code execution, which is useful for debugging.

### Actions in the VBScript package

The VBScript package includes the following actions:

**Note:** The **Open** action must be the first action to use the VBScript in a task.

Action	Description
Close	See <a href="#">Close action in VBScript</a> on page 3347.
Run function	See <a href="#">Run function action in VBScript</a> on page 3347.
Open	See <a href="#">Open action in VBScript</a> on page 3348.

Related tasks

[Example of using the VBScript package in a resilient bot](#) on page 3444

Build a bot that executes a Microsoft Visual Basic script. Use the Try/Catch package to gracefully end the bot if it fails, making it resilient to crashes. A resilient bot allows scheduled and queued bots to continue even if the current bot encounters an error.

Related reference

[VBScript package updates](#) on page 1062

Review the updates in released versions of the VBScript package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Close action in VBScript

This action enables you to close the session in VBScript.

### Settings

Closes the session.

Specify the same session name from the **Open** action in VBScript.

## Run function action in VBScript

You can run a function within VBScript using the Run function action.

### Settings

Runs a function within the VBScript.

- In the VBScript **session** field, specify a session name. Use the same session name from the **Open** action in VBScript.
- Optional: Specify the function name to run and the arguments to pass to the function.

---

**Note:** You can pass only a list variable as an argument for the function. You can use the list variable to pass multiple arguments of different data types such as Boolean, datetime, number, and string.

- Optional: If the specified function returns a value, specify the variable to store that value in the **Assign the output to variable** field. The shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.

---

**Note:** In VBScript, stand alone scripts do not return a value.

---

See the following topic to understand how to use VBScript package.

[Example of using the VBScript package in a resilient bot](#) on page 3444

## Open action in VBScript

This action enables you to open a VBScript file.

### Settings

Opens a VBScript file.

- In the VBScript **session** field, specify a session name. Use this same session name for other VBScript actions.
- In the VBScript , choose one of the following options:
  - In the **Import existing file** option, select an existing VBScript file.

---

**Note:** If you are uploading a script from a file on your desktop, the file and any dependencies must be in a standalone folder. When you select a file for upload, all files and folders at the same folder level are uploaded.

---

- In the **Manual input** option, enter the VBScript.

## Wait package

Use the actions in the Wait package to add a condition to wait for an application screen to change, or a separate window to open or close before proceeding to the next action.

### Actions in the Wait package

The Wait package includes the following actions:

Action	Description
Wait for condition	See <a href="#">Wait for condition action</a> on page 3349
Wait for screen change	See <a href="#">Using Wait for screen change action</a> on page 3350.
Wait for window	See <a href="#">Using Wait for window action</a> on page 3353.

Related reference

[Wait package updates](#) on page 1064

Review the updates in released versions of the Wait package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Wait for condition action

Makes the bot wait until a specific condition is true before executing the next action.

### Settings

In the **Wait till** field, specify the condition to meet. For example, the wait condition can be based on whether an application is running, a folder or file exists, a variable matches the specified value, an application window exists, or a machine or server is running.

---

#### Note:

- If a bot encounters an internal error that does not appear on the UI, it does not wait for the amount of time that is specified in this action. The bot does not stop and continues to the next line.
- When you create a bot and use the variable option to search the window title and use the condition **Window exists**, or **Window does not exist** the bot will not search for the changed window title. Also, it will not identify the window title if you have changed the variable. You can use the condition **Window with same title does not exist**, or **Window with same title exist** to verify whether a window with the same title exists or changed.

---

**Important:** When you use the **Object exists** and **Object does not exist** conditions inside the **Wait for condition** action and choose the **Stop the bot and display an error message** option, the bot will not display an error message but proceed to the next action.

---

When you use the **Object does not exist** condition to verify whether a specific object exists in a window, and if the object exists, the result of the condition will be false. In this scenario, the bot keeps waiting until the specified condition is true, that is, the bot waits till the object does not exist in a window and then executes the next action.

---

**Note:** The value that you enter in the **Keep trying for (seconds)** field when you select Recorder conditions is not the wait time for the specified condition. This time is a timeout to search an object from the window. For example, if you specify a value of 15 seconds in the field, then the Recorder will take a maximum of 15 seconds to send the result to the **Wait for condition** action, that is whether the object exists in a window.

---

This action offers the same conditions as the **If** package. See the [If package](#) on page 2902.

### Group conditions

Use the **Add group** option to add multiple Boolean conditions or combine more than one conditions with **And** and **Or** options within a group and when you want the bot to check multiple conditions at a time before executing a set of .

You can also add a group within a group.

## Using Wait for screen change action

Use the **Wait for screen change** action to wait for the content of a specific screen or the entire window to change before executing the next action.

For example, a Human Resources (HR) personnel automating leave-management tasks wants to log in to the HR portal. After entering the user credentials, this action enables the automation task to wait until the next screen loads.

1. In the **Actions** palette, double-click or drag the **Wait for screen change** action from the Wait package.
2. In the **Screen change relative to** field, choose **Window** or **Screen**.
3. Select an application window:

Option	Steps
<p>Application</p>	<p>From the drop-down list, select the window title from the open applications.</p> <ul style="list-style-type: none"> <li>The <b>Window title</b> field displays the title of the application window you have selected.</li> </ul> <p>Insert a wildcard character (*) in the <b>Window title</b> field to search for window titles that can change. You can specify one or more wildcards (*) at the start, middle, or end of the value. For example, to perform an operation on any window that has Microsoft in the title, use a wildcard to indicate any string by adding it before or after the value: *Microsoft*. The first searches for the exact window title (Microsoft), and if it does not find a match, it searches for windows with the term Microsoft anywhere in the title.</p> <p>You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either <b>String</b> or a <b>Pattern</b> and then enter the value. By default, the <b>Window title</b> field is case-sensitive.</p> <p>To identify a browser title, you can enable the <b>Case sensitive</b> option to match the letter case, or disable the option to identify a window title where the letter case does not match.</p> <hr/> <p><b>Note:</b> Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).</p> <hr/> <p>For example, to match all window title names beginning with a word followed by - Notepad, you can enter the <b>String</b> value as * -Notepad, or use <b>Pattern</b> value as ((\w)\s)*document-Notepad for only those window titles that match this pattern.</p> <hr/> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>When you use a regular expression of type <b>String</b> with -title as the input value for a window title in any , the might encounter a run time</li> </ul>

input as ^-title, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card

Option	Steps
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers.
Variable	Use a window variable to specify the application window you want to use.

4. Optional: Select the **Resize window** option to specify the window dimensions. This option delivers a more reliable bot. It resizes the window to the dimensions at which the task was recorded, which enhances the ability of the bot to identify the target object.
- If the window is maximized when you record the task, this option is not selected.
  - If the window is not at the maximum size when you record the task, this option is selected, by default, and the width and height fields are automatically filled with the dimensions of the window.

---

**Note:** This option is available only for windows that can be resized. It is not available for the **Desktop** or **Taskbar** options.

---

5. Click **Capture region** to select the area on the specific window. The selected window appears.
6. Drag the mouse to draw a rectangle around the region that you want to capture and right-click when done. The captured area appears in the **Preview** section, followed by the image coordinates **X, Y, Width, and Height**.

---

**Note:** After you capture the specific area, the action waits for the content in the captured area to change before executing the next action.

---

7. In the **How long to wait before comparing screens?** field, specify the wait time (in seconds) to begin comparing the window or screen. When a difference is detected, the comparison stops and the task proceeds to the next action.
8. In the **How long to wait before screen comparing is stopped?** field, specify the wait time (in seconds) for the screen to change. If the screen does not change within the time you specified, the task proceeds with the next action.
9. Select the **Throw an exception if the screen is not changed** option to show an error message and terminate the bot if the screen does not change. If the option is deselected and the screen does not change, the task proceeds with the next action.
10. Click **Save**.

## Using Wait for window action

Use the **Wait for window** action to wait for the specified window to open or close before executing the next action.

For example, a Human Resources (HR) personnel automating leave-management tasks might require the attendance application to open before they enter the user credentials. This action enables the automation task to wait until the application window opens.

1. In the **Actions** palette, double-click or drag the **Wait for window** action from the Wait package.
2. In the **Wait for window** field, select the option you want the automation to wait for:
  - **Wait for window to open**
  - **Wait for window to close**
3. Select an application window:

Option	Steps
<p>Application</p>	<p>From the drop-down list, select the window title from the open applications.</p> <ul style="list-style-type: none"> <li>The <b>Window title</b> field displays the title of the application window you have selected.</li> </ul> <p>Insert a wildcard character (*) in the <b>Window title</b> field to search for window titles that can change. You can specify one or more wildcards (*) at the start, middle, or end of the value. For example, to perform an operation on any window that has Microsoft in the title, use a wildcard to indicate any string by adding it before or after the value: *Microsoft*. The first searches for the exact window title (Microsoft), and if it does not find a match, it searches for windows with the term Microsoft anywhere in the title.</p> <p>You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either <b>String</b> or a <b>Pattern</b> and then enter the value. By default, the <b>Window title</b> field is case-sensitive.</p> <p>To identify a browser title, you can enable the <b>Case sensitive</b> option to match the letter case, or disable the option to identify a window title where the letter case does not match.</p> <hr/> <p><b>Note:</b> Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).</p> <hr/> <p>For example, to match all window title names beginning with a word followed by - Notepad, you can enter the <b>String</b> value as * -Notepad, or use <b>Pattern</b> value as ((\w)\s)*document-Notepad for only those window titles that match this pattern.</p> <hr/> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>When you use a regular expression of type <b>String</b> with -title as the input value for a window title in any , the might encounter a run time</li> </ul>

input as ^-title, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card

Option	Steps
Browser	Select from a list of supported browser tabs.  <b>Note:</b> This option supports , Chromium-based , and browsers.
Variable	Use a window variable to specify the application window you want to use.

4. In the **How long you would like to wait for this condition to be true?** field, specify the wait time (in seconds) for the window to open or close.  
If the window does not open or close within the time you specify, the task proceeds to execute the next set of actions.
5. Select the **Throw an exception if wait for window is unsuccessful** option to show an error message and terminate the bot if the window does not open or close within the specified amount of time.  
If the option is deselected and the window does not open or close within the specified amount of time, the task proceeds with the next action.
6. Click **Save**.

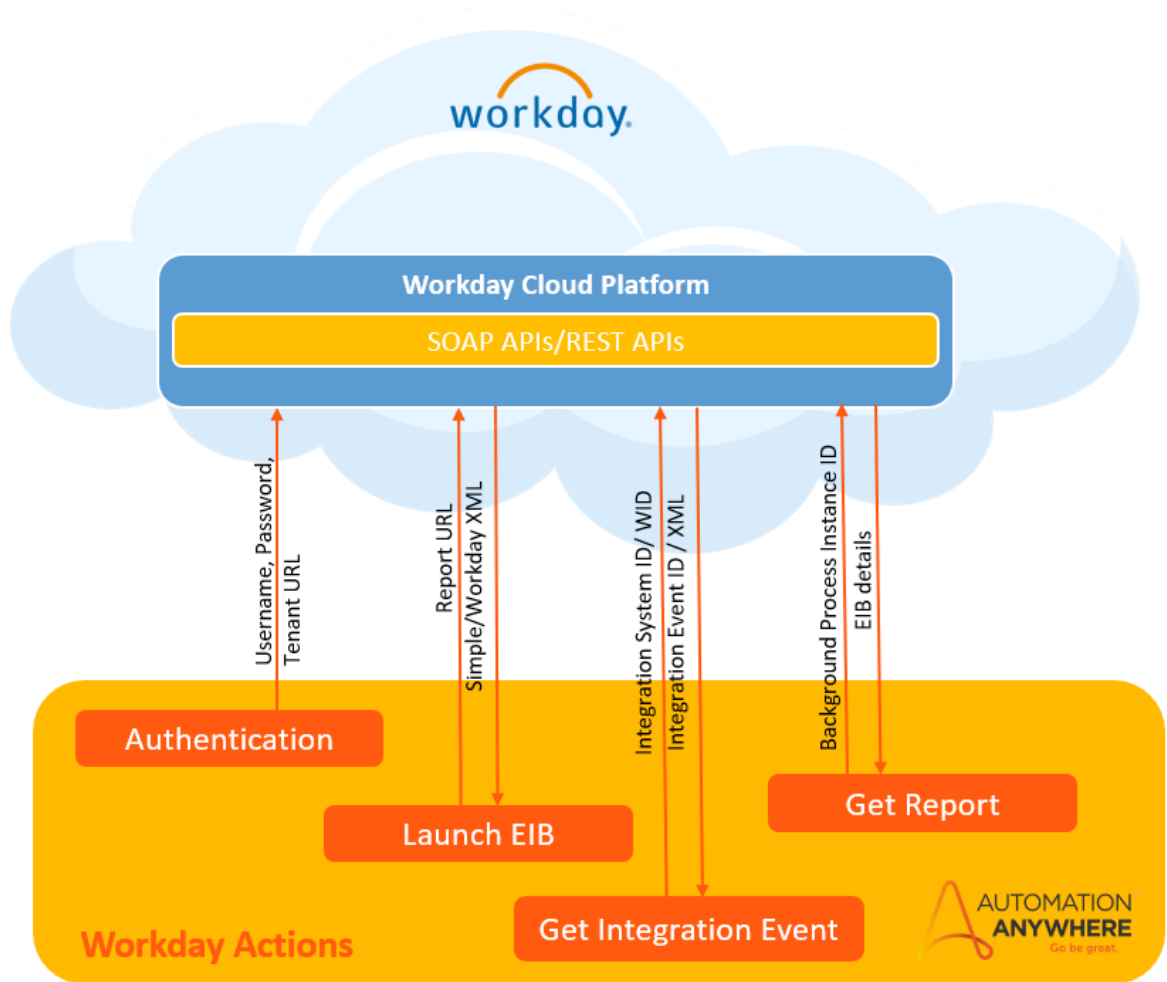

## Workday package

Workday is a leading provider of enterprise cloud applications that helps organizations manage various HR, finance, and business processes, including payroll, and more. The Automation 360 Workday package uses the Workday Web Services (set of SOAP APIs) to read and write data in and out of Workday.

### Note:

The Workday mark and logo are trademarks or registered trademarks of Workday and are used for identification purposes only.

The Workday package has a deep API-level integration with Workday that allows you to build automations and eliminates the need to program. It is aimed at automating Workday processes like reporting, data upload/download, or triggering work flows. To start interacting with Workday, use the authenticate action from the Workday package to authenticate from Automation 360. After you authenticate, you can retrieve reports, launch EIB (Enterprise Interface Builder), and get integration status using various actions in the Automation Anywhere Control Room. The following diagram provides an overview of the actions performed between Automation 360 and Workday:

The following video shows how Workday can be used along with ServiceNow to automate a use case where HR creates the open positions in Workday by launching an Enterprise Interface Builder (EIB) from Automation 360:

[Workday package updates](#) on page 1067

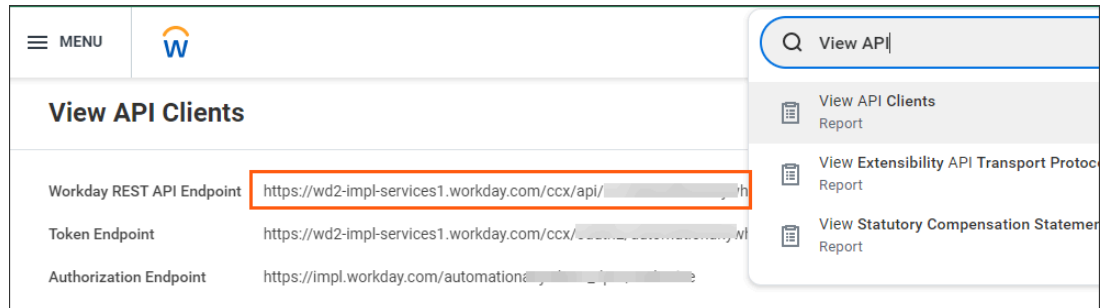

Review the updates in released versions of the Workday package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Workday Authentication action

Workday Authentication action is the first command action that you need to call to get authenticated with your Workday instance.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

- To authenticate to Workday, you need to know your Environment base URL (domain), Tenant ID, Username, and Password.
- Log in to the Workday as an admin. For more information on logging in to a Workday instance, see [Workday Login](#).
- To find the base URL (domain) and tenant of your Workday environment, search for View API Clients. You will be able to derive the base URL from the Workday REST API Endpoint field. The format is `https://{domain}.workday.com/ccx/api/v1/{tenant}`.
  - The base URL is `https://{domain}.workday.com/`. For example, if the Workday REST API Endpoint is `https://wd2-impl-services1.workday.com/ccx/api/v1/yourtenant_abc`, your base URL is `https://wd2-impl-services1.workday.com`

- The tenant is derived from the Workday REST API Endpoint field as well. For example, if the Workday REST API Endpoint is `https://wd2-impl-services1.workday.com/ccx/api/v1/yourtenant_abc`, your tenant is `yourtenant_abc`

- Create a new .
  - Log in to your instance of the .
  - On the left panel, click **Automation**.
  - Click **Create new > Bot**.
  - In the **Create Task Bot** window, enter the name.
  - Accept the default folder location: `\Bots\`  
To change the default storage location, click **Choose** and follow the prompts.
  - Click **Create and edit**.
- From the Actions pane, select **Workday > Authentication** and place it under the **Start** of the bot flow.
  - In the **Environment** field, enter the **base URL** copied from Workday.
  - In the **Tenant** field, paste the **tenant** copied from Workday.
  - Enter the Workday Username. Select one of the following options to specify the **Username**:
    - Credential**: Enables you to use a value available in the Credential Vault that contains information about the Username/Password. For more information on creating a credential, see [Set up lockers and credentials in Credential Vault](#) on page 1978.
    - Variable**: Enables you to use a credential variable that contains information about the Username/Password. For more information on creating a variable, see [Credentials and credential variables in the Bot editor](#) on page 2496.

- **Insecure string:** Enables you to manually enter the Username/Password for the Workday Authentication.
- d) Enter the Workday Password. Select one of the following options to specify the **Password:**
- **Credential:** Enables you to use a value available in the Credential Vault that contains information about the Username/Password. For more information on creating a credential, see [Set up lockers and credentials in Credential Vault](#) on page 1978.
  - **Variable:** Enables you to use a credential variable that contains information about the Username/Password. For more information on creating a variable, see [Credentials and credential variables in the Bot editor](#) on page 2496.
  - **Insecure string:** Enables you to manually enter the Username/Password for the Workday Authentication.
- e) Enter Default as the session name or create a session of type **Workday Session**.

The screenshot displays the Automation Anywhere interface. On the left, the 'Actions' pane shows 'Workday' selected, with 'Authentication' highlighted under the 'Workday' category. The central canvas shows a workflow starting with 'Start', followed by 'Workday: Authentication' (step 1), 'Workday: Get Report' (step 2), and 'Message box' (step 3) with the text 'hi'. On the right, the configuration for 'Workday: Authentication' is shown. It includes fields for Environment (a), Tenant (b), Username (c), and Password (d). The 'Create Workday session' section has 'Local session' selected, and the session name is set to 'Default' (e).

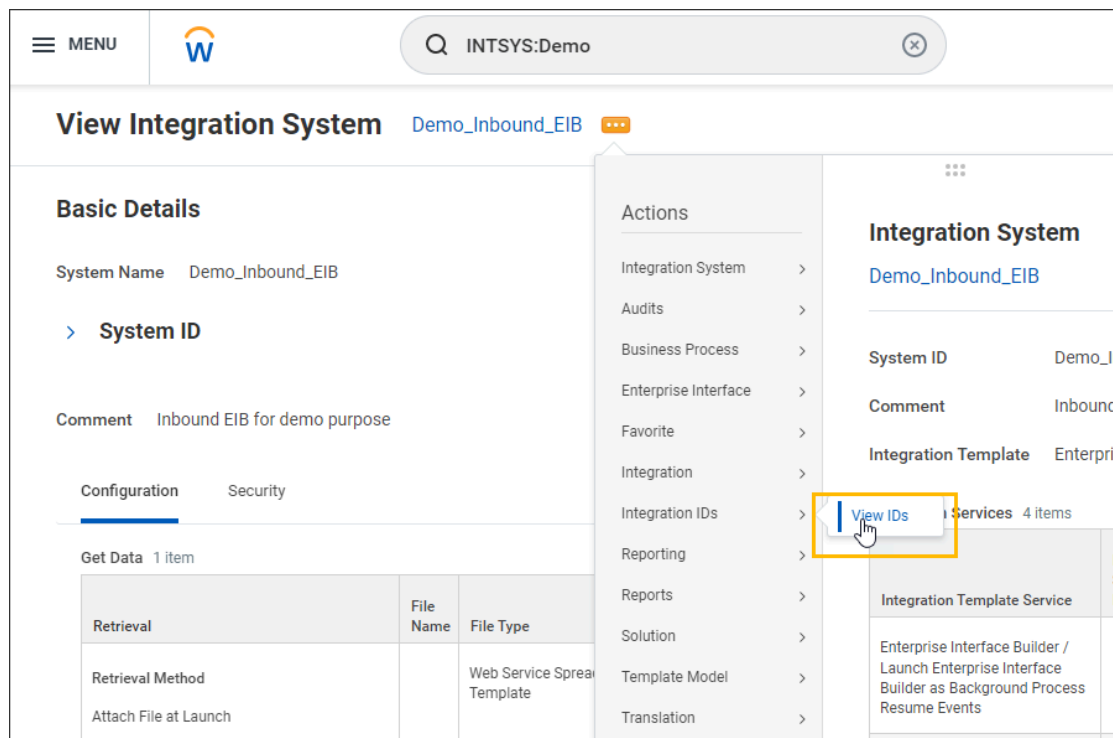

## Workday Launch EIB action

With the Workday Launch EIB(Enterprise Interface Builder) action, you can invoke an inbound or an outbound EIB using the IntegrationSystemID or WorkdayID. An EIB is a tool to get data out of Workday (Outbound EIB) or get data into Workday (Inbound EIB)

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

Ensure that you are authenticated before initiating any Workday action. For more details, see [Workday Authentication action](#). You have the option to launch Inbound or Outbound EIB. Below are the prerequisites for each of these options:

- For Inbound Workday EIBs - Use to load data into your Workday system by downloading EIB template as a file attachment or file transfer from the Control Room. For example, sending an employee record file with the employee's details to Workday creates a new record entry.
  - Log in to Workday as an admin. For more information on logging in to a Workday instance, see [Workday Login](#).
  - Open the EIB you want to launch.
  - To get the Integration System ID or WID of the EIB, navigate to **Actions > Integration IDs > View IDs**.

The **Integration IDs** page appears with the Workday ID (WID) and Integration System ID.

- Copy either the Workday ID (WID) or Integration System ID.
1. For Outbound Workday EIBs - Use to export data from custom reports. You can use Outbound EIBs for simpler integrations. For example, when one data source is used (typically a report) and the transformation is simple enough to be done with a single custom transformation (XSLT) or Custom Report Transformation. For example, extracting employee salary information from Workday in order to send it to a 3rd party payroll system.
1. In the Automation Anywhere Control Room, navigate to the **Actions** pane, select **Workday > Launch EIB**, and place it in the canvas.

- a) From the **Type of ID** drop-down select either the Workday ID (WID) or Integration System ID.
  - b) In the **ID** field, paste either the Workday ID (WID) or Integration System ID copied from Workday.
  - c) Select the **Type of integration**. Automation 360 supports launching both **Inbound** and **Outbound** integrations.
  - d) For the **Inbound** integration, you need to provide the integration template. For more information, see [Workday Launch EIB](#). The **Outbound** integration does not require a template.
  - e) Enter Default as the session name, or create a session of type **Workday Session**.
  - f) The Launch EIB action returns the Integration event ID. You can save it as a variable defined in **Integration event ID (optional)**.
  - g) The Launch EIB action also returns Details of the integration. You can save it as a variable defined in **Details (optional)**.
2. Verify that you can run the bot and launch an EIB. The following video will launch an EIB in Workday from Automation Anywhere Control Room. The video shows how the Workday status changes from Processing to Completed which confirms that the EIB has been successfully launched.

---

**Tip:** Use the Integration Event ID in [Workday Get Integration Event](#) action on page 3361 to get the current status of the integration.

---

## Workday Get Integration Event action

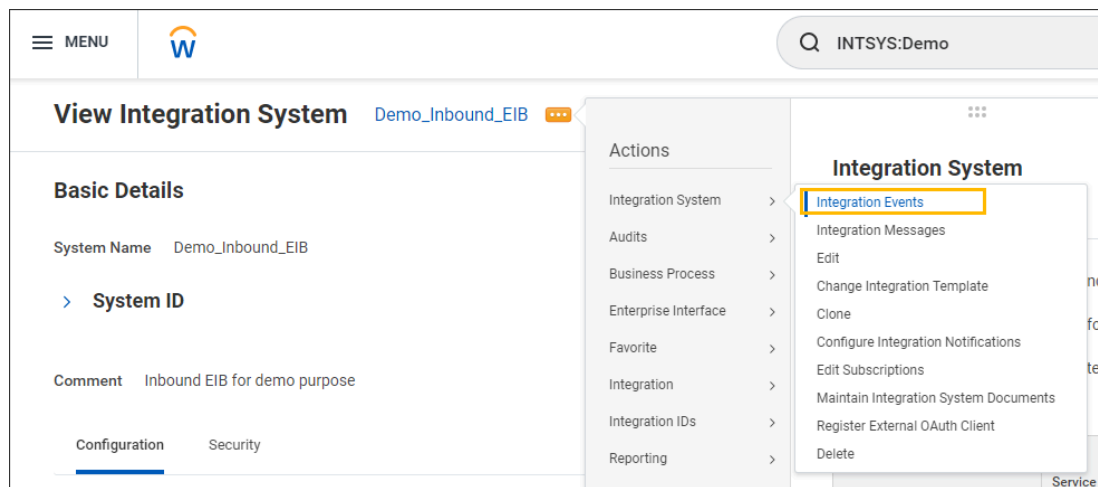

You can use the **Get Integration Event** to monitor the progress of an EIB or other integrations in a Workday instance.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

Ensure that you are authenticated before initiating any Workday action. For more details, see [Workday Authentication action](#). Below are the prerequisites for the **Get Integration event**:

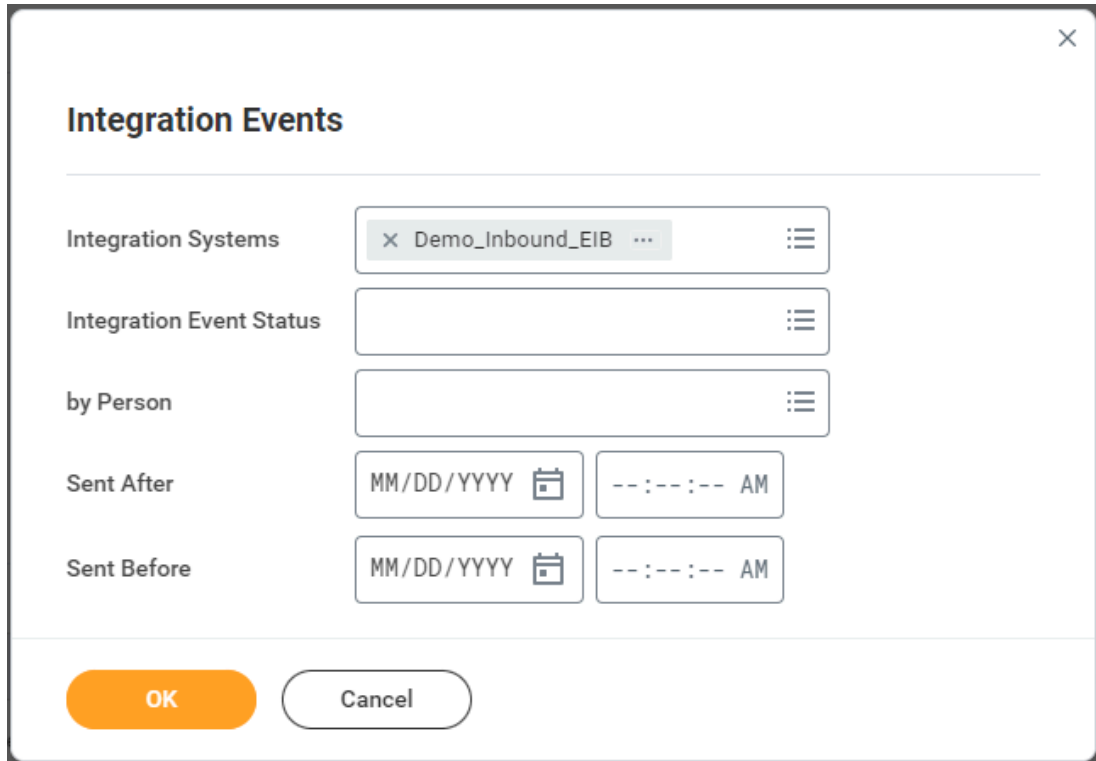

- Log in to the Workday as an admin. For more information on logging in to a Workday instance, see [Workday Login](#).
- Open the EIB that contains the event you want to monitor.
- To review the Background Process Instance ID or WID of an EIB event:

1. Navigate to **Actions > Integration System > Integration Events**.

The **Integration Events** screen appears.

2. Click **OK** to show all the integration events. You can also filter the results based on **Integration Event Status**, **by Person**, or by **Sent After/Sent Before** date and time.

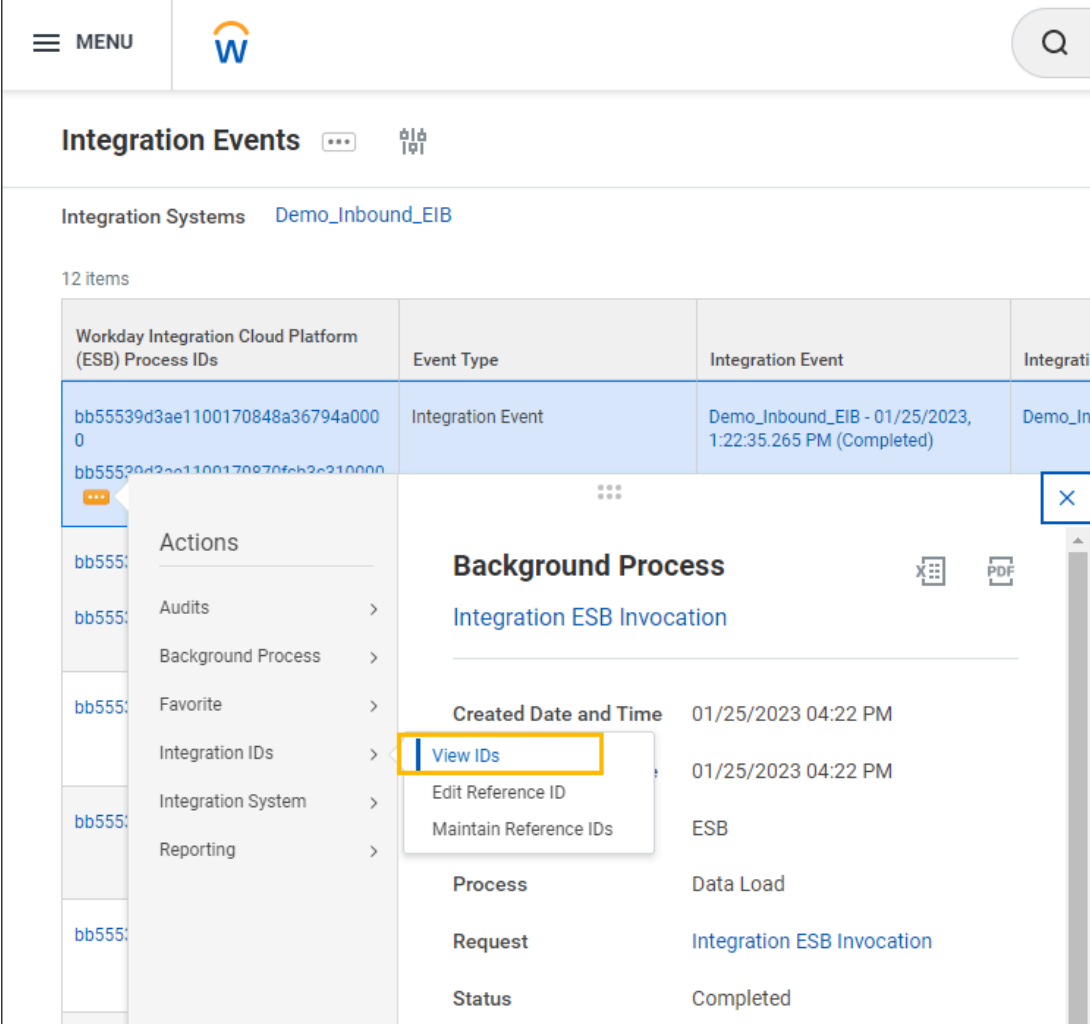

The image shows a dialog box titled "Integration Events" with a close button (X) in the top right corner. The dialog contains several configuration fields:

- Integration Systems:** A dropdown menu with "Demo\_Inbound\_EIB" selected and a menu icon to its right.
- Integration Event Status:** An empty dropdown menu with a menu icon to its right.
- by Person:** An empty dropdown menu with a menu icon to its right.
- Sent After:** Two input fields: the first contains "MM/DD/YYYY" with a calendar icon, and the second contains "--:--:-- AM".
- Sent Before:** Two input fields: the first contains "MM/DD/YYYY" with a calendar icon, and the second contains "--:--:-- AM".

At the bottom of the dialog, there are two buttons: "OK" (orange) and "Cancel" (white with a grey border).

3. Select the EIB event you want to monitor. Navigate to **Actions > Integration IDs > View IDs**.

**Request** Integration ESB Invocation

**Status** Completed

The **Integration IDs** page appears with the Workday ID (WID) and Background Process Instance ID.

1. Copy either the Workday ID (WID) or Background Process Instance ID.
2. In the Automation Anywhere Control Room, navigate to the **Actions** pane, select **Workday > Get Integration Event**, and place it in the canvas.

- a) From the **Type of ID** drop-down, select either the Workday ID (WID) or Background Process Instance ID.
- b) In the **ID** field, paste either the Workday ID (WID) or Background Process Instance ID copied from Workday.
- c) Enter Default as the session name, or create a session of type **Workday Session**.
- d) Save the outcome to a variable. For example, you can store all the lines of the report in a Dictionary (EIB-Status).

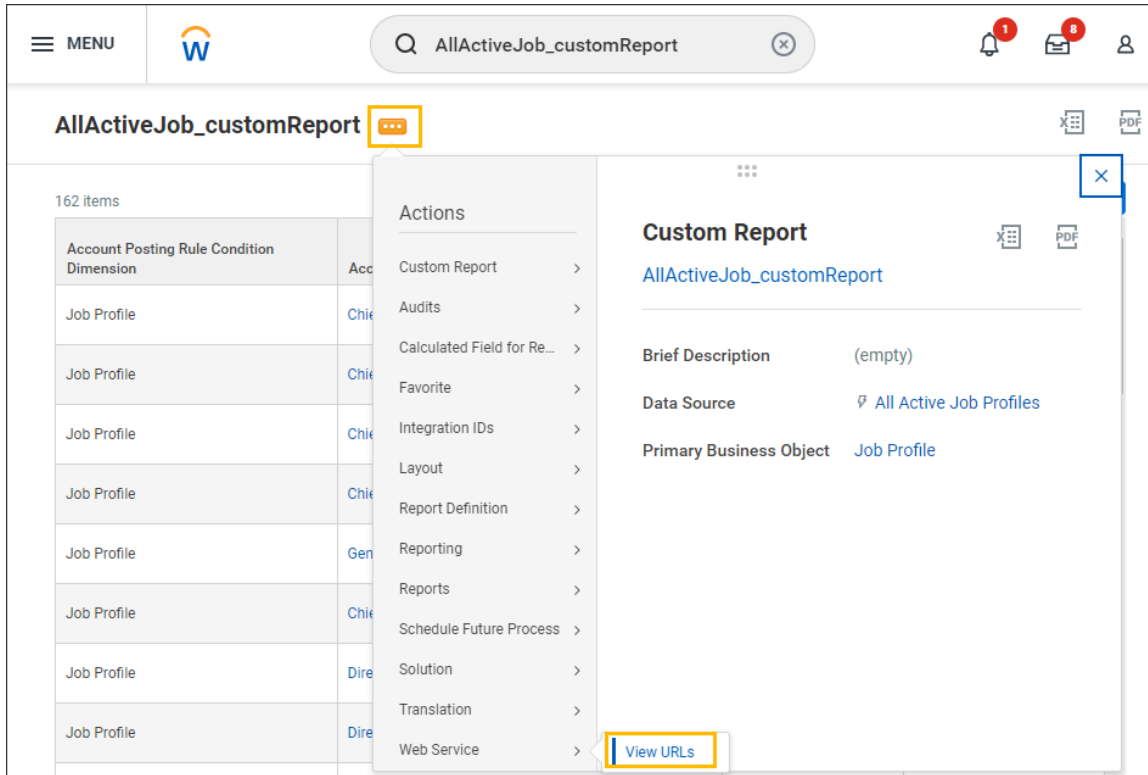

## Workday get report action

Use the Workday - Get Report action to retrieve a report using the Report URL. Workday Reports-as-a-Service (RaaS) is a feature that makes reports available as web services. While you are creating these reports in Workday, you must configure them as Advanced type reports to be web-service enabled.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

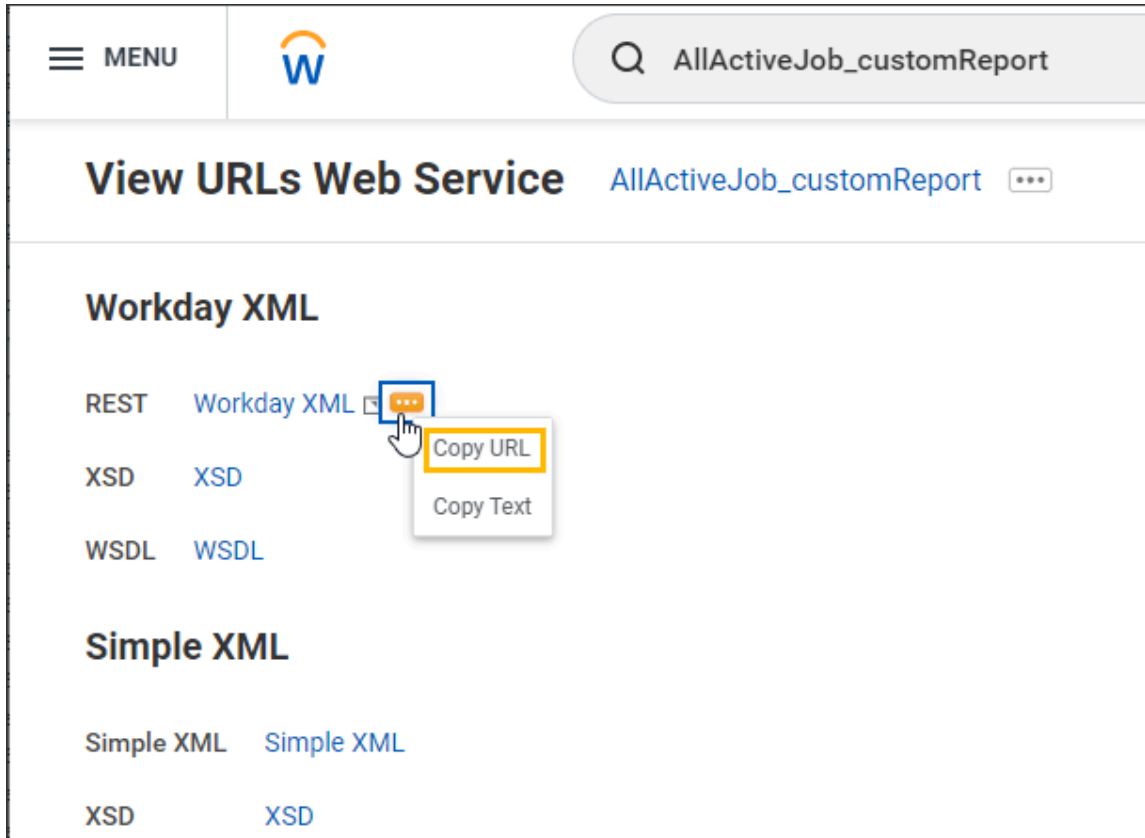

Ensure that you are authenticated before initiating any Workday action. For more details, see [Workday Authentication action](#). Below are the prerequisites for the **Get Report event**:

- Log in to the Workday as an admin. For more information on logging in to a Workday instance, see [Workday Login](#).
- To find the report URL, click the horizontal three dots and navigate to **Actions > Web Service > View URLs**.

The **View URLs Web Service** page appears.

- Right-click **Workday XML** and select **Copy URL**.

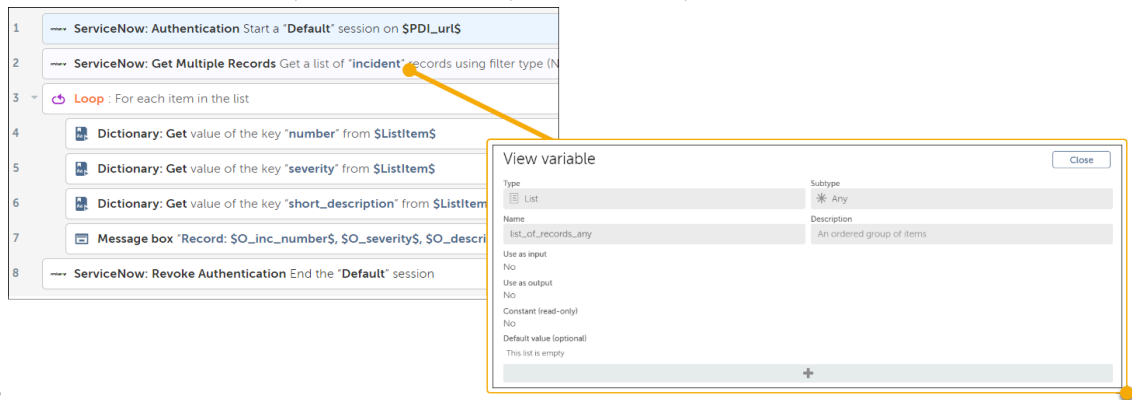

1. In the Automation Anywhere Control Room, navigate to the **Actions** pane, select **Workday > Get Report**, and place it in the canvas.

- a) Paste the **Report URL** copied from Workday. The copied report URL is the report you want to get from Workday in Automation 360.
- b) Select the **Report Format**. Automation 360 supports **Simple Xml** and **Workday Xml** formats. **Workday Xml** contains more data elements (for example, WID (Workday ID)) than the **Simple Xml**.
- c) Enter Default as the session name.

- d) Save the outcome to a variable. For example, you can store all the lines of the report in a list (listReportData)
2. To verify that you can run the bot in Debug mode, set a breakpoint action next to **Get Report**. In the previous example, there is a Message box action. Open the listReportData variable to view the results.

**Note:** The output is retrieved as a list of type . To read an individual record (row) in this list, you need to loop through all the dictionary items using the action and read or extract the records (rows) individually. For example, the output of get multiple records is saved in the variable list\_of\_records\_any. If the variable contains five records, then each record is passed to the Loop action to be processed one at a

time.

## Window package

Use the Window package to automate tasks relating to the window.

**Window** is a data type available for storing application window titles. It is the only data type that can be used in all the actions of the **Window** package. Create a variable of data type **Window** and select or assign a window title.

**Note:** When you create a Window type variable, note that selecting **Browser** as default value supports only Google Chrome tabs whereas selecting **Application** as default value supports any application window.

Use this variable in any number of actions within the automation task. If the application window title changes, then change the value assigned to the variable. The new application title is reflected in all the actions where the variable is used.

### Actions in the Window package

The Window package includes the following actions:

Action	Description
Activate	See <a href="#">Activate action in Window</a> on page 3368
Assign	See <a href="#">Assign action in Window</a> on page 3369

Action	Description
Close	See <a href="#">Close action in Window</a> on page 3370
Close all	See <a href="#">Close all action in Window</a> on page 3371
Get active window title	See <a href="#">Get active window title action in Window</a> on page 3371
Maximize	See <a href="#">Maximize action in Window</a> on page 3371
Minimize	See <a href="#">Minimize action in Window</a> on page 3372
Resize	See <a href="#">Resize action in Window</a> on page 3373
Restore	See <a href="#">Restore action in Window</a> on page 3374
Set title	See <a href="#">Set title action in Window</a> on page 3375

[Window package updates](#) on page 1065

Review the updates in released versions of packagesuch as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Activate action in Window

The **Activate** action in the Window package enables you to activate a window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.
  - Application:** Select from a list of windows, including browser windows, that are currently open on the Bot Creator device.
  - Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- Variable:** Select an existing window variable to specify the title of the application window title.

- In the **Window title** field, specify the title.

Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by -Notepad, you can enter the **String** value as \* -Notepad, or use **Pattern** value as ( (\w) \s) \*document-Notepad for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with -title as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as \*-title, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with -title as the input value for a window title in any , the might encounter a run time error because the input value \*-title is incorrect.

Ensure that you use valid regex patterns.

---

## Assign action in Window

The **Assign** action in the Window package enables you to assign a source window variable's value to a designated window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.
  - **Application:** Select from a list of windows, including browser windows, that are currently open on the device.
  - **Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable:** Select an existing window variable to specify the title of the application window title.
- In the **Select the destination window variable/value** field, specify the variable.

---

**Note:** The regular expression (regex) is currently not supported.

---

## Close action in Window

The **Close** action in the Window package enables you to close the application window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.
  - **Application**: Select from a list of windows, including browser windows, that are currently open on the device.
  - **Browser**: Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable**: Select an existing window variable to specify the title of the application window title.

Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by - Notepad, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

#### Note:

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

---

#### Note:

- When multiple Excel windows are opened, the bot closes all the open Microsoft Excel windows even when a specific Excel window name is selected to close.
  - When you select **Currently active** as the window title, to close any active windows, and then run the bot, the **Shut Down Windows** pop-up is no longer activated, even if there are no active windows on the machine.
- 

## Close all action in Window

The **Close all** action in the Window package enables you to close all the windows.

### Settings

In the **Add window** field, you can provide the title of the application windows that you do not want to close.

You can also search the window titles by using (\*) as a wildcard character. Specify one or more (\*) wildcards at the start, middle, or end of the title. For example, to perform an operation on any window that has Microsoft in the title, use a wildcard to indicate any string by adding it before or after the value: \*Microsoft\*. The bot first searches for the exact window title (Microsoft), and if it does not find a match, it searches for windows with the term Microsoft anywhere in the title.

---

**Note:** To keep the Bot editor window open, ensure that you add it in the **Add window** field. For example, enter \*Control Room | Automation Anywhere\* in the window title to keep it open.

---

## Get active window title action in Window

The **Get active window title** action in the Window package enables you to retrieve the title of the active window.

### Settings

In the **Assign the window title to variable** field, specify the variable.

The shows a descriptive default variable name. If you create several output variables, subsequent variable names are appended with a -1, -2, -3, and so on to avoid duplication.

---

**Note:** The regular expression (regex) is currently not supported.

---

## Maximize action in Window

The **Maximize** action in the Window package enables you to maximize a window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.

- **Application:** Select from a list of windows, including browser windows, that are currently open on the device.
- **Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable:** Select an existing window variable to specify the title of the application window title.

Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `- Notepad`, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

## Minimize action in Window

The **Minimize** action in the Window package enables you to minimize a window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.

- **Application:** Select from a list of windows, including browser windows, that are currently open on the device.
- **Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable:** Select an existing window variable to specify the title of the application window title.

Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.

You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `- Notepad`, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

## Resize action in Window

The **Resize** action in the Window package enables you to resize a window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.

- **Application:** Select from a list of windows, including browser windows, that are currently open on the device.
- **Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable:** Select an existing window variable to specify the title of the application window title.
- Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.
- You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `-Notepad`, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

- 
- In the **Left**, **Top**, **Width**, and **Height** fields, specify values for resizing the window.

## Restore action in Window

The **Restore** action in the Window package enables you to restore a window.

### Settings

- In the **Window** field, select an option: Choose from the **Application**, **Browser**, or **Variable** tab.

- **Application:** Select from a list of windows, including browser windows, that are currently open on the device.
- **Browser:** Select from a list of supported browser tabs.

---

**Note:** This option supports , Chromium-based , and browsers.

---

- **Variable:** Select an existing window variable to specify the title of the application window title.
- Insert a wildcard character (\*) in the **Window title** field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has `Microsoft` in the title, use a wildcard to indicate any string by adding it before or after the value: `*Microsoft*`. The first searches for the exact window title (`Microsoft`), and if it does not find a match, it searches for windows with the term `Microsoft` anywhere in the title.
- You can use a regular expression (regex) to identify a window title. Select the regular expression condition as either **String** or a **Pattern** and then enter the value. By default, the **Window title** field is case-sensitive.

To identify a browser title, you can enable the **Case sensitive** option to match the letter case, or disable the option to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum version installed on your system is the version that was released with v.26. If you have a version released with v.25 or earlier, then by default, the window title will be identified only with matching letter case (case-sensitive).

---

For example, to match all window title names beginning with a word followed by `-Notepad`, you can enter the **String** value as `* -Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

---

**Note:**

- When you use a regular expression of type **String** with `-title` as the input value for a window title in any , the might encounter a run time error. To prevent the run time error, ensure that when you add the string input as `*-title`, the application with the specific title is open. The asterisk (\*) is just a character, not a wild card character.
- When you use a regular expression of type **Pattern** with `-title` as the input value for a window title in any , the might encounter a run time error because the input value `*-title` is incorrect.

Ensure that you use valid regex patterns.

---

## Set title action in Window

The **Set title** action in the Window package assign a new window title to a window variable.

### Settings

- In the **Window** field, click one of the following tabs:
  - **Browser**

- Click the **Choose a browser tab** drop-down menu to select any of the active browsers on your system. Google Chrome, Chromium-based Microsoft Edge, and Internet Explorer browsers are supported.

(Optional) Click the **Refresh windows** icon to update the list.

- In the **Browser title** field, click one of the following tabs:
  - **String**: Enter a wildcard character (\*) in the window title field to search for window titles that can change. You can specify one or more wildcards (\*) at the start, middle, or end of the value. For example, to perform an operation on any window that has Microsoft in the title, use a wildcard to indicate any string by adding it before or after the value: \*Microsoft\*. The bot first searches for the exact window title (Microsoft), and if it does not find a match, it searches for windows with the term Microsoft anywhere in the title.
  - **Regex**: You can use a regular expression (regex) to identify a window title. Select the regular expression **Type** as either **String** or **Pattern** and then enter the value. By default, the Window title field is case-sensitive.

For example, you can enter the **String** value as `((\w*)-Notepad` for all window title names starting with `((\w*)-Notepad`, or use **Pattern** value as `((\w)\s)*document-Notepad` for only those window titles that match this pattern.

- The **Case sensitive** option is enabled by default and is used to match the letter case. Optionally, you can clear the check box to identify a window title where the letter case does not match.

---

**Note:** Ensure that the minimum Bot Agent version installed on your system is the version that was released with Automation 360Automation 360 v.26. If you have any of the older Bot Agent versions, the window title will be identified only with matching letter case (case-sensitive) by default.

---

- The **Link to the web page** field displays the address of the website you have selected through the browser.
- The **Browser application** field displays the name of the browser you have selected.

- **Application**

Click the **Choose an application window** drop-down menu to select an application that is currently active on your Bot Creator device.

(Optional) Click the **Refresh windows** icon to update the list.

- **Variable**

Select an existing application window or browser tab to specify the title.

- In the **Window title is** field, select one of the following options for new title:
  - **Not a regular expression**: If the sub-string is not a regular expression.
  - **A regular expression**: If the sub-string is a regular expression.
- In the **New window title** field, enter the new title that you want to assign.

(Optional) Click the **Insert a value** icon to select an existing variable for the new title.

## Workload package

The Workload package enables you to insert work items in a queue for workload automation. It also enables data chaining between multiple queues. You can orchestrate multiple bots, and enable optimal device utilization through the queueing mechanism of workload management.

For example, a business process of Employee Salary Processing:

- A payroll queue can process the employee salaries, and a payroll bot can add work items to a finance queue.
- The finance queue in turn can release the funds to employees and a finance bot in turn adds works items in a HR queue to email employees on the salary processing completion.

You must have the Queue **Owner** or **Participant** privileges to view the list of queues in the Workload package.

### Actions in the Workload package

The Workload package includes the following action:

**Note:** If you built a bot using actions from the Workload package from Build 5322 or earlier, the action will be missing when you open the bot with the default package version. You must reinsert the action and repopulate the fields.

Action	Description
Insert work item	Allows you to insert a work item from an existing queue to another queue as part of a bot execution.

#### Note:

- To download an individual package (updated in an Automation 360 release where you want only the package), use this URL:  
`https://aai-artifacts.my.automationanywhere.digital/packages/<package-file-name>-<version.number>.jar`
- For Workload package, the naming convention is: `bot-command-wlm-<version.number>.jar`  
 For example, `bot-command-wlm-2.10.1-20220512-164301.jar`

For detailed steps on downloading a package and manually adding it to the Control Room, see [Add packages to the Control Room](#) on page 2026.

Related concepts

[Workload management](#) on page 2135

The workload management module enables users to upload Microsoft Excel and CSV files to the Control Room so that it feeds the records from the files into the bot deployments.

Related tasks

[Attach work item template to bot](#) on page 2465

Attach a work item template to a bot to use the bot in workload automation.

[Use Work Item variables](#) on page 2495

You can use the Work Item variables to pass the Work Item attributes or values to the Task Bot from the Control Room when you run the bot with the option **Run bot with queue**.

## Using Insert work item action

The **Insert work item** action provides you the flexibility to insert a work item to another queue as part of a bot execution.

- You must have the Queue **Owner** or **Participant** privileges to view the list of queues in the Workload package.
- Do not attach the bot with a work item template as the bot fails when it is deployed on a Bot Runner.
- The maximum number of characters you can insert in a work item value is 1000.

Considerations when using the **Insert work item** action:

- Run the bot using one of the following options:
  - Run bot now
  - Schedule bot
  - Run with triggers
- Use the **Insert work item** to manage complex workflows by configuring a bot to add work items from multiple queues.

For example, use a bot to read a list of invoices from a .csv file and add the invoices due for payment to another bot that manages information of payments due on specific dates. The automation can be used in the scenarios where work items are part of a different system (Database, Excel) and the bot reads them and adds them to a queue or where one queue adds work items to another queue as part of data chaining.

1. In the **Automation** page, **Create** a bot or **Edit** an existing bot.
2. In the **Actions** palette, double-click or drag the **Insert Work Item** action from the Workload package.
3. In the **Workload: Insert work item** window, add parameters such as the **Queue** and work item values:
  - a) Click **Browse** to select a queue name from the list of queues to insert as a work item.
  - b) Click **Confirm** to add the queue.
  - c) Start entering work item values in the work item fields.

---

**Note:** These parameters are populated based on the work item template associated with the selected queue.

---

You can also assign a variable value to these parameters by pressing the F2 key and selecting a variable name from the list.

**Tip:** Use UTC format (YYYY-mm-dd 00:00:00) for **Date** data type.

---

4. Click **Save**.  
The action is added to the bot.
5. Add more data using the **Insert Work Item** action.  
After the required data is added, **Save** the bot and **Check in** the bot to the **Public** folder for further processing and deployment.

Related concepts

[Create workload queues](#) on page 2136

A queue is one of the main building blocks of Workload Management. A queue holds data known as Work Items for further processing. The system distributes these Work Items to individual unattended Bot Runners in a device pool for processing.

Related tasks

[Attach work item template to bot](#) on page 2465

Attach a work item template to a bot to use the bot in workload automation.

[Use Work Item variables](#) on page 2495

You can use the Work Item variables to pass the Work Item attributes or values to the Task Bot from the Control Room when you run the bot with the option **Run bot with queue**.

[Insert Work Items](#) on page 2143

Add Work Items from a CSV file to the queue after you define the structure.

## XML package

Extensible Markup Language (XML) is a markup language designed to store and transport data. Use the actions in the XML package to automate the processing of XML data generated from web services and cloud computing applications.

An XML document is structured as an ordered and labeled tree. Each node of the tree is an XML element and is written with an opening and closing tag. In the following example, `custname` and `custid` are nodes:

```
<customer>
 <custname>XYZ Corp</custname>
 <custid>A001</custid>
</customer>
```

XPath is a query language that uses path expressions to select nodes or node-sets in an XML document. XPath includes built-in functions for manipulation of string, numeric, Boolean, date and time, and so on.

### Before you start

Perform the following actions within the XML package.

1. Start the XML session using the **Start XML Session** action. Use this session name for all corresponding actions.
2. Use the different actions available in the XML package to automate XML-related tasks.

3. Save the session using the **Save XML Session** action to assign the data to a file or String-type variable.
4. End the session using the **End XML Session** action to complete a task.

## Actions in the XML package

The XML includes the following actions:

Action	Description
Delete node	See <a href="#">Delete node action in XML</a> on page 3380.
End session	See <a href="#">End session action in XML</a> on page 3381.
Execute XPath function	See <a href="#">Execute XPath function action in XML</a> on page 3381.
Get multiple nodes	See <a href="#">Get multiple nodes action in XML</a> on page 3381.
Get single node	See <a href="#">Get single node action in XML</a> on page 3383.
Insert node	See <a href="#">Using Insert node action</a> on page 3383.
Save session data	See <a href="#">Save session data action in XML</a> on page 3384.
Start session	See <a href="#">Start session action in XML</a> on page 3385.
Update node	See <a href="#">Update node action in XML</a> on page 3385.
Validate XML document	See <a href="#">Validate XML document action in XML</a> on page 3386.

Related reference

[XML package updates](#) on page 1069

Review the updates in released versions of the XML package such as new and enhanced features as well as fixes and limitations. The page also lists the release dates of each version, and the compatible Control Room and Bot Agent versions.

## Delete node action in XML

The **Delete node** action in the XML package enables you to delete a specific node from XML file.

### Settings

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- Enter the **XPath expression** for the node to be deleted.
- Enter the **attribute** (optional).

## End session action in XML

The **End session** action in the XML package enables you to close an XML session.

### Settings

Enter the **session name** or select an existing variable used in the **Start XML session** action .

---

**Note:** The **End session** action clears out session-related data from memory. To save the modified data, use the **Save session data** action.

---

## Execute XPath function action in XML

The **Execute XPath function** action in the XML package enables you to execute XPath function and store the results in a variable.

### Settings

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- Enter the **XPath expression** or select an existing variable.
- Assign a **String-type variable** to the output.

For more information on how to use some of the actions (including Execute XPath function), see this example topic [Example for using actions in XML package](#) on page 3386.

## Get multiple nodes action in XML

The **Get multiple nodes** action in the XML package enables you to retrieve the value of multiple nodes.

### Settings

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- Enter the **XPath expression** to retrieve multiple nodes or select an existing variable.
- In the Get each node field, select if you require the **Text value**, **XPath expression**, or **Specific attribute name of each node**.
  - Text value retrieves the exact value of the specific node element.
  - XPath expression refers to the path of the selected node in an XML document.
  - Specific attribute defines a property or the type of the element in a particular node. For example, lang is an attribute of the locale element in a Cust\_Details node. The output for lang attribute is displayed as es.

## Example of how to retrieve the value of multiple nodes

You can create an XML file on your desktop. This example uses a sample XML with the following structure:

```
<Customer>
 <Cust_Details>
 <custid city="Leon">A001</ custid>
 <custname>XYZ Corp</custname>
 <custzipcode>15639</custzipcode>
 <country>Mexico</country>
 <Locale lang="es"> Spanish</Locale>
 </Cust_Details>
</Customer>
```

To retrieve the value of multiple nodes from a customer details:

1. Create and name the bot: XML\_Bot.
2. Start an XML session by using the **XML > Start session** action.
  - a) In the **Session name** field, enter Default.
  - b) In the **Data Source** field, choose **File** and select the **Desktop file** option. Click **Browse** to locate your XML file, for example: D:\userdefined path\xml sample.xml.
3. Double-click or drag the **Get multiple nodes** action to retrieve the value of multiple nodes.
  - a) In the **Session name** field, enter Default.
  - b) In the XPath Expression field enter //Customer/Cust\_Details/custid.
  - c) In the **Get each node** field, select from the following options and print the output in the message box.
    - **Text value**
    - **XPath expression**
    - **Specific attribute name of each node**. If you select this option then enter the attribute `city` in the text box.
  - d) In the **Assign the output to variable (optional)** field, select TableXMLNodes.
4. Double-click or drag the **Message box** to print the values and enter `$TableXMLNodes [0] [0]` in the **Enter the message to display** field.
5. Click **Save** and then click **Run**.

The values retrieved from each node are as follows:

- **Text value:** A001
- **XPath expression:** /Customer/Cust\_Details/custid
- **Specific attribute name of each node:** Leon

## Get single node action in XML

The **Get single node** action in the XML package enables you to retrieve the value of a single node.

### Settings

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- Enter the **XPath expression**, and **attribute** (optional) to retrieve a node.

Get single node retrieves the first value from the XML document based on the provided XPath expression and the attribute. For example,

```
<Customer>
 <Cust_Details>
 <custid>A001</ custid>
 <custname>XYZ Corp</custname>
 <custzipcode>15639</custzipcode>
 <country>Mexico</country>
 <Locale lang="es"> Spanish</Locale>
 </Cust_Details>
</Customer>
```

- XPath expression with attribute: The attribute value of the XPath expression element is displayed. For example, if the XPath expression is entered as `Customer//Cust_Details//Locale` with the attribute as `lang`, the output is displayed as `es`.
- XPath expression without attribute: The value of the XPath expression element is displayed. For example, if the XPath expression is entered as `Customer//Cust_Details//Locale` without any attribute, `Spanish` is displayed as an output.
- Assign the output to a **String-type variable**.

## Using Insert node action

Use this action to insert a node in an existing XML file and assign it to a value. Optionally, assign a name space and attributes to the node.

---

**Note:** When you use the Insert node action, the attributes are alphabetically sorted and displayed in the XML output.

---

To insert a node, do the following:

1. Enter the session name.  
Use the name of the session that you have used in the **Start XML session** action.
2. Specify an **XPath expression** to indicate where to insert the new node.
3. Enter a node name.
4. Enter a value for the node.
5. If the node name exists, select from the following options:
  - **Insert it anyways**
  - **Skip it**
  - **Overwrite it**

6. Specify the location to insert the node from the following options:

- **Beginning of the child nodes**
- **End of the child nodes**
- **Before specific child note**
- **After specific child node**

If **Before Specific child node** or **After Specific child node** is selected, specify the child node name before or after which the node must be inserted.

7. Optional: Enter the default name space to be mapped to the node.

---

**Note:** The Insert node action currently does not support namespaces. If you specify a namespace prefix in this field, the prefix is ignored in the result document.

---

8. Enter the attributes using a Dictionary-type variable.

Create a new variable of type **Dictionary** or use one that already exists.

9. Optional: Enter the attribute name space using a Dictionary-type variable

Create a new Dictionary-type variable or use one that already exists.

10. Click **Save**.

## Save session data action in XML

The **Save session data** action in the XML package enables you to save the XML session data to a file or variable of type String.

### Settings

Session data is an entity used to save session context information. You can save the session to assign the current state of the XML data to a file or a variable.

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- To save the session data to a file, select the **Write XML data** option and specify a **file path**.
- Select **Overwrite** to replace the existing file if a file with the same name exists in the location you have specified.
- Select the **Use Prettyprint** check box to format your code with proper indentation as per Prettyprint.

---

**Note:** By default, it uses a 2-space indentation and does not add XML document declaration explicitly.

---

**Use Prettyprint** feature works effectively when:

- The source XML document supports the linearization of a tree structure.
- You select the **Remove text nodes that contain only white space** check box in the **Start session** action.

---

**Note:**

- If the source document is already formatted, you do not have to select the **Use Prettyprint** check box.

- When you migrate bots from Enterprise 11 to Automation 360 that are using the **Save session data** action, the **Use Prettyprint** check box is selected by default.
- 
- Assign the output to a **String-type variable**.
- 

**Note:** The session data will be saved if you select the **Write XML data** option.

---

## Start session action in XML

The **Start session** action in the XML package enables you to create a new XML session based on an XML file or specified text.

### Settings

- Start the XML session.
- Enter the **session name** or select an existing variable used in the **Start XML session** action. Use this **session name** for all corresponding actions.
- In the Data Source field, select either **File** or **Text**:
  - File: Select from the **Control Room file**, **Desktop file**, or an existing **Variable** of File type.
  - Text: Specify the text name or select an existing variable.
- Select the **Remove text nodes that contain only white space** check box to remove the blank text nodes when you parse the XML document.

---

**Note:** When you migrate bots from Enterprise 11 to Automation 360 that are using the **Start session** action, the **Remove text nodes that contain only white space** check box is selected by default.

---

- Save the XML session.

## Update node action in XML

The **Update node** action in the XML package enables you to update the value of a node.

---

**Note:** When you use the Update node action, the attributes are alphabetically sorted and displayed in the XML output.

---

### Settings

- Type the **session name** or select an existing variable used in the **Start XML session** action.
- Enter the **XPath expression** for the node to be updated.
- Enter a **New value** for the node.
- Select the **Updates attribute (s)** option to create a new **Dictionary** or to add an existing **Variable** of Dictionary-type.

## Validate XML document action in XML

The tags and document structure are defined when the XML document is created. Use the **Validate XML document** action in the XML package to validate an XML document.

### Settings

- Enter the **session name** or select an existing variable used in the **Start XML session** action.
- Select the validation type from the following options:
  - **XML schema files (.xsd)**
    - **List**: Specify the schema XSD file path you want to validate in the **Value** field. Click **Add** to add multiple XML schema files (.xsd).
    - **Variables**: Create a new variable of type **List** with subtype **String** and enter the XSD file path in the **Default value field (optional)** or use an existing variable.
  - **Internal Document Type Definitions (DTDs)**
  - **Well formed**
- Assign the output to a variable using **Assign the output (Valid or Invalid) to variable**

## Example for using actions in XML package

Using the XML package, create a bot that reads and writes data from an XML file to an Excel sheet.

The sample XML used in this tutorial has the following structure:

```
<movies>
 <movie genre="" year="">
 <name></name>
 <description></description>
 <director></director>
 <writers>
 <writer type=""></writer>
 <writer type=""></writer>
 </writers>
 <rating>R</rating>
 </movie>
</movies>
```

Before you begin, [download a sample XML file](#).

The tutorial is intended to demonstrate the following actions:

- Use an XPath expression to get a node set with specific value and iterate through the items in the node set, for example, movies with specific rating in this tutorial.
- Use an XPath function to iterate through the child node sets.
- Concatenate variables to build a string.
- Write data to an Excel sheet.

Ensure the following:

- You know how to create bots.

- You are familiar with the Control Room user interface.
- 1. Create a bot and name it `XMLDataReader`.
- 2. Add a step to group all tasks for opening an Excel sheet.
  - a) Add the **Step > Step** action after the **Start** flow in the Bot editor.

---

**Note:** To add an action, search for the action in the **Actions** pane and drag it to the bot flow in the Bot editor.

---
  - b) In **Title**, enter `Open an Excel Sheet` and save the action.
- 3. To create and open an Excel sheet, use **Excel advanced > Create workbook**.
  - a) Add the **Excel advanced > Create workbook** action within the **Step** action.
  - b) In **File path**, enter `C:\movies\movies.xlsx`, and save the action. If the `movies` folder does not exist in the specified path, create a `movies` folder in the path.
- 4. To select the first cell on the Excel sheet, use the **Excel advanced > Go to cell** action.
  - a) Add the **Excel advanced > Go to cell** action after the **Excel advanced: Create workbook** action.
  - b) Click **Specific cell** if it is not already selected, and enter `A1`.
  - c) Save the action.
- 5. Create another step to group all the tasks for retrieving XML data.
  - a) Add the **Step > Step** action after the first **Step** action.
  - b) In **Title**, enter `Get XML Data` and save the action.
- 6. Start an XML session.
  - a) Add the **XML > Start session** action within the **Get XML Data** step.
  - b) Under **File**, select **Desktop**, browse and select the sample XML file that you downloaded.
  - c) Save the changes.
- 7. To get all movie nodes with rating R, use the **Get multiple nodes** action.
  - a) Add the **XML > Get multiple nodes** action after the **Start session** action.
  - b) In **XPath Expression**, enter `//movie[rating/text()='R']`, and save the action. The selected node set is stored in a system variable and is available to the **For each Node in a XML dataset** iterator now.
  - c) To ensure that the action retrieves the entire node set instead of just the text nodes, click **Xpath expression**.
- 8. Use the **Loop** action to iterate through the selected node set that the **Get multiple nodes** action retrieves.
  - a) Add **Loop > Loop** after the **XML: Get multiple nodes** action.

- b) Under **Iterator**, select **XML > For each Node in a XML dataset** as the iterator.
  - c) In **Assign the current row to this variable**, click **(x)** and create a variable with the default name, for example, XMLNode. Each item in the node set is now available through the variable.
  - d) Save the action.
9. To get the movie name from the iterated node, use the **Get single node** action.
- a) Add the **XML > Get single node** action within the **Loop: Loop** action.
  - b) In **XPath expression**, enter `$XMLNode$/name`.
  - c) In **Assign the output to variable**, create a variable and name it `sMovieName`.
  - d) Save the action.
10. To write the movie name from the XMLNode variable, use the **Set cell** action.
- a) Add the **Excel advanced > Set cell** action after the **Get single node** action.
  - b) Click **Active cell**, enter `$sMovieName$` in **Cell value**, and save the action.
11. To select a new cell within the Excel sheet, use the **Go to cell** action.
- a) Add the **Go to cell** action after the **Set cell** action after the **Excel advanced: Set cell** action.
  - b) Click **Active cell**, select **One cell to the right**, and then save the action.
12. To get the director name from the iterated node, use the **Get single node** action.
- a) Add the **XML > Get single node** action after the **Excel advanced: Go to cell** action.
  - b) In **XPath expression**, enter `$XMLNode$/director`.
  - c) In **Assign the output to variable**, create a variable with the following name: `sDirector`
  - d) Save the action.
13. To write the director name from the XMLNode variable, use the **Set cell** action.
- a) Add the **Excel advanced > Set cell** action after the **XML: Get single node** action.
  - b) Click **Active cell**, enter `$sDirector$` in **Cell value**, and save the action.
14. To select a new cell within the Excel sheet, use the **Go to cell** action.
- a) Add the **Go to cell** action after the **Excel advanced: Set cell** action.
  - b) Click **Active cell**, select **One cell to the right**, and then save the action.
15. Because the `<writers>` node can contain multiple `<writer>` nodes, get each writer name, concatenate the names, and write them to a single cell instead of writing values to multiple cells. To do so, add the **Loop** action within the current **Loop** action.
- a) To get the number of the `<writer>` nodes within the `<writers>` node, add the **XML > Execute XPath function** after the **Excel advanced: Set cell** action. In **XPath expression**, enter `count ($XMLNode$/writers/writer)`. In **Assign the output to variable**, create a variable named `sWriterCount`.

You will use the `<writer>` node count to loop through all the `<writer>` nodes.

- b) Add the **Loop > Loop** action after the **XML: Execute XPath function** action.

---

**Important:** The second **Loop** action must be added within the main **Loop** action.

---

- c) Under **Iterator**, select **For n times** as the iterator.
- d) In **Times**, enter the following: `$sWriterCount.String:toNumber$`

---

**Note:** `sWriterCount` contains a string value. To convert string to number, you can use the `$<variable name>.String:toNumber$` format, for example, `$sWriterCount.String:toNumber$`.

---

- e) In **Assign the current value to variable (optional)**, create a variable named `Counter`.
- f) Save the action.

16. To concatenate the values from all writer nodes, create a string variable.

- a) In the **Variables** pane, click the plus icon.  
The **Create variable** window opens.
- b) In **Type**, select **String**.
- c) In **Name**, enter `sWriters`.
- d) Click **Create**.

17. To get the value from the iterated `<writer>` node, use the **Get single node** action.

- a) Add the **XML > Get single node** action within the second **Loop** action.
- b) In **XPath expression**, enter `$XMLNode$/writers/writer[$Counter.Number:toString$]`.  
Using the `Counter` variable, you can access a node at a specific index. Note that because the `Counter` variable contains a numeric value, the `.Number:toString$` expression is added to the `Counter` variable to convert it to a string.
- c) In **Assign the output to variable**, create a variable and name it `sWriter`.
- d) Save the action.

18. To assign values from the writer nodes, use the **String > Assign** action.

- a) Add **String > Assign** action after the **XML: Get single node** within the second loop.
- b) In **Select the source string variable(s)/ value (optional)**, enter `$sWriters$, $sWriter$`.
- c) In **Select the destination string variable**, select `sWriters`.
- d) Save the action.

After the inner loop is complete, the `sWriters` variable will contain all the writer names.

19. To write the writer names to a new cell, use the **Excel advanced > Set cell** action within the main loop.

- a) Add the **Excel advanced > Set cell** action after the inner **Loop** action within the first **Loop** action.
- b) Click **Active cell**.
- c) Enter `$sWriters$` in **Cell value**.
- d) Save the action.

The data retrieved from one `<movie>` node is written to a row. To write the data from the next `<movie>` node, you must select the next row in the Excel sheet.

20. To move the cursor to the next row, use the **Excel advanced > Go to cell** action.
  - a) Add the **Go to cell** action after the **Set cell** action.
  - b) Click **Active cell**, select **Beginning of the row**, and then save the action.
  - c) Add the **Go to cell** action again. Click **Active cell**, select **One cell below**, and then save the action.
  
21. Before the next node in the retrieved `<movie>` node set is iterated, you must reset the `sWriters` variable. To reset the `sWriters` variable, perform the following steps:
  - a) Add the **String > Assign** action after the **Excel advanced: Go to cell** within the main loop.
  - b) Leave **Select the source string variable(s)/ value (optional)** blank.
  - c) In **Select the destination string variable**, select `sWriters`.
  - d) Save the action.
  
22. Create a new step.
  - a) Add the **Step > Step** action after the second **Step** action.
  - b) In **Title**, enter `Close the file`.
  
23. To close the Excel sheet, use **Excel advanced Close** action.
  - a) Add **Excel advanced > Close** within the **Close the file** step.
  - b) Save the changes.
  
24. Run the bot.

## Get started building bots

Use the following three examples to become familiar with building bots using in the cloud-based Bot editor. These examples demonstrate using actions and the Universal Recorder to automate tasks in applications and browsers.

[Build a Go be Great bot](#) on page 3391

Build a basic bot using a **Message Box** action and a variable. Follow these steps to create your first bot that prints the message, Go be

	great!, the Automation Anywhere version of Hello World!
<a href="#">Build a basic bot that uses a desktop application</a> on page 3393	Build a bot that uses a conditional statement to verify that the calculator is open, then uses the calculator to multiply two numbers. This example uses actions from the Application, If, Simulate keystrokes, Message Box, and Window packages.
<a href="#">Example of extracting data from a web table</a> on page 3394	Build a bot to open a browser window to the Wikipedia website, extract the data from a table, and write it to a CSV file on your desktop. This example uses actions from the Browser, Data Table, Recorder, and Window packages.

For more examples, see [Examples of building automations](#) on page 3395.

### More resources

- To learn more, search for the Hello Automation 360 Bot: Getting Started with Building Bots course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).
- You can also visit Pathfinder Community for more guidance: [Pathfinder Community](#).

## Build a Go be Great bot

Build a basic bot using a **Message Box** action and a variable. Follow these steps to create your first bot that prints the message, Go be great!, the Automation Anywhere version of Hello World!

To build a bot you must already have done the following:

- [Install Bot Agent and register device](#) on page 1450
- [Set user device credentials](#) on page 1457

If you have already completed the steps in [Create your first bot](#) on page 1595, skip to Step 6.

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: \Bots\  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
2. Insert a **Message box** action.
  - a) Click **Actions**.
  - b) Search for the Message Box package.

Click in the **Actions** search box and enter `message`. Click the arrow to expand the Message Box options.

- c) Double-click or drag the **Message box** action to the Bot editor (open space to the right).
3. In the dialog box on the right, specify the conditions for the **Message box** action.
    - a) In the **Enter the message box window title** field, enter `My first bot!`.
    - b) In the **Enter the message to display** field, enter `Go be great!`.
    - c) Accept the defaults in the **Scrollbar after lines** field and **Close message box after** check box.

4. Click **Save**.

Your bot is now ready to run.

You can view the time spent to create a bot by navigating to **Automation > Home > My metrics**. The **Active Task Bots** table displays the time taken to create every bot. When a bot is edited, the table shows the total time spent on the bot.

For example, if you spend 10 minutes on creating and saving a bot, the **Active Task Bots** table displays the time spent as 10 minutes. If you spend 5 more minutes on editing the same bot, the **Active Task Bots** table displays the total time spent as 15 minutes.

Similarly, the **Average time spent to create a Task Bot** field on the **My Metrics** page displays the average time spent across all users on all bots.

For example, if user 1 spends 120 minutes on **Bot A**, user 2 spends 2 minutes on **Bot B**, and user 3 spends 4 minutes on **Bot C**, the average time is calculated as  $(120+2+4)/3 = 42$  minutes.

5. Test your bot.

Click **Run** at the top right.

The bot displays a Message box with the text `Go be great!`.

In the following steps, you configure a variable and insert it in the Message box.

6. Create a variable.
  - a) Click **Variables** from the accordion menu on the left panel.
  - b) Click **Create variable** (the + sign).
  - c) Enter `vHelloWorld` in the name field.
  - d) Select the **Use as output** option.
  - e) Enter `Say Go be Great! with a variable` in the **Default value** field.
  - f) Click **Create**.
7. Assign the `vHelloWorld` variable to the **Enter the message to display** field.
  - a) Click the **Message box** action in the Bot editor.
  - b) In the dialog box, delete the text from the **Enter the message to display** field.
  - c) Either press the F2 key or click the **Insert variable** icon.  
The **Insert variable** icon is located on the right-side of the text field.
  - d) Select `vHelloWorld` from the drop-down list.
  - e) Click **Yes, insert**.

8. Click **Save**.

9. Click **Run**.

The bot displays a Message box with the text Say Go be Great! with a variable.

After you successfully run your bot, go to [Build a basic bot that uses a desktop application](#) on page 3393.

## Build a basic bot that uses a desktop application

Build a bot that uses a conditional statement to verify that the calculator is open, then uses the calculator to multiply two numbers. This example uses actions from the Application, If, Simulate keystrokes, Message Box, and Window packages.

To build a bot you must already have done the following:

- [Install Bot Agent and register device](#) on page 1450
- [Set user device credentials](#) on page 1457

1. Open a new bot.

- a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
- b) Click **Create new > Bot**.
- c) Enter a bot name and click **Create and edit**.

2. Insert an conditional sequence that verifies that the calculator is open and activates the window.

- a) Double-click or drag the **If** action.
- b) Select **Window exists** from the **Condition** drop-down list.
- c) Select the **Application** tab and click the refresh icon to display all open applications.
- d) Select **Calculator** from the **Window** drop-down list.  
The Calculator window is saved to the variable `window-1`.
- e) Drag the **Message box** action into the **If** container.
- f) In the **Enter the message to display** field, enter `The calculator is running`.
- g) Drag the **Window > Activate** action into the **If** container below the **Message box** action.
- h) In the **Window** field, insert the `window-1` variable.

3. Insert an alternative sequence that opens the calculator.

- a) Double-click the **If > Else** action.
- b) Drag the **Message box** action into the **Else** container.
- c) In the **Enter the message to display** field, enter `The calculator is not running`.
- d) Drag the **Application > Open program/file** action into the **If** container below the **Message box** action.
- e) In the **Location of the program/file** field, enter `C:\Windows\System32\calc.exe`.

4. Insert the **Simulate keystrokes** action to perform the calculation.
  - a) Drag the **Simulate keystrokes** action below the **If** and **Else** containers.
  - b) In the **Window** field, insert the `window-1` variable.
  - c) In the **Keystrokes** field, enter `5*5=`.
  - d) In the **Delay** field, enter 500.
5. Click **Save** to save the bot.
6. Run the bot.

When the bot runs, the `The calculator is not running` message appears, then the Calculator window opens, and the calculation is performed.
7. Run the bot again.

When the bot runs, the `The calculator is running` message appears, then the Calculator window activates, and the calculation is performed.

If the bot does not input all of the numbers into the calculator, try increasing the keystrokes delay.

## Example of extracting data from a web table

Build a bot to open a browser window to the Wikipedia website, extract the data from a table, and write it to a CSV file on your desktop. This example uses actions from the Browser, Data Table, Recorder, and Window packages.

To extract data from a table, do the following steps:

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: `\Bots\`  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.

For information about bot naming conventions, see [Create your first bot](#) on page 1595.

2. Open a browser window to the web page from which you will extract the table.
  - a) Double-click or drag the **Browser > Open** action.
  - b) Select your preferred browser.
  - c) In the `Link to open` field, enter `https://en.wikipedia.org/wiki/Table_(information)`.
  - d) Click **Save**.
  - e) Click **Run**.

The bot opens the window.
3. Specify the table.
  - a) Double-click or drag the **Recorder > Capture** action.

- b)** From the far-right panel, in the **Window** options, select the **Browser** tab and then select the **Table (information) - Wikipedia** window from the drop-down list.  
If the window title does not appear in the list, click **Refresh**.
- c)** Click **Capture object**.  
The **Table (information) - Wikipedia** window activates.
- d)** Hover over the Age table below the Basic description heading.  
An orange box appears, surrounding the table.
- e)** Click the table.  
The **Object Processing** message box appears.
- f)** Return to the Control Room.
- g)** In the Object properties table, verify the Control Type is TABLE.  
If it is not, click **Recapture object**.
- h)** From the Action to take on object drop-down list, select **Get table**.
- i)** In the **Save the outcome to a variable** field, create the Tabledata variable.

The **Table (information) - Wikipedia** window is saved as the variable \$Browser1\$.

- 4.** Specify the file where to save the data.
  - a)** Double-click or drag the **Data Table > Write to file** action.
  - b)** From the **Data table name** list, select Tabledata.
  - c)** In the **Enter file name** field, select your file.  
For example, C:\Users\\Desktop\WikipediaTable.csv.
  - d)** Select to overwrite the existing file.
- 5.** Close the **Table (information) - Wikipedia** window.
  - a)** Double-click or drag the **Browser > Close** action.
  - b)** Select the **Variable** tab and insert \$Browser1\$.
- 6.** Click **Save**.
- 7.** Click **Run**.  
The bot creates a CSV file on the desktop with data on seven indexes, their values, and net change.

## Examples of building automations

Use these example tasks to become familiar with the features and learn to build bots in Automation 360.

## Common automation tasks and examples

This document lists common automation tasks and examples for the tasks.

### Spreadsheet operations

Task	Subtasks/approaches	Example
Read data from spreadsheets	If the spreadsheet is large, you can connect to it as a database.	<a href="#">Connect to an Excel spreadsheet as database</a>
	Read individual rows.	<a href="#">Example of transferring data from CSV file to Excel worksheet on page 3409</a>
	Read data from an Excel spreadsheet and store it in a data table variable.	<a href="#">Example of reading data from a spreadsheet on page 3428</a>
	Read data from spreadsheets and write to a database.	<a href="#">Example of migrating data from Excel to a database on page 3424</a>
Write to spreadsheets	Create a new spreadsheet and write data to it.	<a href="#">Example of reading data from a spreadsheet on page 3428</a>
Merge spreadsheets	Merge two spreadsheets	<a href="#">Run TaskBot to merge Excel sheets on page 3423</a>

### SAP operations

Task	Subtasks/approaches	Examples
Call SAP BAPI functions	Get structure.	<a href="#">Example of using Get structure command from SAP BAPI package on page 3437</a> <a href="#">Example of using Run standard workflow from SAP BAPI package on page 3441</a>
	Write data to SAP using SAP BAPI.	<a href="#">Example of writing data to SAP using SAP BAPI package on page 3439</a>

## Variables, control flow, and logic operations

Task	Subtasks/approaches	Examples
Variables	Pass values between bots.	<a href="#">Example of passing a value between bots on page 3399</a>
	Use file variables.	<a href="#">Example of using a file variable on page 3479</a>
	Use dictionary variables.	<a href="#">Create dictionary type variables on page 3488</a>
Conditions	Use String condition.	<a href="#">Example of using a conditional statement on page 3401</a>

## Custom scripts integration in bots

Tasks	Subtasks/approaches	Example
Use custom Python scripts.	Invoke Python function in bots.	<a href="#">Build a hello world with a Python function</a>
		<a href="#">Example of using Python script to join a list on page 3403</a>
Use custom VBScript.	Invoke a VBScript function.	<a href="#">Example of using the VBScript package in a resilient bot on page 3444</a>

## Example of entering data into a web form from a spreadsheet

Build a bot that reads multiple rows of data from an XLSX sheet and enters it into a web form. Use actions from the Excel advanced, Loop, and Recorder packages to build the bot.

Before you start building the bot, you can create the following data sets on your desktop in .xlsx format as below.

Employee name	Age	Claim amount	Claim date	Claim type
Mike	30	469	22/3/2022	Medical
Sarah	34	766	28/3/2022	Dental
Chris	41	428	13/05/2022	Medical
Samantha	45	1000	09/05/2022	Medical

To read values from an Excel file and input them into a web form, do the following:

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: \Bots\  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
  
2. Open the Excel file.
  - a) Double-click or drag the **Excel advanced > Open** action.
  - b) Enter a session name.
  - c) Select the Excel file.
  - d) Mark the **Sheet contains a header** option.

By marking the **Sheet contains a header** option, you enable the bot to search for the column by the header name during run time.

3. Launch the website.
  - a) Double-click or drag the **Browser > Open** action.
  - b) Enter the website URL which consists the webform to update the data.
  
4. Retrieve the worksheet values and store them in a Table variable.
  - a) Double-click or drag the **Excel advanced > Get multiple cells** action.
  - b) Enter the same session name you used in the **Excel advanced > Open** action.
  - c) Select **All rows** from the drop-down list.
  - d) Create a Table variable using the icon to the right of the **Assign to variable** drop-down list.
  
5. Instruct the bot to process the data row by row.
  - a) Double-click or drag the **Loop** action.
  - b) Select the **For each row in table** iterator.
  - c) Select the same Table variable that you used in **Get multiple cells**.
  - d) Create a Record variable using the icon to the right of the **Assign to variable** drop-down list.

The Record variable holds all of the values for one row. With each iteration of the Loop, the bot retrieves the values of the next row and stores them in the Record variable, overwriting the values from the previous row.

6. Map the first column header to the web form textbox.
  - a) Double-click or drag the **Recorder > Capture** action.
  - b) Select the same window you opened with the **Open** action.
  - c) Click **Capture object**.

- d) Hover over the textbox until a red outline appears.
  - e) Click the textbox.
  - f) Return to the Control Room.
  - g) Verify that the **Control Type** value is TEXTBOX.
  - h) Select **Set text** from the **Action** drop-down list.
  - i) In the **Keystrokes** field, insert the same Record variable that you used in the Loop.
  - j) Select the **By name** option and copy-paste the first column header into the field.
7. Repeat the sub-steps in step 5 to map the other columns, with the following differences:
- a) Instead of searching for the browser window title, insert the Window variable generated by the Recorder.
  - b) When inserting the Record variable in the **Keystrokes** field, copy-paste the subsequent column header into the "By name" field.
8. Capture the Submit button.
- a) Double-click or drag the **Recorder > Capture** action.
  - b) Insert the Window variable generated by the Recorder.
  - c) Click **Capture object**.
  - d) Verify that the **Control Type** value is BUTTON.
  - e) Select the **Click** action.
9. Click **Save**.

Related reference

[Excel advanced package](#) on page 2722

The Excel advanced package contains actions that enable you to automate many of the repetitive tasks when working with Microsoft Excel spreadsheets.

[Loop package](#) on page 2975

Use the Loop package to run a sequence of actions repeatedly for a specific number of times or until a specific condition is met.

[Recorder package](#) on page 3108

Recorder package captures a series of tasks in a process and then automates them. You can automate your business applications (for example, desktop, Web, SAP, and Java applications) using the Recorder to capture actions performed on application objects such as a text box, button, table, radio button, combo box, and list view.

## Example of passing a value between bots

Learn how to pass a value from one Task Bot to another by using a dictionary variable.

Build a parent Task Bot and a child Task Bot that do the following:

- The parent bot prompts the user to enter a song title and passes it to the child bot.
- The child bot takes the input string and returns a new string to the parent bot.

- The parent bot receives the string that the child bot passes as a dictionary.
1. Build a child bot.
    - a) From the Control Room interface, go to the **Automation** tab.
    - b) Click **Create New > Bot**.
    - c) Enter the name for the bot as `GetSongDetails`.
    - d) Click **Create and Edit**.
  2. Create a variable named `sMySong`.
    - a) In the **Variables** panel, click the Create variable button.
    - b) In **Type**, select **String** if it is not already selected.
    - c) In **Name**, enter `sMySong`.
    - d) Select the **Use as input** and **Use as output** check boxes.
    - e) Click **Create**.
  3. To build a return string, use the **String > Assign** action.
    - a) From the **Actions** panel, find the **String > Assign** action, and add it to the child bot flow.
    - b) In **Select the source string variable(s)/ value**, enter `I love $sMySong$ too!`.  
During runtime, `$sMySong$` in the output string will be replaced with the value that the parent bot passes to the child bot.
    - c) In **Select the destination string variable**, select `sMySong` to store the new string.
    - d) Click **Save**.
  4. Build the parent bot.
    - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
    - b) Click **Create New > Bot**.
    - c) Enter the name for the bot as `FavoriteSong-Parent`
    - d) Click **Create and Edit**.
  5. Create a variable named `sMySong`.
  6. Use the **Prompt > For value** action to capture a song title.
    - a) From the **Actions** panel, find and add the **Prompt > for value** action to the parent bot flow.
    - b) In the **Prompt window caption** field, enter `Favorite Song`.
    - c) In the **Prompt message** field, enter `Type the title of your favorite song.`
    - d) In the **Assign the value to a variable** field, enter `sMySong`.
    - e) Click **Save**.
  7. Use the **Task Bot > Run** action to call the child bot:
    - a) From the **Actions** panel, find and add the **Task Bot > Run** action to the parent bot flow.
    - b) In **Task Bot to run**, select **Control Room** and then click **Choose**.

- c) Click **Browse** and navigate to the folder that contains the child bot and select `GetSongDetails`.
  - d) In **Input values**, select **Set sMySong** and then enter `$sMySong$` in the variable field.
  - e) In **Save the outcome to a variable (option)**, select **Dictionary** and then create a variable named **dOutput**.
  - f) Click **Save**.
8. Use the **Message box** action to display the string that the child bot returns.
  - a) From the **Actions** panel, find and add the **Message box > Message box** action to the parent bot flow.
  - b) In **Enter the message box window title**, enter `Automation Anywhere Enterprise Client`.
  - c) In **Enter the message to display**, enter `$dOutput{sMySong}$`.  
The name of the output variable that the child bot uses is used as the key for retrieving the value from the dictionary variable.
  - d) Click **Save**.
9. Test the bot.
  - a) Click **Run** to run the bot.  
After bot is deployed, the **Favorite Song** input box opens.
  - b) In the **Favorite Song** input box, enter a song title.
  - c) Click **OK**.  
A message box should display the string that the child bot returns. If no value returns, then review the procedure to assign the incoming value to a dictionary key and a variable.

[Dictionary package](#) on page 2648

The **Dictionary** package contains actions that enable you to do various operations on dictionary-type values.

## Example of using a conditional statement

In this example, you build a bot that prints a message based on whether a cell has a value or is empty. Use the actions from the Excel basic or Excel advanced, If, and Message Box packages.

Before building this bot, save an empty Excel worksheet to the desktop.

Because this bot does not create a new Excel worksheet, you can use either the Excel basic or Excel advanced packages.

---

**Note:** All of the actions must be from the same package.

---

1. Open a new bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create new > Bot**.

- c) Enter a bot name and click **Create and edit**.
2. Use the **Open** action from the Excel basic or the Excel advanced package to open the Excel sheet.
  - a) Double-click or drag the **Open** action.
  - b) Enter a session name.
  - c) Click **Browse** to provide the file path to the empty Excel worksheet on the desktop.
3. Use the **Get single cell** action to assign the value of a cell to a string variable.
  - a) Double-click or drag the **Get single cell** action from the same package that you used for the **Open** action.
  - b) Provide the session name that you used in the **Open** action.
  - c) Select the **Active cell** option.
  - d) In the **Store cell contents to** field, create the variable `Output`.
4. Use the **If** action to configure the conditional statement.
  - a) Double-click or drag the **If** action.
  - b) Select **String** from the **Condition** drop-down list.
  - c) In the **Source value** field, insert the variable `Output`.
  - d) Select **Equals to** as the **Operator**.
  - e) Leave the **Target value** field empty.
5. Insert a Message box into the **If** container.
  - a) Drag the **Message box** action.
  - b) In the **Enter the message to display** field, enter `Cell is empty`.
6. Use the **Else** and **Message box** actions to configure the alternative sequence of actions.
  - a) Drag the **Else** action next to the **If** action.
  - b) Drag the **Message box** action into the **Else** container.
  - c) In the **Enter the message to display** field, enter `Cell is not empty`.
7. Click **Save**.
8. Run the bot.

As the bot runs, the message box appears with the message `Cell is empty`.
9. Enter a value into the cell located at A1 in the Excel sheet and save the sheet.
10. Run the bot.

As the bot runs, the message box appears with the message `Cell is not empty`.

[Excel advanced package](#) on page 2722

The Excel advanced package contains actions that enable you to automate many of the repetitive tasks when working with Microsoft Excel spreadsheets.

[If package](#) on page 2902

Use the actions in the `If` package to control the sequence of execution based on one or more conditions of a task.

[Message box package](#) on page 2988

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

## Example of using Python script to join a list

Build a bot that uses a Python function to print the message `Go Be Great!`, the Automation Anywhere version of `Hello World`. In this example, the bot combines a list of string values and prints them to a message box.

To run Python script from Automation 360, you must already have the latest version of Python 3.x installed on your device.

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: `\Bots\`  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
  
2. Create a variable to hold the list values:
  - a) Click the **Create variable** icon.
  - b) Enter `lArgument` in the **Name** field.

---

**Recommendation:** Prefix the variable name with a lowercase character to indicate the variable data type.

[Variable naming](#) on page 2483

---
  - c) Select the **List** type and **String** subtype.
  - d) In the **Default value** field, enter the following values:
    1. **Value at 0:** `Go`
    2. **Value at 1:** `Be`
    3. **Value at 2:** `Great`
    4. **Value at 3:** `!`
  - e) Click **Create**.
  
3. Provide the script with a **Python Script > Open** action:
  - a) Double-click or drag the **Python Script > Open**.
  - b) Select the **Manual input** option.

- c) Copy and paste the following text into the **Enter script here** field.

```
def data (str):
 x = " ".join(str)
 return x
```

4. Use a **Python Script > Execute function** action to tell the bot to run the script:
  - a) Double-click or drag **Python Script > Execute function**.
  - b) Enter data in the **Enter name of function to be executed** field.
  - c) Select the **lArgument** variable from the **Arguments to the function** drop-down list.
  - d) Create the variable sOutput for the **Assign the output to variable** field.
5. Insert a **Message box** action to hold the Python function output:
  - a) Double-click or drag the **Message box > Message box** action.
  - b) In the **Enter the message to display** field, select and insert the variable **sOutput**.
  - c) Select the **Close message box after** option. Retain the default value of 5 seconds in the field.
6. Close the script execution session with a **Python Script > Close** action:
  - a) Double-click or drag **Python Script > Close**.
  - b) Click **Save**.
7. Click the **Run** icon.

The bot generates a message box with the text `Go Be Great!`. After 5 seconds, the message box disappears.

To review the bot launcher logs, navigate to `C:\ProgramData\AutomationAnywhere\BotRunner\Logs\<current month>\Bot_Launcher-<today's date>.log.zip`. Each zipped folder contains a file with data on the code execution, which is useful for debugging.

[Python Script package](#) on page 3099

The Python Script package contains actions that enable Python Script functions in a task.

[Message box package](#) on page 2988

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

## Example of using the DLL package

Build a very simple DLL that will generate a message. Create a bot to run the DLL.

This topic shows how to create a DLL package. If you do not have Microsoft Visual Studio, download the free Community version from [Microsoft Visual Studio Community IDE](#).

Create the DLL package.

1. In Microsoft Visual Studio, create a new class library that will generate a file type .dll by using C#.
  - a) Navigate to **File > New > Project**.
  - b) Search for d11 in the **Search for templates** field.
  - c) Select the C# library option.
  - d) Configure your project as follows:
    - Project name: DemoDLL
    - Location: [Any]
    - Solution Name: DemoDLL
  - e) Click **Create**.
  - f) Copy the following code and replace the contents of class1.cs by pasting:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;

namespace DemoDLL
{
 public class CallMe
 {
 public string ImHere()
 {
 String Reply = "You are now inside the DemoDLL,
ImHere function!";
 return Reply;
 }
 }
}
```

- g) In **Solution Explorer**, right-click **Class1.cs** and rename it to "CallMe.cs".
- h) Navigate to **File > Save All**.
- i) Navigate to **Build > Build Solution**.  
The output window confirms that the DLL package was successfully created and displays the path to your new DemoDLL.dll package in the **Output** window. Note the package location, as you will need it later to enter into the bot.

Create a bot to execute the DLL package.

2. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Provide a name for the bot: MyDLLbot
  - d) Enter the folder location: Bots\TaskBotExample
  - e) Click **Create and Edit**.
3. Create a variable: sReturnedString: string type.

[Create a variable](#) on page 2488

4. Use a **DLL > Open** action to load your DLL package.
  - a) From the Actions pane, double-click or drag the **DLL > Open** action.
  - b) In the **DLL:Open, Filepath** field, select file type **Desktop file** and click **Browse** to find your DLL package. Click **Open**.
  - c) Click **Save**.
5. Use a **DLL > Run function** action to execute your DLL package.
  - a) Double-click or drag the **DLL > Run function** action to the last line of the bot.
  - b) Click **Get DLL Details**.
  - c) Select **Desktop file** type and then click **Browse**. Locate your DLL package and click **Open**.
  - d) Click **Next**.
  - e) Expand the DemoDLL namespace and select the **CallMe** function. Select method **ImHere** and click **Apply**.
  - f) In the **Assign the value to a variable** field, select `sReturnedString`.
6. Use a **Message box** action to report what was returned from the DLL bot:
  - a) Double-click or drag the **Message box** action to the last line of the bot.
  - b) In the **Enter the message to display** field, type: `From the DLL: "$sReturnedString$"`.
7. Click **Save**.
8. Use the **DLL > Close** action to end the DLL session.
  - a) Double-click or drag the **DLL > Close** action to the last line of the bot.
9. Click **Save**.
10. Click the **List** tab to view your code in text-only mode.

Your code should look like this:

```
Start
DLL:Open "C:\myFolder\source\repos\DemoDLL\DemoDLL\bin\Debug
\DemoDLL.dll for session "Default"
DLL:Run function "ImHere" and store output in variable
$sReturnedString$ and session "Default"
MessageBox "From the DLL: "$sReturnedString$".
DLL:Close session "Default"
End
```

11. Run your bot.

The DLL package returns a message to the bot: **From the DLL: "You are now inside the DemoDLL, ImHere function!"**.

[DLL package](#) on page 2653

A dynamic-link library (DLL) file contains a shared library of functions that can be used by Windows programs. The **DLL** package uses a `.dll` file as reference and calls functions from the bot.

## Example of using To string action from Datetime package

Build a bot that compares the current date with the expiration dates of products.

You need sample inventory data with expiration dates. If you do not have any sample data, download [this spreadsheet](#) that contains sample inventory data with expiration dates.

In this example, the bot loops through a list of products in a spreadsheet and compares the expiration date of each product with the current date. If the dates match, the bot marks the product as expired.

1. Create a new bot.
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Task Bot**.
  - c) In the **Create Task Bot** window, enter a name for the bot.
  - d) Accept the default folder location: `\Bots\`
  - e) To change the default bot storage location, click **Choose** and follow the prompts.
  - f) Click **Create and edit**.
  
2. Dates in the sample data are specified in `yyyy-MM-dd` format. To compare each date to the current date, you need to obtain the current date using the `System:Date` variable and convert it to the `yyyy-MM-dd` format. To do so, use the **Datetime > To string** action and the `System:Date` variable.
  - a) From the **Actions** panel, find and add **Datetime > To string** action to the Bot editor.
  - b) In **Source date and time variable**, click **Variable**, and enter `System:Date`. You can use the `System:Date` variable to get the current date.
  - c) In **Select date time format**, click **Custom format**, and enter `yyyy-MM-dd`.
  - d) In **Assign the output to a variable**, click **(x)** and create a string variable named `currentDate`.
  - e) Save the changes.
  
3. Open the spreadsheet with the sample inventory data.
  - a) From the **Actions** panel, find and add **Excel basic > Open** action to the Bot editor.
  - b) In **File path**, click **Desktop file** and select the spreadsheet with the sample inventory data.
  - c) Select **Sheet contains a header**.
  - d) Select **Specific sheet name** and enter the sheet name. If you are using the sample spreadsheet downloaded from this page, specify `inventory` as the sheet name.
  - e) In **Create Excel session**, click **Local session** and enter `Default`.
  - f) Save changes.
  
4. Select the second row in the current spreadsheet.
  - a) From the **Actions** panel, find and add **Excel basic > Go to cell** action to the Bot editor.
  - b) In **Cell option**, click **Specific cell** and then enter `A2` in **Cell name**.

- c) In **Session name**, enter Default.
  - d) Save changes.
5. Iterate through the rows in the spreadsheet and get the expiry date for each product.
- a) From the **Actions** panel, find and add **Loop > Loop** action to the Bot editor.
  - b) In **Iterator**, choose **Excel basic > For each row in worksheet** .
  - c) In **Loop through**, select the **All rows** variable.
  - d) In **Session name**, enter Default.
  - e) In **Assign the current row to this variable**, click **Record**, and click **(x)** to create a record variable named ExcelRow.
  - f) Save changes.
6. Compare each expiry date with the current date.
- a) From the **Actions** panel, find and add **String > compare** action within the Loop action.
  - b) In **Source string**, enter \$currentDate\$.
  - c) In **Compare to string**, enter \$ExcelRow[2]\$.
  - d) In **Assign the output to variable**, click **(x)** to create a Boolean variable named datesMatched.
  - e) Save the changes.
7. Verify if the current date matches the expiry date of the current item.
- a) From the **Actions** panel, find and add **If > If** action with the Loop action.
  - b) In **Condition**, select **Boolean > Boolean condition** .
  - c) In **Boolean variable**, click **True**.
  - d) In **Operator**, select **Equals to(=)**.
  - e) In **Value**, click **Variable** and enter \$datesMatched\$.
  - f) Save the changes.
8. If the dates match, move the cursor to the end of the current row.
- a) From the **Actions** panel, find and add **Excel basic > Go to cell** action within the If action.
  - b) In **Cell option**, click **Active cell** and then select **End of the row**.
  - c) In **Session name**, enter Default.
  - d) Save changes.
9. If the dates match, mark the product as expired.
- a) From the **Actions** panel, find and add **Excel basic > Set cell** action within the if action.
  - b) In **Use**, click **Active cell**.
  - c) In **Value to set**, enter Yes.
  - d) In **Session name**, enter Default.
  - e) Save the changes.

10. Select the first cell in the current row.
  - a) From the **Actions** panel, find and add **Excel basic > Go to cell** action after the If action but within the Loop action.
  - b) In **Cell option**, click **Active cell** and then select **Beginning of the row**.
  - c) In **Session name**, enter `Default`.
  - d) Save changes.
  
11. Select the next row before the next iteration.
  - a) From the **Actions** panel, find and add **Excel basic > Go to cell** action within the Loop action.
  - b) In **Cell option**, click **Active cell** and then select **One cell below**.
  - c) In **Session name**, enter `Default`.
  - d) Save changes.
  
12. Close the current spreadsheet.
  - a) From the **Actions** panel, find and add **Excel basic > Close** action after the Loop action.
  - b) Select **Save the changes when closing the file**.
  - c) In **Session name**, enter `Default`.
  - d) Save changes.

## Example of transferring data from CSV file to Excel worksheet

Build a bot that reads data from a CSV file and updates the data in an Excel worksheet, using actions from the CSV/TXT, Excel advanced, IF/ELSE, and Loop packages.

Before you start building the bot, create the following data sets on your desktop in the specified file formats:

Data set 1: ProductInventory.xlsx

Item number	Name	Count	Category	Unit price	Taxable
A0001	Milk	15	Grocery	3	N
A0002	Eggs	6	Grocery	4	N
A0003	Flower	3	Garden	10	Y
A0004	Table	1	Home	50	Y
A0005	Towel	4	Home	10	Y
A0006	Dog Food	16	Pet	22	N
A0007	Paint	43	Home	12	Y

Data set 2: NewProductNames.csv

Item number	Name
A0005	Hand Towel
A0002	Chicken Eggs
A0003	Sunflower
A0004	Coffee Table
A0006	Dog Food - Small Dogs
A0007	Paint - Dark Blue
A0001	2% Milk

In this example, you will build a bot to update the product inventory in an Excel worksheet with new product names from a CSV file. The Excel worksheet has old product names and the CSV file has new product names. You will relate the data in the Excel worksheet and the CSV file with item number and update the Excel worksheet with the new item name corresponding to the item number. Use actions from the CSV/TXT, Excel advanced, IF/ELSE, and Loop packages

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: `\Bots\`  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
2. Open the `NewProductNames.csv` file that you just created.
  - a) Double-click or drag the **CSV/TXT > Open** action.
  - b) In the **Session name** field, enter `session 1`.
  - c) Provide the file path to `NewProductNames.csv`.
  - d) Select the **Contains header** option.
3. Open the `ProductInventory.xlsx` file that you just created.
  - a) Double-click or drag the **Excel advanced > Open** action.
  - b) In the **Session name** field, enter `session 2`.
  - c) Provide the file path to `ProductInventory.xlsx`.
  - d) Choose to open the file in **Read-write** mode.
  - e) Select the **Contains header** option.
4. Use the **Go to cell** action to indicate the first cell in which to update the product names.
  - a) Double-click or drag the **Excel advanced > Go to cell** action.
  - b) In the **Session name** field, enter `session 2`.
  - c) Select the **Specific cell** option and enter `B2`.

5. Use a **Loop** action to retrieve the cell values in each row from `ProductInventory.xlsx`.
  - a) Double-click or drag the **Loop** action.
  - b) Select the **Excel Advanced > For each row in worksheet** iterator.
  - c) In the **Session name** field, enter `session 2`.
  - d) In the **Loop through** field, select **All rows**.
  - e) In the **Assign current value to this variable** field, create a `rInventory` variable.
  
6. Use a **Loop** action to retrieve the cell values in each row from `NewProductNames.csv`.
  - a) Drag the **Loop** action into the **For each row in worksheet Loop** container.
  - b) Select the **For each row in CSV/TXT** iterator.
  - c) In the **Session name** field, enter `session 1`.
  - d) In the **Assign current value to this variable** field, create a `rNewProduct` variable.
  
7. Use an **If** action to compare the item number from `ProductInventory.xlsx` to the item number from `NewProductNames.csv` to ensure they are the same before moving on to the next action.
  - a) Double-click or drag the **If** action into the **For each row in csv/txt Loop** container.
  - b) Select the **String** condition.
  - c) In the **Source value** field, input `rInventory[0]`.
  - d) Select the **Equals to (=)** operator.
  - e) In the **Target value** field, input `rNewProduct[0]`.
  
8. Use the **Set cell** and **Go to cell** actions to update the product name and move to the cell below.
  - a) Double-click or drag the **Excel Advanced > Set cell** action.
  - b) In the **Session name** field, enter `session 2`.
  - c) Select the **Active cell** option.
  - d) In the **Cell value** field, input `rNewProduct{Name}`
  - e) Double-click or drag the **Excel Advanced > Go to cell** action.
  - f) In the **Session name** field, enter `session 2`.
  - g) From the **Active cell** drop-down list, select **One cell below**.
  
9. Insert an alternative to the **If** action: if the item numbers are not the same, the bot continues to the next row in `NewProductNames.csv`.
  - a) Drag the **If > Else** action.
  - b) Drag the **Loop > Continue** action.
  
10. Close the files.
  - a) Double-click or drag the **Excel advanced > Close** action.
  - b) In the **Session name** field, enter `session 2`.
  - c) Select the **Save changes** option.

- d) Double-click or drag the **CSV/TXT > Close** action.
- e) In the **Session name** field, enter `session 1`.

11. Click **Save**.

12. Run the bot.

The bot updates the `ProductInventory.xlsx` file to look like the following table:

Data set 3: ProductInventory.xlsx

Item number	Name	Count	Category	Unit price	Taxable
A0001	2% Milk	15	Grocery	3	N
A0002	Chicken Eggs	6	Grocery	4	N
A0003	Sunflower	3	Garden	10	Y
A0004	Coffee Table	1	Home	50	Y
A0005	Hand Towel	4	Home	10	Y
A0006	Dog Food - Small Dogs	16	Pet	22	N
A0007	Paint - Dark Blue	43	Home	12	Y

## Example of using Find file/folder action from Google Drive package

Build a bot that searches Google Drive for a file and creates the file if it is not found in the specified path.

- Set up an OAuth2 application in Google Cloud Platform. For more information, see [Set up OAuth2 in the Google Cloud Platform](#).

- This bot uses the Control Room OAuth connection method. Configure OAuth connection in the Control Room. For more information, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.
- A CSV file with some sample data. If you do not have a CSV file, you can download [this file](#).

Imagine you want to create a Google sheet if it does not exist in Google Drive. You can use the **Google Drive > Find File/Folder** action from the Google Drive package to check if a file already exists in Google Drive. If it does not exist, you can create the file using the Create Workbook action from the Google Sheets package.

This bot checks Google Drive for a Google sheet. If it does not exist in the path specified, the bot creates a Google sheet and copies data from a CSV file to it.

1. Create a new bot.
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Task Bot**.
  - c) In the **Create Task Bot** window, enter a name for the bot.
  - d) Accept the default folder location: \Bots\
  - e) To change the default bot storage location, click **Choose** and follow the prompts.
  - f) Click **Create and edit**.
2. Open the CSV file that contains data you want to copy to a Google Sheet.
  - a) From the **Actions** panel, find and add **CSV/TXT > Open** action to the Bot editor.
  - b) In **Session name**, enter `csvsession`.
  - c) In **File path**, specify the path to the CSV file from which data should be copied.
  - d) If the CSV table has a header, select **Contains header**.
  - e) Select a delimiter as per the delimiter used in the CSV file.
  - f) Save the changes.
3. Read data from CSV and store it in a data table variable.
  - a) From the **Actions** panel, find and add **CSV/TXT > Read** action to the Bot editor.
  - b) In **Session name**, enter `csvsession`.
  - c) In **Assign value to the variable**, click **(x)** and create a variable called TableFromCSV.
  - d) Save the changes.
4. Close the CSV file.
  - a) From the **Actions** panel, find and add **CSV/TXT > Close** action to the Bot editor.
  - b) In **Session name**, enter `csvsession`.
  - c) Save the changes.
5. Connect to Google Drive.
  - a) From the **Actions** panel, find and add **Google Drive > Connect** action to the Bot editor.
  - b) In **Username**, select **Insecure string**, and enter the email ID associated with OAuth connection you have set up.

- c) In **OAuth2 Authentication Mode**, select **Control Room managed**.
  - d) Click **Pick** and select the connection you have configured in Control Room.
  - e) Save the changes.
6. Connect to Google Sheets.
- a) From the **Actions** panel, find and add **Google Sheets > Connect** action to the Bot editor.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with OAuth connection you have set up.
  - c) In **Session name**, enter `gsheetsession`.
  - d) In **OAuth2 Authentication Mode**, select **Control Room managed**.
  - e) Click **Pick** and select the connection you have configured in Control Room.
  - f) Save the changes.
7. Before you create a new sheet in Google Drive, check if the file you are trying to create already exists. Create the file only if it does not exist in the specified path. To do this , use the Try Catch actions.
- a) From the **Actions** panel, find and add **Error Handler > Try** action to the Bot editor.
  - b) Save the changes.
8. To check if the file already exists, use the Google Drive Find file/folder action.
- a) From the **Actions** panel, find and add **Google Drive > Find file/folder** action within the Try block.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Find**, click **File**.
  - d) In **Source Folder Path**, enter the source folder. For example, in this sample scenario, the bot looks for the file in the `aa-docs/spreadsheets` path.
  - e) In **Match type**, select **Exactly matches**.
  - f) In **File/Folder name**, enter `contacts`.
  - g) In **Returns the list of files or folders**, select **Dictionary**.
  - h) Click **(x)** , and create a dictionary variable named `FileFolderDictionary`with subtype as **Any**.
  - i) Save changes.
9. If the file does not exist, create the file.
- a) From the **Actions** panel, find and add **Google Sheets > Create workbook** action within the Catch block.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Session name**, enter `gsheetsession`.
  - d) In **Workbook name**, enter `contacts`.

- e) In **File path**, click **From my shared location**, and enter the parent folder path. For example, in this sample in scenario, the bot searches for the file in the `aa-docs/spreadsheets` path.
  - f) Save changes.
10. To open a spreadsheet from Google Drive, you need its file ID or the file path. Since this bot creates the file dynamically, you will not have the file path prior to the bot execution. However, you can get the File ID using the Google Drive Find file/folder action again.
- a) From the **Actions** panel, find and add **Google Drive > Find file/folder** action after the Try Catch blocks.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Find**, click **File**.
  - d) In **Source Folder Path**, enter the source folder. For example, the sample bot in this example looks for the file in the `aa-docs/spreadsheets` path.
  - e) In **Match type**, select **Exactly matches**.
  - f) In **File/Folder name**, enter `contacts`.
  - g) In **Returns the list of files or folders**, click **Dictionary** and select the **FileFolderDictionary** variable.

The Find file/folder API returns a dictionary with information about matched files. The dictionary contains a key called `NumberOfFiles`. It provides the count of files that matched. The dictionary also contains keys named `File1`, `File2`, and so on, depending on the number of matched files. These keys contain information such as file names and file IDs in JSON format. The following is an example of a dictionary returned by the Find file/folder API call:

```
{NumberOfFiles,1},{File1,
{"fileName":"contacts","fileId":"171yBUzqH80ZW_KLEp23DwebzkCdDZgnGFWBzB6K9kco"}}
```

You can retrieve the file ID by parsing the JSON string, which is the value associated with the key `File1`.

- h) Save changes.
11. Parse the JSON string associated with the `File1` key.
- a) From the **Actions** panel, find and add **Json > Start session** action.
  - b) In **Data source**, select **Text** and enter `$FileFolderDictionary{File1}$`
  - c) In **JSON object session**, click **Local session** and enter `jsonsession`.
  - d) Save the changes.
12. Retrieve file ID from the JSON object.
- a) From the **Actions** panel, find and add **Json > Get node value**.
  - b) In **JSON node key or path**, enter `fileId`
  - c) In **Session name**, enter `jsonsession`.
  - d) In **Save the outcome to a variable**, click **(x)** and create a variable called `FileId`.

- e) Save the changes.
13. End the JSON session.
- a) From the **Actions** panel, find and add **Json > End session** action.
  - b) In **Session name**, enter `jsonsession`.
  - c) Save the changes.
14. With the retrieved file ID, open the spreadsheet created in Google Drive.
- a) From the **Actions** panel, find and add **Google Sheets > Open spreadsheet** action.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Session name**, enter `gsheetssession`
  - d) In **Open sheet**, click **From Spreadsheet Id**, and enter `$FileId$`.
  - e) Save the changes.
15. Write the data table variable to the Google sheet.
- a) From the **Actions** panel, find and add **Google Sheets > Write from data table** action.
  - b) In **Session name**, enter `gsheetssession`
  - c) In **Sheet options**, click **Specific Sheet** and enter `Sheet1` or the sheet name from your target spreadsheet in **Sheet name**.
  - d) In **Enter data table variable**, select **TableFromCSV**
  - e) In **Start Cell value**, enter `A1`.
  - f) Save the changes.
16. Disconnect Google Drive and Google Sheets.
- a) From the **Actions** panel, find and add **Google Drive > Disconnect** action.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) Save changes.
  - d) From the **Actions** panel, find and add **Google Sheets > Disconnect** action.
  - e) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - f) In **Session name**, enter `gsheetssession`
  - g) Save the changes.
17. Run the bot.

## Example of using Create Folder action from Google Drive package

Build a bot that creates a folder in Google Drive.

- Set up an OAuth2 application in Google Cloud Platform. For more information, see [Set up OAuth2 in the Google Cloud Platform](#).
- Configure OAuth connection in the Control Room. For more information, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.
- Create a parent folder in Google drive. In the example, the `aa-docs/monthly-reports` is used as the parent folder.

Suppose that ACME Inc stores all its monthly reports on Google Drive. To streamline the process, the company decides to develop a bot that creates a new folder at the beginning of each month and then uploads the reports to the folder.

In this example, the bot performs the following tasks:

- Uses the Datetimepackage to retrieve the current date.
- Uses the Create Folder action from theGoogle Drivepackage to create a folder with the current date as its name.
- Displays the ID of the new folder.

### 1. Create a new bot.

- a) On the left panel, click **Automation**.
- b) Click **Create new > Task Bot**.
- c) In the **Create Task Bot** window, enter a name for the bot.
- d) Accept the default folder location: `\Bots\`
- e) To change the default bot storage location, click **Choose** and follow the prompts.
- f) Click **Create and edit**.

### 2. The bot creates a folder at the start of every month with the format the `<current date>-report` as its name. To get the current date, use the **Datetime > To string** actionand theSystem: Date variable.

- a) From the **Actions** panel, find and add **Datetime > To string** action to the Bot editor.
- b) In **Source date and time variable**, click **Variable**, and enter `System:Date`. You can use the System: Date variable to get the current date.
- c) In **Select date time format**, click **Custom format**, and enter `dd-MM-yyyy`.
- d) In **Assign the output to a variable**, click **(x)** and create a string variable named `currentDate`.
- e) Save the changes.

### 3. Connect to Google Drive.

- a) From the **Actions** panel, find and add **Google Drive > Connect** action to the Bot editor.
- b) In **Username**, select **Insecure string**, and enter the email ID associated with OAuth connection you have set up.

- c) In **OAuth2 Authentication Mode**, select **Control Room managed**. For more information, see [Use managed OAuth2 authentication in Google](#).
  - d) Click **Pick** and select the connection you have configured in Control Room.
  - e) Save the changes.
4. Create a folder.
  - a) From the **Actions** panel, find and add **Google Drive > Create Folder** action.
  - b) In **Username**, enter the email ID in **Insecure string**.
  - c) In **Parent folder name**, enter the path to the parent folder where the new folder must be created. For example, `aa-docs/monthly-reports`.
  - d) In **Folder name**, enter `$(currentDate)-report`.
  - e) In **Returns the ID of created folder**, click **(x)** and create a string variable named FolderID.
  - f) Save changes.
5. Display the folder ID.
  - a) From the **Actions** panel, find and add **Message Box > Message Box** action within the Catch block.
  - b) In **Enter the message to display**, enter `$(FolderID)`.
  - c) Save the changes.

You can improve this example by using the folder ID to do additional processing. For example, you can use the Upload files action to upload files to the new folder. However, this use case is not covered in this example.

6. Run the bot.

If you are using device pools, you can schedule the bot to run at the start of every month.

## Example of using Go to Cell action from Google Sheets package

Build a bot that loops through the records in a Google Sheet and creates a report based on the records.

- Set up an OAuth2 application in Google Cloud Platform. For more information, see [Set up OAuth2 in the Google Cloud Platform](#).
- Configure OAuth connection in the Control Room. For more information, see [Configure OAuth 2.0 connection in Control Room](#) on page 3057.
- Make sure you have a spreadsheet with some sample product inventory data in Google Drive. If you do not have any sample data, you can download [this spreadsheet](#) and copy the data from it to a Google Sheet in your Google Drive. Make a note of its file ID.
- Create another Google Sheet where the bot can copy data from the inventory list. Name the file "restock" and make a note of the file ID.

In the example, the bot loops through an inventory list in a Google Sheet and finds products that need to restocked. After that, the bot updates another Google Sheet with the details of the products that require restocking.

1. Create a new bot.
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Task Bot**.
  - c) In the **Create Task Bot** window, enter a name for the bot.
  - d) Accept the default folder location: \Bots\
  - e) To change the default bot storage location, click **Choose** and follow the prompts.
  - f) Click **Create and edit**.
  
2. Connect to Google Sheets.
  - a) From the **Actions** panel, find and add **Google Sheets > Connect** action to the Bot editor.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with OAuth connection you have set up.
  - c) In **Session name**, enter gsheets.
  - d) In **OAuth2 Authentication Mode**, select **Control Room managed**.
  - e) Click **Pick** and select the connection you have configured in Control Room.
  - f) Save the changes.
  
3. Open the spreadsheet that contains the inventory list.
  - a) From the **Actions** panel, find and add **Google Sheets > Open spreadsheet** action to the Bot editor.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Session name**, enter gsheets.
  - d) In **Open sheet**, click **From Spreadsheet id** and then enter the file ID of the spreadsheet that contains inventory data in Google Drive.
  - e) Select **Sheet contains header**.
  - f) Save changes.
  
4. Copy the inventory data to a Data table variable.
  - a) From the **Actions** panel, find and add **Google Sheets > Get multiple cells** action to the Bot editor.
  - b) In **Session name**, enter gsheets.
  - c) In Cell option, click All cells.
  - d) In Assign the output to variable, click **(x)** and create a Data table variable named InventoryTable.
  - e) Save the changes.
  
5. Close the current Google Sheet.
  - a) From the **Actions** panel, find and add **Google Sheets > Close** action to the Bot editor.

- b) In **Session name**, enter `gsheet`.
6. Open the Google Sheet where you want to copy information about the items that need to be restocked.
- a) From the **Actions** panel, find and add **Google Drive > Open spreadsheet** action to the Bot editor.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with the OAuth connection.
  - c) In **Session name**, enter `gsheet`.
  - d) In **Open sheet**, click **From Spreadsheet id** and then enter the file ID of the spreadsheet to which you want to copy the items to be restocked.
  - e) Select **Specific sheet name**.
  - f) Save changes.
7. Select the second row in the current spreadsheet.
- a) From the **Actions** panel, find and add **Google Sheets > Go to cell** action to the Bot editor.
  - b) In **Session name**, enter `gsheet`.
  - c) In **Cell options**, click **Specific cell** and then enter `A2` in **Cell name**.
  - d) Select **Specific sheet name**.
  - e) Save changes.
8. Loop through the records in the data table variable.
- a) From the **Actions** panel, find and add **Loop > Loop** action to the Bot editor.
  - b) In **Iterator**, choose **Data table > For each row in table**.
  - c) In **In Table variable**, select the **InventoryTable** variable.
  - d) In **Assign the current row to this variable**, click (x) and create a record variable named `TableRow`.
  - e) Save changes.
9. The bot selects only the rows where the current stock is below the reorder threshold. To compare the current stock value to the reorder threshold for each item in the inventory, you need two variables.
- a) From the **Actions** panel, find and add **String > To number** action with the Loop action.
  - b) In **Enter the string**, enter `TableRow[4]` to get the reorder threshold value for the current item.
  - c) In **Assign the output to variable**, click (x) and create a Number variable named `ReorderThreshold`.
  - d) From the **Actions** panel, find and add **String > To number** action with the Loop action.
  - e) In **Enter the string**, enter `TableRow[3]` to get the current stock value for the current item.
  - f) In **Assign the output to variable**, click (x) and create a Number variable named `currentStock`.

- g) Save the changes.
10. To check if the current item is below the reorder threshold, use the If action.
    - a) From the **Actions** panel, find and add **If > If** action with the Loop action.
    - b) In **Condition**, select **Number > > Number condition**.
    - c) In **Source value**, enter \$currentStock\$.
    - d) In **Operator**, choose **Less Than (<)**.
    - e) In **Target value**, enter \$ReorderThreshold\$.
    - f) Save the changes.
  11. Copy the item ID to the restock sheet.
    - a) From the **Actions** panel, find and add **Google Sheets > Set cell** action within the if action.
    - b) In **Session name**, enter gsheets.
    - c) In **Cell options**, click **Active cell**.
    - d) In **Cell value**, enter \$TableRow[0]\$.
    - e) Save the changes.
  12. Move the cursor to the next column.
    - a) From the **Actions** panel, find and add **Google Sheets > Go to cell** action within the If action.
    - b) In **Session name**, enter gsheets.
    - c) In **Cell options**, click **One cell to the right**.
    - d) Save changes.
  13. Copy the product name to the restock sheet.
    - a) From the **Actions** panel, find and add **Google Sheets > Set cell** action within the if action.
    - b) In **Session name**, enter gsheets.
    - c) In **Cell options**, click **Active cell**.
    - d) In **Cell value**, enter \$TableRow[1]\$.
    - e) Save the changes.
  14. Move the cursor to the next column.
    - a) From the **Actions** panel, find and add **Google Sheets > Go to cell** action within the If action.
    - b) In **Session name**, enter gsheets.
    - c) In **Cell options**, click **One cell to the right**.
    - d) Save changes.
  15. Calculate the quantity needed for reordering the current item.
    - a) From the **Actions** panel, find and add **Number > Decrement** action within the if action.
    - b) In **Enter number**, enter \$ReorderThreshold\$.

- c) In **Enter decrement value**, enter **\$currentStock\$**.
  - d) In **Assign the output to variable**, click **(x)** and create a Number variable named quantityToStock.
  - e) Save the changes.
16. Write the quantity to reorder in the Quantity to Restock column.
- a) From the **Actions** panel, find and add **Google Sheets > Set cell** action within the if action.
  - b) In **Session name**, enter gsheet.
  - c) In **Cell options**, click **Active cell**.
  - d) In **Cell value**, enter `$quantityToStock.Number:toString$`.
  - e) Save the changes.
17. Move the cursor to the start of the current row.
- a) From the **Actions** panel, find and add **Google Sheets > Go to cell** action within the If action.
  - b) In **Session name**, enter gsheet.
  - c) In **Cell options**, click **Beginning of the row**.
  - d) Save changes.
18. Select the next row before the next iteration.
- a) From the **Actions** panel, find and add **Google Sheets > Go to cell** action within the If action.
  - b) In **Session name**, enter gsheet.
  - c) In **Cell options**, click **One cell below**.
  - d) Save changes.
19. Close the current Google Sheet.
- a) From the **Actions** panel, find and add **Google Sheets > Close** action after the Loop action.
  - b) In **Session name**, enter gsheet.
20. Disconnect from Google Sheets.
- a) From the **Actions** panel, find and add **Google Sheets > Disconnect** action after the Loop action.
  - b) In **Username**, select **Insecure string** and enter the email ID associated with OAuth connection you have set up.
  - c) In **Session name**, enter gsheet.
21. Run the bot.

## Run TaskBot to merge Excel sheets

Download and run sample Task Bot from the Bot Store to merge two spreadsheets.

Complete these requirements for using the example :

- Microsoft Excel must reside on the Bot Runner device
- Automation 360 Build 4088 or later
- Excel Advanced package version 2.0.0-20200422-000103 or later
- Two spreadsheets as input: Both sheets must have common data within column A, such as a product or customer number

You can manually create the spreadsheets with columns similar to the following tables 1 and 2. Sheet 1 has columns to append to sheet 2 where a common value resides in column A. The bot expects the file locations and names to be `c:\bot_test\Spreadsheet1.xlsx` and `c:\bot_test\Spreadsheet2.xlsx`.

Table 1

Item Number	Name	Count	Category	Unit Price	Taxable	Backorder	Perishable	Locale
A0001	Milk	15	Grocery	3	N	Y	Y	US
A0005	Towel	4	Home	10	Y	N	N	US
A0006	Dog Food	16	Pet	22	N	N	N	US
A0007	Paint	43	Home	12	Y	N	N	IN

Table 2

Item Number	Name	Brand	Popular	Unit Price	TTS
A0001	Milk	Wholesome Foods	Y	3	1
A0002	Eggs	Dairy Love	Y	4	1
A0003	Flower	Spring Me Up!	N	10	3
A0004	Table	Woods Are Us	N	50	10
A0005	Towel	Claire Dane	N	10	6
A0006	Dog Food	Purina	Y	22	3
A0007	Paint	Color the World	N	12	2

1. Get the [Merge Excel Sheets Example](#) bot from the Bot Store.  
The bot is automatically loaded to your Automation 360 On-Premises or Cloud environment.

You will receive an email with instructions for installing the bot in Automation 360 from the Bot Store.

2. Follow the instructions carefully. If you do not have the Bot Developer role assigned, contact your administrator to add the role.
3. If your spreadsheets are not located at `c:\bot_test\Spreadsheet1.xlsx` and `c:\bot_test\Spreadsheet2.xlsx`, update lines 5 and 9 of the bot with your desktop file location.
4. Run the Task Bot.
5. Update the Task Bot with any changes that reflect your use case, and make it your own.  
You can also use the bot as a template for future Excel Advanced Task Bots by copying and saving it with a new name.

[Excel advanced package](#) on page 2722

The Excel advanced package contains actions that enable you to automate many of the repetitive tasks when working with Microsoft Excel spreadsheets.

## Example of migrating data from Excel to a database

In this example, you build a bot to transfer values from an Excel spreadsheet to a database using actions from the Database, Excel advanced, and Loop packages.

Before you start building your bot, create the following:

- Create an Excel spreadsheet with the following values and save it (For example: Test\_migration\_db.xlsx)

John	Williams	jwilliams@cmail.com
Sam	Li	sam.li@xyz.org
Carl	Miller	carl@carlmillerllc.com

	A	B	C	D	E	F
1	John	Williams	<a href="mailto:jwilliams@cmail.com">jwilliams@cmail.com</a>			
2	Sam	Li	<a href="mailto:sam.li@xyz.com">sam.li@xyz.com</a>			
3	Carl	Miller	<a href="mailto:carl@carlmillerllc.com">carl@carlmillerllc.com</a>			

- Create an Access database table named CustomerT with the following columns: (create a database similar to the image below and save it - for example: save it as Test\_Migration\_db.accdb)
  - FirstName
  - LastName

- Email

ID	FirstName	LastName	Email	Click to Add
(New)				

To migrate values from a spreadsheet to a table in a database, perform the following steps:

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: `\Bots\`  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
2. Open the spreadsheet:
  - a) Double-click or drag the **Excel advanced > Open** action .
  - b) Click **Browse** to provide the file path.

**Excel advanced: Open**

Opens an excel spreadsheet. This action works with xlsx, xls, csv, xlsx, xlsb, xml, txt, ods, html, htm, mhtml, silk and pdf files.

Required bot agent version: 21.112 or above

File path

Control Room file Desktop file Variable

C:\Temp\Test\_migration\_db.xlsx [Browse...]

e.g. C:\Working\Excel1.xlsx

Sheet contains a header

Specific sheet name

Sheet name

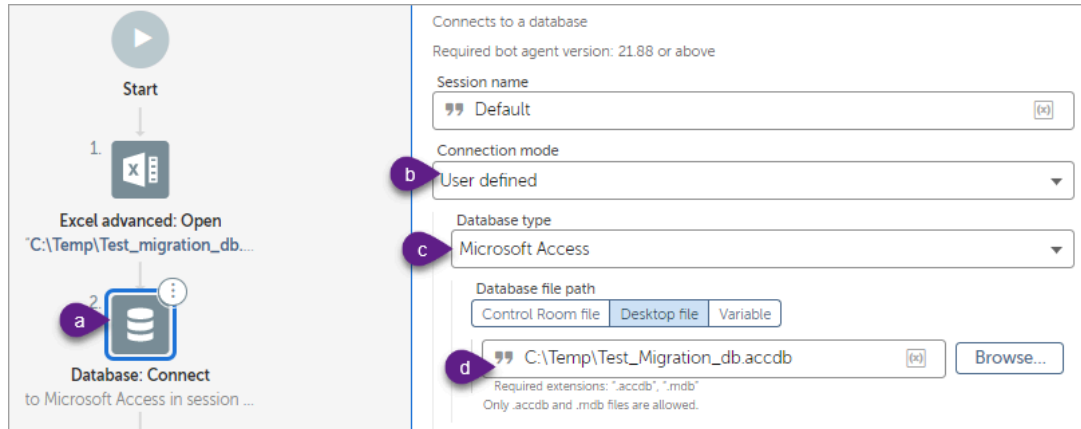

e.g. Sheet1 or SHEET1

Open in

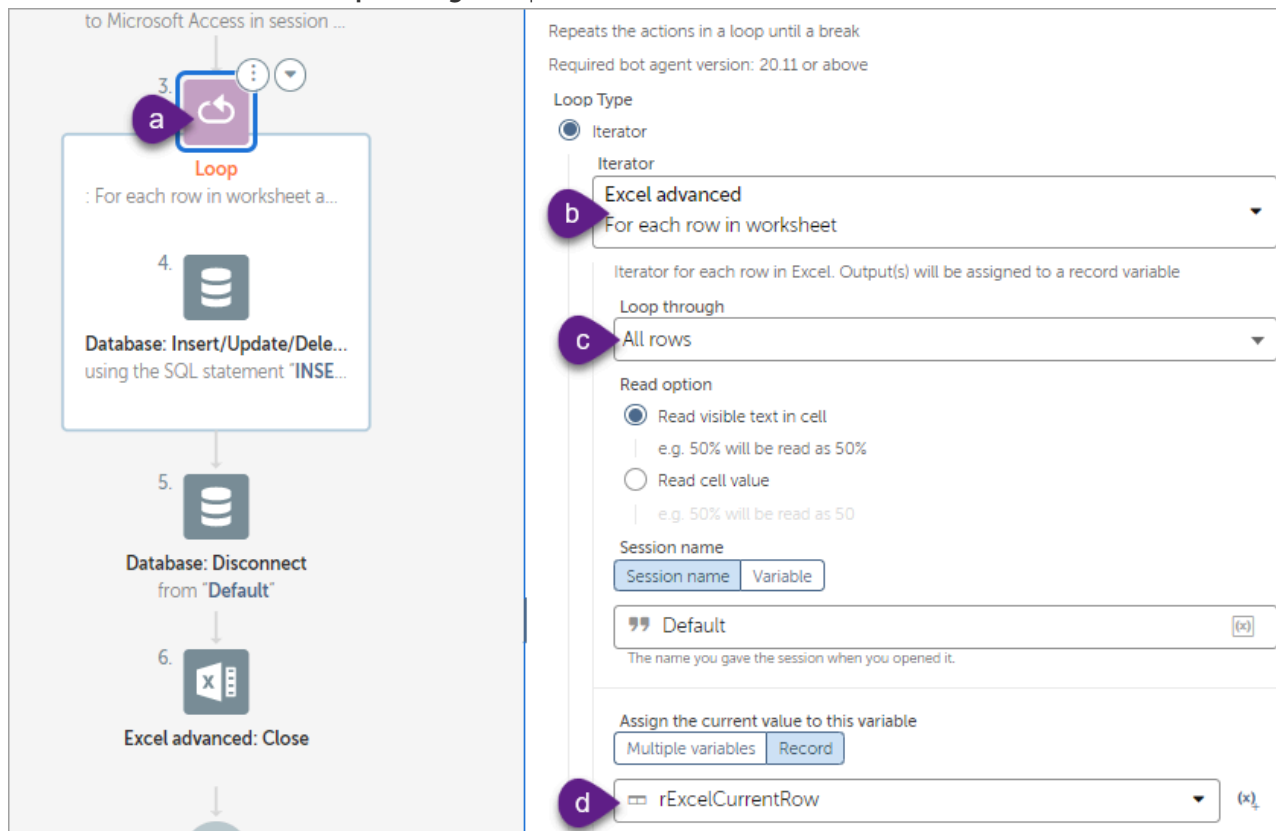

Read-only mode

Read-write mode

- c) Select the option to open the file in **Read-write**.
3. Connect to the database:
    - a) Double-click or drag the **Database > Connect** action.
    - b) Select the **User defined** connection mode.

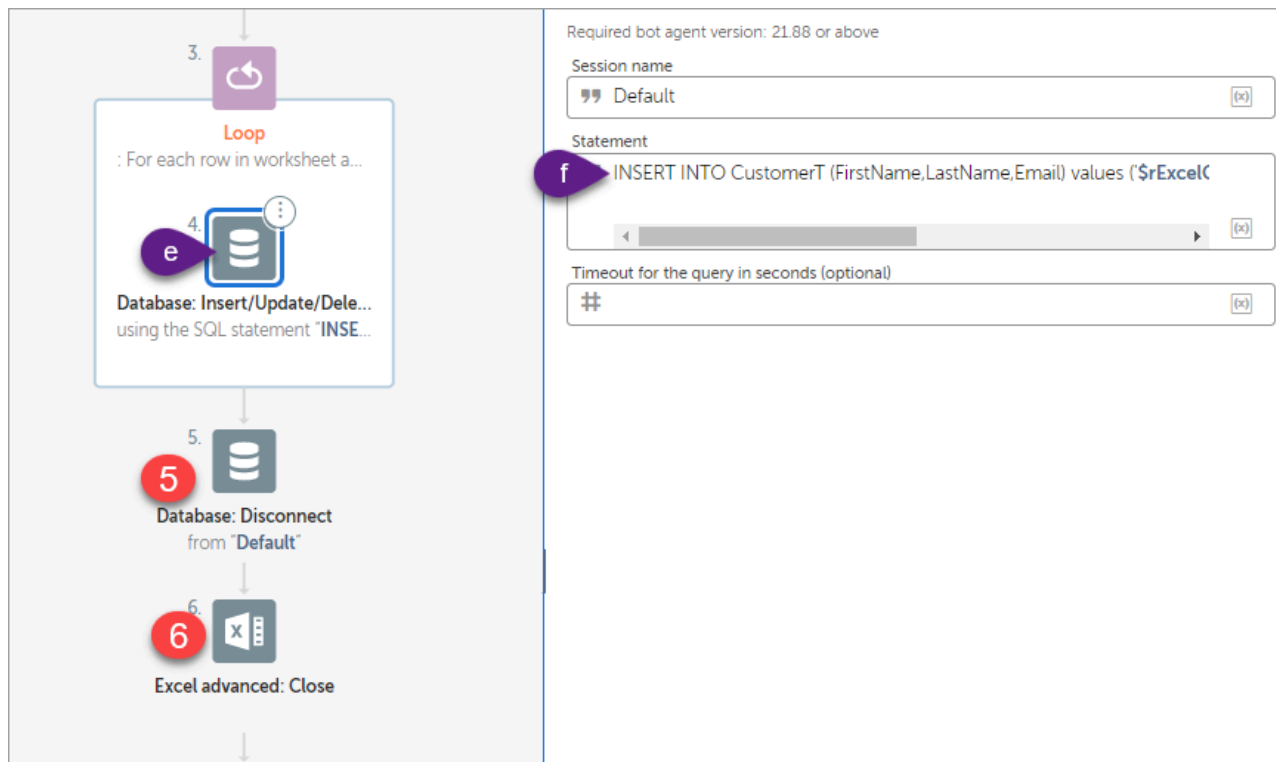

- c) Select the **Microsoft Access** database type.
  - d) Click **Browse** to provide the file path.
4. Insert the Excel values into the database, row by row:
- a) Double-click or drag the **Loop** action.
  - b) Select the **Excel advanced > For each row in worksheet** iterator.
  - c) Select **All rows** from the **Loop through** drop-down.

- d) In the Assign the current value to this variable, create the record variable `rExcelCurrentRow`.
- e) Drag the **Database > Insert/Update/Delete** action into the Loop container.

f) Enter the following SQL statement:

```
INSERT INTO customert
(
 firstname,
 lastname,
 email
)
VALUES
('{$rExcelCurrentRow[0]}$',
'{$rExcelCurrentRow[1]}$',
'{$rExcelCurrentRow[2]}$');
```

5. Disconnect from the database. Drag the **Database > Disconnect** action below the Loop container.
6. Close the spreadsheet. Double-click or drag **Excel advanced > Close Spreadsheet** action.
7. Click **Save**.

[Database package](#) on page 2621

Databases support internal operations of an enterprise by storing a variety of data, such as sales transactions, product catalogs, inventories, and customer profiles. Use the Database package to connect to a database, begin a transaction, and manipulate the stored data by retrieving, inserting, updating, deleting, and exporting it to a CSV file.

[Excel advanced package](#) on page 2722

The Excel advanced package contains actions that enable you to automate many of the repetitive tasks when working with Microsoft Excel spreadsheets.

[Loop package](#) on page 2975

Use the Loop package to run a sequence of actions repeatedly for a specific number of times or until a specific condition is met.

## Example of reading data from a spreadsheet

Build a bot that reads data from one Excel worksheet and writes it to another worksheet.

To use the Excel advanced package, Microsoft Excel must be installed on the device where you run the sample bot.

Suppose an Order Processing team receives order data in a spreadsheet as part of the Order Fulfillment process. The team automates the process of creating a priority shipping list from the spreadsheet and sharing it with the Picking department. The sample bot in this tutorial performs the following tasks:

- Reads spreadsheet data that contains a list of orders using the Excel advanced package.
- Creates a new spreadsheet containing a list of orders that need to be shipped as a priority.

For this tutorial, you can download and use a sample Excel file from [here](#).

1. Create a new bot.
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Task Bot**.
  - c) In the **Create Task Bot** window, enter `Priority List` in **Name**.
  - d) Click **Create and edit**.
2. To read data from the spreadsheet that contains the list of orders, open the Excel sheet.
  - a) From the **Actions** panel, find and add the **Excel advanced > Open** action to the Bot editor.
  - b) Click **File** and select the sample Excel file you downloaded.
  - c) Select **Sheet contains a header**.
  - d) Select **Specific sheet name** and enter `order_list`.
  - e) In **Create Excel session**, click **Local session**, and enter `orderlist` as the session name.
3. For the list of priority orders, create a new spreadsheet.
  - a) From the **Actions** panel, find and add the **Excel advanced > Create workbook** action to the Bot editor.
  - b) In **File path**, specify a file path for the new file. For example, `C:\\bots\\priority-orders.xlsx`.
  - c) In **Sheet name**, enter `priority orders`.
  - d) In **Create Excel session**, select **Local session** and enter `prioritylist` as the session name.
  - e) Save the changes.
4. Copy the header from the source spreadsheet to the new spreadsheet.
  - a) From the **Actions** panel, find and add the **Excel advanced > Get multiple cells** action to the Bot editor.

- b) In **Select range of cells to be returned**, select **Specific rows**, and then enter 1 in both the **From row** and **to row** fields.
  - c) In **Session name**, enter `orderlist`.
  - d) To store the copied values to a variable, create and assign a variable named `HeaderData` in **Assign value to the variable**. The values are stored in a data table variable.
  - e) Save the changes.
- 5. Write the copied header to the new sheet.
  - a) Find and add the **Excel advanced > Write from data table** action to the Bot editor.
  - b) In **Enter data table variable**, select **HeaderData**.
  - c) Click **Specific worksheet** and enter `priority orders`.
  - d) In **Specify the first cell**, enter `A1`.
  - e) In **Session name**, enter `prioritylist`.
  - f) Save the changes.
- 6. Before you write the data to the new spreadsheet, make sure that the A2 cell is selected on the new worksheet. To do so:
  - a) From the **Actions** panel, find and add the **Excel advanced > Go to cell** action to the Bot editor.
  - b) In **Specific cell**, enter `A2`.
  - c) In **Session name**, enter `prioritylist`.
  - d) Save the changes.
- 7. Loop through the list of orders in the source spreadsheet.
  - a) From the **Actions** panel, find and add the **Loop** action to the Bot editor.
  - b) From **Iterator**, select **For each row in worksheet** for Excel advanced.
  - c) In **Loop through**, select **All rows**.
  - d) In **Session name**, enter `orderlist`.
  - e) In **Assign the current value to this variable**, select **Record**, and then create a variable named `order-record`.
  - f) Save changes.
- 8. Select the records where `ShippingType` equals `Priority`.
  - a) a. From the **Actions** panel, find and add the **If** action within the **Loop** action.
  - b) In **Condition**, select **String** condition.
  - c) In **Source value**, enter `$order_record[4]$` to select the fifth column in the current record.
  - d) In **Operator**, select **Equal to(=)**.
  - e) In **Target value**, enter `Priority`.
  - f) Save the changes.

9. If a matching record is found, write the record to the new spreadsheet. You can achieve this by using the Set cell action as many times as the number of columns in the source data. However, this example uses the Loop action to achieve the same result.
  - a) From the **Actions** panel, find and add the **Loop** action within the **If** action.
  - b) From **Iterator**, select **For each value in record**.
  - c) In **Record variable**, select **order-record**.
  - d) In **Assign the current value to this variable**, select create a variable named **RecordValue**.
  - e) Save changes.
  - f) On the **Variables** panel, create a variable with the following details:
    - In **Name**, enter RecordValueCounter
    - In **Type**, select **Number**.
    - In **Default value**, enter 0.
  - g) From the **Actions** panel, find and add the **Excel advanced > Set cell** action.
  - h) Make sure **Active cell** is selected.
  - i) In **Cell value**, enter `$order-record[$recordValueCounter$]$`.
  - j) In **Session name**, enter `prioritylist`.
  - k) To move the cursor to the next cell in the row, find and add the **Excel advanced > Go to cell** action, and then select **One cell to the right** in **Active cell**.
  - l) In **Session name**, enter `prioritylist`.
  - m) To increment the recordValueCounter variable, find and add the **Number > Increment** action. Select **recordValueCounter** in both **Enter number** and **Assign the output value to a variable** fields. In **Enter increment** value, enter 1.
  - n) Save the changes.
10. Reset the recordValueCounter variable to zero.
  - a) Find and add the **Number > Decrement** action after the inner loop but within the **If** action.
  - b) Select **recordValueCounter** in both **Enter number** and **Assign the output value to a variable** fields.
  - c) In **Enter increment value**, enter 7.
  - d) Save the changes.
11. Move the cursor to the next row before the next iteration.
  - a) Find and add the **Excel advanced > Go to cell** action within the first **Loop** action (after the **Decrement** action).
  - b) Click **Active cell** and select **Beginning of the row**.
  - c) In **Session name**, enter `prioritylist`.
  - d) Find and add the **Excel advanced > Go to cell** action.
  - e) Click **Active cell** and select **One cell below**.
  - f) In **Session name**, enter `prioritylist`.

**g)** Save the changes.

**12.** Run the bot.

## Example of using the Run action

The **Run** action from the Task Bot package enables you to run and pass values to one or more child bots. In this example, you use the **Run** action to pass two values from a parent bot to the child bot; the child bot adds the values and passes the sum back to the parent bot.

This example demonstrates the following:

Modularization

Modularization separates a Task Bot into several bots, where each bot is built with all the actions necessary to perform one specific function of the greater task.

In this example, you build a single child bot to add the values. You can build several child bots, with each performing a different mathematical operation, and edit the parent bot to call whichever one you want to use.

Reusability

Reusability enables the user to build a bot once, and then use that bot to automate many processes.

The child bot contains only the actions necessary to add the values and print them to a Message Box. Also, the bot adds two variables instead of hard-coded values. As a result, this bot can be reused for any task that involves an addition operation.

Data control

Because the child bot accepts and returns values only through the use of variables, it does not hold data. This minimizes the chance of data leakage.

To run a Task Bot from the current task, perform these steps:

Build the child bot.

- 1.** Open a new bot.
  - a)** On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b)** Click **Create a bot**.
  - c)** Enter the bot name `AddChildBot`.
  - d)** Enter the folder location `Bots\TaskBotExample`.  
To change where your bot is stored, click **Choose** and follow the prompts.
  - e)** Click **Create and Edit**.
- 2.** Create the following variables:

- v1: number type; use as input
- v2: number type; use as input
- nSum: number type
- sSum: string type; use as output

[Create a variable](#) on page 2488

3. Use a **Number > Assign** action to perform the mathematical operation.
  - a) Double-click or drag the **Number > Assign** action.
  - b) In the **Select the source string variable/ value** field, enter the following expression:  $\$v1\$ + \$v2\$$
  - c) Select nSum from the **Select destination number variable** list.
4. Use the **Number > To string** action to convert the value so it can be printed to a Message Box.
  - a) Double-click or drag the **Number > To string** action.
  - b) In the **Enter a number** field, enter the following expression:  $\$nSum\$$
  - c) Select sSum from the **Assign output to variable** list.
5. Click **Save**.
6. Click **Close**.

Build the parent bot.

7. Open a new bot.
  - a) On the left panel, click **Automation**  
A list of available bots and forms is displayed.
  - b) Click **Create a bot**.
  - c) Enter the bot name MathBot.
  - d) Enter the folder location `\Bots\TaskBotExample`.  
To change where your bot is stored, click **Choose** and follow the prompts.
  - e) Click **Create and Edit**.
8. Create a Dictionary variable of Any subtype named dSums to accept the values passed from the child bot.  
Use the Any subtype to enable the parent bot to accept String, Number, or Boolean type values.
9. Insert a **Task Bot > Run** action to specify the values for the mathematical operation and the output variable to hold the sum.
  - a) Double-click or drag the **Task Bot > Run** action.
  - b) Click **Browse** to navigate to `Bots\TaskBotExample\AddChildBot`.
  - c) Enter the following values in the **Input values** fields:
    - v1: 12
    - v2: 54
  - d) Select dSums from the **Assign output to variable** list.

**Note:** Use a Dictionary variable to hold the output of the **Run** action in order to make the parent bot more versatile. This way a parent bot can handle different child bots regardless of whether they return a single value or several values.

---

10. Use a Message Box to retrieve and print the sum.

The variable `sSum` retrieved from the child bot is a key in the Dictionary variable `dSums`.

---

**Note:** You must know the variable names from the child bot to extract them from the parent bot. The interface does not automatically import the variable names to the parent bot.

---

- a) Double-click or drag the **Message box** action.
- b) Enter `$dSums { sSum } $` in the **Message to display** field.

11. Click **Save**.

12. Click **Run**.

The bot runs and the Message Box appears containing the sum 66.

Related reference

[Task Bot package](#) on page 3302

Use the **Run**, **Pause**, and **Stop** actions in the Task Bot package to manage running one or more child bots from a parent bot or with a third-party software using an API.

[Message box package](#) on page 2988

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

## Example of using the SOAP web service action

Use the **SOAP web service** action to pass two numeric values and return the sum from an online calculator application.

To make a SOAP web services call, perform the following steps:

1. Double-click or drag the **SOAP web services** action.
2. Select a connection method:
  - To connect using a URI, enter the URI, for example, `http://www.dneonline.com/calculator.asmx?WSDL`.
  - To connect using a file, select a file from the Control Room or the Desktop, or insert a variable.
3. Optional: Enter the SOAP endpoint in the **Address location** field.

If you specify the address location, the bot uses it during execution; otherwise, the bot uses the address location from the WSDL file.

---

**Note:** If you are creating the SOAP URI manually and not using the **Build SOAP request** option, go to step 6 on page 3434.

---

4. Click **Build SOAP request**.

The **SOAP request** window appears, displaying the services and ports, with details about their operations and parameter.

5. In the **SOAP request** window, expand the service for which you want to view the list of ports. Click the required port to display the list of available operations. Select the required operation and click **Apply** to retrieve the operation details from the SOAP request.

If you use the **Build SOAP request** option, **Services, Port, Operation, and Operation parameters** fields are automatically populated with details based on the operation you selected. Go to step 10 on page 3434.

6. In the **Service** field, enter the service name.

This field identifies the collection of ports supported by the web service. It holds the `@service` name value for a SOAP web service call, for example, `Calculator`.

7. Optional: In the **Port** field, enter the endpoint to connect with.

If you do not specify a port, the bot will use the first port mentioned in the WSDL file based on the service selected. However, if that port is not supported by the SOAP web service, bot execution will fail.

This field holds the `@binding` name value for a SOAP web service call, for example, `CalculatorSoap`.

8. Select the **SOAP version** of the endpoint that you specified in the **Port** field.

Choose either **1.1** or **1.2**.

---

**Note:** The **SOAP version** can be determined using one of following namespaces specified in the WSDL file:

- SOAP 1.1 namespace: `http://schemas.xmlsoap.org/soap/envelope`
- SOAP 1.2 namespace: `http://www.w3.org/2003/05/soap-envelope`

- 
9. In the **Operation** field, enter the name of the service function for the endpoint that you specified in the **Port** field.

The bot execution fails if either of the following is true:

- The port mentioned in the port field does not have any operations.
- The operation mentioned in the SOAP request for the port is unavailable.

This field holds the `@operation` name value for a SOAP web service call, for example, `Add`.

10. Select **Operation parameters** or **Raw data parameters** to provide the parameter details.

---

**Note:** If you have selected **Build SOAP request**, the parameter details table in the **Operation** tab is automatically populated with the parameters of the selected operation. Provide values for these parameters. You can also add, edit, or delete the parameters for a particular operation.

- 
- If you select **Operation parameters**, enter the name and value of each parameter. For example, enter the following values:
    - a) `intA` in the first **Name** field
    - b) `10` in the first **Value** field
    - c) `intB` in the second **Name** field
    - d) `20` in the second **Value** field

- If you choose **Raw data parameters**, select **Parameters** or **Credential parameters**.

- 11. Parameters:** You can use the credential values from the credential locker without exposing the credentials (username or password) in plain text in the raw data. To do so, you must first map the credential in the credential mapper and use the reference name in the raw data within curly braces.

For example, in the raw data, you provided the password in plain text to authenticate to the server.

```
<aut:AuthHeader>
<aut>Password> abc@123</aut>Password>
</aut:AuthHeader>
```

To use the password from the credential locker, perform the following steps:

- a) Click Add substitution.**

Enter the reference name, for example, `pwd`, in the **Name in XML** field. Select **Credential** to use a value available in the credential vault, **Variable** to use a credential variable, or **Insecure string** to manually specify the value you want to use.

For more information about credential vaults and how to use them, see [Credentials and lockers in the Credential Vault](#) on page 1977.

- b) Click Add**

- c) Specify the reference in the raw data within curly braces, as follows:**

```
<aut:AuthHeader>
<aut>Password>{ {pwd} }</aut>Password>
</aut:AuthHeader>
```

The reference name `pwd` specified in raw data will substitute the corresponding value stored in the credential vault.

Ensure that you enter the reference name in the same format as specified in **Add substitution**. For example, if you have entered `password` as `pwd` in **Add substitution** and enter `password` as reference name in the raw data, when you run the bot, the bot will encounter an error.

- 12. Credential parameters:** If you want to enter raw data parameters as credential. You can choose **Credential** to use a value available in the Credential Vault or select **Variable** to use a credential variable or **Insecure string** to manually specify the value you want to use.
- 13. Select **No Authentication** or **Basic** from the **Authentication Mode** list.**

  - If you select **No Authentication**, proceed to the next step.
  - If you select **Basic**, enter your credentials.

- 14. Optional:** Provide a Client certificate by selecting a file from the Control Room or your desktop, or insert a variable.
- 15. Optional:** Provide custom headers.
- 16. Optional:** Provide a file to save the XML output.
- 17. Select **Complete response** or **Selected response** to narrow the scope of the response.**

  - If you select **Complete response**, proceed to the next step.
  - If you select **Selected response**, perform the following steps if you are creating the Xpath expression manually and not using the **Build Xpath** option.

- a) Provide the XPath expression. For example:

```
/*[local-name()='Envelope' and namespace-uri()='http://schemas.xmlsoap.org/soap/envelope/']/*[local-name()='Body' and namespace-uri()='http://schemas.xmlsoap.org/soap/envelope/']/*[local-name()='AddResponse' and namespace-uri()='http://tempuri.org/']/*[local-name()='AddResult' and namespace-uri()='http://tempuri.org/']
```

- b) Select a section of the XML output: **Values**, **Inner XML**, or **Outer XML**.
- c) If you select the option **Values**, choose return content as: **String delimited by** or **List of strings**.

- If you select **String delimited by**, choose a delimiter option: **Pipe**, **Semicolon**, or **Custom**.

If you select **Custom**, enter variables or characters in the **Custom Delimiter** (optional) field.

---

**Note:** The special character dollar sign (\$) as delimiter is not supported.

---

- Select **List of strings** to return the output of the soap response as list of strings.

---

**Note:** You can only specify a list type of variable with data type as strings.

---

**18.** Click **Build Xpath**.

The Output preview window appears.

**19.** Select the appropriate node from the response body. The XML path is automatically created. Click **Apply**.

If you use the **Build Xpath** option, **XPath expression** and **Value** fields are automatically populated with details based on the operation you selected.

**20.** Optional: To set a time-out value when you send a SOAP request and receive a response, in the **Wait for action to complete** field, specify the wait time (in milliseconds).

By default, the wait time is 60000 milliseconds.

**21.** Configure the P12 certificate:

- To get the SSL certification file, select one of the following options: **Control Room file**, **Desktop file**, or **Variable**
- Configure the Keystore properties:
  - **Keystore file (Optional):** To provide the keystore file in .p12 format, select one of the following options: **Control Room file**, **Desktop file**, or **Variable**. The keystore file includes the client's private key and certificate.
  - **Keystore password (Optional):** To provide the password for the keystore file, select one of the following options: **Credential**, **Variable**, or **Insecure string**. The password is used to access the keystore file.

**22.** Select a variable to store the XML output.

For example, prompt-assignment

**23.** Verify the output of the **SOAP web service** action by inserting a **Message box** action with the variable prompt-assignment in the body message.

When you run the bot, the message box should show 30.

Use the **SOAP web service** action from the SOAP Web Service package to access and exchange information between two systems in XML format.

## Example of using Get structure command from SAP BAPI package

Using the SAP BAPI package, build a bot that inputs a structure to get data.

Download the SAP Java connector and DLL from the SAP website.

In this tutorial, you will build a bot that invokes BAPI\_FLIGHT\_GETLIST from the SAP demo Flight Data application. When executed, the bot calls the BAPI function by inputting an airline ID and destination details, gets a list of flights, and writes the response data to a CSV file.

You will use the following import parameters to limit your search:

- AIRLINE: Use the parameter to pass the airline ID.
- DESTINATION\_FROM: Use the parameter to get the structure and pass the city name and airport ID.

The tutorial is intended to demonstrate how to perform the following actions:

- Get the structure of an import parameter.
- Set the values for the fields in the retrieved structure.
- Get response data in a table based on the input data.

### 1. Create a Task Bot named SAP-BAPI-FlightListReport.

- a) Log in to Control Room.
- b) On the left pane, click **Automation**.
- c) Click the **Create a bot** icon.
- d) In the **Name** field, enter SAP-BAPI-FlightListReport, and click **Create & Edit**.

### 2. To connect the bot to your SAP system, from the **Actions** panel, find **SAP BAPI > Connect** action and add it to the bot.

- a) In **JCo: SAP Java Connector package**, specify the path to the Java connector .jar file.
- b) In **JCo DLL dependency**, specify the path to the DLL file.
- c) Choose **Custom Application Server** as **Connection Type**.
- d) In **Application server host name**, specify the host name of the SAP application server.

---

**Note:** As a best practice, use the bot to specify sensitive information such as host name, user name, and password.

---

- e) In **System number**, enter the instance number.
- f) In **SAP instance system ID**, enter the system ID.
- g) In **Client number**, enter the client number.

- h)** In **Logon language code**, enter **EN** or the language specific to your system.
  - i)** In **Router string**, enter the SAP router string.
  - j)** In **Username**, enter your SAP user name.
  - k)** In **Password**, enter your password.
  - l)** Run the to test the connection.  
If the specified connection properties are correct, the bot is executed successfully.
- 3.** To create a function, add the **SAP BAPI > Create function** action.
  - a)** In **Function alias name**, enter `getFlightListByAirline`.
  - b)** In **BAPI name**, enter `BAPI_FLIGHT_GETLIST`.
- 4.** To filter the data by an airline name, add the **SAP BAPI > Set field value** action.
  - a)** In **Function alias name**, enter `getFlightListByAirline`.
  - b)** Click the **Function** tab.
  - c)** In **Field name**, enter `AIRLINE` as the input parameter name.
  - d)** In **Field value**, enter `AZ`.
- 5.** To limit the selection by the airport and the destination city, get the structure of the `DESTINATION_FROM` import parameter first, and then set values for the fields in the retrieved structure. To do this, add the **SAP BAPI > Get structure** action.
  - a)** In **Function alias name**, enter `getFlightListByAirline`.
  - b)** In **Structure name**, enter `DESTINATION_FROM`.
  - c)** To assign the retrieved structure to an alias, click the **Alias** tab in **Destination**, and enter `destinationFrom` in **Create structure alias**.  
You can now use the alias to set values for the fields in the retrieved structure.
- 6.** To set a value for the `AIRPORT ID` field in the `DESTINATION_FROM` parameter, add the **SAP BAPI > Set field value** action.
  - a)** In **Function alias name**, enter `getFlightListByAirline`.
  - b)** In **Source**, click the **Structure** tab.
  - c)** In **Structure alias**, enter `destinationFrom`.
  - d)** In **Field name**, enter `AIRPORTID`.
  - e)** In **Field value**, enter `FCO`.
- 7.** To set a value for the `CITY` field in the `DESTINATION_FROM` parameter, add the **SAP BAPI > Set field value** action.
  - a)** In **Function alias name**, enter `getFlightListByAirline`.
  - b)** In **Source**, click the **Structure** tab.
  - c)** In **Structure alias**, enter `destinationFrom`.
  - d)** In **Field name**, enter `CITY`.
  - e)** In **Field value**, enter `ROME`.

8. To execute `BAPI_FLIGHT_GETLIST`, add the **SAP BAPI > Run function** action.
  - a) In **Function alias name**, enter `getFlightListByAirline`.
9. To get the filtered data from the `FLIGHT_LIST` table, add the **SAP BAPI > Get table** action.
  - a) In **Function alias name**, enter `getFlightListByAirline`.
  - b) In **Table name**, click the `FLIGHT_LIST` tab.
  - c) In **Destination**, click **Variable** to store the retrieved table data in memory.
  - d) In **Save the outcome to a variable**, create a variable named `tblFlightList` by clicking **(x)**.
10. To write the data from the retrieved table to a CSV file, add the **Data Table > Write to file** action.
  - a) In **Data table**, select `tblFlightList`.
  - b) In **Enter file name**, specify the path to the CSV file to which you want to write the data.
  - c) Select **Create folders/files if it doesn't exist**.
  - d) Click **Overwrite existing file**.
11. Save and then run the bot.

## Example of writing data to SAP using SAP BAPI package

Using the SAP BAPI package, build a bot that writes data to the SAP database.

Download the SAP Java connector and DLL from the SAP website.

In this tutorial, you will build a bot that invokes `BAPI_FLICUST_CREATEFROMDATA` from the SAP demo Flight Data application. You will use the `CUSTOMER_DATA` import parameter to pass the customer data to the BAPI. When executed, the bot creates a new customer record in SAP database and displays the customer number returned by the BAPI.

The tutorial demonstrates how to perform the following actions:

- Use the Get structure command to set values for the import parameters.
  - Create a new record in an SAP table.
  - Receive a response from a BAPI.
1. Create a bot named `SAP-BAPI-CreateNewFlightCustomer`.
    - a) Log in to the Control Room.
    - b) On the left pane, click **Automation**.
    - c) Click the **Create a bot** icon.
    - d) In the **Name** field, enter `SAP-BAPI-CreateNewFlightCustomer`, and click **Create & Edit**.
  2. To connect the bot to your SAP system, from the **Actions** panel, find **SAP BAPI > Connect** action and add it to the bot.
    - a) In **JCo: SAP Java Connector package**, specify the path to the Java connector `.jar` file.
    - b) In **JCo DLL dependency**, specify the path to the DLL file.

- c) Choose **Custom Application Server** as **Connection Type**.
- d) In **Application server host name**, specify the host name of the SAP application server.

---

**Note:** As a best practice, use the to specify sensitive information such as host name, user name, and password.

---

- e) In **System number**, enter the instance number.
- f) In **SAP instance system ID**, enter the system ID.
- g) In **Client number**, enter the client number.
- h) In **Logon language code**, enter **EN** or the language specific to your system.
- i) In **Router string**, enter the SAP router string.
- j) In **Username**, enter your SAP user name.
- k) In **Password**, enter your password.
- l) Run the to test the connection.  
If the specified connection properties are correct, the bot is executed successfully.

3. To create a function, add the **SAP BAPI > Create function** action.
  - a) In **Function alias name**, enter `createNewFlightCustomer`.
  - b) In **BAPI name**, enter `BAPI_FLCUST_CREATEFROMDATA`.
4. Because the `CUSTOMER_DATA` parameter is of the type structure, get the structure of the import parameter and assign it to an alias. To do this, add the **SAP BAPI > Get structure** action.
  - a) In **Function alias name**, enter `createNewFlightCustomer`.
  - b) In **Structure name**, enter `CUSTOMER_DATA`.
  - c) To store the retrieved structure as an alias, click the **Alias** tab in **Destination**.
  - d) In **Create structure alias**, enter `CustomerData`.  
You will use the alias to set values for the import field within the retrieved structure.
5. To set the value for the `CUSTNAME` field, add the **SAP BAPI > Set field value** action.
  - a) In **Function alias name**, enter `createNewFlightCustomer`.
  - b) In **Source**, click the **Structure** tab.
  - c) In **Structure alias**, enter `CustomerData`.
  - d) In **Field name**, enter `CUSTNAME`.
  - e) In **Field value**, enter `John Doe`.

6. Repeat Step 5 to add and configure the **Set field value** action for each of the following fields:

Field name	Field value
STREET	testStreet
POSTCODE	101001
CITY	testCity

Field name	Field value
COUNTR	US
COUNTR	00000000
EMAIL	test@example.com
CUSTTYPE	P

7. To execute `BAPI_FLCUST_CREATEFROMDATA`, add the **SAP BAPI > Run function** action.
- a) In **Function alias name**, enter `createNewFlightCustomer`.

---

**Note:** If you want `BAPI_FLCUST_CREATEFROMDATA` to write the data to SAP database, you must select the **End sequence** and the **Commit transaction** options. If you select the **End sequence** option, ensure that you select the **Begin sequence** option in the **Create function** action.

The sample bot created with the help of this tutorial is intended to demonstrate how the `Create()` BAPIs work when the SAP BAPI package is used. It is not intended to modify the database.

---

The BAPI assigns and returns a customer number after a new customer record is created.

8. To get the number into a variable, add the **SAP BAPI > Get field value** action.
- a) In **Function alias name**, enter `createNewFlightCustomer`.
- b) In **Source**, click the **Function** tab.
- c) In **Field name**, enter `CUSTOMERNUMBER`
- d) In **Save the outcome to a variable**, create a variable named `strCustomerNumber` by clicking **(x)** and select the variable.
9. To display the customer number, add the **Message Box** action.
- a) In **Enter the message to display**, select the `strCustomerNumber` variable.
10. Save and run the bot.

## Example of using Run standard workflow from SAP BAPI package

Using the Run standard workflow action from the SAP BAPI package, build a bot that retrieves data from SAP systems.

Download the SAP Java connector and DLL from the SAP website.

In this tutorial, you will build a bot that uses the Run standard workflow action. The Run standard workflow action provides a user interface that enables you to select BAPIs and configure the parameters for the selected BAPI.

By using this single SAP BAPI package action, you will perform the following actions:

- Select a BAPI (`BAPI_FLIGHT_CHECKAVAILABILITY`) from a list of function modules available in the connected SAP system.

- Set values for the import and export parameters of the selected BAPI.
- Assign retrieved structure or tables to dictionary or table variables.

When executed, the bot gets flight availability data based on the input data, and writes it to a CSV file.

1. Create a bot named `SAP-BAPI-CheckFlightAvailability`.
  - a) Log in to the Control Room.
  - b) On the left pane, click **Automation**.
  - c) Click the **Create a bot** icon.
  - d) In the **Name** field, enter `SAP-BAPI-CheckFlightAvailability`, and click **Create & Edit**.
2. To connect the to your SAP system, from the **Actions** panel, find **SAP BAPI > Connect** action and add it to the .
  - a) In **JCo: SAP Java Connector package**, specify the path to the Java connector .jar file.
  - b) In **JCo DLL dependency**, specify the path to the DLL file.
  - c) Choose **Custom Application Server** as **Connection Type**.
  - d) In **Application server host name**, specify the host name of the SAP application server.

---

**Note:** As a best practice, use the to specify sensitive information such as host name, user name, and password.

---

- e) In **System number**, enter the instance number.
  - f) In **SAP instance system ID**, enter the system ID.
  - g) In **Client number**, enter the client number.
  - h) In **Logon language code**, enter **EN** or the language specific to your system.
  - i) In **Router string**, enter the SAP router string.
  - j) In **Username**, enter your SAP user name.
  - k) In **Password**, enter your password.
  - l) Run the to test the connection.  
If the specified connection properties are correct, the bot is executed successfully.
3. From the **Actions** panel, find **SAP BAPI > Run standard workflow** action after the **Connect** action.
  4. Select a BAPI.
    - a) Click the **Select workflow** option.
    - b) In the **Standard BAPI Selector** window, from **Select Standard BAPI**, expand **SAP Modules**.
    - c) Find and expand **Flight with connection data (SAP training)**.
    - d) In **Flight with connection data (SAP training)**, expand **General > Create**, select **BAPI\_FLIGHT\_CHECKAVAILABILITY**, and then click **Select**.

5. Specify values for the fields in the import parameter. Do the following in **Import to BAPI**:

- a) Click the vertical ellipsis option for the **AIRLINEID** field, and select **Edit**.
- b) In **Value**, enter DL and click **Apply**.
- c) Click the vertical ellipsis option for the **CONNECTIONID** field, and select **Edit**.
- d) In **Value**, enter 1699 and click **Apply**.
- e) Click the vertical ellipsis option for the **FLIGHTDATE** field, and select **Edit**.
- f) In **Value**, enter 20170418 and click **Apply**.  
The Java connector for SAP systems takes the date values in the yyymmdd format.

BAPI\_FLIGHT\_CHECKAVAILABILITY returns data in the AVAILABILITY export parameter, which is of the type structure.

- 6. In **Export to BAPI**, perform the following steps:
  - a) Click the ellipsis option for the **AVAILABILITY** field.
  - b) On the **Availability** window, select the **Field name** check box to select all fields within the structure, and then click **Apply**.
- 7. Store the data that the BAPI exports to a variable.
  - a) In **Save exported structures and scalars**, create a variable by clicking **(x)** and name it ReturnStructure.
- 8. In **Save exported structures and scalars**, create a variable by clicking **(x)** and name it ReturnStructure.
- 9. Save the **Run standard workflow** action.
- 10. Convert the exported data to a table.
  - a) From the **Actions** panel, find **Dictionary > Get** action, and add it after the **Run standard workflow** action.
  - b) Click inside **Dictionary variable** and select ReturnStructure.
  - c) In **Key**, enter AVAILABILITY.
  - d) In **Assign the output to variable**, create a variable by clicking **(x)** and name it Availability.
- 11. To write the data from the retrieved table to a CSV file, add the **Data Table > Write to file** action.
  - a) In **Data table**, select Availability.
  - b) In **Enter file name**, specify the path to the CSV file, to which you want to write the data.
  - c) Select **Create folders/files if it doesn't exist**.
  - d) Click **Overwrite existing file**.
- 12. Save and run the bot.

## Example of using the VBScript package in a resilient bot

Build a bot that executes a Microsoft Visual Basic script. Use the Try/Catch package to gracefully end the bot if it fails, making it resilient to crashes. A resilient bot allows scheduled and queued bots to continue even if the current bot encounters an error.

In this bot, you ask the user to provide a number. The bot passes the number to a Microsoft Visual Basic script to multiply by pi and return the value. The bot then reports the result to the user. You can use the **VBScript** action to either import an external script or type it directly into your bot. In this example, you manually type the script. You also add resiliency to the bot by adding error handling.

1. Create a bot:
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Provide a name for the bot: `MultiplyPi`
  - d) Enter the folder location: `Bots\TaskBotExample`
  - e) Click **Create and Edit**.
2. Create a variable: `nPromptAnswer`:
  - Type: **Number**
  - Name: `nPromptAnswer`

[Create a variable](#) on page 2488
3. Create a variable: `lNumbersForPi`:
  - Type: **List**
  - Subtype: **Number**
  - Name: `lNumbersForPi`
4. Click **Save**.
5. Use the **Prompt > For value** action to ask the user for a number.
  - a) Click the **Show** link on the Actions pane.
  - b) Double-click or drag the **Prompt For value** action to add it to the bot.
  - c) In the **Prompt window caption** field, type: `Any Number`
  - d) In the **Prompt message field**, type: `Enter any number to multiply by pi.`
  - e) In the **Assign the value to a variable** field, select **SampleString**.
6. Click **Save**.
7. Use the **Error handler > Try** action to gracefully end the bot if there was an error, such as the user not entering a number.
  - a) Double-click or drag the **Error handler > Try** action.
  - b) Drag the **Prompt > For value** action under the **Error handler > Try** action.
8. Click **Save**.
9. Convert the **SampleString** (string) to a number value.

- a) Double-click or drag the **String > To number** action, adding it as the last line before the **Error handler: Catch** action.
  - b) In the **Enter the string** field, press F2 to open the list of your variables, and select **SampleString**.
  - c) Click **Yes, insert**.
  - d) In the **Assign the output to variable** field, select **nPromptAnswer**.
10. Click **Save**.
11. Copy the number value to the first item in the list of numbers to pass to VBScript.
- a) Double-click or drag the **List > Add item** action, adding it as the last line before the **Error handler: Catch** action.
  - b) In the **List variable** field, select **INumbersForPi**.
  - c) In the **Item to be added** field, select **nPromptAnswer**.
12. Click **Save**.
13. Use the **VBScript > Open** action to provide your Visual Basic source code.
- a) Double-click or drag the **VBScript Open** action, adding it as the last line before the **Error handler: Catch** action.
  - b) In the **VBScript** options, select **Manual Input**.
  - c) Copy the following code and paste it into the **Enter script here** field:

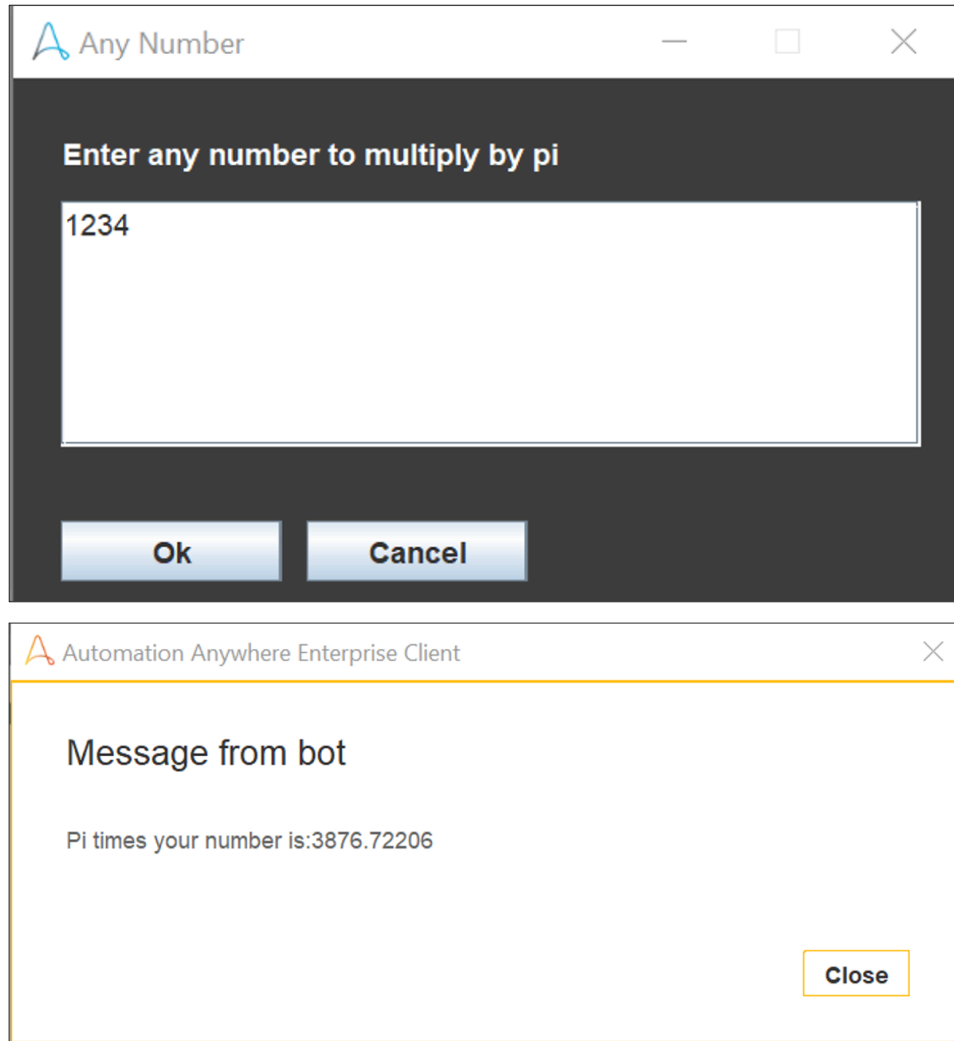

```
Dim Arg, var1, var2
Set Arg = WScript.Arguments
Function MultiplyPi (Arg)
 var1 = Arg(0)
 var2 = 3.14159
 MultiplyPi = cdbl(var1)*var2
End Function
```

14. Click **Save**.
15. Use the **VBScript > Run function** action to execute the script.
- a) Double-click or drag the **VBScript Run function** action, adding it as the last line before the **Error handler: Catch** action.
  - b) In the **Enter the name of the function to be executed (optional)** type **MultiplyPi**.
  - c) In the **Parameters (optional)** field, select **INumbersForPi** variable.
  - d) In the **Assign the output to variable (optional)** field, select **SampleString**.
16. Click **Save**.
17. Use the **VBScript > Close** action to end the session.
- a) Double-click or drag the **VBScript Close** action, adding it as the last line before the **Error handler: Catch** action.
18. Click **Save**.
19. Print the answer generated in the VBScript on the screen.

- a) Double-click or drag the **Message box** action, adding it as the last line before the **Error handler: Catch** action.
  - b) In the **Enter the message to display** field, type `Pi times your number is:` , then press F2 to open the list of your variables. Select **SampleString**.
  - c) Click **Yes, insert**.
20. Click **Save**.
21. Notify the user if an error occurred and end the bot gracefully.
- a) Click the **Error handler: Catch AllErrors** action once so that it is highlighted in your bot.
  - b) Double-click or drag the **Message box** action to insert it as the last bot action.
  - c) In the **Enter the message to display** field, type `Bot failed. Please be sure to enter only numbers..`
22. Click **Save**.
23. Click the **List** tab to view your code as text only.  
Your code should look like this:

```
Start
Error handler: Try
 Prompt: For value during bot execution and assign the value
 $SampleString$
 String: To number Convert string $SampleString$ to a number and
 assign it to number variable $nPromptAnswer$
 List: Add item $nPromptAnswer$ to $lNumbersForPi$
 VBScript: Open VBScript manual script of 7 lines
 VBScript: Run function "MultiplyPi"
 VBScript: Close VBScript "Default"
 Message box "Pi times your number is: $SampleString$"
Error handler: Catch AllErrors
 Message box "Bot failed. Please be sure to enter only numbers."
End
```

24. Run your bot.
25. When the bot runs successfully, the prompt window opens where you enter the value, and then the message box displays the calculated number. View the message and click **Close**.

You can test the resiliency of your bot by running the bot again and entering a letter instead of a number.

[VBScript package](#) on page 3346

The VBScript package contains actions that enable VBScript functions in a task.

## Build a Bot Insight dashboard bot

In this example, you build a bot that retrieves data from a website to create visualizations in Bot Insight.

Configure an empty string variable named sNu11.

[Create a variable](#) on page 2488

1. Create a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.

- c) In the **Create Task Bot** window, enter the bot name.
  - d) Accept the default folder location: \Bots\  
To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and edit**.
2. Open a browser window to the web page from which you want to extract the table.
  - a) Double-click or drag the **Browser > Launch website** action.
  - b) In the URL field, enter `https://www.statista.com/statistics/183483/ranking-of-languages-spoken-at-home-in-the-us-in-2008/`.
  - c) Select the Internet Explorer browser.

---

**Note:** Use Microsoft Internet Explorer because it reliably launches the website in a new window, even if another window is already open. Other browsers might launch the website in a new tab if there is an open window.

---
  - d) Click **Save**.
  - e) Click **Run**.  
The bot opens the window.
3. Select the table for extraction.
  - a) Double-click or drag the **Recorder > Capture** action.
  - b) Click the **Window** tab and select the **Languages spoken in the United States 2018 | Statista** window from the drop-down list.  
If the window title does not appear in the list, click **Refresh**.
  - c) Click **Capture object**.  
The **Languages spoken in the United States 2018 | Statista** window is activated.
  - d) Hover over the table until an orange box that surrounds the entire table appears.
  - e) Click the table.
  - f) Return to the Control Room.
  - g) In the Object properties table, verify the Control Type is TABLE.  
If it is not, click **Recapture object**.
  - h) From the Action drop-down list, select **Get table**.
  - i) In the **Assign output to variable** field, create the `tLanguages` table variable.
4. Specify the file in which to save the data.
  - a) Double-click or drag the **Data Table > Write to file** action.
  - b) From the **Data table name** list, select **tLanguages**.
  - c) Provide a file path to create a CSV file.  
For example, `C:\Users\\Desktop\LanguagesTable.csv`.
  - d) Select the **Create folders/files if it doesn't exist** option.
  - e) Select to overwrite the existing file.
5. Specify the file that holds the extracted data.

- a) Double-click or drag the **CSV/TXT > Open** action.
  - b) Provide the file path to the file specified in step 4.
  - c) Select the **Contains header** option to exclude the first row.
6. Iterate through each row of the file.
- a) Double-click or drag the **Loop** action.
  - b) Select the **For each row in CSV/TXT** iterator.
  - c) In the **Assign the current row to this variable** field, create the variable `rCurrentRow`.
7. Specify the data to populate the Bot Insight dashboard.
- a) Double-click or drag the **Analyze > Open** action.
  - b) Double-click or drag the **String > Assign** action.
  - c) Enter `$rCurrentRow[0]$` as the source string.  
Press F2 to open the variables menu.
  - d) In the **Select destination string variable** field, create the variable `sLanguage`.
  - e) Double-click or drag the **String > Replace** action.  
The extracted data uses commas to separate digits. You must remove the commas before you can convert the string to a number data type to use in Bot Insight.
  - f) Enter `$rCurrentRow[1]$` as the source string.  
Press F2 to open the variables menu.
  - g) Enter `,` in the **Find string** field.
  - h) Select the **Not a regular expression** option.
  - i) In the **Replace with** field, enter `$sNull$`.
  - j) In the **Assign the output row to variable** field, create the variable `sPopulation`.
  - k) Double-click or drag the **String > To number** action.
  - l) Enter the `$sPopulation$` variable.
  - m) In the **Assign the output row to variable** field, create the variable `nPopulation`.
  - n) Double-click or drag the **Analyze > Close** action.
  - o) Select the following variables:
    - **sLanguage**
    - **nPopulation**
8. Click **Save** and then **Run**.
9. Click **Analyze**.  
The Bot Insight window appears.

Learn more about dashboards.

[Analyze package](#) on page 2566

Use the actions in the **Analyze** package to specify the actions and variables to use in the Bot Insight dashboard and widgets. The **Analyze** package enables you to perform transactional analytics for the data that is logged by the variables when the bot runs.

[Browser package](#) on page 2590

The **Browser** package contains actions that enable you to download files, find broken links, and launch a website. This package supports Google Chrome, Chromium-based Microsoft Edge, and Internet Explorer browsers.

[Recorder package](#) on page 3108

Recorder package captures a series of tasks in a process and then automates them. You can automate your business applications (for example, desktop, Web, SAP, and Java applications) using the Recorder to capture actions performed on application objects such as a text box, button, table, radio button, combo box, and list view.

[Data Table package](#) on page 2607

The **Data Table** package contains actions that enable you to perform various operations on the values of table variables. Use these actions to join or merge content, search for specific values, insert rows and columns, remove duplicate rows, and write values to a file.

[CSV/TXT package](#) on page 2604

The **CSV/TXT** package contains actions that enable you to open a CSV or text file, read data from that file, and assign the data to a Table variable. This package supports files encoded in ANSI, Unicode, UTF-8, or Windows-1251, and can process up to one million records.

[Loop package](#) on page 2975

Use the **Loop** package to run a sequence of actions repeatedly for a specific number of times or until a specific condition is met.

## Example of using multiple analyze actions in a task

Build a bot that uses multiple **Open** and **Close** Analyze actions in a task to analyze and compare the sales data for each quarter of XYZ Company, and create visualizations in Bot Insight.

Before you start building the bot, create the following data set on your desktop in the .csv file format.

PRODUCT	COUNT	QUANTITY	SALES_C	QUANTITY	SALES_C	QUANTITY	SALES_C	QUANTITY	SALES_C	QTR4

1. Create a bot.
  - a) Log in to the Control Room as a Bot Creator.
  - b) On the left pane, click **Automation**.  
A list of available bots and forms is displayed.
  - c) Click **Create new > Bot**.
  - d) Click **Create and edit**.
  
2. Open the XYZ sales data.csv file that you created.
  - a) Double-click or drag the **CSV/TXT > Open** action.
  - b) In the **Session name** field, enter `Session 1`.
  - c) Provide the file path to XYZ company sales data.csv.
  - d) Select the **Contains header** option to exclude the first row.
  
3. Create a **Record** variable as Row by using the **Create variable** icon.  
The **Record** variable holds all the values for one row. With each iteration of the loop, the bot retrieves the values of the next row and stores them in the **Record** variable, overwriting the values from the previous row.
  
4. To retrieve the values in the cells from each row in the XYZ company sales data.csv file, use a **Loop** action.
  - a) Select **For each row in CSV/TXT iterator**.
  - b) In the **Session name** field, enter `Session 1`.
  - c) In the **Assign the current row to this variable** field, select the Row variable that you created.

5. Create the following variables for four quarters by using the **Create variable** icon at the top of the **Variables** menu.
  - PRODUCTCODE
  - PRODUCTLINE
  - COUNTRY
  - QUANTITYORDERED\_QTR1
  - SALES\_QTR1
  - QUANTITYORDERED\_QTR2
  - SALES\_QTR2
  - QUANTITYORDERED\_QTR3
  - SALES\_QTR3
  - QUANTITYORDERED\_QTR4
  - SALES\_QTR4

6. Specify the data to populate on the Bot Insight business dashboard.

- a) Double-click or drag the **Analyze > Open** action.

---

**Note:** Ensure that you insert the Analyze **Open** and **Close** actions inside the **Loop** action to analyze and capture the data from each row in the Bot Insight dashboard.

---

- b) Double-click or drag the **String > Assign** action.

Press F2 to open the variables menu.

- c) Choose the Row variable from the drop-down list.

- d) Enter PRODUCTCODE and click **Yes, insert**.

- e) In the **Select destination string variable** field, choose the PRODUCTCODE variable.

To assign string variables for PRODUCTLINE and COUNTRY, repeat [Step 6b](#) through [Step 6e](#).

- f) Double-click or drag the **Number > Assign** action.

Press F2 to open the variables menu.

- g) Choose the row variable from the drop-down list.

- h) Enter QUANTITYORDERED\_QTR1 and click **Yes, insert**.

- i) In the **Select destination string variable** field, choose the QUANTITYORDERED\_QTR1 variable.

To assign number variables for SALES\_QTR1, QUANTITYORDERED\_QTR2, SALES\_QTR2, QUANTITYORDERED\_QTR3, SALES\_QTR3, QUANTITYORDERED\_QTR4, and SALES\_QTR4, repeat [Step 6f](#) through [Step 6i](#).

- j) Double-click or drag the **Analyze > Close** action.

- k) Enter the **Transaction** name as `Quarters 1 and 2`.

- l) Select the following transactional variables in the **Close** action:

- PRODUCTCODE
- PRODUCTLINE
- COUNTRY
- QUANTITYORDERED\_QTR1
- SALES\_QTR1
- QUANTITYORDERED\_QTR2

- SALES\_QTR2
- m) Double-click or drag the **Analyze > Open** action.
  - n) Double-click or drag the **Analyze > Close** action.
  - o) Enter the **Transaction** name as `Quarters 3 and 4`.
  - p) Select the following transactional variables in the **Close** action:
    - PRODUCTCODE
    - PRODUCTLINE
    - COUNTRY
    - QUANTITYORDERED\_QTR3
    - SALES\_QTR3
    - QUANTITYORDERED\_QTR4
    - SALES\_QTR4

7. Click **Save** and then **Run**.

8. Click **Analyze Task Bot**.

The Bot Insight business dashboard appears.

9. Select the **Preview** option.

The sales data is displayed as follows:

Task Name: XYZ company sales data analysis

Transaction Name: Quarter 1 and 2 Total Records: 13

sales_qtr2	productcode	sales_qtr1	quantityordered_qtr1	quantityordered_qtr2	productline	country

## Example of updating default package version across bots

This example shows how to perform a bulk update of multiple bots in the Control Room repository and use the default version of the Excel advanced and Message Box packages.

To update bots to the default package version, ensure you have the View packages permission and the permission to edit bots .

This example shows how you can update all the bots in a public repository that use the Excel advanced and Message Box packages to their default versions with one action.

1. To update all the bots in the public repository that use Excel advanced and Message Box packages to default version, perform these steps:
  - a) Navigate to **Administration > Bot update**.
  - b) Click the **Update Bots** drop-down and click **Package Version**.
  - c) On the **Update - Package Version > Settings** page, search and select the Excel advanced and Message Box packages.
  - d) Click the right arrow (→) to add the Excel advanced and Message Box packages to the selection.
  - e) In the selection list, select the Excel advanced and Message Box packages and click **Next**.
  - f) From the list of available bots, select the required bots for which you want to update the package version.
  - g) Click the right arrow (→) to add your selection, select the bots from the selection list, and click **Next**.
  - h) Review the selected bots and dependencies that you selected for the update and click **Update-Package Version**.

The bots are checked out to set the package default versions for the Excel advanced and Message Box packages.

2. On the **Bot update list** page, click the three dots icon next to the required update and click **View update bot details** to view a detailed report.
3. Navigate to **Administration > Audit log**.
4. On the **Audit log** page, search by event type and select the **Update default package** value. You can view information about status, name, start and end time, duration required for the update, the number of completed, failed, skipped, and total items with last modified time, and user details (such as username) who initiated the package update.
  - a) Click the three dots icon next to the required event and click **View event details**.

### Event details:

- **Status:** Successful
- **Item name:** AAAAb
- **Event started by:** doc-packages
- **Time:** 12 : 49 : 06IST2023-02-27
- **Object type:** Event
- **Event type:** Update default package
- **Source device:** product-kernel-5cbc499957-1n4s8
- **Source:** Control Room

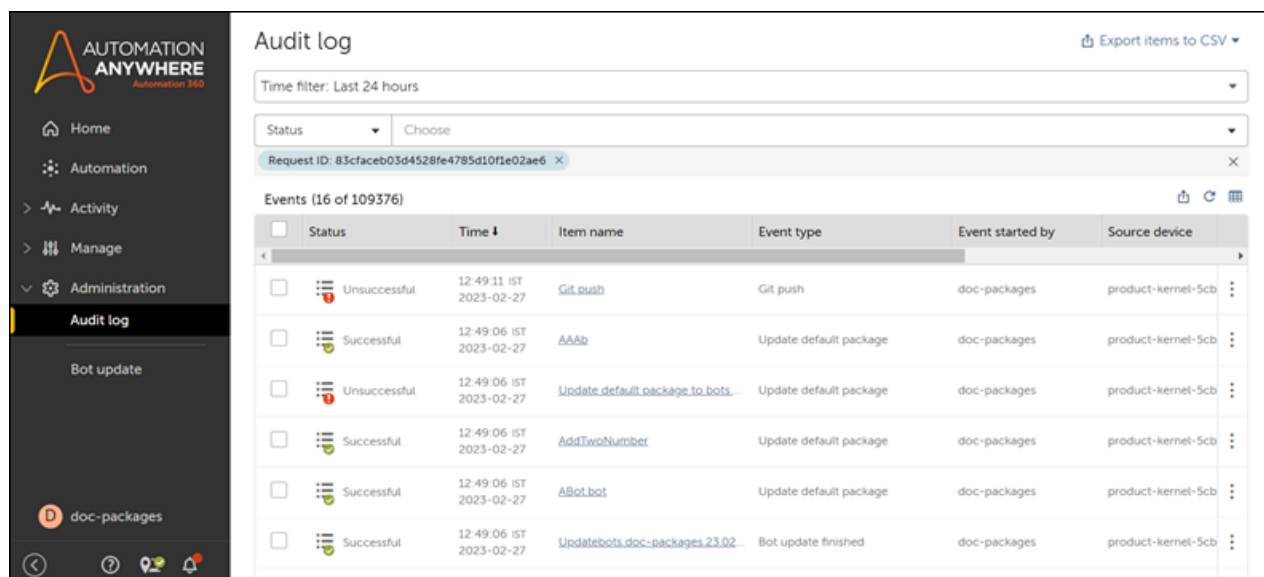

- **Request ID:** 83cfaceb03d4528fe4785d10f1e02ae6

**Update default package details:**

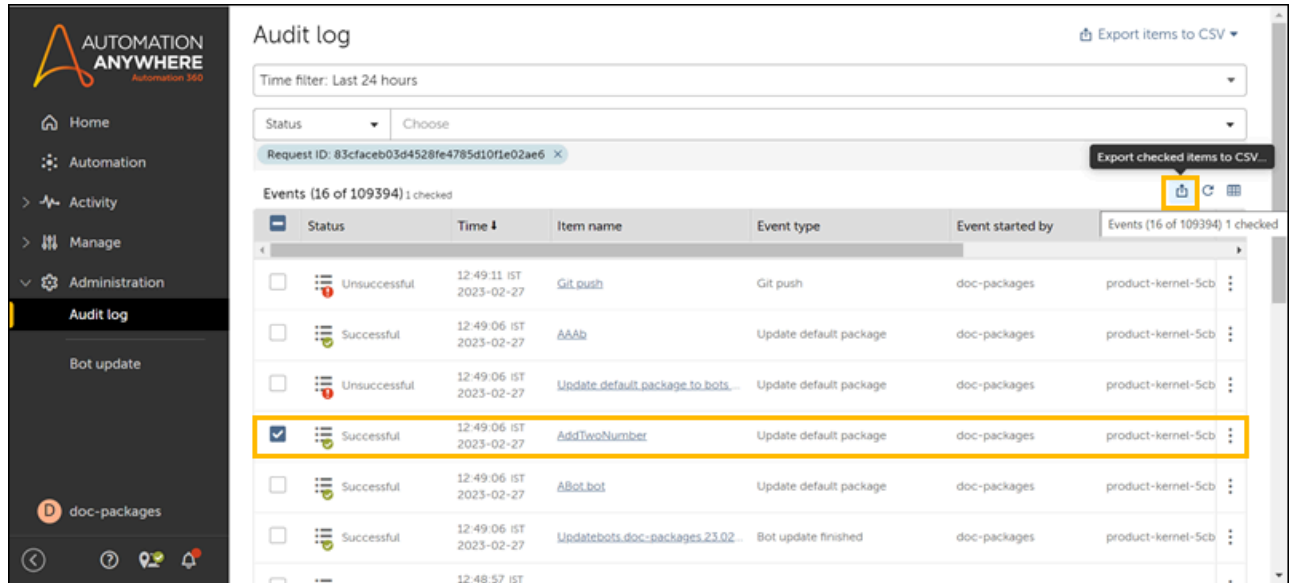

- **Request name:** Updatebots.doc-packages.23.02.27.12.18.02
- **Bot path:** Bots\AAAb
- **What changed?:** Package version
- **Package name:** MessageBox
- **Old package version:** 2.1.0-20210118-185321
- **Target package version:** 6.14.0-20221221-171419, 3.5.0-20221223-065722
- **Old bot version:** 1
- **New bot version:** 2

- Copy the **Request ID**, for example, 83cfaceb03d4528fe4785d10f1e02ae6 from the **Update default package** page.
- On the **Audit log** page, search by filter **Request ID** and enter the value 83cfaceb03d4528fe4785d10f1e02ae6.

The **Audit log** page displays all the bots that are either successfully updated or those that failed the update process as shown in the following image:

- Click any bot, for example, **AddTwoNumber**, to view the **Update default package details**.
- Select the required event from the **Audit log** page, for example, **AddTwoNumber**, and click **Export checked items to CSV** to download the audit data to a CSV file.

## Example of using remote function call in SAP

This example describes how to build a bot that will create a document in SAP using the remote function call method.

Download the SAP Java connector package and DLL from the SAP website.

1. Open a new bot:
  - a) On the left panel, click **Automation**.
  - b) Click **Create new > Bot**.
  - c) In the **Create Task Bot** window, enter a bot name.
  - d) Click **Create and edit**.
  
2. Establish a connection with the SAP application using the **Connect** action.
  - a) In the **SAP BAPI Session** field, enter Default.
  - b) Select the **Desktop** option, then browse and select the SAP Java connector package available on your device.  
Example: F:\SAP \SAP JCo 3.1.3\Microsoft Windows and Windows Server \64-bit\sapjco3.jar
  - c) Select the **Desktop** option, then browse and select the SAP Java connector DLL available on your device.  
Example: F:\SAP \SAP JCo 3.1.3\Microsoft Windows and Windows Server \64-bit\sapjco3.dll
  - d) Select the **Group/Server** option as the connection type.
  - e) Select **Insecure string** and enter AWINAAW012.bcone.com to specify the hostname for the SAP message server.
  - f) Enter AWINAAW012.bcone.com in the **Gateway host** field to connect to the server.

- g) Enter the following values:

Field	Value
Logon group	Public
System number	01
SAP instance system ID	AAI
Client number	800
Logon language code	EN
Router string	/H/115.112.148.66/S/3299

- h) Select **Insecure string** and enter `ISR3` to specify the username you want to use to connect to the SAP server.
- i) Select **Insecure string** and enter **Automation@123** to specify the password you want to use to connect to the SAP server.

3. Use the Create function action to create a function for the SAP BAPI function.

- a) Create an alias for an SAP BAPI function and save it with an alias name.
- b) In the **Session name** field, enter `Default`.
- c) In the **Function alias name** field, enter `BAPI_Post`.
- d) In the **BAPI name field**, enter `BAPI_ACC_DOCUMENT_POST`.

---

**Note:** The SAP BAPI function name and other parameters are specific to the customer environment while creating the Automation 360 bot.

---

4. To create `BAPI_ACC_DOCUMENT_POST` in SAP, you must first create a structure and tables. Select **Get structure** to obtain data from a structure using the function alias.

- a) In the **BAPI function alias** field, enter `BAPI_POST` (the alias you provided for SAP BAPI function using the Create function action).
- b) In the **Structure name** field, enter `DOCUMENTHEADER` (the name of the structure from which you want to get data).
- c) In the **SAP BAPI session** field, enter `Default` (the session name you used to connect to the SAP application in the **Connect** action).
- d) Select the **Alias** option to save the data retrieved from the structure and enter `Doc` in the **Create structure alias** field.

5. Select the **Get table** action to get tabular data from a table using the function alias.

- a) In the **BAPI function alias** field, enter `BAPI_Post` (the alias you provided for the SAP BAPI function using the **Create function** action).
- b) In the **Table name** field, enter `ACCOUNTGL` (the name of the table from which you want to obtain data).
- c) In the **SAP BAPI session** field, enter `Default` (the session name you used to connect to the SAP application in the **Connect** action).

- d) Select the **Alias** option to save the data retrieved from the table and enter GL in the **Create table alias** field.
- 6. Repeat [step 5](#). In step 5(b), enter the value CURRENCYAMOUNT in the **Table name field** and in step 5(d) enter the value Currency in the **Create table alias** field.
- 7. Select the **Set field value** action to set data into the empty structure and table created previously.
  - a) In the **BAPI function alias** field, enter BAPI\_Post.
  - b) From the **Source** field, select **Structure**.
  - c) Enter DOC in the **Structure alias** field.
  - d) In the **Field name** field, enter USERNAME (the name of the field in which you want to set data).
  - e) In the **Field value** field, enter sy-uname( the value that you want to set).
  - f) In the **SAP BAPI session** field, enter Default.
- 8. Repeat [step 7](#) seven times and input the same values as you previously entered in steps 7(a,) 7(b), 7(c), and 7(f). Enter the following values for steps 7(d) and 7(e).

Field name	Field value
BUS_ACT	RFBU
HEADER_TXT	TEST BOC BAPI POSTING
COMP_CODE	1000
DOC_DATE	20210127
PSTNG_DATE	20210127
DOC_TYPE	SA
FIS_PERIOD	00

- 9. Select the **Get structure** action.
  - a) In the **BAPI function alias** field, enter BAPI\_POST.
  - b) In the **Structure name** field, enter DOCUMENTHEADER.
  - c) In the **SAP BAPI session** field, enter Default.
  - d) Select the **Variable** option to store the data retrieved from the structure in a table variable. Create table variable Sap-Bapi-Table.
- 10. Double-click or drag the Data table > **Write to file** action.
  - a) Select the Table variable **Sap-Bapi-Table** that contains the data to write from the Data table name list.
  - b) Specify the location of the file in which to write the data in the **Enter file name** field. For example, D:/user defined/My Desktop/SAP Test/DOCUMENTHEADER.csv.
  - c) Select the **Create folders/files if it doesn't exist** check box.
  - d) Select the **Override existing file** option when writing data in an existing file.
  - e) Select the **new line** option from the **Row delimiter** field.

- f) Select the **comma** option from the **Column delimiter** field.
  - g) Select the **ANSI** option from the **Encoding list**.
- 11.** Double-click or drag the **Set field value** action to set data into table.
- a) In the **BAPI function alias** field, enter BAPI\_POST.
  - b) From the **Source** field, select **Table**.
  - c) Enter GL in the **Table alias** field.
  - d) In the **Field name** field, enter ITEMNO\_ACC (the name of the field in which you want to set data).
  - e) In the **Field value** field, enter 2 (the value that you want to set).
  - f) In the **SAP BAPI session** field, enter **Default** (the session name you used to connect to the SAP application in the **Connect** action).
- 12.** Repeat [step 11](#), seven times to set data into a table.

While setting values in the table, retain the same value as you previously entered in steps 11(a), 11(b), 11(c), and 11(f). Change the following values for steps 11(d) and 11(e):

Field value	Field name
GL_ACCOUNT	0000078310
PSTNG_DATE	20210127
ITEM_TEXT	TEST POSTING DEBIT ITEM
QUANTITY	1000
BASE_UOM	EA
COMP_CODE	1000
DOC_TYPE	SA

- 13.** Select the **Set value** field action.
- a) In the **BAPI function alias** field, enter BAPI\_POST.
  - b) From the **Source** field, select **Table**.
  - c) Enter GL in the **Table alias** field.
  - d) Select the **Create new row** check box to enter data in the next row.
  - e) In the **Field name** field, enter ITEMNO\_ACC (the name of the field in which you want to set data).
  - f) In the **Field value** field, enter 1 (the value that you want to set).
  - g) In the **SAP BAPI session** field, enter **Default** (the session name you used to connect to the SAP application in the **Connect** action).
- 14.** Select the **Get table** action.
- a) In the **BAPI function alias** field, enter BAPI\_POST.
  - b) In the **Table name** field, enter ACCOUNTGL.
  - c) In the **SAP BAPI session** field, enter Default.

- d) Select the **Variable** option to store the data retrieved from the table in a table variable. Create table variable Sap-Bapi-Table.
15. Double-click or drag the Data table > **Write to file** option.
- a) Select the Table variable **Sap-Bapi-Table** that contains the data to write from the **Data table name** list.
  - b) Specify the location of the file in which to write the data in the **Enter file name** field. For example, `D:/user defined /My Desktop/SAP Test/ACCOUNTGL.csv`.
  - c) Select the **Create folders/files if it doesn't exist** check box.
  - d) Select the **Override existing file** option when writing data in an existing file.
  - e) Select the **new line** option from the **Row delimiter** field.
  - f) Select the **comma** option from the **Column delimiter** field.
  - g) Select the **ANSI** option from the **Encoding list**.
16. Double-click or drag the **Set field value** action to set data into a table.
- a) In the **BAPI function alias** field, enter `BAPI_POST`.
  - b) From the **Source** field, select **Table**.
  - c) Enter `CURRENCY` in the **Table alias** field.
  - d) In the **Field name** field, enter `ITEMNO_ACC` (the name of the field in which you want to set data).
  - e) In the **Field value** field, enter `2` (the value that you want to set).
  - f) In the **SAP BAPI session** field, enter `Default` (the session name you used to connect to the SAP application in the **Connect** action).
17. Repeat [step 16](#), seven times to set data into a table.

While setting values in the table, retain the same value as you previously entered in steps 16(a), 16(b), 16(c), and 16(f). Change the following values for steps 16(d) and 16(e):

Field name	Field value
CURRENCY	USD
AMT_DOCCUR	-2000
ITEMNO_ACC	1
CURRENCY	USD (repeated) line 43
AMT_DOCCUR	2000

- 18. Repeat [step 14](#) and enter `CURRENCYAMOUNT` in the **Table name** field.
- 19. Repeat [step 15](#) and specify the location of the file, for example `D:/user defined /My Desktop/SAP Test/CURRENCYAMOUNT.csv`.
- 20. Select the **Run function** action to run the SAP BAPI function.
  - a) In the **BAPI function alias** field, enter `BAPI_POST`.
  - b) Select the **End sequence** option to mark the end of a process and the **Commit transaction** option to commit the changes made during the process.

- c) In the **SAP BAPI session** field, enter `Default`.
21. Select the **Get table** action.
- a) In the **BAPI function alias** field, enter `BAPI_POST`.
  - b) In the **Table name** field, enter `RETURN`.
  - c) In the **SAP BAPI session** field, enter `Default`.
  - d) Select the **Variable** option to store the data retrieved from the table in a table variable. Create table variable `Sap-Bapi-Table`.
22. Repeat [step 15](#) and specify the location of the file, for example `D:/user defined /My Desktop/SAP Test/Return.csv`.
23. Select the **Get field value** action to obtain data of a specified field from a function.
- a) In the **BAPI function alias** field, enter `BAPI_POST`.
  - b) Select the **Function** tab from **Source** field.
  - c) In the **Field name** field, enter `OBJ_KEY`.
  - d) In the **SAP BAPI session** field, enter **Default**.
  - e) Select **Prompt-Assignment** in the **Save the output to a variable** field.
24. Double-click or drag the **Message box** action.
- a) Enter **Automation Anywhere Enterprise Client** in the **Enter the message box window title** field.
  - b) Enter **\$Prompt-Assignment\$**.
  - c) Enter **30** in the **Scroll bar after lines** field to show a scroll bar.
25. Repeat [step 23](#) and [step 24](#) (In step 23(c), enter the value `OBJ_SYS`).
26. Repeat [step 23](#) and [step 24](#) (In step 23(c), enter the value `OBJ_TYPE`).
27. Click **Save** and **Run**.

## Example of using JSON package actions in a bot

Build a bot that runs a JSON script with multiple records. In this example, we use a JSON file that contains a list of feeds from a blog, and the bot extracts the required information from the JSON file and prints it to a message box.

To run JSON script from Automation 360, you must already have the JSON data stored either as a variable or a file (.json, .txt format) on your desktop. The following screenshot displays the structure of a JSON object as a sample.

```
{
 "feeds": [
 {
 "id": 1090,
 "title": "Amsterdam Beaches",
 "description": "It's true that few people think of the Netherlands when planning a beach holiday. But whether you're just
```

```

visiting or lucky enough to call this iconic city home, there are
plenty of great beaches to enjoy in Amsterdam",
 "location": "Kloveniersburgwal 1, 1012 CW Amsterdam,
Netherlands",
 "lng": 0,
 "lat": 0,
 "userId": 3043,
 "name": "Ritu singh",
 "isdeleted": false,
 "profilePicture": "/Images/userimageicon.png",
 "videoUrl": null,
 "images": null,
 "mediatype": 0,
 "imagePaths": null,
 "feedsComment": null,
 "commentCount": 3,
 "multiMedia": [
 {
 "id": 2157,
 "name": "beach of amsterdam.PNG",
 "description": null,
 "url": "feedsmedia/3043/c5522956-4ab5-408e-
b540-16a8c90af9b0.PNG",
 "mediatype": 1,
 "likeCount": 0,
 "place": null,
 "createAt": "0001-01-01T00:00:00"
 }
],
 "likeDislike": {
 "likes": 2,
 "dislikes": 1,
 "userAction": 2
 },
 "createdAt": "2019-12-26T07:08:38.4659686",
 "code": 0,
 "msg": null
},
"totalFeed": 125
}

```

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Provide a name for the bot: **JsonBot**.
  - d) Click **Create and Edit**.
  
2. Start a JSON session by using the **JSON > Start session** action.
  - a) From the **Actions** pane, double-click or drag the **JSON > Start session** action.
  - b) In the **Data Source** field, choose **File** and select the **Desktop file** file type. Click **Browse** to find your JSON file, for example, **D:\userdefined\My Downloads\Sample Json with 200 Records.json**.

- c) To create a JSON session, from **Json object session**, select **Local session** and enter **Default** as the session name.
3. Create a variable: SampleString
    - **Type:** String
    - **Name:** SampleString
  4. Retrieve the value of the total number of feeds from the JSON script by using the **JSON > Get node value** action.
    - a) From the **Actions** pane, double-click or drag the **JSON > Get node value** action.
    - b) In the **JSON node key or path** field, enter `totalFeed`.
    - c) In the **Session name** field, enter `Default`.
    - d) In the **Save the outcome to a variable** field, select SampleString.
    - e) To print the value of `totalFeed`, double-click or drag the **Message box** action.
    - f) To open the list of your variables, in the **Enter the message to display** field, press F2, and then select SampleString.
    - g) Click **Yes, insert**.

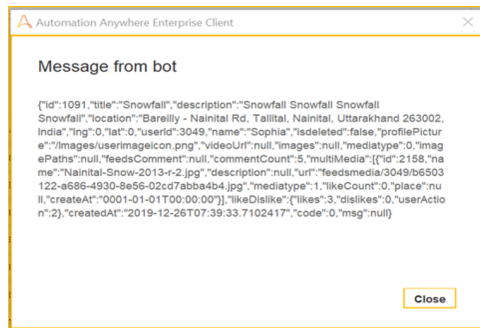

5. To retrieve any specific value from 125 feeds, perform the following steps.
  - a) From the **Actions** pane, double-click or drag the **JSON > Get node value** action.
  - b) In the **JSON node key or path** field, enter `feeds[52].title`.
  - c) In the **Session name** field, enter `Default`.
  - d) In the **Save the outcome to a variable** field, select SampleString.
  - e) To print the value of `feeds[52].title`, double-click or drag the **Message box** action.
  - f) To open the list of your variables, in the **Enter the message to display** field, press F2, and then select SampleString.
  - g) Click **Yes, insert**.

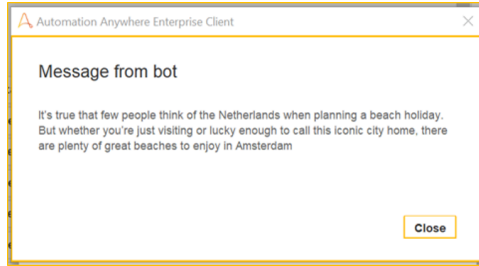

6. Create a variable: StringList
  - **Type:** List

- **Subtype:** String
  - **Name:** StringList
7. To retrieve the list of child nodes from a node path, use the **JSON > Get node list** action.
    - a) From the **Actions** pane, double-click or drag the **JSON > Get node list** action.
    - b) In the **JSON node key or path** field, enter `feeds`.
    - c) In the **Session name** field, enter `Default`.
    - d) In the **Save the outcome to a variable** field, select `StringList`.
    - e) To print all the child nodes under the `feed 51` object, double-click or drag the **Message box** action.
    - f) To open the list of your variables, in the **Enter the message to display** field, press F2, and then select **StringList[51]**.
    - g) Click **Yes, insert**.

8. To close a JSON session, use **End session**. In the **Session name** field, enter `Default`.
9. Click **Save** and then click **Run**.
10. Start a new JSON session.
  - a) From the **Actions** pane, double-click or drag the **JSON > Start session** action. In the **Data Source** field, select **Text** and enter `StringList [52]`.
  - b) From **Json object session**, select **Local session** and enter `Default 1` as the session name.
11. To retrieve the value from a specific node, use **JSON > Get node value**.
  - a) From the **Actions** pane, double-click or drag the **JSON > Get node value** action.
  - b) In the **JSON node key or path** field, enter `description`.
  - c) In the **Session name** field, enter `Default 1`.
  - d) In the **Save the outcome to a variable** field, select `SampleString`.
  - e) To print the value of the `description` node, double-click or drag the **Message box** action.
  - f) To open the list of your variables, in the **Enter the message to display** field, press F2, and then select `SampleString`.
  - g) Click **Yes, insert**.

12. To close the JSON session, use **End session**. In the **Session name** field, enter `Default 1`.
13. Click **Save** and then click **Run**.  
You can further perform operations to extract the required information from the JSON feed and use the extracted values in your bot. To extract the name value from feed 50 through 60, perform the following steps.
14. Create a variable: `ListItem`
  - **Type:** `String`
  - **Name:** `ListItem`
15. To process each item in the list, use the **Loop** action.
  - a) Double-click or drag the **Loop** action.
  - b) Select the **For each item in the list** iterator.
  - c) In the **List** field, select `StringList`.
  - d) Choose the **Range** option and for the following fields, enter the values provided:
    - **From Index:** `50`
    - **To index:** `60`
  - e) In the **Assign the current value to variable** field, select `ListItem`.
16. Start a new JSON session.
  - a) From the **Actions** pane, double-click or drag the **JSON > Start session** action.
  - b) In the **Data Source** field, select **Text** and enter `ListItem`.
  - c) To create a JSON session, from **Json object session**, select **Local session** and enter `Default 2` as the session name.
17. To retrieve the value from a specific node, use the **JSON > Get node value** action.
  - a) From the **Actions** pane, double-click or drag the **JSON > Get node value** action.
  - b) In the **JSON node key or path** field, enter `name`.
  - c) In the **Session name** field, enter `Default 2`.
  - d) In the **Save the outcome to a variable** field, select `SampleString`.
  - e) To print the value of the `name` node, double-click or drag the **Message box** action.
  - f) To open the list of your variables, in the **Enter the message to display** field, press `F2`, and then select `SampleString`.
  - g) Click **Yes, insert**.
18. Click **Save** and then click **Run**.

The name values retrieved from the feeds 50 through 60 are as follows:

Feeds (object)	Name
50	Ashish
51	Sophia
52	Ritu
53	Shivam
54	Navya
55	Faiz
56	Martin
57	Shweta
58	Jagjit
59	Mark
60	Sophia

## Build automation using JSON actions

In this example, we create a Task Bot using JSON actions to perform operations on the JSON data.

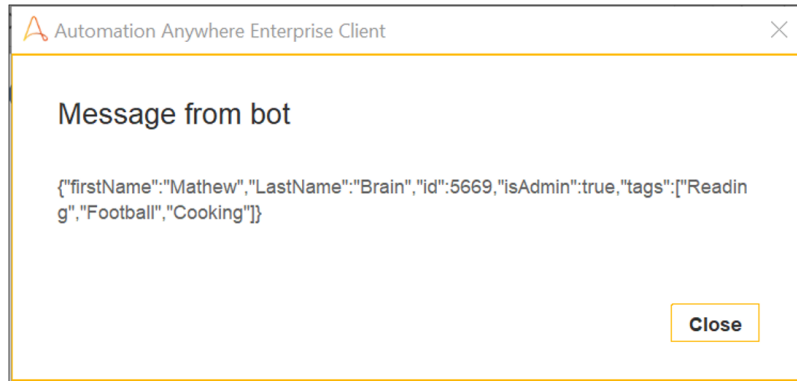

1. Create a bot
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Provide a name for the bot: `Json_Test_Bot`.
  - d) Click **Create and Edit**.
2. Create the following variables:
  - vSourceDictionary
    - Type: Dictionary
    - Subtype: Any
    - Variable name: vSourceDictionary
    - Default values:

Type	Key	Value
String	firstName	Mathew
String	LastName	Brain
Number	id	5669

---

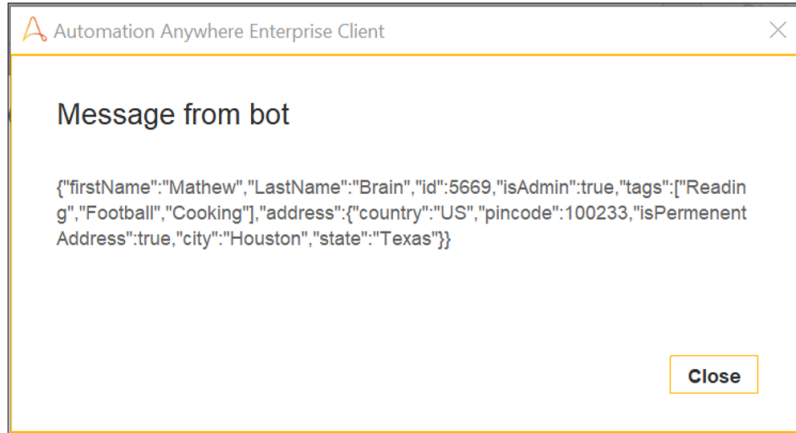

Type	Key	Value
Boolean	isAdmin	True

- vHobby
    - Type: List
    - Subtype: String
    - Default values:
      - a) Value at 0: Reading
      - b) Value at 1: Football
      - c) Value at 2: Cooking
  - vJson
    - Type: String
    - Name: vJson
  - vAddressDictionary
    - Type: Dictionary
    - Subtype: Any
    - Name: vAddressDictionary
  - vDestinationDictionary
    - Type: Dictionary
    - Subtype: Any
    - Name: vDestinationDictionary
  - Create a SampleString and a SampleNumber variable.
3. Double-click or drag the **Dictionary > Put** action to assign a value to a key in the dictionary.
    - a) Select vSourceDictionary dictionary variable from the drop-down list.
    - b) Enter tags in the **Key** field.
    - c) Choose **Variable** tab and select vHobby value from the drop-down list.
  4. Double-click or drag the **JSON > Convert Dictionary to JSON** action to convert the dictionary variable to JSON and store it in a string variable.
    - a) Select vSourceDictionary dictionary variable from the drop-down list.
    - b) In the **Save the outcome to a variable** field, Select vJson.
  5. Double-click or drag the **Message box** action to print the values. In the **Enter the message to display** field, press F2, and then select \$vJson\$.

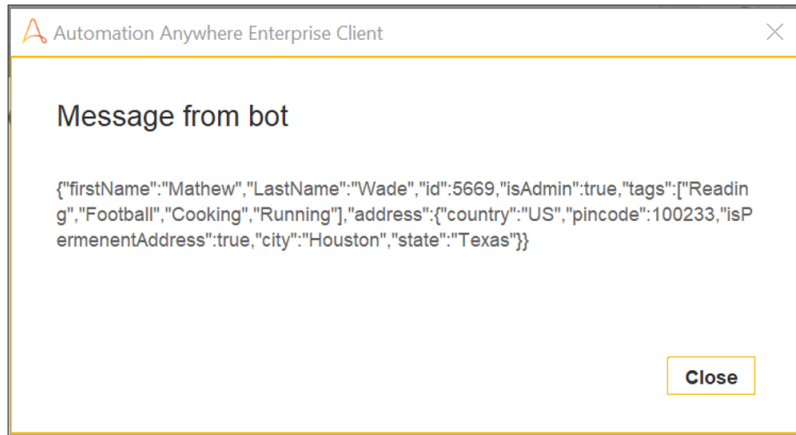

6. Double click or drag the **JSON > Start session** action to start a JSON session.
  - a) In the Data Source field, choose the **Text** option and press F2, and then select `$$JSON$`.
  - b) To create a JSON session, from JSON object session, select **Local session** and enter `Default` as the session name.
  
7. Double-click or drag the **JSON > Add node value** action to add a new value to existing json.
  - a) Enter `$$` in the **JSON node path** field.
  - b) Enter `address` in the **key name** field.
  - c) Select **Dictionary** variable from the **Value type** field.
  - d) In the **Value** field, select **Dictionary** tab and enter the following values:
 

Type	Key	Value
String	City	Huston
String	State	Texas
String	Country	US
Number	Pincode	100233
Boolean	isPermenentAddress	True
  - e) Choose **Session name** option and enter `Default` in the **Session name** field.
  
8. Double click or drag **JSON > Get node value** action to retrieve the node values.
  - a) Enter `$$` in the **JSON node path** field.
  - b) Choose **Session name** option and enter `Default` in the **Session name** field.
  - c) In the **Save the outcome to a variable** field, select `SampleString`.
  
9. Double-click or drag the **Message box** action to print the values. In the **Enter the message to display** field, press F2, and then select `SampleString`.

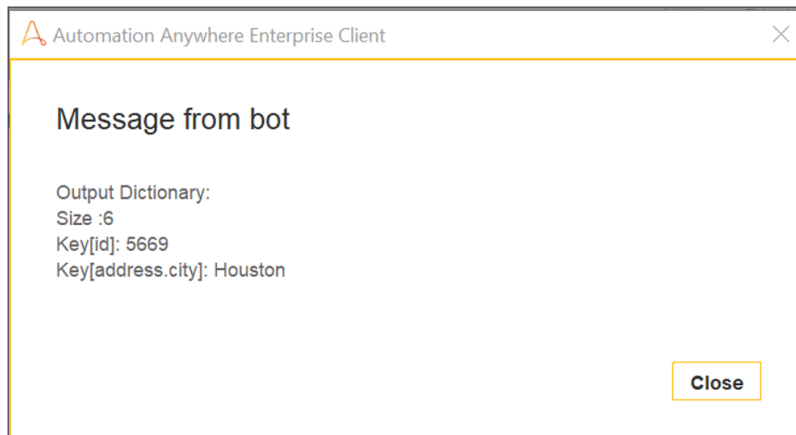

10. Double click or drag **JSON > Update node value** action to update a new value to existing Json.
  - a) Enter `tags` in the **JSON node path** field.
  - b) Select `String` variable from the **Value type** field.
  - c) Enter `Running` in the **Value (optional)** field.
  - d) Choose **Session name** option and enter `Default` in the **Session name** field.
  
11. Double click or drag **JSON > Update node value** action to update a new value to existing Json.
  - a) Enter `lastName` in the **JSON node path** field.
  - b) Select `String` variable from the **Value type** field.
  - c) Enter `Wade` in the **Value (optional)** field.
  - d) Choose **Session name** option and enter `Default` in the **Session name** field.
  
12. Double click or drag **JSON > Get node value** action to retrieve the node values.
  - a) Enter `$$` in the **JSON node path** field.
  - b) Choose **Session name** option and enter `Default` in the **Session name** field.
  - c) In the **Save the outcome to a variable** field, select `SampleString`.
  
13. Double-click or drag the **Message box** action to print the values. In the **Enter the message to display** field, press `F2`, and then select `SampleString`.

14. Double-click or drag **JSON > Convert JSON to Dictionary** action to convert JSON string into dictionary.
  - a) Choose **Session name** option and enter `Default` in the **Session name** field.
  - b) In the **Save the outcome to a variable** field, choose **Dictionary** option and select `vDestinationDictionary` from the drop-down list.
15. Double-click or drag the **Dictionary > Get** action to verify if a key exists in a dictionary variable and return the corresponding value.
  - a) Select `vDestinationDictionary` dictionary variable from the drop-down list.
  - b) Enter `address` in the **Key** field.
  - c) In the **Assign the output to variable** field, press F2 and select `vAddressDictionary` variable.
16. Double-click or drag the **Message box** action to print the values. In the **Enter the message to display** field, enter:

```
Output Dictionary:
Size :$vDestinationDictionary.Dictionary:size.Number:toString$
Key[id]: $vDestinationDictionary{id}$
Key[address.city]: $vAddressDictionary{city}$
```

17. Double click or drag **JSON > End session** action to close the JSON session. Choose **Session name** option and enter `Default` in the session name field.

18. Click **Save** and then click **Run**.

## Example using Email actions in a bot

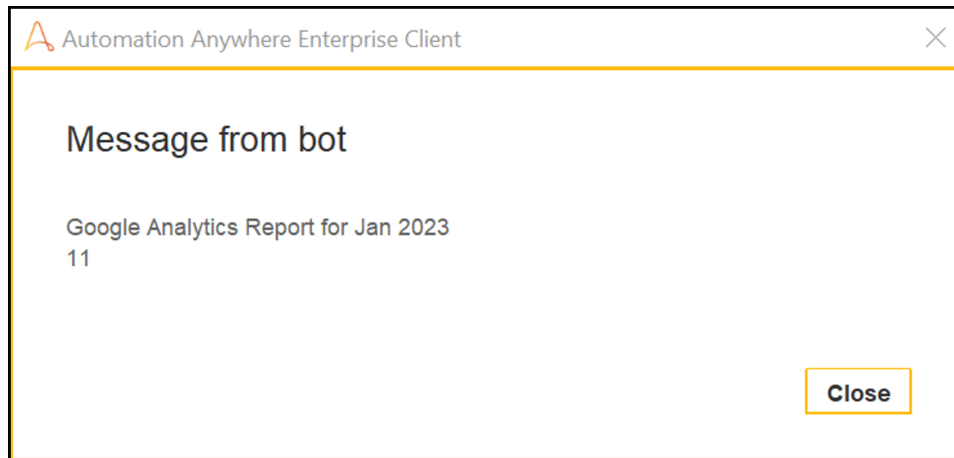

In this example, we use email actions to perform email-related operations using Outlook Client.

Create a bot to perform the following tasks:

- Retrieve the total number of attachments from emails and print the result in the message box.
- Send a response to the sender and all the recipients of an email with the different subject.
- Delete and remove read emails from the Inbox.

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Provide a name for the bot: `Email_Operation_Bot`.
  - d) Click **Create and Edit**.
2. Use the Connect action to establish a connection with an email server.
  - a) Double-click or drag the **Email > Connect** action.
  - b) Enter `EmailSession` in the **Session name** field.
  - c) Select **Outlook** to establish a connection with Microsoft Outlook.
  - d) Enter `test@automationanywhere.com` in the **Outlook mailbox (optional)** field.
3. To process each item in the email, use the **Loop** action.
  - a) Double-click or drag the **Loop** action.
  - b) Select **For each mail in mail box** from the iterator list.
  - c) In the **Session name** field, enter `EmailSession`.
  - d) Select **All** from the **Type of emails to get** field to retrieve emails from the email server.
  - e) In the **From a specific folder (optional)** field, enter `Inbox/Analytics` folder.
  - f) Choose **HTML** option for message format.
  - g) Select **True** from the **Use local timezone** list.
  - h) In the **Assign the current value to variable (optional)** field, create `EmailDetails` as a Dictionary variable.
4. Retrieve the total number of attachments from each mail and print.
  - a) double-click or drag the **Message box** action
  - b) In the **Enter the message to display** field, enter: `$(EmailDetails{emailSubject})$  
$(EmailDetails{emailNoOfAttachments})$`
5. Double-click or drag the **Email > Disconnect** action. In the **Session name** field, enter `EmailSession`.
6. Click **Save** and then **Run**.

The attachment details are retrieved from the emails as follows:

emailSubject	emailNoOfattachments
Google Analytics Report for Dec 2022	12
Google Analytics Report for Nov 2022	11
Google Analytics Report for Oct 2022	9
Google Analytics Report for Aug 2022	10
Google Analytics Report for July 2022	13
Google Analytics Report for May 2022	11
Google Analytics Report for March 2022	5

7. Start a new Email session.
  - a) Double-click or drag the **Email > Connect** action.
  - b) Enter `EmailSession1` in the **Session name** field.
  - c) Select **Outlook** to establish a connection with Microsoft Outlook.
  - d) Enter `test@automationanywhere.com` in the **Outlook mailbox (optional)** field.
  
8. To process each item in the email, use the **Loop** action.
  - a) Double-click or drag the **Loop** action.
  - b) Select **For each mail in mail box** from the iterator list.
  - c) In the **Session name** field, enter `EmailSession1`.
  - d) Select **All** from the **Type of emails to get** field to retrieve emails from the email server.
  - e) In the **From a specific folder (optional)** field, enter `Inbox/Daily stand up meeting`.
  - f) Choose **HTML** option for message format.
  - g) Select **True** from the **Use local timezone** list.
  
9. Use the **Reply All** action to send a response to an email.
  - a) Enter the following email IDs. `peter_wilson@example.com`, `john.smith@example.com`, `nancy.mark@example.com`

---

**Note:** Use comma to separate the emails IDs.

---

- b) In the Subject (optional) field, enter `Documentation deliverables for upcoming releases`.
- c) Add the file attachment to the email message `release plan.xlsx`.
- d) Select **Plain text** for the email body.
- e) In the **Message** field, enter the following message as follows:

```
Hi All,
See the attached document outlining the release plan.
```

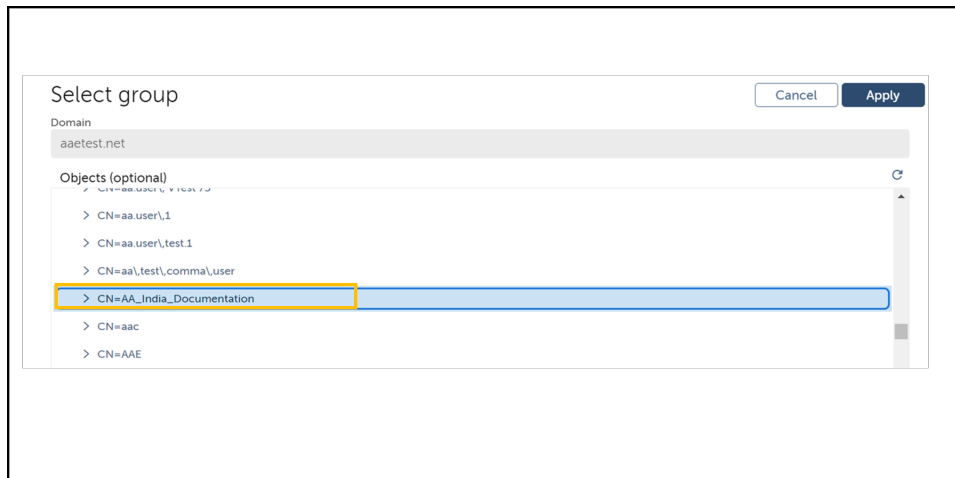

- f) Select the **Outlook** option from the **Send email via** list.
10. Double-click or drag the **Email > Disconnect** action. In the **Session name** field, enter `EmailSession1`.
  11. Click **Save** and then **Run**  
The response will be sent to the sender and all the recipients of an email.
  12. Start a new Email session.
    - a) Double-click or drag the **Email > Connect** action.
    - b) Enter `EmailSession2` in the **Session name** field.
    - c) Select **Outlook** to establish a connection with Microsoft Outlook.
    - d) Enter `test@automationanywhere.com` in the **Outlook mailbox (optional)** field.
  13. Use the **Delete All** action to delete all the email from the inbox.
    - a) Enter `EmailSession2` in the **Session name** field.
    - b) In the **From a specific folder (optional)** field, enter `Inbox/Backup mails`.
    - c) Select **All** from the **Type of emails to get field** to retrieve emails from the email server.
  14. Double-click or drag the **Email > Disconnect** action. In the **Session name** field, enter `EmailSession2`.
  15. Click **Save** and then **Run**.  
The emails will be deleted from the specified folder.

## Example using user account actions from Active Directory package

This example shows how to use actions to automate user account management tasks, such as: Create, Delete, Get property, Remove, Rename, and Set property.

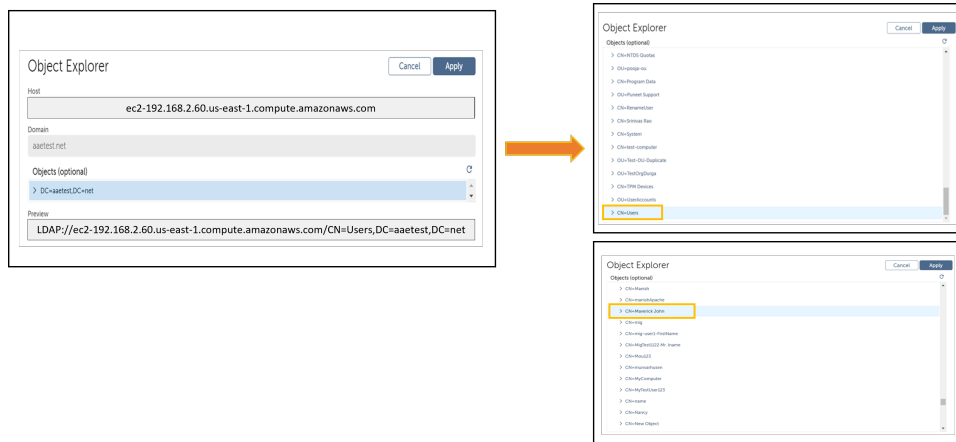

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) Enter a name for the bot: `Active_Directory_User Operation`.

- d) Click **Create and Edit**.
2. Use the **Connect** action to establish a connection with an Active Directory server.
    - a) Double-click or drag the **Active Directory > Connect** action.
    - b) Enter `Default` in the **Session name** field.
    - c) Enter the LDAP URL in the **Parent path** field: `LDAP://ec2-192.168.2.60.us-east-1.compute.amazonaws.com/CN=Users,DC=aaetest,DC=net`
    - d) In the **Login username** and **Login password** fields, enter your user name and password. For example, select **Insecure string** tab and enter the following values:
      - Login username: `ksmith.doe`
      - Login password: `aa_testqwerty@123`
  3. Use the **Create group** action to create a new group.
    - a) Double-click or drag the **Active Directory > Create group** action.
    - b) Enter `Default` in the **Session name** field.
    - c) Enter `AA_India_Documentation` in the **Group name** field.
    - d) Select the group scope as **Global**.
    - e) Select the group type as **Distribution**.

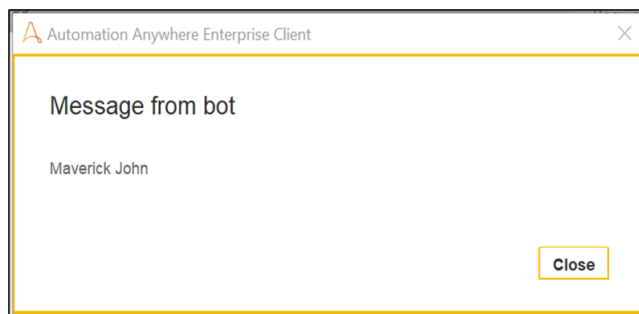

4. Use the **Create user** action to configure and activate a new user.
  - a) Double-click or drag the **Create user** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Enter `Maverick John` in the **User name** field.
  - d) Enter `maverick.john` in the **Logon name** field.
  - e) Enter `Maverick` in the **First name** field.
  - f) Select the check box **Active user** to activate the user.
5. Use the **Add user to group** action to add an existing user to a user-created group.
  - a) Double-click or drag the **Add user to group** action.

- b) Select the **Add users from server** option. To add an existing user from the server, enter these details : **Host**, **Domain**, **Username**, and **Password** in the **Connect to server** window and then click **Connect**.
- c) Enter `AA_India_Documentation` in the **Group name** field.
- d) Enter `Default` in the **Session name** field.

- 6. Use the **Set user property** action to assign a value to a user property, view the current details, and update it.
  - a) Double-click or drag the **Set user property** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John`.
  - d) Enter `displayName` in the **Property** field.
  - e) Enter `Mark` in the **Value** field.
- 7. Use the **Get user property** action to retrieve a specific property value for a user and assigns the results to a variable.
  - a) Double-click or drag the **Get user property** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John`.
  - d) Enter `displayName` in the **Property** field.
  - e) Select `SampleString` variable to assign value.

- 8. Use **Message box** action to print the values.

- a) Double-click or drag the **Message box** action.
  - b) In the **Enter the message to display** field, select `$$SampleString$`.
9. Use the **Rename user** action to rename the user logon name or the user account name.
- a) Double-click or drag the **Rename user** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John`.
  - d) Enter `Maverick John Ray` in the **New name** field.
  - e) Select the **Rename user name** option to update.
10. Use **Update user details** action to update the details of a user.
- a) Double-click or drag the **Update user details** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John`.
  - d) Enter `Maverick John Ray` in the **First name** field.
11. Use the **Disable user account** action to disable a user account.
- a) Double-click or drag the **Disable user account** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John Ray`.
12. Use the **Delete user** action to delete an existing user.
- a) Double-click or drag the **Delete user** action.
  - b) Enter `Default` in the **Session name** field.
  - c) Select the **User name** option and enter `Maverick John Ray`.
13. Use the **Disconnect** action to close the connection with the LDAP server. In the **Session name** field, enter `Default`.
14. Click **Save** and then **Run**.

## Example of using Custom column option in Data Table package

In this example, you will build a bot to read a CSV file, assign it to a data table variable, and then modify the table by adding a new column. Use the Custom column option in the Data Table package to insert columns at a specified index.

Before you start building the bot, create a file in .CSV format using the data in the following table and save it as `Data_table_input.csv`.

Name	Company	Availability
Rene	AA	FALSE
Leote	DG	FALSE

Name	Company	Availability
Shane	CV	FALSE

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Bot**.
  - c) In the **Create Task Bot** window, enter a name for the bot: `Datatable_test`.
  - d) Accept the default folder location: `\Bots\`. To change the default bot storage location, click **Choose** and follow the prompts.
  - e) Click **Create and Edit**.
  
2. Open and read data from the CSV file.
  - a) Double-click or drag the **CSV/TXT > Open** action.
  - b) In the **Session name** field, enter `Session 1`.
  - c) In the **File path** field, click **Browse** to select your file.

**CSV/TXT: Open**

Opens a CSV/TXT file

Required bot agent version: 20.11 or above

**Session name**

🗨 Session 1
(x)

**File path**

Control Room file
Desktop file
Variable

🗨 C:\Temp\Data table\_input.csv
(x)
Browse...

Required extensions: ".csv", ".txt", ".tsv"

- d) Select the **Contains header** check box.
  - e) In the **Delimiter** tab, select the **Comma** check box.
  - f) Double-click or drag the **CSV/TXT > Read** action.
  - g) In the **Session name** field, enter `Session 1`.
  - h) In the **Assign value to the variable** field, create a table variable `TableFromCSV` to save the output.
  - i) Double-click or drag the **CSV/TXT > Close** action.
3. Insert a new column of data type String to the existing table.
    - a) Double-click or drag the **Data Table > Insert column** action.
    - b) In the **Destination table** field, select the variable `TableFromCSV`.
    - c) From the **Insert column at index** field, select **last index**.
    - d) From the **Insert column** option, select **Custom column**.

- e) In the **Column name** field, enter **Address**.
  - f) In the **Column type** field, select the data type as **String**.
  - g) In the **Default value** field, enter Bangalore.
4. Write the new data to the CSV file.
- a) Double-click or drag the **Data Table > Write to file** action.
  - b) In the **Data table name** field, select TableFromCSV variable.
  - c) In the **Enter file name** field, select the CSV file that you have saved on your desktop.
  - d) From the **When writing** field, select the **Overwrite existing file** option.
5. Open the CSV file to view the updated data.
- a) Double-click or drag the **Excel advanced > Open** action.
  - b) In the **File** tab, click **Browse** to select your file.
  - c) Select the **Sheet contains a header** check box.
  - d) Select the **Read-write mode** option to enable reading and editing of the file.
  - e) Double-click or drag the **Delay > Delay** action.
  - f) Enter a delay time of 5 seconds.
6. Close the CSV file.
- a) Double-click or drag the **Excel advanced > Close** action.
  - b) Select the **Save changes when closing file** option.
  - c) In the **Session name** field, select the name of the session that you used to open the CSV file.
7. Insert a new column of data type DateTime to the existing table.
- a) Double-click or drag the **Data Table > Insert column** action.
  - b) In the **Destination table** field, select the variable TableFromCSV.
  - c) From the **Insert column at index** field, select **specific index** and specify the index in the text field.
  - d) From the **Insert column** option, select **Custom column**.
  - e) In the **Column name** field, enter **Date of joining**.
8. Open the CSV file to view the updated data.
- a) Double-click or drag the **Excel advanced > Open** action.
  - b) In the **File** tab, click **Browse** to select your file.
  - c) Select the **Sheet contains a header** check box.
  - d) Select the **Read-write mode** option to enable reading and editing of the file.
  - e) Double-click or drag the **Delay > Delay** action.
  - f) Enter a delay time of 5 seconds.
9. Close the CSV file.

- a) Double-click or drag the **Excel advanced > Close** action.
- b) Select the **Save changes when closing file** option.
- c) In the **Session name** field, select the name of the session that you used to open the CSV file.

## Example of using a file variable

Learn to use file variables in bots. There can be instances where a bot needs to access a file multiple times based on the task it performs. You can store file references in file variables and use the file variables in bots instead of adding direct file paths.

In this example, the sample bot does the following:

- Uses a file variable to access a CSV file.
- Opens and reads data from the file using the file variable.
- Retrieves and displays the address of an employee as a message.

If you do not already have a sample CSV file with addresses, you can copy the following data to a text file and save it as a CSV file on your computer:

```
Roy, Doe, 120 Jefferson St., Riverside, IT_PROG
Shaun, McGinnis, 220 Hobo Av., Rocky Point, FI_ACCOUNT
John, Mark, 124 Jefferson St., Riverside, SA_HEAD
Sophie, Tyler, 7300 Terrace "At the Plaza" Rd., Wells, IT_PROG
Stephen, Mathew, 22 Theressia St., Troy, IT_PROG
Anne, Ross, 9th St., Lexington, IT_PROG
```

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Task Bot**.
  - c) Enter `Employee Data` as the name for the bot.
  - d) Click **Create and Edit**.
2. Create a variable named `varFile`.
  - a) Click **Create variable** in the **Variables** panel.
  - b) In **Type**, select **File** as the variable type.
  - c) In **Name**, enter `varFile`.
  - d) Select **Desktop folder or file**.
  - e) In **Specific path**, click **Browse** and select the sample CSV file you have on your computer.
  - f) Click **Create**.
3. To open the CSV file using the file variable, find the **CSV/TXT** package from the **Actions** panel, and add the **Open** action to the Bot editor.
  - a) In **File path**, click **Variable** and enter `$varFile$`.

- b) Ensure that **Comma** is selected as delimiter if you are using the sample data provided in the tutorial. If your CSV file uses another delimiter, specify the delimiter.
        - c) Click **Save**.
4. To read the CSV file, find the **CSV/TXT** package from the **Actions** panel, and add the **Read** action to the Bot editor.
  - a) In **Assign value to the variable**, click **(x)** to create a variable named TableFromCSV. The values read from the CSV file will be stored in the variable.
  - b) Click **Save**.
5. To display the address from the fourth row as a message, add the **Message Box** action to the Bot editor.
  - a) In **Enter message to display**, click **(x)**.
  - b) Select the TableFromCSV variable.
  - c) To select the fourth row, enter 3 in **Table row index**.
  - d) To select the third column, click **Index** in **Table column**, and then enter 2. Ensure that the value entered in the **Enter message to display text** field is `$TableFromCSV[3][2]`.
  - e) Click **Yes, insert**.
  - f) Click **Save**.
6. Run the bot.

The bot displays the address: 7300 Terrace "At the Plaza" Rd.

## Example of using Salesforce package and record variable

Build a bot that queries Salesforce objects and writes data to a CSV file. The bot also uses a record variable to retrieve data from individual records fetched from Salesforce.

- Set up a connected app in Salesforce if you do not have one already.
- This bot uses the Control Room OAuth connection method. Create a Control Room OAuth connection before you begin to build the bot. For more information, see [Salesforce Authentication action](#) on page 3167.
- Set up sample opportunity and accounts data in Salesforce. If you do not have sample data, you can import the data from the following CSV files into Salesforce:
  - [Opportunities](#)
  - [Contacts](#)

Suppose that the Sales team at Acme Solutions Pvt Ltd decides to automate the process of getting all opportunity records with the prospecting status and then assigning them to sales representatives to follow up. The team builds a bot that performs the following tasks:

- Fetches all opportunities with the Prospecting status from the Opportunity object in Salesforce.
- Fetches the Account name from the Account object using the Account id retrieved from each opportunity record.
- Uses a record to capture data from individual opportunity records.

- Writes the records to a CSV file, which can be further processed to assign sales reps.

The sample bot uses the Salesforce, Record, Loop, and Data Table packages along with record variables to show how to perform the following automation tasks:

- Queries a Salesforce object using the Salesforce Execute SOQL action.
- Get an individual record from a Salesforce object using the Salesforce Get record action.
- Update record variables and reset record variables.
- Insert records into a Data Table variable.
- Write a Data Table to a CSV file.

1. Create a bot.
  - a) On the left panel, click **Automation**. A list of available bots and forms is displayed.
  - b) Click **Create New > Task Bot**.
  - c) In **Name**, enter `Get Sales Opportunities`.
  - d) Click **Create and Edit**.
2. Authenticate with Salesforce. For this tutorial, **Control room OAuth connection** is used as **Authentication type**. The instructions for setting up OAuth connection are beyond the scope of this tutorial. If you are not familiar with setting up OAuth connections, follow the instructions provided on this [page](#) or you can use **OAuth 2 - Client Credentials** as the **Authentication type**, and provide client id, client secret, Salesforce username, and password within the Salesforce Authentication action.
  - a) From the **Actions** panel, find and add **Salesforce > Authentication** action to the Bot editor.
  - b) In **Authentication type**, select **Control room OAuth connection**.
  - c) Click **Pick** and select the OAuth connection you have set up with the following details:
    - **Provider type: Salesforce**
    - **Connection name:** the connection you have set up.
    - **Token type: Shared**.
  - d) In **API version**, enter the version number of the API for the Salesforce connected app. For example, `50.0`.
  - e) Leave the **Session name** as `Default`.
  - f) In **Mapped variables**, click **Add variable mapping**, and then map the key `InstanceUrl` to a String variable named `InstanceUrl`.
3. To check for authentication errors before executing other tasks, use the Try Catch actions.
  - a) From the **Actions** panel, find and add **Error handler > Try** action to the Bot editor.
  - b) Click the **Catch** block icon.
  - c) In **Exception**, select **Error handler**.
  - d) In **Assign exception message to**, click **(x)** and create a String variable named `ErrorMessage`.
  - e) Add the **Message box** action within the Catch block.
  - f) In **Enter the message to display**, select the **ErrorMessage** variable and save the changes.

4. Query the Salesforce Opportunity object to fetch opportunities records with the Prospecting status .
  - a) From the **Actions** panel, find and add **Salesforce > Execute SOQL** action within the **Try** block.
  - b) In **SOQL query to execute** enter the following query.

```
SELECT Id, Name, AccountId, Amount, CloseDate, StageName,
NextStep FROM Opportunity WHERE StageName = 'Prospecting'
```

- c) In **Include deleted records**, click **No**.
  - d) Ensure Default is set as the **Session name**.
  - e) In **Save the outcome to a variable**, click **(x)** and create a List variable named list\_records\_prospecting.
  - f) Save the changes.

5. Loop through the list of retrieved opportunities records.
  - a) From the **Actions** panel, find and add **Loop > Loop** action after the Execute SOQL action within the **Try** block.
  - b) In **Iterator**, select **For each item in the list**.
  - c) In **list**, select the **list\_records\_prospecting** variable.
  - d) In **Assign the current value to variable**, click **(x)** to create variable named dict\_record\_opportunity with type **Any**.

The following is an example of a record that is stored as dictionary. The bot retrieves values only from the Name, Account name, Amount, CloseDate, StageName, and NextStep fields and leaves out the rest.

```
{attributes,com.automationanywhere.botcommand.data.impl.DictionaryValue@5d804b
{Id,0065j00001Q2ISAAA3},{Name,Opportunity #1},
{AccountId,0015j00001BU2hnAAD},{Amount,2000.0},
{CloseDate,2023-10-05},{StageName,Prospecting},{NextStep,Call to
Discuss}
```

- e) Save the changes.
6. Before retrieving values from each field in a record, create two record variables - one for storing the values from each opportunity record and another for resetting the first record variable at the end of each iteration.
  - a) In **Variables panel**, click **Create variable**.
  - b) In **Type**, select **Record**.
  - c) In **Name**, enter out\_record\_prospecting.
  - d) Click **Create**.
  - e) Repeat steps a to d to create another record variable with the following details:  
**Type:** Record  
**Name:** record\_empty

7. Update the record variable with the Opportunity name from the current record.

- a) From the **Actions** panel, find and add **Record > Add column** action within the Loop action.
  - b) In **Source record variable**, select **out\_record\_prospecting**.
  - c) In **Column type**, select **String**, and in **Value**, enter `$dict_record_opportunity{Name}$`.
  - d) Click **specific index**, enter 0.
  - e) In **Destination record variable**, select **out\_record\_prospecting**.
  - f) Save the changes.
8. The opportunities records retrieved from Salesforce contain only the account IDs and not account names. Retrieve the account name using the account ID for each record.
- a) From the **Actions** panel, find and add **Salesforce > Get record** action within the Loop action.
  - b) In **Object name**, enter Account.
  - c) Select **Record ID** and enter `$dict_record_opportunity{AccountId}$`.
  - d) In **Fields and data**, select **List** and click **Add**.
  - e) In **Type**, select **String**.
  - f) In **Value at 0**, enter Name.
  - g) Make sure Default is set as the Salesforce Session name.
  - h) In **Mapped variables**, click **Add variable mapping** to map the key Name to a String variable AccountName. The Get record call retrieves the account name using key Name and stores it in the AccountName variable.
  - i) Save the changes.
9. Add a new column and update the record variable with the account name.
- a) From the **Actions** panel, find and add **Record > Add column** action within the Loop action.
  - b) In **Source record variable**, select **out\_record\_prospecting**.
  - c) In **Column type**, select **String**, and in **Value**, enter `$AccountName$`.
  - d) Click **specific index**, enter 1.
  - e) In **Destination record variable**, select **out\_record\_prospecting**.
  - f) Save the changes.
10. Add a new column and update the record variable with amount.
- a) From the **Actions** panel, find and add **Record > Add column** action within the Loop action.
  - b) In **Source record variable**, select **out\_record\_prospecting**.
  - c) In **Column type**, select **Number**, and in **Value**, enter `$dict_record_opportunity{Amount}$`.
  - d) Click **specific index**, enter 2.
  - e) In **Destination record variable**, select **out\_record\_prospecting**.

f) Save the changes.

11. Update the record variable with CloseDate, StageName, and NextStep.

a) Add the **Add column** action to the Loop action and then enter the following details:

Field	Value
Source record variable	out_record_prospecting
Column type	String
Value	<code>\$dict_record_opportunity{CloseDate}\$</code>
specific index	3

b) Add the **Add column** action to the Loop action and then enter the following details:

Field	Value
Source record variable	out_record_prospecting
Column type	String
Value	<code>\$dict_record_opportunity{StageName}\$</code>
specific index	4

c) Add the **Add column** action to the Loop action and then enter the following details:

Field	Value
Source record variable	out_record_prospecting
Column type	String
Value	<code>\$dict_record_opportunity{NextStep}\$</code>
specific index	5

d) Save the changes.

12. Insert the record into a DataTable variable.

- To keep track of the iterations and use it as a row index number, create a Number variable named counter and set the default value to 0.
- From the **Actions** panel, find and add **Data Table > Insert row** action within the Loop action.
- In **Data table name**, click **(x)** and create a Table variable named table\_records.
- Click **specific index** and enter `$counter$`.
- In **Row record name**, select **out\_record\_prospecting**.
- Save the changes.

13. Increment the counter variable by 1.

- From the **Actions** panel, find and add **Number > Increment** action within the Loop action.

- b) In **Enter number**, enter `$counter$`.
  - c) In **Enter increment value**, enter 1.
  - d) In **Assign the output to variable**, select **counter**.
  - e) Save the changes.
14. Reset the `out_record_prospecting` record variable before the next iteration.
- a) From the **Actions** panel, find and add **Record > Assign** action within the Loop action.
  - b) In **Select the source record variable**, select `record_empty`.
  - c) In **Select the source record variable**, click **Record** and select **out\_record\_prospecting**. Since the `record_empty` variable does not have any value, the `out_record_prospecting` will be reset.
  - d) Save the changes.
15. Write the retrieved opportunity records to a CSV file.
- a) From the **Actions** panel, find and add **Data Table > Write to file** action outside the Loop action.
  - b) In **Data table name**, select **table\_records**.
  - c) In **Enter file name**, specify the CSV file path. For example, `C:\bots\opportunities.csv`.
  - d) Select **Create folders/files if it doesn't exist**.
  - e) Click **Overwrite existing file**.
  - f) Save the changes and run the bot.

## Example of using Custom selection option in Log variables to file action

In this example, you will use the Custom selection option to log user-defined variables to an existing log file and then modify the values of the variables and log the appended data into a file.

1. Create a bot.
  - a) On the left panel, click **Automation**.  
A list of available bots and forms is displayed.
  - b) Click **Create New > Task Bot**.
  - c) Enter a name for the bot: `Log user defined variables`
  - d) Click **Create and Edit**.
2. Create the following user-defined variables using the **Create variable (+)** icon at the top of the **Variables** menu.

Data type	Variable name	Variable value
String	Day_1	monday

Data type	Variable name	Variable value
String	Day_2	Tuesday
String	Day_3	Wednesday
Number	Temperature_Mon	9.3555555555555589
Number	Temperature_Tues	10.822222222222222
Number	Temperature_Wed	17.800000000000004
Datetime	Time_Mon	5/7/2023 01:15 AM
Datetime	Time_Tues	5/8/2023 01:00 AM
Datetime	Time_Wed	5/9/2023 01:00 AM
Boolean	Chances_of_rain_Mon	True
Boolean	Chances_of_rain_Tues	False
Boolean	Chances_of_rain_Wed	True

3. Double-click or drag the **Log to file > Log variables to file** action.
  - a) In the Output file path field, specify the file location. For example, D:\userdefined path\weather\_forecast-data.txt.
  - b) In the **When logging** field, select **Overwrite existing log file** option.
  - c) In the Variables to log field, select the Custom selection option and select all variables as follows:

**Variables to log**

By type Custom selection

Variables selected below, will be considered. Any variable added later will not be used

- Select all variables

---

- Chances\_of\_rain\_Mon
- Chances\_of\_rain\_Tues
- Chances\_of\_rain\_Wed
- Day\_1
- Day\_2
- Day\_3
- # Temperature\_Mon
- # Temperature\_Tues
- # Temperature\_Wed
- 📅 Time\_Mon
- 📅 Time\_Tues

4. Click **Save** and then **Run**.  
The data is logged as follows:

```
Task bot name : \Bots\Log user defined variables
chances_of_rain_mon (Boolean) = true
chances_of_rain_tues (Boolean) = false
chances_of_rain_wed (Boolean) = true
day_1 (String) = monday
day_2 (String) = Tuesday
day_3 (String) = Wednesday
temperature_mon (Number) = 9.35555556
temperature_tues (Number) = 10.82222222
temperature_wed (Number) = 17.8
time_mon (Datetime) = 2023-05-07T01:15:00+05:30[Asia/Calcutta]
time_tues (Datetime) = 2023-05-08T01:00:00+05:30[Asia/Calcutta]
time_wed (Datetime) = 2023-05-09T01:00:00+05:30[Asia/Calcutta]
```

5. Double-click or drag the **String > Uppercase** action.
  - a) In the **Source string** field, select Day\_1 to insert the variable.
  - b) In the **Assign the output to variable** field, select the Day\_1 variable from the drop-down.
  
6. Double-click or drag the **Number > Increment** action.
  - a) In the **Enter number** field, select Temperature\_Tues to insert the variable.
  - b) Enter 15 in the **Enter increment value** field.
  - c) In the **Assign the output to variable** field, select Temperature\_Tues variable from the drop-down.
  
7. Double-click or drag the **Boolean > Invert** action.
  - a) From the **Select the boolean variable to be inserted** field, select the True option.
  - b) In the **Assign the output to** field, select the Chances\_of\_rain\_Wed variable from the drop-down.
  
8. Double-click or drag the **Log to file > Log variables to file** action.
  - a) In the Output file path field, specify the file location. For example, D:\userdefined path\weather\_forecast-data.txt.
  - b) In the **When logging** field, select **Append to existing log file** option.
  - c) Select the **Append timestamp** check box.
  - d) In the **Variables to log** field, select the **Custom selection** option and select all variables as previously shown in Step 3c.
  
9. Click **Save** and then **Run**.

The updated data is logged with the timestamp details in the file as follows.

```

Task bot name : \Bots\Log user defined variables

chances_of_rain_mon (Boolean) = true
chances_of_rain_tues (Boolean) = false
chances_of_rain_wed (Boolean) = true
day_1 (String) = monday
day_2 (String) = Tuesday
day_3 (String) = Wednesday
temperature_mon (Number) = 9.35555556
temperature_tues (Number) = 10.82222222
temperature_wed (Number) = 17.8
time_mon (Datetime) = 2023-05-07T01:15:00+05:30[Asia/Calcutta]
time_tues (Datetime) = 2023-05-08T01:00:00+05:30[Asia/Calcutta]
time_wed (Datetime) = 2023-05-09T01:00:00+05:30[Asia/Calcutta]

Logged date : 30-05-2023 14:37:35
Task bot name : \Bots\Log user defined variables

chances_of_rain_mon (Boolean) = true
chances_of_rain_tues (Boolean) = false
chances_of_rain_wed (Boolean) = false
day_1 (String) = MONDAY
day_2 (String) = Tuesday
day_3 (String) = Wednesday
samplenumber (Number) = 0
samplestring (String) =
temperature_mon (Number) = 9.35555556
temperature_tues (Number) = 25.82222222
temperature_wed (Number) = 17.8
time_mon (Datetime) = 2023-05-07T01:15:00+05:30[Asia/Calcutta]
time_tues (Datetime) = 2023-05-08T01:00:00+05:30[Asia/Calcutta]
time_wed (Datetime) = 2023-05-09T01:00:00+05:30[Asia/Calcutta]

```

## Create dictionary type variables

Use Automation 360 to create dictionary type variables using different dictionary subtypes and key value type parameters.

- Ensure you have access to the Control Room.
  - You must have credentials with **AAE\_Basic** permissions.
  - Your workstation must be a registered device in the Control Room.
1. Log in to the Control Room.
  2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  3. Click the **Create a bot** icon.
  4. In the **Name** field, enter DictionaryMapping, and click **Create & Edit**.
  5. From the Bot editor, click **Variables** > **Create variable** (+ icon) at the top of the **Variables** menu to create four new custom dictionary variables:

Variable type	Subtype	Variable name	Default value
Dictionary	String	Dictionary1	<b>Key:</b> Company name <b>Value:</b> Acme publication

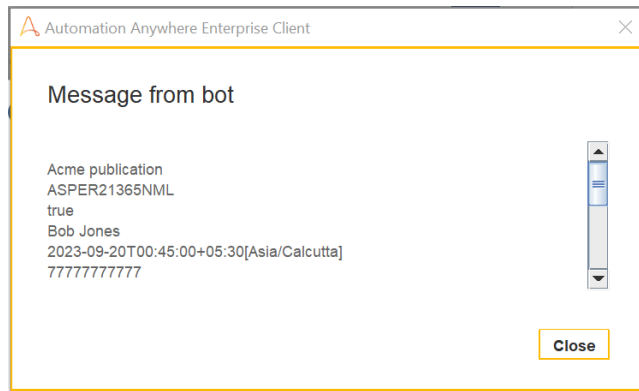

Variable type	Subtype	Variable name	Default value
Dictionary	String	Dictionary2	<b>Key:</b> Company Registration number <b>Value:</b> ASPER21365NML
Dictionary	Number	Dictionary3	<b>Key:</b> Total employees <b>Value:</b> 3000
Dictionary	Any	Dictionary4	<ul style="list-style-type: none"> <li>• <b>Type: String</b> <ul style="list-style-type: none"> <li>• <b>Key:</b> Employee name</li> <li>• <b>Value:</b> Bob Jones</li> </ul> </li> <li>• <b>Type: Datetime</b> <ul style="list-style-type: none"> <li>• <b>Key:</b> Date of Joining</li> <li>• <b>Value:</b> 9/20/2023</li> </ul> </li> <li>• <b>Type: Boolean</b> <ul style="list-style-type: none"> <li>• <b>Key:</b> Employment type- Contractor</li> <li>• <b>Value:</b> True</li> </ul> </li> <li>• <b>Type: Number</b> <ul style="list-style-type: none"> <li>• <b>Key:</b> Phone number</li> <li>• <b>Value:</b> 7777777777</li> </ul> </li> </ul>

6. In the **Actions** pane, find **Message box**. In **Enter the message to display**, enter **F2**, and select the following variables:

- \$Dictionary1{"Company name"}\$
- \$Dictionary2{"Company Registration number"}\$
- \$Dictionary4{"Employment type - Contractor"}\$
- \$Dictionary4{"Employee name"}\$
- \$Dictionary4{"Date of Joining"}\$
- \$Dictionary4{"Phone number"}\$

7. Save and run the **DictionaryMapping** Task Bot.

The output is displayed as:

This section contains code examples and explanations about how to code some basic bot capabilities.

## Attended and unattended automation

Automation 360 provides attended and unattended automation for users to create bots that can manage routine tasks efficiently. While users focus on critical inputs that require manual overview or approval, bots handle tasks such as gathering information across databases, validating data, or responding to chats.

### Overview

Collaboration between humans and software bots is called attended automation. As attended automation requires user supervision, it is best suited for use with smaller and more fragmented tasks. However, some tasks within a business process do not change a lot over time and might not require extensive user intervention, such as collecting data or retrieving information from multiple databases. When such tasks that require little or no user judgment are configured to trigger other bots, it is called unattended automation. Unattended automation is useful to perform privileged operations, requiring elevated permissions and credentials.

Automation 360 offers a combination of attended and unattended automation for a complete automation solution with the following benefits:

- Automated integration between multiple applications or databases, reducing errors as very little user intervention is necessary.
- Access bots in real-time through an easy to use interface.
- Users can set up or change triggers to start bots based on real-time.

Watch the following video to understand attended automation:

[Using bots to solve problems](#)

## Using interactive forms

Interactive forms enable you to build forms for submitting and regrouping data that is used to send and receive information from various applications within your attended automation process.

Interactive forms provide a list of actions that you can drag into a bot as a task logic. Specific function of each action is displayed when you hover over them. The actions within the interactive forms can be broadly classified into the following types:

Form level actions

Represented by  and used within a task logic to manage the linked form.

Element level actions

Represented by  and used to manage elements of a form.

Watch the following video to understand how to use Interactive forms in Automation 360:

## Add a form to bot

Adding an existing form to a bot enables users to collaborate with bots. Use the necessary action items to create a bot and build a task logic.

This task describes a scenario where you want to design a bot that triggers an existing New User Registration form. A **Hot key** preset trigger starts the bot. An existing form that is linked to the bot is displayed where the user enters the information.

- If the user clicks **Submit**, a User Agreement form is displayed.
- If the user clicks **Cancel**, User registration is canceled message is displayed and the bot is terminated.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click **Create new > Bot**.
3. Enter a name for the bot.  
All the bots are stored in the \Bots folder. Click **Browse** to change the folder.
4. Click **Create & edit**.  
The bot builder pane is displayed that has **Flow** (default view), **List** and **Dual** view. You can drag the required actions from the left pane to create a task.
5. In **Triggers > Hot key**, drag **Hot key trigger** into **Drag a trigger here** in the bot logic.
6. Set **Ctrl** and **L** as the hot key combination.
7. Use the **Search actions** field to find **Interactive forms**.
8. Drag **Display** into the task logic.  
You can use the display action to show the form when the bot is triggered. The display action properties appear on the right.

9. Click the create variable icon (  ) to create a variable.  
You have to create a form variable by linking an existing form. This enables you to use the form variable and the associated form across multiple instances.

---

**Note:** The form variable can be linked only to forms created using the Control Room form builder.

---
10. On the **Create variable** screen, enter a name for the form variable you are creating.
11. Click **Browse** and select the New User Registration form.  
This links the New User Registration form to the form variable that you are creating.
12. Click **Create & select**.  
A new form variable is created. For any existing form variable, use the **Form name** drop-down menu to select it.
13. Use the **Search actions** field to find **Trigger loop** and drag it to add event monitoring.  
Event monitoring enables you to simultaneously set multiple events within the task logic of a bot.
14. Drag **Handle** into the **Trigger loop**.  
Handle enables you to run an action by configuring a trigger in the **Trigger loop: Handle** for the bot. You can set a trigger when a event occurs on the selected interface (selected application) or when a user clicks the selected form element.
15. For this scenario, use the **Trigger on** drop-down menu to select **INTERACTIVE FORMS > Form trigger**.
16. Click the **Form name** drop-down menu and select the New User Registration form.  
This enables you to set a trigger for the **Submit** option of the New User Registration form.
17. Click the **Form element** drop-down menu and select **Submit**.  
For the **Button** element of a form, the **Select action trigger** is set to **Clicked** by default. When the user clicks **Submit** on the New User Registration form, it triggers the User Agreement form.
18. (Optional) Use **Assigned to** to create a variable.  
You can use this variable to fetch various details for the element you have selected in the **Form element** drop-down menu. This return value is either a string or number based on the element type selected. For example, if you have selected the **Date** element, the return value is a string.
19. Search for **Interactive forms** and drag **Display** into **Trigger loop: Handle**.
20. Click the **Form name** drop-down menu and select User Agreement form.  
The User Agreement form appears.
21. Search for **Message** and drag it into **Trigger loop: Handle**, after **Interactive forms**.  
A successful registration message appears when the user clicks **Submit**.
22. Terminate the trigger by dragging **Break** into the **Trigger loop**.  
Use **Break** to exit the current event loop and for actions where finishing a process is required.
23. Drag another **Handle** next to the **Trigger loop: Handle**.  
This enables you to set a trigger for the **Cancel** option of the New User Registration form.
24. Click the **Form element** drop-down menu and select **Cancel**.
25. Search for **Message** and drag it into **Trigger loop: Handle**. Update the **Enter the message to display** field as User registration is canceled.

When the user clicks **Cancel** on the New User Registration form, it triggers a `User registration is canceled` message and terminates the bot.

26. Drag **Trigger Loop > Break** to terminate the loop.

27. Click **Save**.

28. Click **Run with triggers**.

The **Run with triggers** sets the **Hot key** trigger to start the bot, which is Ctrl plus L combination from the keyboard in this scenario.

Related reference

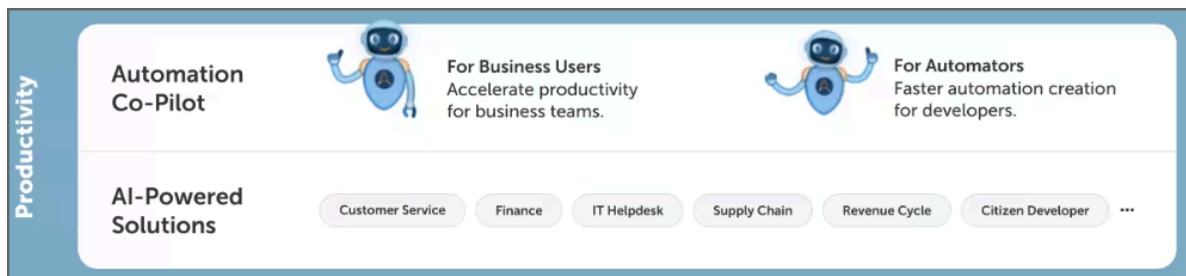

[Interactive forms package](#) on page 2918

The interactive forms package contains actions that handle exceptions encountered by a bot. All the actions performed by users on the interactive forms can be monitored to execute logic using subtasks.

## Automation Co-Pilot

Automation Co-Pilot is part of the Automation Success Platform that enables both business users and automators to accelerate productivity across their enterprise by engaging with and developing AI-powered solutions for customer service, finance, supply chain, and IT helpdesk. Automation Co-Pilot is a generative AI-powered assistant that is engineered for automation.

Business users and automators can quickly deploy and deliver automation and AI across their systems and applications on a unified platform with a human-in-the-loop. You can embed Automation Co-Pilot into your favorite applications.

### Benefits of Automation Co-Pilot

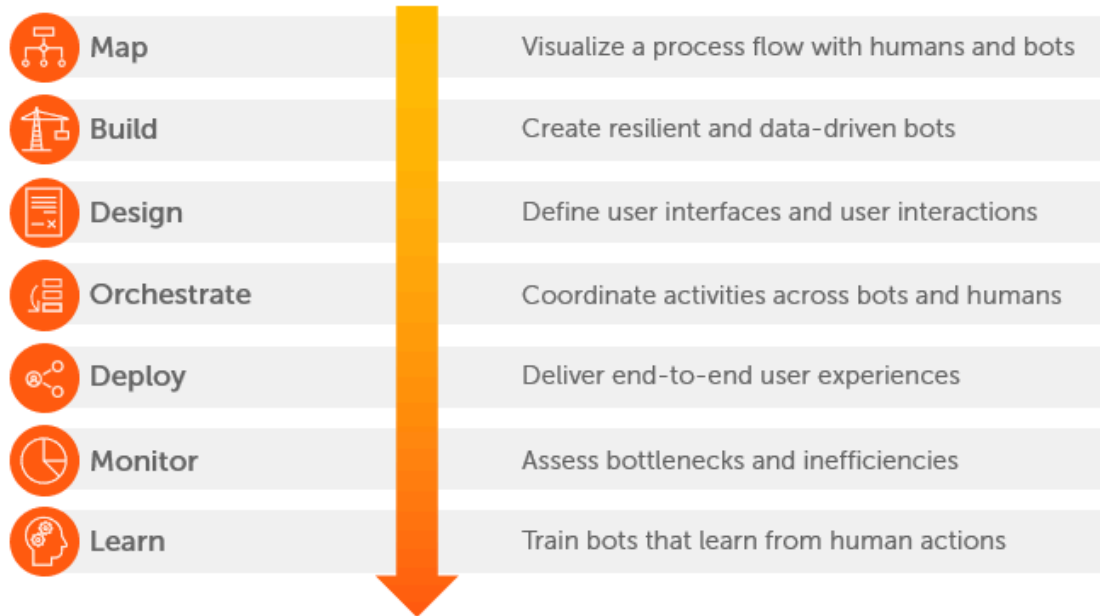

Using Automation Co-Pilot, you can:

- Simplify everyday tasks, such as reporting and keeping track of urgent requests.
- Collaborate easily with your team's applications and bots, thereby improving average handle time and resolution rate, which helps improve customer satisfaction.
- Speed up even the most complex requests by automating escalations and approvals.
- Accelerate return-on-investment owing to minimal investment on infrastructure, training, and set-up costs for your enterprise.

## What you can do with Automation Co-Pilot

Automation Co-Pilot enables real-time communication between users and bots. By using Automation Co-Pilot to automate repetitive and time-consuming tasks, you can improve customer experience, increase employee productivity, and cut operational costs for your organization.

The following image describes how Automation Co-Pilot enhances automation:

## Automation Co-Pilot for Business Users

Automation Co-Pilot for Business Users provides a simple, front-end interface for users to execute and interact with bots and applications. You can use Automation Co-Pilot for Business Users to create, run, and access end-to-end process automations across enterprises by connecting bots in the front and back offices. For more details, see [Automation Co-Pilot for Business Users](#) on page 3495.

## Automator AI

Automator AI enables you to empower everyone, from professional developers to business users, to use generative AI to transform natural language into automations and dramatically reduce the time, cost, and effort to create automations. For more details, see [Automator AI](#) on page 3622.

## Automation Co-Pilot for Business Users

Automation Co-Pilot for Business Users provides a simple, front-end interface for users to execute and interact with bots and applications.

---

**Note:** Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI)] within the product.

---

### How to use Automation Co-Pilot for Business Users

Business users can use Automation Co-Pilot for Business Users to create, run, and access end-to-end process automations across enterprises by connecting bots in the front and back offices. For more details about the tasks and goals of a business user, see [Understanding the Business user](#) on page 3602.

You can access Automation Co-Pilot for Business Users through the following interfaces where you can connect to business workflows at multiple touchpoints:

- Web browser: Access Automation Co-Pilot for Business Users through a URL to manage front and back office functions, gathering input and approval from a single interface. With [Automation Co-Pilot for Business Users on the web interface](#) on page 3575, you can create automations using attended and unattended bots. It provides a unified experience to view and organize your documents and tasks, perform actions, and deliver automations with a process-centric approach.
- Desktop: Retrieve and update data with custom forms. You can view and interact with all data from a single screen instead of switching between multiple systems. [Using Automation Co-Pilot for Business Users on desktop](#) on page 3562, you can access and run automations as an attended Bot Runner without logging into the Control Room. Manage routine tasks such as validating data and retrieving approvals with interactive forms, and managing escalations through bots by adding triggers.
- Embed automations: [Embed automations in your application using Automation Co-Pilot](#) on page 3496 to deliver automation anywhere you want. Access automated processes and bots from any platform with an embedded interface. You can integrate Embedded Automation with your web application or deliver it through a browser extension such as: Microsoft Teams, SAP, ServiceNow, Workday, and Genesys.
- Applications: Execute bots from various third-party applications that are integrated with Automation 360 using their built-in connectors such as: Salesforce, Google Workspace, Genesys, MuleSoft, ServiceNow, Workday, or SAP; and through Automation 360 pre-built Integration Platform as a Service (IPaaS)s such Apigee, SnapLogic, and Workato.

[Data security for generative AI - FAQ](#) on page 1178

We have introduced generative AI (GenAI) infused features to help our customers realize productivity gains by building better and smarter automations. Our customers can realize the power of GenAI with features such as Automation Co-Pilot for Business Users and Document Automation.

## Embed automations in your application using Automation Co-Pilot

Using the Automation Co-Pilot interface, you can embed automations into any web application or cloud environment using an intuitive widget or browser extension.

With embedded automations, you can provide users access to data in essential forms, applications, and business history across platforms. With automation only a click away, users no longer need to keep additional applications open on their workspace. Users can quickly reach out to customers or colleagues, and deliver information to improve the customer experience, or promote business continuity and efficiency, respectively. Whenever users need business data, Automation Co-Pilot ensures that it is readily available.

## Methods to embed automations with Automation Co-Pilot

You can use either of the following two methods to embed automations with Automation Co-Pilot:

- Use an iFrame widget for web apps which support customization: You can add an iFrame widget (composed from an HTML inline frame) to the source code of your web application to enable end-users access to automated processes and bots without leaving their familiar environments. You can configure and access the iFrame widget in supported web browsers.
- Use a Google Chrome extension widget for web apps which do not support customization: You can develop custom bricks that are coded into your browser through an extension and embed our interface as a side panel of the web browser. A Google Chrome extension renders the interface to enable end-users access to automated processes and bots without leaving the web application in the browser. Extensions provide additional adaptability through web page customization. With an OAuth 2.0 connection, existing access to automations in the Automation Workspace is shared with Automation Co-Pilot (extensions) providing a seamless user experience.

The diagram illustrates two methods for embedding Automation Co-Pilot into a web application. On the left, the **iFrame Widget** is shown as a sidebar menu with items like 'Change payment terms', 'Set up payment account', and 'Automation name'. Below it, a text box states: 'iFrame Widget for web apps supporting customization'. In the center, a laptop icon is labeled 'Embed automation in any web application', followed by 'Attended, unattended and process automations', 'Lightweight and responsive interface', and 'Seamless authentication with OAuth 2.0 or SAML SSO'. On the right, the **Chrome Extension Widget** is shown as a browser sidebar with a list of tasks like '7730 Concur expenses to review' and '7729 New financial dashboard approval'. Below it, a text box states: 'Chrome Extension Widget for web apps not supporting customization'.

Click the video link for a demonstration of the two available embed methods.

## Comparing automation embed methods

Based on your business needs, you should compare the two Automation Co-Pilot methods of embedding automation and decide which is right for your situation. As you explore using Automation Co-Pilot with the embedded widget or with the Google Chrome extension, both methods might seem similar. Both methods provide your environment with an iFrame widget interface powered by AARI. The iFrame widget hosts automation from AARI on the web and offers the same power of automating with Automation 360.

However, depending on where you want to embed automation, one method might be better than the other. Before you select an embed method (iFrame widget or Google Chrome extension),

review the following prerequisites, technical specifications, and styles of the two methods described in the table:

Table 7: Embed methods comparison

Specification	iFrame widget	Google Chrome extension
Automation 360 version	Automation 360 v.26 or later	Automation 360 v.26 or later
Supported web browser	<ul style="list-style-type: none"> <li>Google Chrome</li> <li>Microsoft Edge</li> <li>Apple Safari</li> </ul> <p>See <a href="#">Browser requirements for Automation Workspace</a> on page 1312.</p>	<ul style="list-style-type: none"> <li>Google Chrome</li> <li>Microsoft Edge (see <a href="https://chromewebstore.google.com/">https://chromewebstore.google.com/</a> to locate the extension)</li> </ul>
AARI licenses and fluency	Yes	Yes
Location of widget	Automation Co-Pilot embedded in web application	Widget appears outside the application as an Automation Anywhere stylized panel
Requirement	Web application supports iFrame widget	OAuth 2.0 Control Room configuration for server validation

## Getting started with an embed method

Using Automation Co-Pilot, the Co-Pilot Admin has the key role of organizing access points for business users. The Co-Pilot Admin selects configurations from Automation Co-Pilot to the desired application.

- For Automation Co-Pilot using an embedded iFrame widget, the iFrame widget embeds seamlessly into adjacent content of your web application. The Co-Pilot Admin must first set up and configure the iFrame widget details and then assign automation to teams by adding specific members of a team and defining the team owners and admins. After setup is completed, business users can deploy automation in their web application using the iFrame widget. For more details, click [Automation Co-Pilot using embedded widget overview](#) on page 3499.
- Automation Co-Pilot using Google Chrome extension has a similar setup process yet differs in how users access the interface. Because the interface is accessed through the Google Chrome browser, a developer must enable web components for the extension.

The Co-Pilot Admin then completes the setup and configuration of the iFrame widget. Next, a bot creator develops a web component using a **Page Editor** assisted by a generated iFrame widget embed code. Newly created web components become visible within Automation Co-Pilot using the Google Chrome extension for administrators to assign to teams. Assigned users will then navigate to their web application and access the components, while logged in to their Automation Workspace. For more details, click [Automation Co-Pilot using Chrome extension](#) on page 3528.

## Automation Co-Pilot using embedded widget overview

You can use a widget that embeds automation built on the Automation 360 platform that can be applied natively on any supported web application.

### Capabilities

#### iFrame widget

A widget that is composed from an HTML inline frame, or simply iFrame widget, can be used as a "window" to access another website located in your current web application environment. In addition, the iFrame widget provides reliable and secure methods of quick integrations performance without the need for heavy development work, when involved with custom integrations.

For example, your current web application environment is domain 1, which can access a widget that shows a website from domain 2. These two domains exist in one shared environment, without you navigating to a separate page or window.

#### iFrame widget experience on supported web applications

The Automation 360 platform can support embedding an iFrame widget on any web application that supports the iFrame technology to access external contents. Many software-as-a-service (SaaS) web applications support the iFrame widget to allow for customization in a secure environment.

Business users can add contextual workflow automations from inside their most used and preferred enterprise applications. This approach means that users need to add only minimal code to their most used web applications, which when applied can produce a rich, friendly, and more secure interactive user experience.

#### Actions that can be performed with iFrame widget

Business users can use iFrame widget to perform the following:

- Invoke local automations on their desktop.

- Invoke multi-step process workflows from Automation Co-Pilot requests.
- Monitor request progress to completion.
- Receive notification of pending tasks.
- Respond directly to pending tasks from iFrame widget.
- View the history of currently running or previously completed automations.

## Requisites

- Ensure that you have the proper role and permissions. [Create users for Automation Co-Pilot](#) on page 3610
  - AARI license.
  - Proper roles for Co-Pilot Admin and Co-Pilot User.
- Automation 360 v.26 or later.
- Google Chrome, Microsoft Edge Chromium, or Apple Safari web browsers. See [Browser requirements for Automation Workspace](#) on page 1312.
- Automation Co-Pilot web interface.
- Web application that supports iFrame technology.

## Process flow

1. Set up your iFrame widget for a web application.
2. Assign automations to a team for them to access data from the iFrame widget.
3. Configure widget settings in a web application to properly access iFrame widget.
4. Deploy the iFrame widget.

Workflow map: Click the following schematic image to view the Automation Co-Pilot using embedded widget workflow in an interactive visual

format:

1. [AARI Integrations](#)

## Setup iFrame widget using Automation Co-Pilot

You can setup your iFrame widget for your supported web applications. This includes embedding a widget and configuring the iFrame widget code.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- Have access to the Automation Co-Pilot for Business Users on the web interface.
- Complete any necessary password changes to access the Automation Co-Pilot for Business Users on the web interface.

**Note:** Ensure third party partitioning is disabled in your Google Chrome settings. [Automation Co-Pilot for Business Users FAQ](#) on page 3561

Create new connections to applications and configure your iFrame widget details including access to the embed code for you to copy and use in a web application.

You can only setup the iFrame widget for web applications that support the iFrame widget. If the web application does not support the iFrame widget, refer to [Embed automations in your application using Automation Co-Pilot](#) on page 3496.

**Important:** The iFrame URL has changed starting from Automation 360 v.32 release. If you have set up your iFrame widgets in Automation 360 v.31 or earlier and are updating to Automation 360 v32 or later, you must recreate these widgets in the updated version to generate the code with new URL for the iFrame widgets. Copy this new iFrame URL in your applications for Co-Pilot to run successfully.

See the video below on how to obtain the new iFrame URL:

1. Log in to Automation Co-Pilot for Business Users on the web interface.
2. Navigate to **Manage > Applications**.  
The **Applications Setup** page appears for you to setup your connection. If this is your first time accessing this page, you will see the **No applications** label.
3. Click **Add application** to add a new application.

4. Specify a name for the application in the **Name** field.  
You can name it **Applications** or the name of your favorite web application to help you define the web application that you plan to embed the iFrame widget.
5. Optional: Specify a description for your application in the **Description** field.
6. Click **Create & edit**.  
Your instance is now created and forwards you to an **Edit application** page where you can make edits.
7. Navigate to the **Widgets** tab in the same page.  
You can add iFrame widgets to your application in this tab.
8. Click the plus (+) icon.  
The **Add Widget** page prompts you to add a new iFrame widget to your application.
9. Specify a name for the iFrame widget in the **Widget name** field.
10. Specify your tags in the **Filtered automations** field.  
You can select existing tags from the drop-down to add to the widget. When you add tags, they display in the embedded **widget** tab on your desktop application, in the **tags** column next to the widgets. Tags allow you to filter out automations and display only a subset of automations from the entire list. This will give you the ability to call and access only the tagged automations in your embedded widget. To add a tag, see: [Configure a process](#) on page 3599.

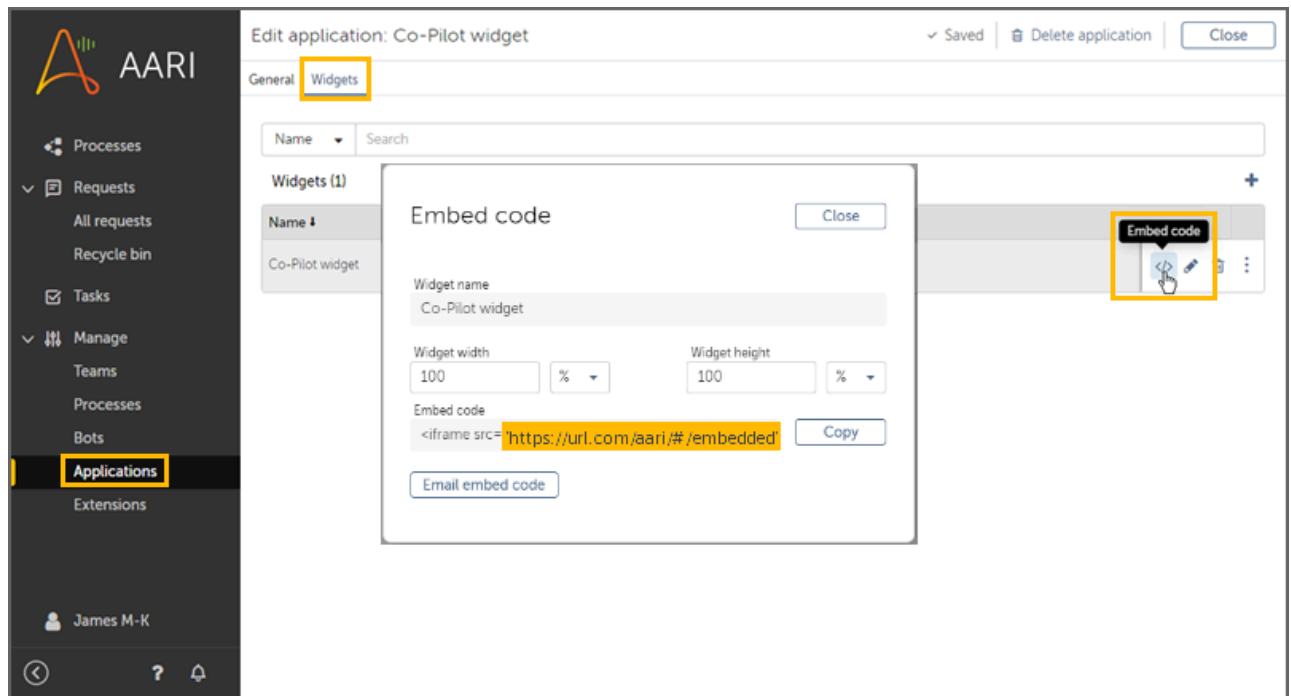

11. Click **Save**.  
You have now successfully defined a new iFrame widget for your application.  
You can now generate an iFrame code.
12. Click the three dots (ellipses) next to the name of your iFrame widget.
  - **Embed code** option allows you to generate code for the iFrame widget.
  - **Edit** option enables you to edit the iFrame widget details.
  - **Delete** option will delete the iFrame widget.
13. Click **Embed code** option.  
The **Embed code** window appears and prompts you configure the code details.
14. Specify the size of the iFrame widget width and height in the **Widget width** and **Widget height** fields, respectively.

---

**Note:** The default size of the iFrame widget width and height are **100 %**. You can change **%** (default) to **px** for pixels depending on your preference.

---

15. Click **Copy** in the **Embed code** section to copy the code.

16. Optional: Click **Email embed code** if you would like to open your local mail client to email the embed code to another individual.

You now have access to the iFrame widget code.

17. Click **Close**.

You have now successfully copied your iFrame widget code that can be used in a supported web application.

For your next steps, you can assign automations to your team, see [Assign automations to teams](#) on page 3503.

## Assign automations to teams

You can configure teams to access automations and tasks for it to be accessed via Automation Co-Pilot Desktop Assistant, Automation Co-Pilot for Business Users on the web interface, and the iFrame widget embedded in other business applications.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- Have access to Automation Co-Pilot for Business Users on the web interface.

1. Log in to Automation Co-Pilot for Business Users on the web interface.
2. [Assign members to a team](#) on page 3504.
3. [Assign teams to a process](#) on page 3504.
4. [Assign teams to a bot](#) on page 3505.

You have now assigned automations for your team. Members of your team can now automate using the iFrame widget.

For your next steps, you can configure the widget in a web application to access to automations in the iFrame widget, see [Configure an iFrame widget in a web application](#) on page 3505.

Assign members to a team

You can follow this task to create a new team and assign members to your team.

**1. Navigate to **Manage > Teams**.**

The **Team Setup** page appears for you to create new or edit existing teams.

**2. Click **Create new team**.**

The **Create a team** window appears with details for you to edit.

**3. Specify the name of the team in the **Team Name** field.**

**4. Specify a description for your integration in the **Description** field.**

**5. Select the **AARI Manager** option in the **Team admin** field.**

The Automation Co-Pilot manager will be the team admin that manages the user and their access.

**6. Click **Create & edit**.**

You will now be forwarded to the **Edit team** page where you can edit the team attributes.

**7. Select the **Shared** or **Private** option in the **Request Visibility** section.**

- **Shared** option allows for all requests to be access by all member, owners, and team admins in the team.
- **Private** option allows for the requests to be to be available to only the member who created the request, owner, and team admin in the team.

**8. Navigate to the **Users** tab.**

**9. Click the plus (+) icon to add a users to your team.**

**10. Select a user or users to be added.**

**11. Click **Add & save**.**

You have now added one or more users to your team.

**12. Click **Close**.**

You have successfully added users to your team. You can now add automations to the team that allows for members of your team to view and run the automations you assigned.

Related tasks

[Create a team and assign roles to team members](#) on page 3612

An Co-Pilot Manager is a team admin who can create new teams, add members to their team, and assign new team roles. Co-Pilot Admin can also configure a team but does not have a team role.

Assign teams to a process

You can follow this task to assign teams to a process.

**1. Navigate to **Manage > Processes**.**

The **Process Setup** page appears for you manage your process.

**2. Select your existing process from the list of available processes.**

For example, you select the **Ordered Items** process.

The **Edit process** page appears with details of your process.

3. Navigate to the **Teams** tab.
4. Click the plus (+) icon to assign the teams to your process.
5. Select your team or teams.
6. Click **Add & save**.
7. You can repeat these steps and add teams to another process of your choice.
8. Click **Close**.  
You have successfully added teams your process.  
You can now assign teams to your bot.

#### Related tasks

[Assign a team to a process](#) on page 3589

An Co-Pilot Admin can configure processes in the web interface and assign teams to a process for request creation. They access the web interface to view and manage processes in the **Process Setup** page.

#### Assign teams to a bot

You can follow this task to assign teams to a process.

1. Navigate to **Manage > Bots**.  
The **Bot Setup** page appears for you manage your bots.
2. Click **Add bot**.  
The **Add bot** page appears for you to add available bots.
3. Select a bot or bots.  
For example, you select the **Enterprise Account** bot.
4. Click **Add** to add bot.  
The bot that you selected will now be added to the bot list.
5. Select the bot that was added.  
The **Edit bot** page appears with details of your bot.
6. Navigate to the **Teams** tab.
7. Click the plus (+) icon to assign the teams to your bot.
8. Select the team that you have created.
9. Click **Add & save**.
10. Click **Close**.  
You have now successfully added teams your bot.

## Configure an iFrame widget in a web application

You must configure iFrame widget settings in a supported web application to properly enable the iFrame widget.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- Have access to Automation Co-Pilot for Business Users on the web interface.
- Have access to the web application of your choice that supports the iFrame technology. For this task, it would be the ServiceNow Service Portal and ServiceNow App Engine Studio.

1. Log in to the ServiceNow Service Portal.

2. Navigate to the **Widget Editor** page.  
This page has a few options for you to configure your widget, as well as a reference for you to view any recently updated widgets.
3. Click the **Create a new widget** option for creating new widgets.  
The **Add a Widget** window appears with details for you to specify your widget.
4. Specify the name of the widget in the **Widget Name** field.  
The ID of the widget will be automatically generated when you enter the name.  
For example, you can name your widget **AA Bots** for reference that this is an Automation Anywhere bots widget.
5. Click **Submit**.  
A new window with an HTML template or editor prompts you to enter the iFrame widget details, if applicable.

```
HTML Template
1 <div>
2 <iframe src='https://embed.aaiengineering.com/aari/#/embedded' name="aari-embedded-app" width="370px" height="650px"></iframe>
3 </div>
```

6. Paste your iFrame widget code to the **HTML** template.  
This is the iFrame widget code that you had generated in the Automation Co-Pilot (web).
7. Click **Save** or press **Ctrl + S** to save the current session.  
You have now added the iFrame widget code and saved your session. This is the code to embed your iFrame widget.
8. Access to the main page of the ServiceNow App Engine Studio.
9. Navigate to **All > Service Portal Configuration**
10. Click **Designer**.
11. Select an existing page to edit.  
You are now directed to a designer page.
12. Optional: Rearrange or remove your existing widgets on the page, to give space for the iFrame widget.
13. Drag the widget you had created (ex: **AA Bots**) from the **Widgets** tab and place it on the page.  
You have now successfully added the iFrame widget and should now be visible on the page.

---

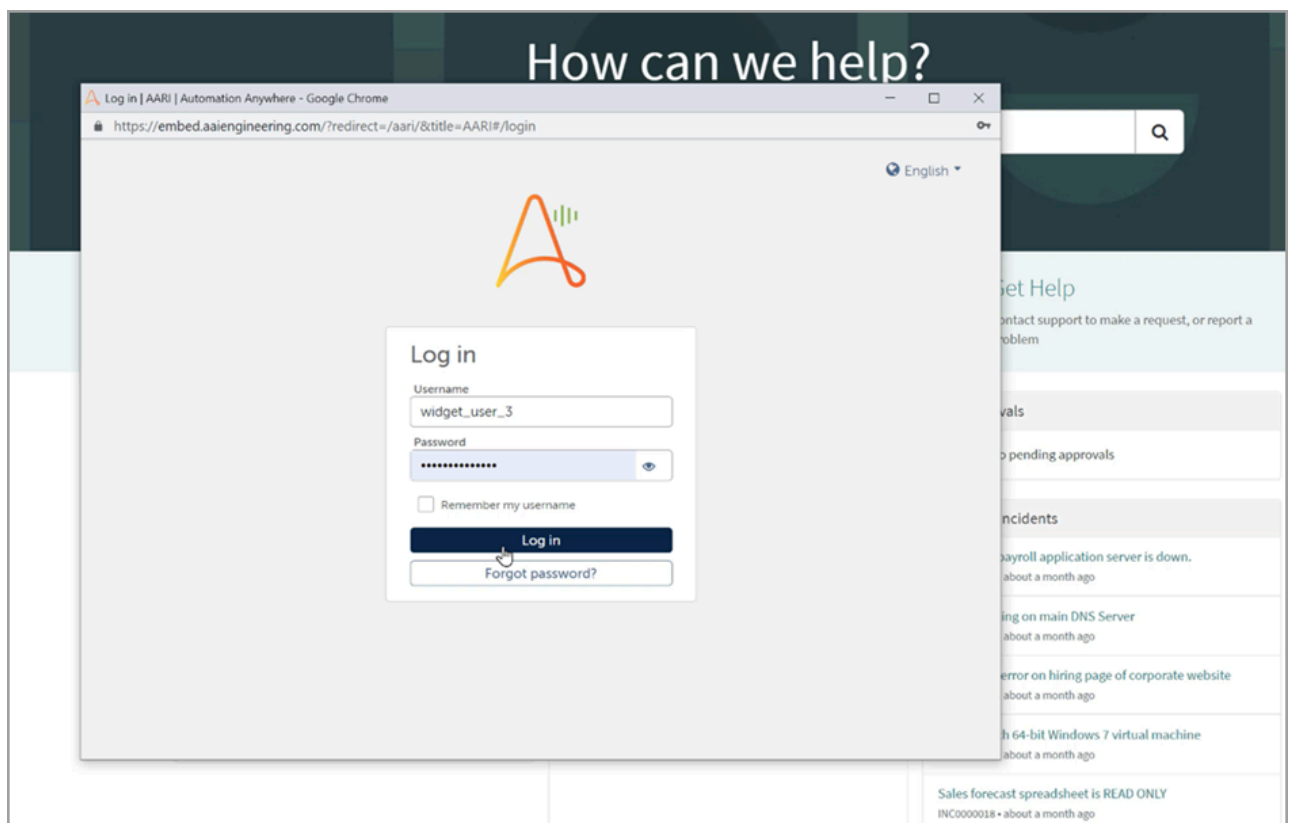

**Important:** The iFrame widget is visible but with no styling applied.

---

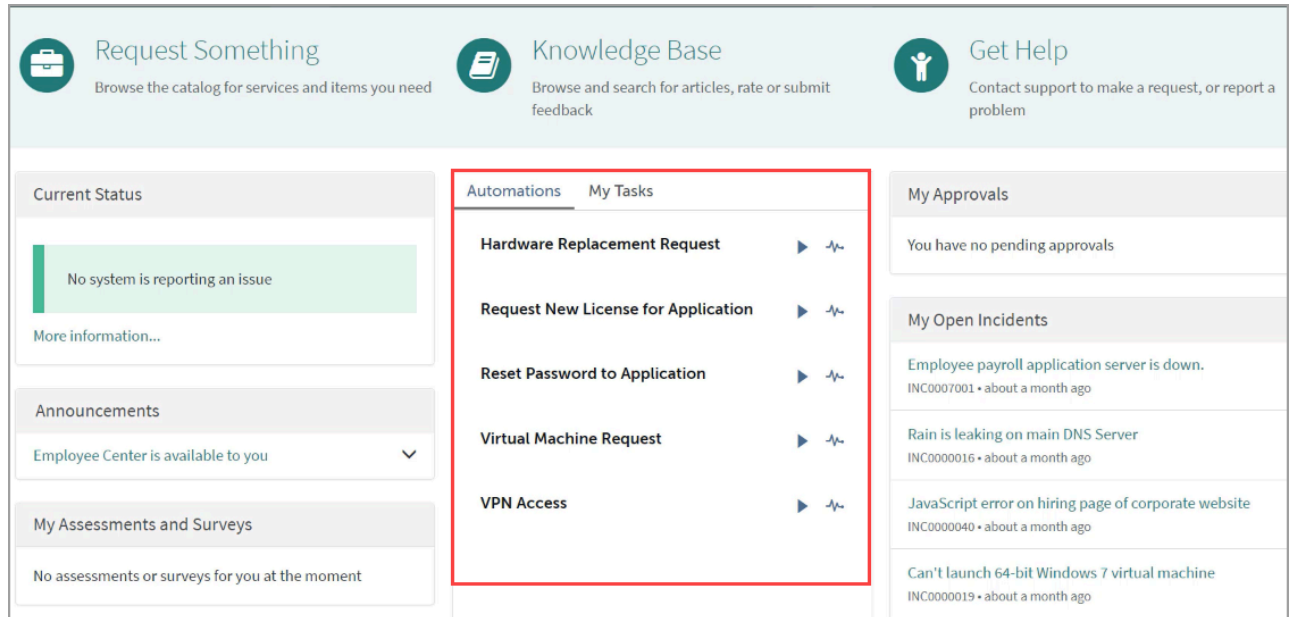

14. Navigate back to the ServiceNow Service Portal
15. Click **Widget Editor**.
16. Click on your widget (ex: **AA Bots**) from the **Recently Updated** list.  
You are now navigated to the window with an HTML template. The page should also include a CSS template.
17. Specify the widget (ex: **AA Bots**) details in the **CSS** template.  
This can be the border size, style, and color of the widget.

```
CSS - SCSS
1 iframe{
2 border-width: 1px;
3 border-style: solid;
4 border-color: #dee5e7;
5 border-radius: 0.4rem;
6 }
```

18. Navigate back to the designer page.  
The iFrame widget structure has now been updated.
19. Refresh the page.  
You will notice a small-sized window that appears and is connected to the Automation Co-Pilot (web) interface with a login page.

20. Log in with your user credentials to the iFrame widget in order to access your Automation Co-Pilot data.  
The iFrame widget will refresh and a list of automations and tasks from Automation Co-Pilot is now available. You can interact directly with your data.
21. View the iFrame widget.

You have now successfully embedded the iFrame widget with Automation Co-Pilot data to your web application.

For your next steps, you can deploy your automations using the iFrame widget, see [Deploy automations in web application](#) on page 3508.

## Deploy automations in web application

You can now automate your tasks using the iFrame widget.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- Have access to Automation Co-Pilot for Business Users on the web interface.
- Have access to the web application of your choice that supports the iFrame technology. For this task, it would be the ServiceNow Service Portal.

1. Log in to the ServiceNow Service Portal.
2. Navigate to the page(s) on which you had embedded the iFrame widget.  
This can be the **Designer** portal in the ServiceNow Service Portal where you manage your data and relevant information.
3. Log in with your user credentials to the iFrame widget in order to access your Automation Co-Pilot automations.

---

**Note:** When using Automation Co-Pilot (extensions), users should open their Google Chrome extension to login.

---

This is the user that is assigned to a team.

The iFrame widget will refresh with a list of available automations.

4. Optional: Fill your initial forms using URL parameters.  
You can modify your URL with specific query parameters, to provide more control over your specific data.

**Note:** Embedded Automation supports these parameters: Check Box, Date, Dropdown, Number, Radio Button, Time, Text Area, and Text Box. For more details, see [Construct URL parameters for supported elements](#) on page 3654.

5. Run your automations or complete pending tasks.

You can deploy automations using the iFrame widget in the ServiceNow Service Portal.

**Note:** You can run your bots with the Picture-in-Picture feature. You can enable this feature when you configured your bot in Automation Co-Pilot to run in a virtual window. See [Configure a bot](#) on page 3598.

Related reference

[Construct URL parameters for supported elements](#) on page 3654

You can construct URL parameters for the following supported elements: **Date**, **Number**, **Text Box**, and **Time**.

## Automation Co-Pilot for Business Users supported features

There are more ways you can use Automation Co-Pilot.

### Overview

Automation Co-Pilot using embedded widget enabled you to setup your embedded iFrame widget and run your automations, while maintaining the consistent Automation Co-Pilot experience, in your favorite web applications such as ServiceNow, Salesforce, and Genesys.

There are now more opportunities for you to get the most out of the Automation Co-Pilot experience, with additional enhancements and features.

### Automation Co-Pilot in Microsoft Teams

Automation Co-Pilot allows you to bring the Automation Anywhere platform experience of running bots directly to Microsoft Teams. This allows for your business users to automate tasks without leaving their favorite collaboration applications. This can be expanded to even more automation opportunities and improve the existing routine tasks and processes.

#### Enhancements

- Automation Co-Pilot can be accessed by users at anytime from their Teams apps menu in the sidebar tab. The Automation Co-Pilot app can be pinned by users to show up next to their **Activity** and **Calendar** tabs.
- When Automation Co-Pilot is deployed in Teams, this will become a web application that is available for users, as a tab application experience.
- The automation experience will always be in Teams, without needing to navigate to or use multiple applications.
- All details and statuses of your bots, tasks, and automations are in Teams.
- The automation experience in Teams provides access to all Automation Co-Pilot functionalities, such as running your automations, complete tasks from your workflows, and being alerted by proactive notifications on your important events.

#### Benefits

- Anyone who uses Teams can use Automation Co-Pilot.
- For any employee who uses Teams for everyday tasks, they would require access to services, such as human resources, IT, or

even customer support. With a simple bot run:

- You can create a new IT ticket to contact your IT admins quicker, without the need to access Okta or other applications.
- You can contact HR directly and the bot establishes connection to your HR helpdesk.
- You might need to create a support ticket to resolve a customer issue, now you can do that directly in Teams.

See the following video for an overview of Automation Co-Pilot in Microsoft Teams:

For reference of setup process, see [Integrate Automation Co-Pilot with Microsoft Teams](#) on page 3559.

## Smart embedded forms and dynamic data mapping

As a developer, you can design smart forms to embed in a widget of a host web application and run a script to populate data dynamically. This saves you time to avoid repetitive data re-entry while you run your automations.

To learn more, see [Smart embedded forms and dynamic data mapping](#) on page 3513 and [Map data from HTML to form](#) on page 3515.

## Enhanced automation activities

In the embedded widget, you will find that when you run your automations (attended bots), the interface has been improved to show you better automation activities. You must have the **Manage my activity** permission as a prerequisite to use the bot controls.

### Enhancements

- When you run your attended automations, its progress and execution status, as well as controls to pause, start (resume), and stop, are located in a progress page inside the Embedded Automation application.
- You can easily switch between the **Automation** tab to execute additional automations and navigate back to the progress view, to monitor the running automations
- You can view more details of your bots such as the error message, when your bots had failed, to give you a better insight into your bot status.

### Benefits

- This gives you an ease of mind when you run your automations, as all the relevant

controls and details of your bots are located in one place.

- The user interface make it simpler for you to run your automations.

For reference of the user interface enhancements, see [Automation Co-Pilot Desktop Assistant automation activities](#) on page 3564.

## Platform alerts and notifications

Notifications from the Automation Workspace can work in a widget to notify users of specific task completions and bot status.

You will be notified with real-time message alerts based on recent automation events that occurred in Automation Co-Pilot. Notifications are alerts that notifies and updates you based on statuses of your automations. When you view notifications in your embedded widget, you will only see relevant updates for your automations.

### Enhancements

- The **Notifications** tab in your widget will alert you of your automation outcomes such as the successful or failed status of your bots. You no longer need to check each individual bot to view its current status.
- When you are assigned a task, the **New task assigned** message will notify you, and you can click to be redirected to the newly assigned task and confirm your details.
- You can filter your list of notifications with the **Attention needed** toggle to identify high-priority tasks that requires your attention

### Benefits

As you run your automations in your embedded widget, the notification system helps enhance your automation experience as you are updated in real time for any successful or failed bots and newly assigned tasks.

For reference, see [Notifications](#) on page 2342.

## Tags

These tag improvements provide a more accurate search and save you time when searching for available tags. You can select and manage up to 500 tags at a time in the tag selector, when you configure your process. The tag selector can display up to 500 tags at a time. You can fully or partially type keywords that makes up the tag and use the search all function for the tag selector to view the database for the tag.

---

**Note:** A minimum of two characters are required to use the search all function.

---

For reference of adding tags, see [Configure a process](#) on page 3599.

## URL Parameters

These process level URL improvements make it easier for you to pass URL data to your requests:

- You can pass custom data from applications to requests.
- Supported data types include: dates, time, number, text box, check box, radio button, text area, and drop-down.
- Hidden variable types in a form are supported to receive URL data.

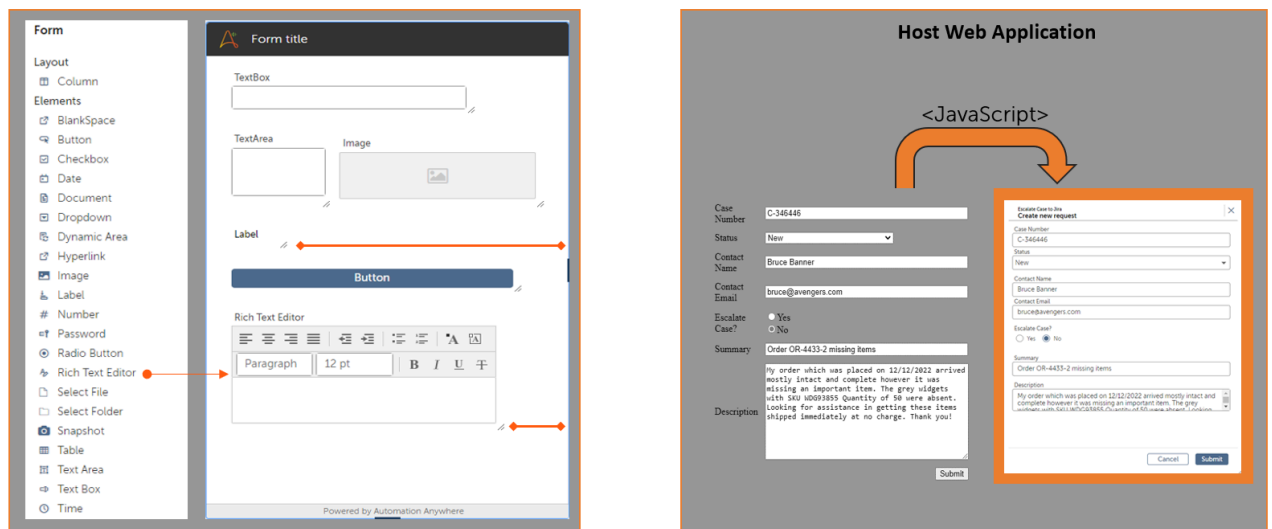

See [Construct URL parameters for supported elements](#) on page 3654.

You can use supported languages from Control Room to change the localized language for your embedded widget or web page. You use the XX\_XX format to structure the language format, such as for English (**en\_US**) and French (**fr\_FR**), that you can add to the end of a URL such as **www.sampleaddress.com/en\_US** or **www.sampleaddress.com/fr\_FR**. This language format is based on the JavaScript language tags.

## Smart embedded forms and dynamic data mapping

As a developer, you can design smart forms to embed in a widget of a host web application where you can run a script to populate data dynamically.

This enhanced form builder experience enables you to quickly design smart forms with more concise controls. The smart forms are embedded as a widget (using iFrame widgets) in a web application where you can populate data dynamically and run your automations.

See the following video for an overview of smart forms and dynamic data mapping:

## What a developer can do

Design smart forms with the enhanced form builder:

- Drag form elements directly to the form builder to add new elements.
- Resize individual form elements to a precise length.
- Design forms to use in an embedded widget.

Populate data dynamically in an embedded widget:

- Utilize a Javascript for a host web application to read and use as inputs in processes. [Map host data to Automation Co-Pilot forms](#) on page 3515
- Run a script (postMessage API JavaScript) to populate the data of the process based on the process ID, element ID, and its value.

## Benefits

Smart embedded forms provides the following benefits:

- Dragging and resizing form elements are a seamless and consistent experience.
- Developers can quickly add new elements to their forms.
- Forms created in the form builder is rendered the same way in an embedded widget.
- Form builder supports up to 25 form elements.
- Behaviors of the older forms are maintained.

Dynamic data mapping provides the following benefits:

- Data is populated dynamically to avoid repetitive data re-entry.
- Only specified data are dynamically populated, which provides a secure way to run automations.

Related concepts

[Embed automations in your application using Automation Co-Pilot](#) on page 3496

Using the Automation Co-Pilot interface, you can embed automations into any web application or cloud environment using an intuitive widget or browser extension.

[Automation Co-Pilot using embedded widget overview](#) on page 3499

You can use a widget that embeds automation built on the Automation 360 platform that can be applied natively on any supported web application.

#### Map host data to Automation Co-Pilot forms

Configure your widget settings for a host application to populate data in the initial form of your iFrame widget. Eliminate repetitive data entry and ensure control over data during automation runtime.

As process automation typically starts with initial forms, you can streamline form completion by passing data from the host application (such as contact or account records). By configuring the iFrame widget to consume data from the host application, users can focus on verifying and engaging the customer to enhance the business experience.

For the host application to pass data, develop the iFrame widget with attributes that map values from the host and can be recognized by the iFrame as your designated input fields. This development will allow data to transfer from a page in your host application and command your iFrame widget to call the mapped data to the process automation upon launch. Most applications have a developer space for necessary code to be added to the iFrame widget. You simply need to identify what developments need to be made for your business needs.

#### The iFrame widget in host applications

When leveraging Automation Co-Pilot capabilities, like passing data into forms, it is important to consider the setup and development of web components in your host application, like the iFrame widget. Development parameters vary across applications when integrating new components like the Automation Co-Pilot widget. Familiarize yourself with your host application parameters when developing the iFrame widget to customize the components to your specific requirements.

#### Example synopsis

The following is a generic workflow to demonstrate using sample code to enable the transfer of data from host to Automation Co-Pilot (iFrame widget). Multiple example codes are available that map existing values from the host page to the Automation Co-Pilot process initial form elements.

1. Navigate to the developer environment of the host application.
2. Ensure you have a preview or testing panel available for debugging.
3. Use one of the sample code to model the code you will use for your business requirement.
  - a) [Map data from HTML to form](#) on page 3515
  - b) [Map data from Salesforce to form](#) on page 3520
  - c) [Map data from ServiceNow to form](#) on page 3518
4. Ensure the parameter `referrerpolicy="origin"` is in your HTML template to avoid cross origin issues.
5. **Save** your widget.

#### Map data from HTML to form

Configure your widget from a host application and populate data in the initial form of your iFrame widget. This ensures that you have control over your data without the need for repetitive data entry.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- Have access to the Automation Co-Pilot for Business Users on the web interface.
- Have access to the host web application of your choice that supports the iFrame technology.

- You already set up the iFrame widget. For more details, see [Configure an iFrame widget in a web application](#) on page 3505.
- Log in to the host web application.  
This is your target application with the iFrame widget.
  - Navigate to widget settings page or source code of your host web application (where you added the iFrame widget code).  
This page contains the embedded code for your widget source.
  - Enter the host data and send data in the script.

---

**Important:** To map data, you must load a process on the host web application with a process ID, element ID, and values of the element ID which correlate with each another.

---

Example structure of host data:

```
hostData =
{
 process ID
 {
 elementID1: value1
 elementID2: value2
 elementID3: value3
 }
}
sendDataToEmbeddedApp = (processID) =>
{
 iframeElement = document.querySelector();
 iframeElement.contentWindow.postMessage({data:
 hostData[processID]},
 iframeElement.getAttribute());
}
```

---

**Note:** The element ID uses form element data types, such as: Check Box, Number, Radio Button, and Text Box.

---

An additional sample structure:

```
<script>
 const hostData = {
 '34': {
 'Number0': '70',
 'Number1': '71',
 'Number2': '72',
 },
 '30': {
 'TextBox0': 'Abhijeet',
 'TextBox1': 'Mukherjee',
 'TextBox2': 'Important One!!',
 },
 },
}
```

```

'45': {
 'CheckBoxGroup0': 'key:option1,key:CheckBox2',
 'CheckBoxGroup1': 'key:CheckBox1',
 'RadioButtonGroup0': 'Radio2',
 'TextArea0': 'Hello..',
 'Dropdown0': 'Item3'
},
'38': {
 'Number0': '45',
 'RadioButtonGroup0': 'Radio1',
 'CheckBoxGroup0': 'key:CheckBox'
},
'48': {
 'RadioButtonGroup0': 'Radio2',
}
}
const sendDataToEmbeddedApp = (processId) => {
 const iframeElement = document.querySelector('[name="aari-embedded-app"]');
 iframeElement.contentWindow.postMessage({data: hostData[processId]}, iframeElement.getAttribute('src'));
}

```

In this example: 45 is the process ID, Number0 is the element ID, and 45 is the value of the element ID.

4. **Save** your session.

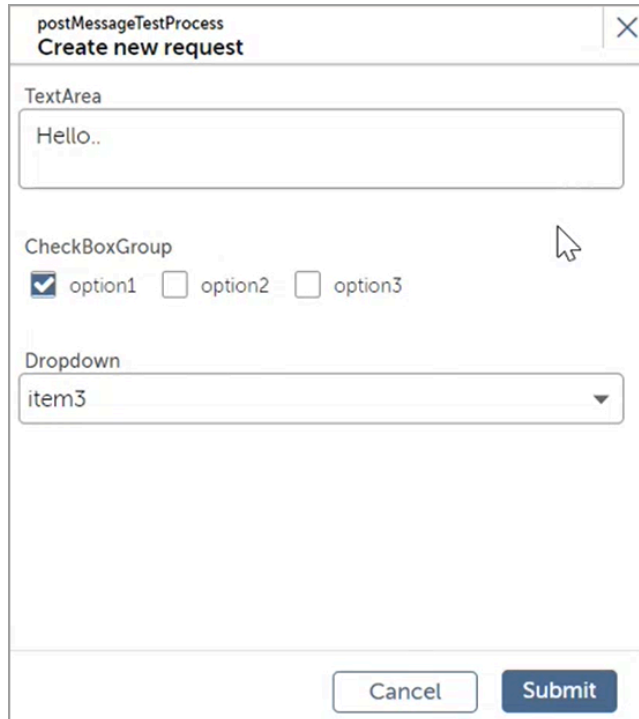

You have now configured the host data, and mapped the data to your processes.

5. Navigate to the iFrame widget.

The iFrame widget should show a list of automations.

Automations	My Tasks
<b>post123-process</b> No activity	▶ 
<b>postMessageTestProcess</b> No activity	▶ 
<b>Various Number</b> No activity	▶ 

6. Click a process to open an initial form with data already mapped and filled in.

The screenshot shows a window titled "postMessageTestProcess" with a subtitle "Create new request". Inside the window, there is a "TextArea" containing the text "Hello..". Below that is a "CheckBoxGroup" with three options: "option1" (checked), "option2", and "option3". Underneath is a "Dropdown" menu with "item3" selected. At the bottom of the window are two buttons: "Cancel" and "Submit".

The initial form shows the mapped data.

7. Click **Submit** to run your automations.

Map data from ServiceNow to form

The following example can be used to model code when developing the iFrame widget to transfer and consume host data in ServiceNow.

## Before you begin

The following example uses ServiceNow as the host application to demonstrate using HTML and JavaScript to enable the transfer of data from host to Automation Co-Pilot (iFrame widget). The referenced code maps existing values from the host page (ServiceNow) to the Automation Co-Pilot process initial form elements. The code in this example is generic and can be used in similar applications to model structure for edits made to the elements of your specific business needs. Development and setup of the iFrame widget is specific to ServiceNow parameters.

Ensure you have completed the following.

- Provided a system-created AAE\_Robotic\_Interface User role for the end user.
- Have access to the Automation Co-Pilot for Business Users on the web interface.
- Have access to the host web application of your choice that supports the iFrame technology.
- You already set up the iFrame widget. For more details, see [Configure an iFrame widget in a web application](#).

## Procedure

1. From ServiceNow, click **Start Building**. This will redirect you to your corresponding developer account. [ServiceNow developer account](#)
2. Navigate through the following: **All > Service Portal > Service Portal Configuration > Service Portal Configuration > Widget Editor > Create a New Widget**.
3. Enable **Create test page** while creating the widget to view the HTML template and client script during development.
4. Click **Enable Preview** and click the **eye** icon to show the preview tab for testing the code changes.
5. Use the following sample to model the code you will use for your business requirement.

---

**Note:** The code in this example is generic and can be used in similar applications as a model. Development and setup of the iFrame widget is specific to ServiceNow parameters. See : [Map data from HTML to form](#) on page 3515.

---

- a) Add the corresponding code to Client script.
  - b) Add the Automation Co-Pilot iFrame element to the HTML template.
  - c) Ensure the parameter `referrerpolicy="origin"` is in your HTML template to avoid cross origin issues.
6. **Save** your widget. The preview will load.
  7. Review the preview and make necessary edits to the HTML template and client script.
  8. **Save** your changes.

## Sample of HTML

```
<div>
<!-- your widget template -->
<label for="fname">First name:</label>
<input type="text" id="fname" name="fname" value="sikha">

<label for="lname">Last name:</label>
<input type="text" id="lname" name="lname" value="poyyil">

<iframe
src='https://aa-pet-us-17.my.automationanywhere.digital/aari/#/
embedded?tags=%5B%5D'
name="aari-embedded-app"
width="100%"
height="500px"
style="border: none;"
referrerpolicy="origin">
</iframe>
</div>
```

## Sample of Client script

```

api.controller=function() {
 /* widget controller */
 var c = this;
 console.log(c)
 console.log(window)
 var getLatestData = function() {
 return {
 167 : {
 TextBox0: document.getElementById("fname").value,
 TextBox1: document.getElementById("lname").value
 }
 };
 }
 console.log("Data" + JSON.stringify(getLatestData()));
 console.log(event)
 setTimeout(function() {
 window.addEventListener('message', function(event) {
 if(event.data.aariDataRequest === 'aari-data-request') {
 var mappedHostData = getLatestData();
 var id = event.data.processId || event.data.botId;
 console.log("Event data: " + JSON.stringify(event.data));
 console.log("Data passed: " + JSON.stringify(mappedHostData[id]));
 var iframeElement = document.getElementsByName("aari-embedded-
app")[0];
 iframeElement.contentWindow.postMessage({data: mappedHostData[id]
 },
 iframeElement.getAttribute("src"));
 }
 });
 }, 100);
};

```

Map data from Salesforce to form

This example can be used to model code when developing the iFrame widget to transfer and consume host data from Salesforce.

### Attention:

You must add the Control Room in the content service provider Trusted URL page or data will not be passed from host to Automation Co-Pilot and will instead throw errors.

[Help And Training Community](#)

## Overview

The following example leverages Salesforce as the host application to demonstrate using HTML and JavaScript to enable the transfer of data from host (Salesforce) to an Automation Co-Pilot iFrame widget. Development and setup of the iFrame widget is specific to Salesforce parameters. The sample code maps existing values from the host page to the initial form elements of an automated process, operating in Automation Co-Pilot. The code in this example is generic and can be used in similar applications to model structure. A developer should edit the elements of the code to match your initial form elements. This will map data from Salesforce to your widget,

and result in pre-populated fields during run time of the automation that include the data of your specific business needs.

Ensure you have completed the following.

- Use the AAE\_Robotic\_Administrator permissions to set up the Automation Co-Pilot iFrame widget and have the embed code readily available. See, [Configure an iFrame widget in a web application](#).
- Have developer access to your Salesforce web application that supports the iFrame technology.
- Have the documented elements and attributes from the process automation that will surface in the iFrame.

Specifically the Process ID and the initial form input field IDs.

- The Process ID: The user with AAE\_Robotic\_Administrator permissions can view by selecting a process from your Process list. Note the numerical value in the URL (`https://URL>/aari#/processes/97`).
- Input field ID: Fields from the initial form of the process in the form designer. You will use the Element ID fields for all of the input fields that should be mapped to Salesforce data.

Develop a Lightning web component for Salesforce

Develop a Lightning web component (LWC) in Salesforce to receive the embed code for your Automation Co-Pilot iFrame widget. LWC is a stack of modern lightweight frameworks created on the latest web standards, utilizing HTML and Javascript. Developing and deploying an LWC will require Visual Studio Code (VSCode) along with the SFDX plugin.

- The following Trailhead exercise can guide you to set up your VSCode environment, if none is available to you already. [Set up Visual Studio dev environment](#)
- This Trailhead exercise can guide you through configurations for Salesforce Extensions. All steps are not required. Primarily, steps for Creating a Project and Authenticating your Instance of Salesforce assist with getting started. [Start coding with Visual Studio](#)

You are ready to develop your LWC when you have installed the necessary Salesforce Extensions for VSCode and configured them for your Salesforce instance.

## Procedure

The following steps detail developing VSCode that is needed for your LWC project. Use the corresponding sample code provided, and edit the attributes with your details to customize your code for your business needs.

1. Create a new HTML file and insert the HTML sample for this section.
  - a) Enter the **Name** and **Description** for the component (ex. Case\_Record\_CoPilot).
  - b) Between the provided `<template>` tags, add your custom iFrame snippet that is generated through Automation Anywhere (embed code). See step 6 for the HTML sample, that also contains a lightning card tag to display a title on the component.
  - c) Replace `YOUR CONTROL ROOM URL` with a value that points to your Control Room.
  - d) Ensure the parameter `referrerpolicy="origin"` is in your HTML template to avoid cross origin issues.

2. **Save** your widget.
3. Identify the file for your Javascript and insert the Javascript sample. This file represents your controller.
  - a) Enter the name (ex. Case-Record-CoPilot.js).
  - b) Edit the `Case field names` appropriately for the data you need transferred. Use a comma-separated list of API names that match the fields in Salesforce that data is mapped from.
  - c) Replace `YOUR CONTROL ROOM URL` with the domain of your Control Room.
  - d) Replace the `Process ID` with the ID of the Automation Co-Pilot process, found in the URL of the process.
  - e) Ensure you replace `TextBox0` and `Dropdown3` with element IDs that match your initial form elements in Automation Co-Pilot. Add additional fields as required.
  - f) The data that will be mapped to the form field is represented by `this.caseRec.fields.Status.value`.
    - The `caseRec` is an object that has a number of field values that are accessed through dot notation.
    - The `field` name you want to map follows `fields` and
    - The `value` ensures the data value is what is retrieved and mapped.
4. Once mapping is complete, right-click your JS file.
5. From the menu, select **SFDX: Deploy Source to Org**. This generates your new component and make it available in your Salesforce instance.
6. Lastly, open the **Page Layout Editor** from the Case record, or the component you are mapping, and drag your LWC on to the page layout.
7. **Save** your changes.
8. Test your process. Data should be mapped to the inputs. If you do not see any data, there might be an error in the code. Use the Chrome Developer Tools to inspect the Console logs to locate the issue.

## Sample of HTML template

Use the sample from the following sections to model the code you will use for your business requirement.

```
<template>
 <lightning-card>
 <h3 slot="title">
 Automation Co-Pilot
 </h3>
 <iframe src='https://aa-pmorgdemo.cloud.automationanywhere.digital/
aari/#/embedded?tags=%5B%22Insurance%22%5D'
name="aari-embedded-app"
id="aari-embedded-app"
width="100%"
height="450px">
```

```

 referrerpolicy="origin"
 sandbox="allow-same-origin allow-scripts allow-forms allow-popups
allow-modals"
 style="border: none;"></iframe>
</lightning-card>
</template>

```

The sample code will connect the iFrame to the Salesforce record data using the PostMessage method (wire service). Specify the list of fields in your form to pull in the FIELD constant and then provide that to getRecord. The wire service will populate the data which is then mapped into variables and added to the postMessage payload. The following is one example that you can modify for your personal business needs.

## Sample of Javascript

```

import { LightningElement, api, wire } from 'lwc';
import { getRecord } from 'lightning/uiRecordApi';
const FIELDS = ['Policy_Holder__c.First_Name__c',
 'Policy_Holder__c.Last_Name__c', 'Policy_Holder__c.Contact_Phone__c',
 'Policy_Holder__c.Contact_Email__c',
 'Policy_Holder__c.Policy_Holder_ID__c',
 'Policy_Holder__c.Street__c', 'Policy_Holder__c.City__c',
 'Policy_Holder__c.State__c', 'Policy_Holder__c.ZIPPostalCode__c', 'Policy_Holder__c.Co
const crorigin = https://aa-pmorgdemo.cloud.automationanywhere.digital;

export default class PolicyHolderLWC extends LightningElement {

 @api recordId;
 phCustomer;
 firstName;
 lastName;
 phone;
 email;
 phID;
 street;
 city;
 state;
 country;
 zip;

 @wire(getRecord, { recordId: '$recordId', fields: FIELDS })
 policyholderdata({data, error}){
 console.log(' data --> ' + JSON.stringify(data) + ' error --> ' +
JSON.stringify(error))
 if(data){
 this.phCustomer = data;
 this.firstName = this.phCustomer.fields.First_Name__c.value;
 this.lastName = this.phCustomer.fields.Last_Name__c.value;
 this.phone = this.phCustomer.fields.Contact_Phone__c.value;
 this.email = this.phCustomer.fields.Contact_Email__c.value;
 this.phID = this.phCustomer.fields.Policy_Holder_ID__c.value;
 this.street = this.phCustomer.fields.Street__c.value;
 this.city = this.phCustomer.fields.City__c.value;
 this.state = this.phCustomer.fields.State__c.value;
 this.zip = this.phCustomer.fields.ZIPPostalCode__c.value;
 this.country = this.phCustomer.fields.Country__c.value;

```

```

 } else if(error){
 this.error = error;
 }
}

/*****Called on LOAD of LWC *****/
connectedCallback() {
 // Binding EventListener here when Data received from iframe
 console.log("Adding Event Listener");
 window.addEventListener("message", this.handleResponse.bind(this));
}
handleResponse(event) {
 console.log("Checking Event Origin");
 if ((event.origin || event.originalEvent.origin) !== crorigin) {
 // Not the expected origin: Reject the message!
 console.log("Not the expected origin; Reject the message!");
 return;
 }
 else{
 this.handleFiretoCoPilot(event);
 }
}
handleFiretoCoPilot(event) {
 console.log("Sending postmessage data");
 if (event.data.aariDataRequest === "aari-data-request")
 {
 if (event.data.processId === "9")
 {
 var postData = {"data": {
 "TextBox0": this.firstName,
 "TextBox1": this.lastName,
 "TextBox2": this.phone,
 "TextBox3": this.email,
 "TextBox4": this.phID,
 "TextBox5": this.street,
 "TextBox7": this.city,
 "TextBox8": this.state,
 "TextBox9": this.zip,
 "Dropdown2": this.country
 }}
 console.log(postData);
 //Firing an event to send data to iframe

 this.template.querySelector("iframe").contentWindow.postMessage(postData,
 crorigin);
 }
 }
}
}
}

```

#### Map host data using bot inputs

In a host application, you can pass supported input variable data to your attended bots in the iFrame widget.

Ensure that you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- You have access to Automation Co-Pilot.

- You have already set up your host data in a web application that supports the iFrame technology, such as Salesforce or ServiceNow, see [Map data from HTML to form](#) on page 3515.
- You have created a bot that contains variables with an input type, and checked in. Therefore this bot is available for you to access in the iFrame widget.

**Note:** **String**, **Number**, **Boolean**, and **DateTime** variable types are supported to pass data to an attended bot. In addition, there are new IDs for **event.processId** and **event.botId**, where **pID** is for process and **botID** is for bots.

Sample of a bot with input variables:

This form uses the Set action from the Interactive Forms package to set input variable values in each form fields. See [Interactive forms package](#) on page 2918.

1. Log in to Salesforce (host application).
2. Configure your code in the Salesforce console.  
This code can be found in the code controller option.

```

Copilot Copilot.cmp CopilotController.js
22 Date1: component.get("v.accountRecord")["CreatedDate"],
23 TextArea0: component.get("v.accountRecord")["BillingStreet"],
24 Password0: component.get("v.accountRecord")["Sic"]
25 },
26 102 : {
27 account_name: component.get("v.accountRecord")["Name"],
28 type: component.get("v.accountRecord")["Type"],
29 industry: component.get("v.accountRecord")["Industry"],
30 employee: component.get("v.accountRecord")["NumberOfEmployees"],
31 phone: component.get("v.accountRecord")["Phone"],
32 account_number: component.get("v.accountRecord")["AccountNumber"],
33 Created_at: component.get("v.accountRecord")["CreatedDate"],
34 created_date: component.get("v.accountRecord")["CreatedDate"],
35 billing_address: component.get("v.accountRecord")["BillingStreet"],
36 boolVar: component.get("v.accountRecord")["Active__c"] == 'Yes',
37 sic_code: component.get("v.accountRecord")["Sic"]
38 },
39 101 : {
40 var1: component.get("v.accountRecord")["Name"],
41 var2: component.get("v.accountRecord")["Name"],
42 var3: component.get("v.accountRecord")["Name"],
43 var4: component.get("v.accountRecord")["Name"],
44 var5: component.get("v.accountRecord")["Name"],

```

Sample of a full code that includes host data:

```

({
 handleRecordChanged : function(component, event, helper) {
 console.log("Hi from controller");
 if(event.getParams().changeType === 'LOADED') {
 const userLang = $A.get('$Locale.language');
 console.log('User language setting: ' + userLang);
 console.log("Account record: " + JSON.stringify(component.get("v.accountRecord")));
 } else {
 console.log('Not loaded')
 }

 const mappedHostData = {
 102 : {
 account_name: component.get("v.accountRecord")["Name"],
 type: component.get("v.accountRecord")["Type"],
 industry: component.get("v.accountRecord")["Industry"],
 employee: component.get("v.accountRecord")["NumberOfEmployees"],
 phone: component.get("v.accountRecord")["Phone"],
 account_number: component.get("v.accountRecord")["AccountNumber"],
 Created_at: component.get("v.accountRecord")["CreatedDate"],
 created_date: component.get("v.accountRecord")["CreatedDate"],
 billing_address: component.get("v.accountRecord")["BillingStreet"],
 boolVar: component.get("v.accountRecord")["Active__c"] == 'Yes',
 sic_code: component.get("v.accountRecord")["Sic"]
 },
 };
 console.log("Data" + JSON.stringify(mappedHostData));
 console.log(event)
 setTimeout(function() {
 window.addEventListener('message', function(event) {
 if(event.data.aariDataRequest === 'aari-data-request') {
 const id = event.data.processId || event.data.botId;
 console.log("Event data: " + JSON.stringify(event.data));
 console.log("Data passed: " + JSON.stringify(mappedHostData[id]));
 const iframeElement = component.find("aari-embedded-app").getElement();
 iframeElement.contentWindow.postMessage({data: mappedHostData[id]}, iframeElement.getAttribute("src"));
 }
 });
 }, 100);
 }
})

```

**Note:** This code shows an number (ex: **102**) that matches with the **Bot ID** from the Control Room. You can view the Bot ID when you access your public bots in the **public repository**. The ID will be shown in the URL similar to the following:

<https://.../bots/repository/public/taskbots/102/view>

3. View the bot in the embedded widget.

In this case, **Account\_Details\_Validation** bot is available for you to select.

4. Deploy your bot.

The bot will begin the automation process.

Simultaneously, the data fields in the form will populate based on the input variables.

5. Close the automation session.  
You have successfully ran a bot with input variables.

## Automation Co-Pilot using Chrome extension

Use Automation Co-Pilot using Chrome extension to embed an interface for the Automation Anywhere platform in your Google Chrome browser.

### Benefits and capabilities of Automation Co-Pilot (extensions)

Broader access to automations brought to your familiar environment

With Automation Co-Pilot using Chrome extension, you can develop custom actions and workflows. The OAuth 2.0 connection offers a seamless connection from the Automation Anywhere Control Room to your web browser. This connection extends automated features into your preferred environment through embedded web components. Develop these components in any web scenario through the use of Automation Co-Pilot using Chrome extension. Users with these components can launch automated processes and bots directly from existing environments, where most time is spent. With this access, business data can be retrieved and processed without ever changing applications.

Secure connection with admin control for organizing team and user workloads

Automation Co-Pilot using Chrome extension is fully integrated with Automation Anywhere for security and authorization of content. This means that the administrator has complete control over which content is made public through Automation Co-Pilot by assigning Automation Co-Pilot using Chrome extension

content to teams. Content assigned to a team will become visible to the members of the team when the target pages are opened. With this control and organization, administrators can develop specialized components for specific team functions by empowering users with streamlined automation.

Requisites:

- OAuth 2.0 Automation Workspace configuration: using secure credentials, configure a security token to validate your identity as a licensed user. Servers will recognize this token and approve your access, eliminating the need to log in multiple times to your accounts. [Use AuthConfig App to enable OAuth2 services](#) on page 1962
- Automation 360 v.26 or later
- Google Chrome browser
- Automation Co-Pilot licenses: Automation Co-Pilot using Chrome extension uses teams and members to securely authorize and deploy content to the right users.
- Automation Co-Pilot fluency: administrators should be familiar with the environment in order to identify key elements used to map custom content to teams.

Additional considerations:

- Roles: Ensure that you have the proper role and permissions for your activity. [Users and team roles for Automation Co-Pilot](#) on page 3609
- Ensure that your browser is not blocking Automation Co-Pilot using Chrome extension access and windows.

## Process flow

The end-to-end workflow is illustrated in the following diagram.

1. To begin accessing features, set up and connect your Control Room to Automation Co-Pilot using Chrome extension. [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3530
2. Develop and embed content in your preferred application for Automation Co-Pilot using Chrome extension. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3534
3. Administer your developed content to teams for users to access through Automation Co-Pilot using Chrome extension. [Provisioning Automation Co-Pilot using Chrome extension to users](#) on page 3541

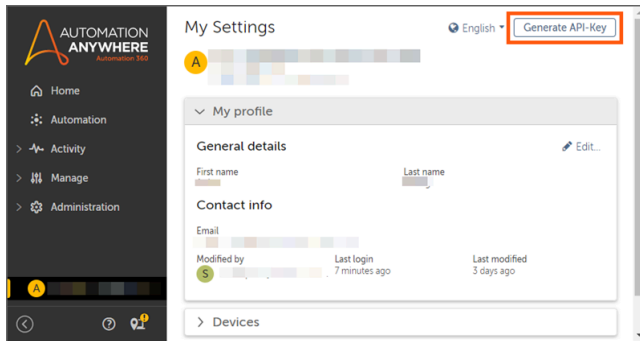

4. Get started using the embedded content through Automation Co-Pilot using Chrome extension. [Deploy automations in web application](#) on page 3508

### Set up and connect Automation Co-Pilot using Chrome extension

Set up and connect to Automation Co-Pilot using Chrome extension.

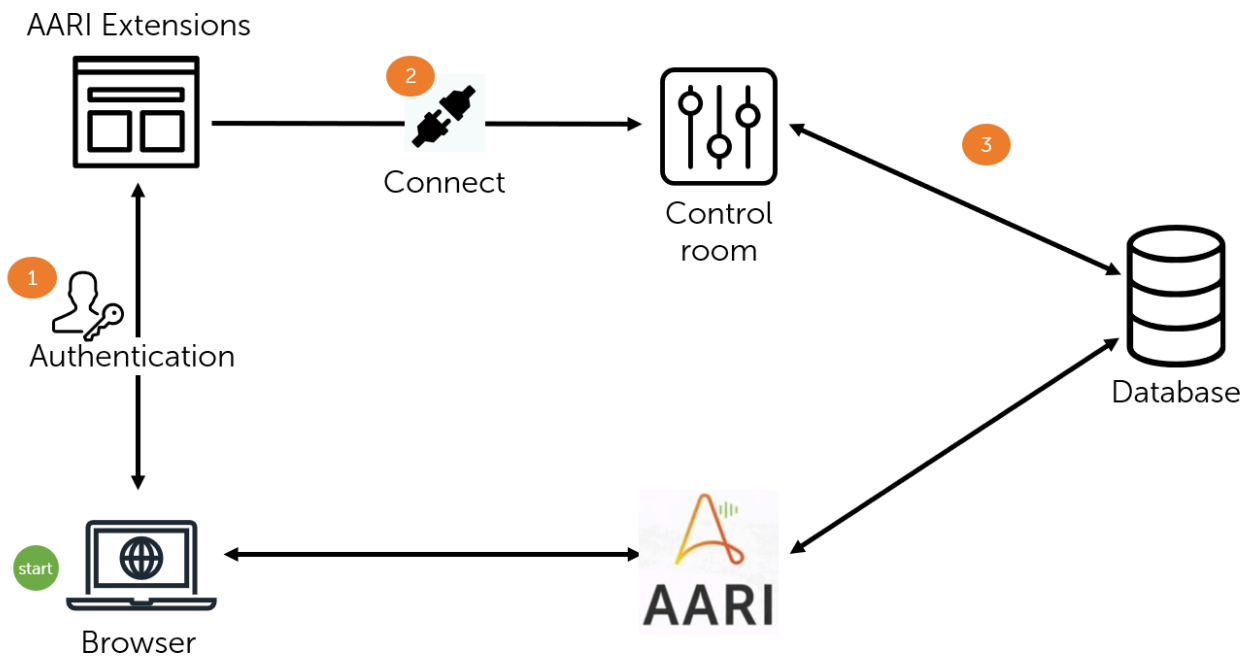

- Ensure that you meet all the prerequisites. [Automation Co-Pilot using Chrome extension](#) on page 3528
- Have your Service Account Token accessible to enter in setup. [Create a service account for Automation Co-Pilot using Chrome extension](#) on page 3533

**Note:** This token is an API key generated in the Control Room, from **Settings**.

**Note:** Ensure third party partitioning is disabled in your Google Chrome settings. [Automation Co-Pilot for Business Users FAQ](#) on page 3561

Automation Co-Pilot using Chrome extension requires setup and connection of your system. Perform the following steps to complete the setup illustrated in the following diagram.

The following video shows the setup process.

1. To open the extensions setup in a new tab with context about the AAI tenant click **Connect Accounts**.

---

**Note:** Your Control Room URL and Partner ID will be automatically filled as part of the setup.

---

2. Select your Google or Microsoft account to begin the process of deploying and connecting Automation Co-Pilot using Chrome extension to your Control Room.
3. Enter a **Name** for the new Automation Co-Pilot using Chrome extension Tenant that will be connected to your Control Room, for example, Production.
4. In the Control Room settings:
  - a) Enter the Username of the Service Account that you created previously.
  - b) Enter the **Service Account API Key** to use for server-to-server communication.
5. Select **Connect**.  
You are now connected to Automation Co-Pilot using Chrome extension, and you can assign developed content.

[Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3534

Firewall configuration and trusted URLs for Chrome extension

Ensure your network firewall configuration allows the sites and services required for the HTTPS network connections of the Automation Co-Pilot Chrome extension.

## Automation Co-Pilot URLs list

Because Automation Co-Pilot service hosting uses dynamic IP addresses, we recommend you add the following complete URL instead of an IP address for PixieBrix services to your safe recipients or trusted sites list. In order for PixieBrix to function properly, the following origins must be allowlisted.

---

**Note:** We recommend Administrators review the timeout settings and select a larger value than the current maximum of 60 minutes for a session timeout under: **Control Room > Administration > Settings > Security > Time-out Session Settings**. Up to a 24 hour maximum should be considered as this 24 hour setting aligns with many modern applications including Salesforce.

---

**Important:** During setup of the Automation Co-Pilot Chrome extension, ensure you have added the AuthConfig app URL to the allowed list - outbound from the Control Room (https/SSL port).  
[Authentication App | Automation Anywhere](#)

---

Service	Description	URL	Communication
Outbound from browser			
Host	Required for all users.	https://*.pixiebrix.com	Outbound
PixieBrix package registry	Required for all users.	https://app.pixiebrix.com	Outbound

Service	Description	URL	Communication
Documentation portal	Recommended for Mod developers and admins.	<a href="https://docs.pixiebrix.com">https://docs.pixiebrix.com</a>	Outbound
Website and templates	Recommended for Mod developers.	<a href="https://www.pixiebrix.com">https://www.pixiebrix.com</a>	Outbound
Error telemetry endpoint	Required for all users.	<a href="https://api.rollbar.com">https://api.rollbar.com</a>	Outbound
Inbound to Automation Anywhere Control Room through the SSL Port			
Load-balanced pair of IP addresses so if one fails, traffic automatically routes through the second IP with health checks and automated failover.	Recommended for all users.	<ul style="list-style-type: none"> <li><a href="#">54.205.35.75:9294</a></li> <li><a href="#">3.222.129.4:9294</a></li> </ul>	Inbound
Incoming Email Domain	Recommended for all users.	<a href="https://pixiebrix.com">pixiebrix.com</a>	Inbound
Incoming System Email IP Address	System emails are sent from the following IP address (updated July 1, 2023).	149.72.154.34	Inbound

**Note:** The default https/SSL port is typically 443, but can be customized based on your organization's firewall settings.

Further details regarding set up of the Automation Co-Pilot Chrome extension can be found in partner documentation with PixieBrix. [AARI Extensions Enterprise IT Setup Guide](#)

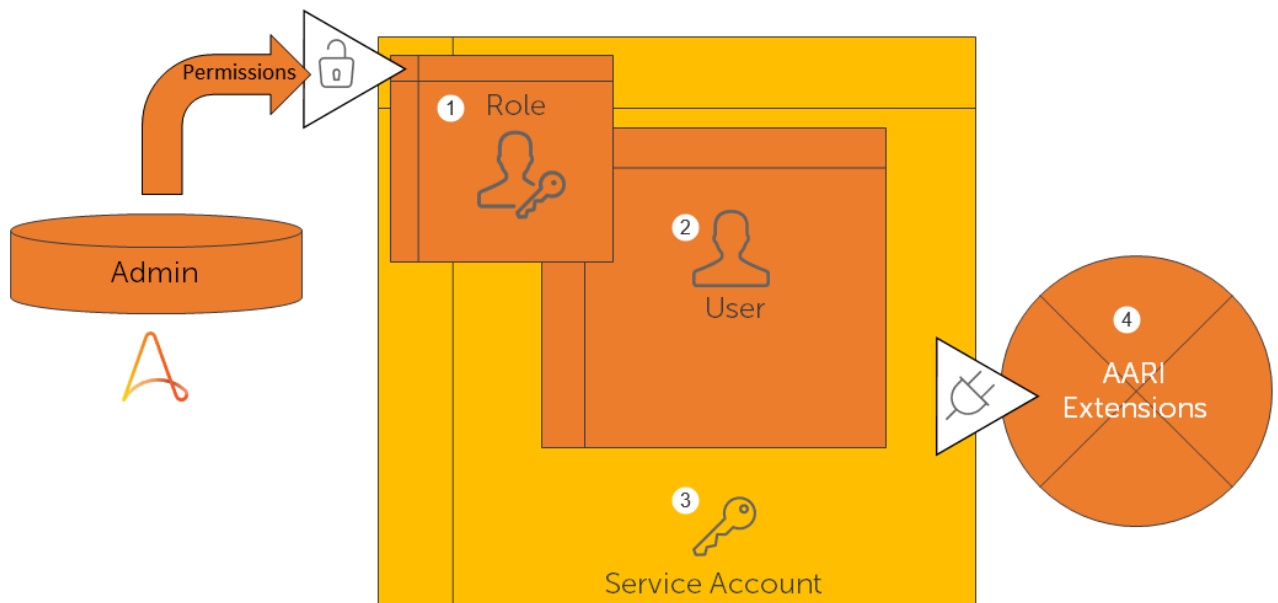

For details regarding Automation Anywhere network and firewall protocols, see [Ports, protocols, and firewall requirements](#).

Create a service account for Automation Co-Pilot using Chrome extension  
 Create the service account and assign permissions to customize the Automation Co-Pilot using Chrome extension experience in your embedded widget.

Use your Co-Pilot Admin account (AAE\_Robotic Interface Admin) to create a new user with the proper role and permissions to configure the Automation Co-Pilot using Chrome extension experience.

#### Overview

1. **Role:** Create a new role, with specific permission, to operate in Automation Co-Pilot as the service account. The permission you assign will structure the Automation Co-Pilot using Chrome extension experience.
2. **User:** After you set up the role, create a new user and assign the role to administer permissions.
3. **Key:** Generate the API-Key of the user account that Automation Co-Pilot using Chrome extension will identify as the service account. During setup of Automation Co-Pilot using Chrome extension, enter the API-Key.
4. **Connect:** Name the account to complete the Automation Co-Pilot using Chrome extension connection.

To grant permissions to the role:

1. Log in to your Control Room as an Admin user.
2. Navigate to **Administration > Roles** in the left-hand menu.
3. Click **Create Role** at the top right of the page.
4. Enter the name for your new role and select the following permissions on the Features page. These permissions enable the Automation Co-Pilot using Chrome extension server to query information to verify user access and save meta data to Automation Co-Pilot.
  - View users
  - View roles
  - View users and roles basic information

- View licenses
- Generate API-Key
- Extension API for service account

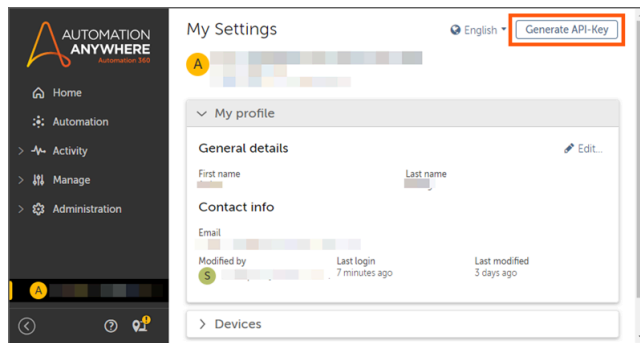

**5. Save** your new role.

To create a new user for your service account and assign the role:

- 6.** Navigate to **Administration > Users** in the left-hand menu.
- 7.** Click **Create User** located at the top right toolbar to define a new service account user.
- 8.** Enter information in the required fields and select the role you previously created and assign it to this user.
- 9.** Select **Allow** for Allow Multiple Sessions on the user creation page.
- 10.** Click **Save**.

To generate the API key:

- 11.** Log in to the Control Room with the user you previously created.
- 12.** Click your user name in the left-hand menu and then click **My Settings** in the profile card that displays.
- 13.** Select **Generate API key** at the top right of the My Settings page.

- 14.** Save the API key to use when connecting Automation Co-Pilot using Chrome extension.

[Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3530

## Develop a widget for Automation Co-Pilot using Chrome extension

Develop the iFrame widget in Automation Co-Pilot using Chrome extension to deploy in your web application.

- You must be logged in to the Control Room with **AAE\_Basic** permissions.
- Ensure that Automation Co-Pilot using Chrome extension is installed in your browser by completing setup. [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3530
- Set up the widget in Automation Co-Pilot that will map automations into Automation Co-Pilot using Chrome extension. [Setup iFrame widget using Automation Co-Pilot](#) on page 3501
- Have the widget **embed code** accessible to enter into Automation Co-Pilot using Chrome extension. You need only the URL in quotes after `src=`.

With Automation Co-Pilot using Chrome extension, your Chrome browser will act as the vessel to embed the widget. Using the following steps, develop an iFrame widget for your web application and deploy the widget to Automation Co-Pilot to map your complete embedded automation experience. While you can develop many web components, the following steps streamline a simple process to bring automations directly into your web application.

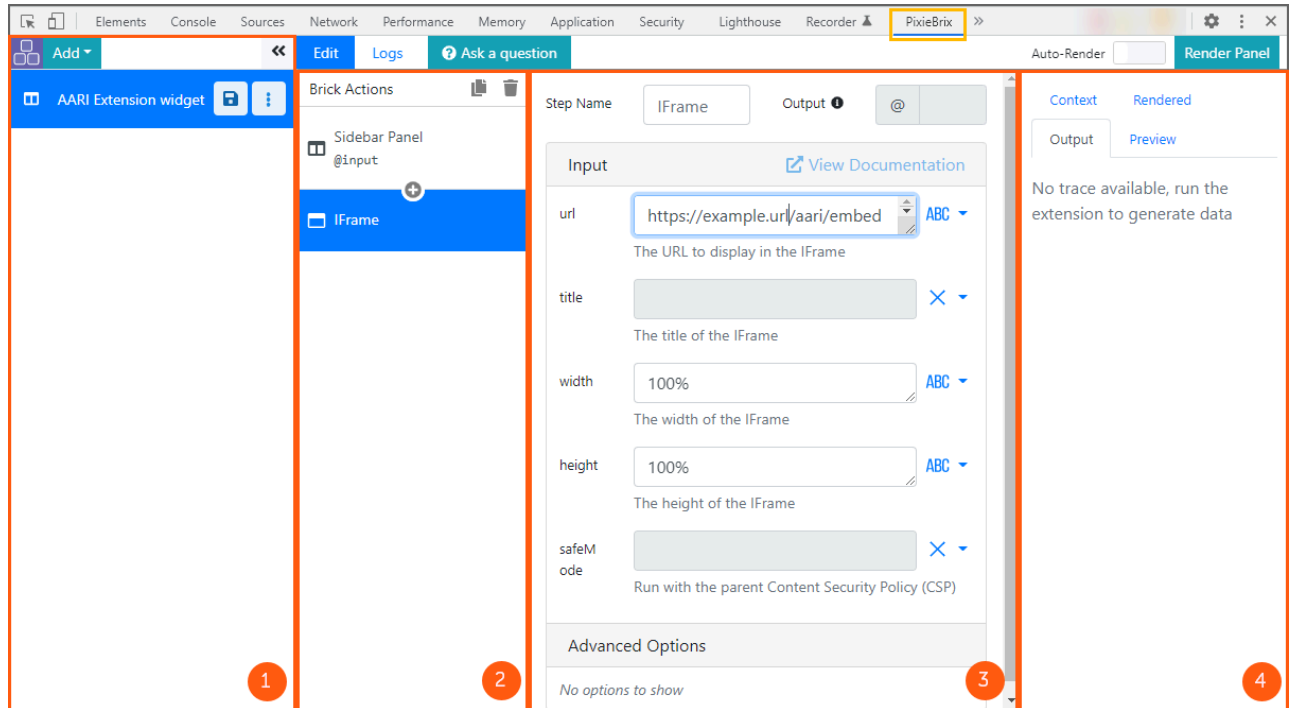

The PixieBrix Page Editor environment is used to map and configure automations from Automation Co-Pilot to your web application and select the component for embedding the widget. This environment uses your OAuth connection to access saved processes and automations from your Control Room and map them to the selected component. For complete details on developing in the Editor, see the following link: [Guide to PixieBrix Page Editor](#)

The following video demonstrates the process of developing the widget in Automation Co-Pilot using Chrome extension.

1. To begin, navigate to the web application where the iFrame widget will be embedded.
2. Select the **Render Panel** action and delete it by clicking the trash icon on the top of the pane.
3. To open the page editor, from the desired web application, right-click and select **Inspect**.

The following table and image details the development environment.

	Panel	Description
1	Extensions List	Create and select an extension for development.
2	Extension Overview	Add, view, and edit the components of the extension.
3	Configurations panel	Map and configure how components interact with the web page.
4	Data panel	Test and debug your extension.

4. From Extensions List, click **Add** and select **Sidebar panel**.
5. From the Overview panel, click the **plus icon** to open the component menu.
6. Select the **iFrame** component and click **Add brick**.
7. In the Configuration panel, complete the necessary fields.
  - a) Enter the **Name** of the widget. This name will appear in Automation Co-Pilot when you begin provisioning to users.
  - b) Enter the widget **URL** to access your Control Room.

This is the URL taken from the **embed code** found in Automation Co-Pilot using embedded widget. You need only the URL in quotes after `src=`.

8. **Save** your Extension.
9. Test and debug your extension by using the data panel.  
The final output is detailed in the data panel and alerts you to any action that might be mapped or configured incorrectly.

---

**Important:** If an alert for invalid connection or invalid credential appears, check that you have set up and connected Automation Co-Pilot correctly to Automation Co-Pilot using Chrome extension.

---

10. After successful verification, click the vertical ellipses in the Extensions List panel to add your extension to a blueprint.

11. Select **create new blueprint**.
12. Select **move** or **copy** into the new blueprint.
13. Enter your **unique id**.
14. Enter the **name** to identify the extension in the next step.
15. Enter the **version** for developers to identify the progressive customizations made over the life of the extension.
16. Enter a **description**.
17. Click **Create** to save your changes.

After developing the extensions for your team, deploy the blueprint to Automation Co-Pilot using Chrome extension. [Deploy an extension version to Automation Co-Pilot using Chrome extension on page 3537](#)

## Deploy an extension version to Automation Co-Pilot using Chrome extension

Select and deploy the version of a verified extension for Teams to access in Automation Co-Pilot using Chrome extension.

Select and deploy an extension version (called a mod) for teams to access in Automation Co-Pilot using Chrome extension. Mods package all customizations and return them to the web application as a single version. This provides developers access to make improvements on one version while users simultaneously run a verified version.

Use the management console in the Automation Co-Pilot using Chrome extension to deploy a mod and control the version of developed artifacts.

Automation Co-Pilot using Chrome extension offers a management console for development artifacts to provide version control. Select the version of an extension by choosing a mod from the console. Mods package all customizations and return them to the web application as a single version. This allows developers access to make improvements, while users run a verified version.

This task describes how to deploy a mod from the Automation Co-Pilot using Chrome extension management console to populate your widget and make it accessible.

### Prerequisites

- Use a Google Chrome browser with a profile setup with Automation Co-Pilot using Chrome extension.
- Ensure you have access to two Automation Co-Pilot users, one with the Automation Co-Pilot admin profile for set up and one with the Automation Co-Pilot user profile for testing.

1. You can either:
  - Open a new browser window on your machine and log in to Automation Co-Pilot using Chrome extension as an Co-Pilot Admin; or

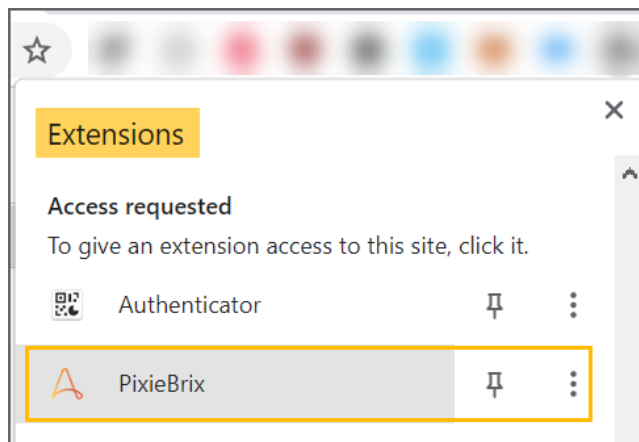

- Open a new browser window on a different machine to easier manage active sessions.

**Tip:** Use Chrome Profiles to manage multiple user profiles on the same machine. For each user profile created, the user must log into Automation Co-Pilot and install the Chrome extension into that Chrome profile. Then, each user must log in to the Chrome extension using their respective Automation Co-Pilot credentials. This management method:

- Organizes profiles for Administrator, Developer, and end users for testing.
- Optimizes managing multiple sessions when tasks are completed on the same device.

To learn more about Chrome Profiles, see [Google Chrome help](#)

2. Open the Console page by selecting **Chrome > Extensions > PixieBrix**.

3. Click the **Options** button in the slide out panel that appears.

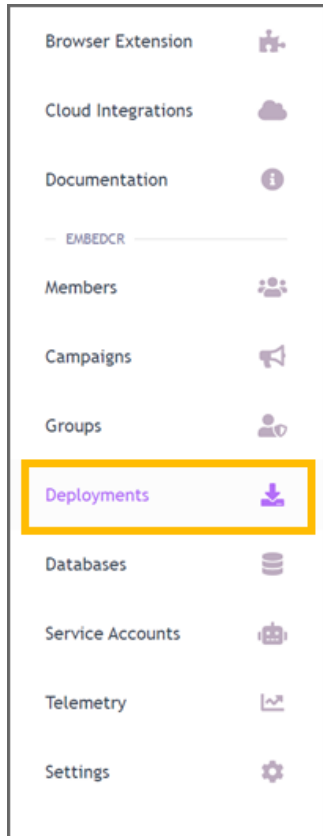

4. If prompted to log in enter your Control Room URL and log in using the Co-Pilot Admin account.

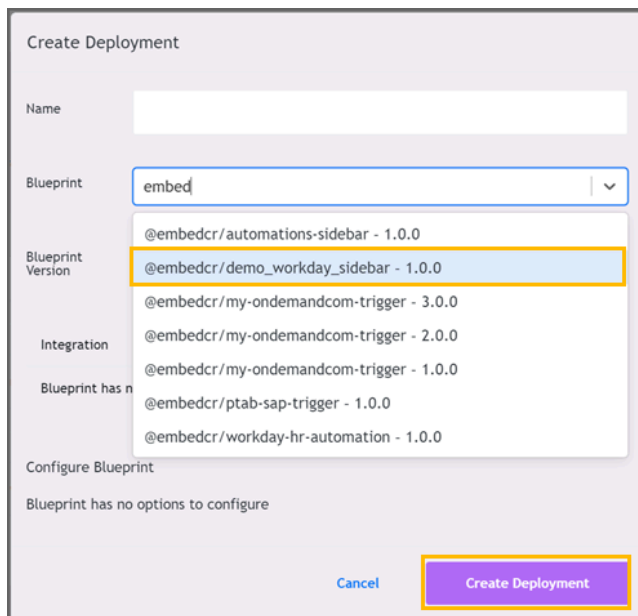

**Note:** To switch to a different user in the existing session, click **Open Admin Console** at the top right of the page. In the new tab, click the **username** and select **Logout**.

5. When logged in as the Co-Pilot Admin, click **Open Admin Console** at the top right of the page.
6. Select **Deployments** from the left navigation menu.

7. Click **+ Create Deployment** at the top right of the Deployments page.
8. Enter the name of your deployment.
9. Select the mod of the extension you previously created using the Develop an widget for Automation Co-Pilot using Chrome extension procedure. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3534

10. Click **Create Deployment** to save your settings to Automation Co-Pilot.

11. In a new tab or window, navigate to Automation Co-Pilot and log in as an Co-Pilot Admin.
12. Open the Extensions page by selecting **Manage > Extensions** from the left-hand navigation menu.
13. Click **+ Add Extension** on the top right of the page.

Your newly deployed extension displays in the table.

14. Select the check box next to your deployed extension and then click **Add & Save**.

You return to the Extension Setup page.

15. From the Extension Setup page, select the deployment you added. Automation Co-Pilot navigates to the Properties page.
16. To assign one or more teams, select the **Teams** tab at the top of the page.
17. Click the **+** button on the bottom right to open the Teams dialog.

18. Select the Teams for which to assign the extension.

19. Click **Add & Save** to activate and deploy teams customization.

Test the customization.

**Note:** If using Chrome Profiles, switch to a user profile dedicated to an Co-Pilot User profile that belongs to this respective Team. Otherwise, follow the steps to log the user out of the Chrome

extension and then log in with a user that already has an AARI user license assigned and has been added to this respective Team.

---

As the user, navigate to your configured application, (similar to how Workday was configured in the previous task). After you access the page configured on the Trigger, the Sidebar panel should automatically display with the list of available automations for the user.

## Provisioning Automation Co-Pilot using Chrome extension to users

Organize and assign developed extensions to users for business roles and functions.

Ensure that you have completed development of the Automation Co-Pilot using Chrome extension content. [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3534

After developing an extension, make sure to **refresh** Automation Co-Pilot to load recently developed content.

1. In Automation Co-Pilot using Chrome extension, click **Add Extension**.
2. Select the extension.  
Recognize the extension by the **Name** you entered in development.
3. Click **Add and Save**
4. To edit properties, select the newly added extension on the **Extension Setup** page .
5. Click the **Teams** tab.
6. Select **Teams** to assign them the extension.
7. To commit your changes, click **Add and Save**.  
The ellipsis on the far right of each team offers an option to send the extension link to users.  
Users will now be able to access the widget from their web applications.

Check out what users can do with the extension. [Deploy automations in web application](#) on page 3508

## Use Automation Co-Pilot as embedded widget in Genesys

Invoke Automation Co-Pilot as an interaction widget inside Genesys Cloud. The agent uses the widget to correct a pricing error without leaving Genesys.

Automation Co-Pilot

Business users can directly access authorized automation from within their favorite business applications, without having to open a new interface or learn a new app. Automation Co-Pilot delivers automation everywhere you want, through a widget, either integrated with your web application or delivered through a browser extension. To make the widget accessible, create and configure the widget in your preferred application. Then populate the widget by assigning pre-built automation to teams or roles in Automation Co-Pilot. Assigned users can access Automation Co-Pilot to complete daily tasks.

### Setup

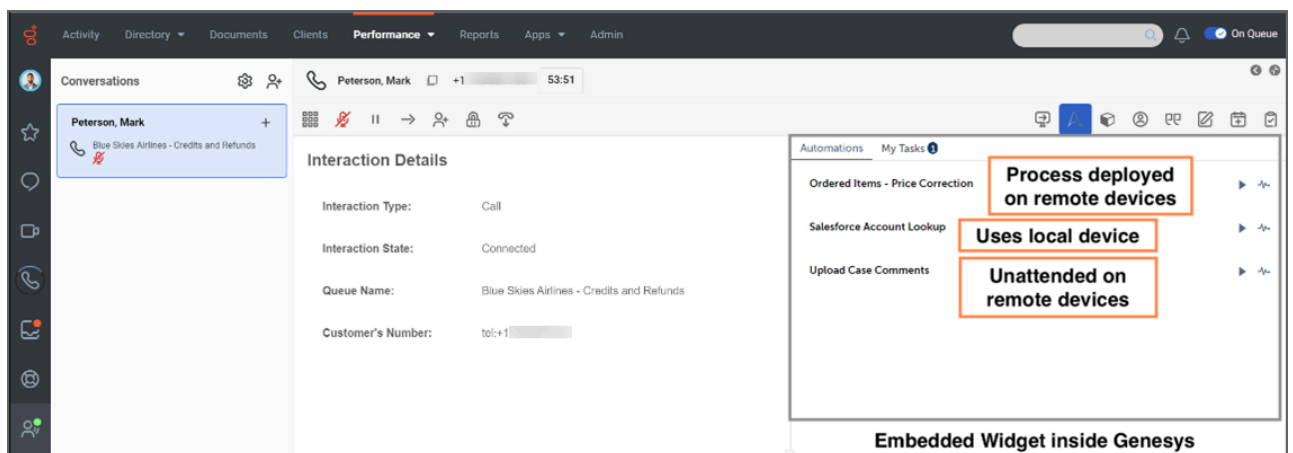

1. Complete the setup process flow [Automation Co-Pilot using embedded widget overview](#) on page 3499
2. Assign automation [Assign automations to teams](#) on page 3503
3. Automation assigned should include the following.
  - Attended bot (that can be deployed on the local device) [Attended and unattended automation](#) on page 3490
  - Automation Co-Pilot Process invocation (with two human step forms) [Deploy processes](#) on page 3578
  - Unattended bot (triggered via Automation Co-Pilot process with no human inputs) [Create a process automation in Process Composer](#) on page 3684

**Tip:** Usable sample code

You can download the following sample code to test this example in your own environment.  
[GitHub: Embedded Use Case 1](#)

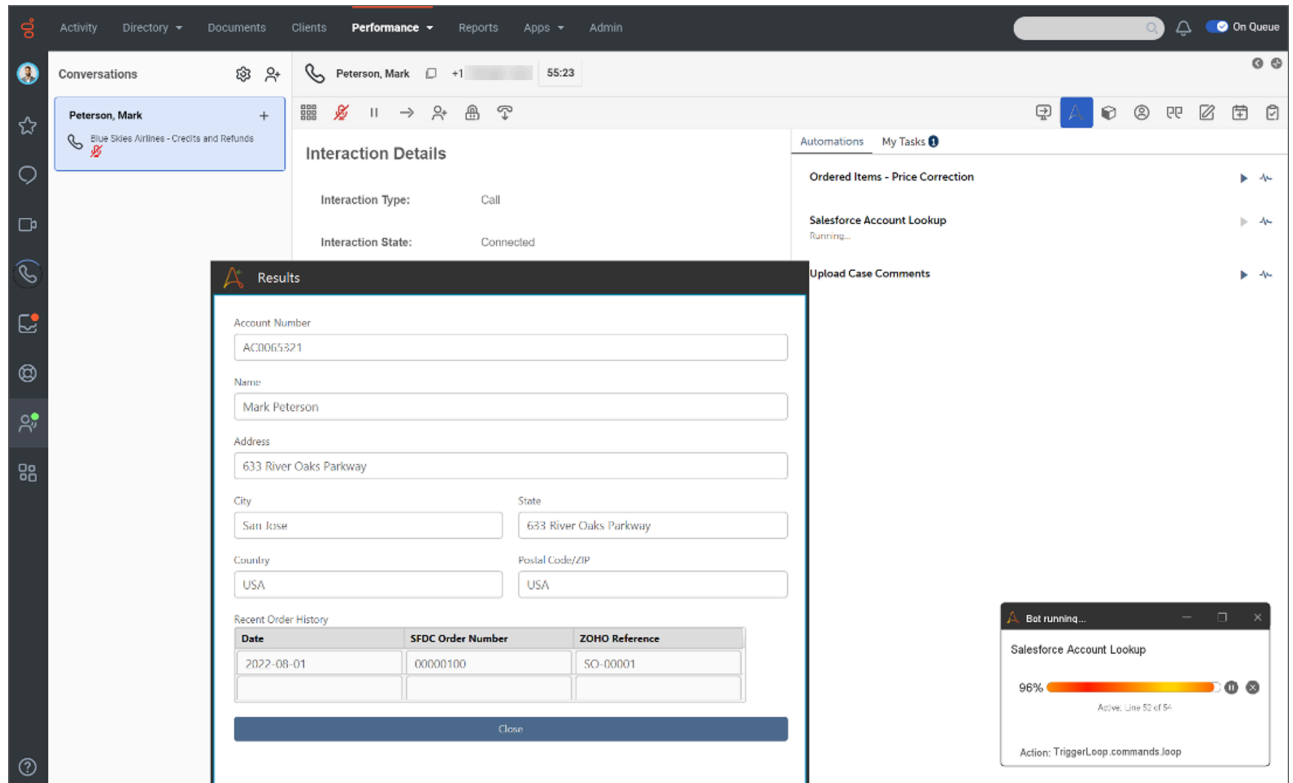

### Example Summary

In this example, a contact center agent receives a call about an order with an incorrect charge. The agent, operating in Genesys, responds using the embedded widget by launching automated processes and bots, and handles the order correction without leaving Genesys. Deployed automation touch Salesforce and Zoho Sales Order Management to correct the error in respective systems. Assigned automation are detailed in the following image.

This example describes steps the agent takes to correct a pricing error while in Genesys, by using the Embedded Automation widget.

1. Deploy the **Salesforce Account Lookup** bot and enter the phone number to pull up the account record.

The screenshot shows the Genesys interface with a bot window titled "Results" open. The bot is performing a "Salesforce Account Lookup" action. The results displayed are:

Account Number: AC0065321  
Name: Mark Peterson  
Address: 633 River Oaks Parkway  
City: San Jose, State: California  
Country: USA, Postal Code/ZIP: 95128

Recent Order History:

Date	SFDC Order Number	Zoho Reference
2022-08-01	00000100	SO-00001

The bot window also shows a progress bar at 96% and the action "TriggerLoop.commands.loop".

Copy the **SFDC Order Number** to enter in the next step.

2. Launch the **Order Items Price Correction** process from within the widget and enter the order number you have retrieved.  
A Bot retrieves order details from Zoho and renders the **Display Order Details** in a form, including products and prices paid.

7-10 Order Number Input

Enter the **file location**, for the automation to sends notes to the appropriate contacts.

## Use Automation Co-Pilot as Chrome extension in Workday

Automation Co-Pilot makes automation accessible for end users operating inside Workday. For example, a Human Resource admin enters an employee address and can order business assets to ship without leaving Workday.

Automation Co-Pilot

Business users can directly access authorized automation from within their favorite business applications without having to open a new interface, or learn a new app. You can invoke the widget in Workday. To make the widget accessible:

1. Create and configure the widget in your preferred application.
2. Assign any pre-built automation in Automation Co-Pilot required for teams to complete their daily tasks.

The widget (shown in the following image) populates assigned automation for specific roles.

Setup

1. Complete the following setup process.
  - a) [Set up and connect Automation Co-Pilot using Chrome extension](#) on page 3530
  - b) [Setup iFrame widget using Automation Co-Pilot](#) on page 3501
  - c) [Develop a widget for Automation Co-Pilot using Chrome extension](#) on page 3534

---

**Note:** For this example, configure the widget to trigger as a Page Load event.

---

  - d) [Provisioning Automation Co-Pilot using Chrome extension to users](#) on page 3541
2. Two types of automation are assigned in this example and include the following details:
  - Attended bot (that you can deploy on the local device). See [Attended and unattended automation](#) on page 3490.
  - Automation Co-Pilot Process invocation (with two human step forms). See [Deploy processes](#) on page 3578

**Tip:** Sample code

You can download sample code to test this example in your own environment. See [GitHub: Embedded Use Case 2](#)

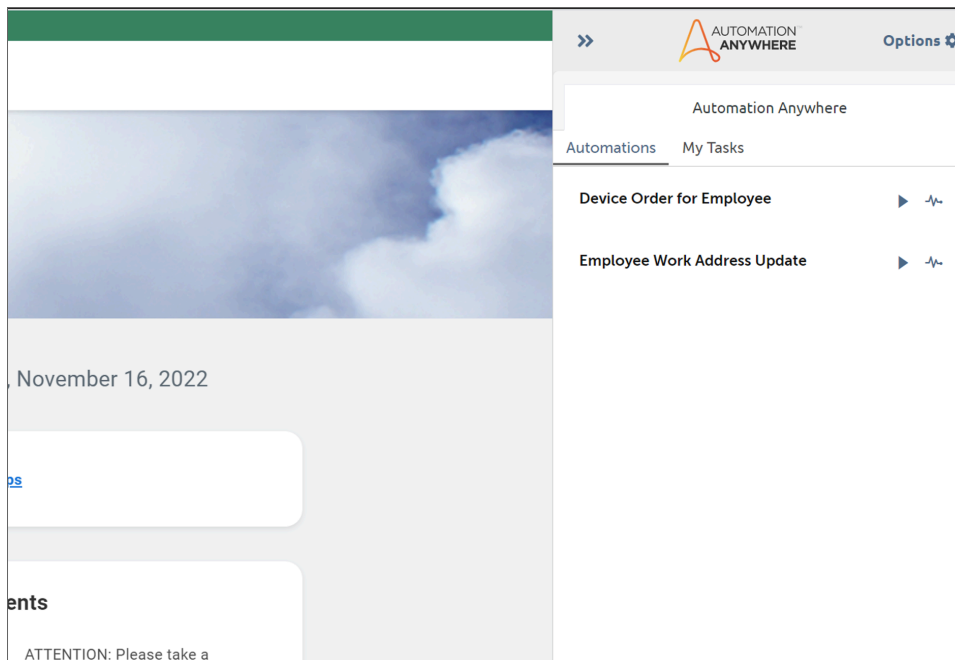

Example Summary

An HR Admin logs into the Workday application and views the new widget sidebar on the home page that has been deployed by the RPA Center of Excellence (CoE). The sidebar opens has been designed to open automatically when the user accesses the Workday application and the page has completed loading.

The HR Admin can use Embedded Automation to access and update an employee address, and then order hardware assets to deliver to that employee.

The deployed automations used in this example touch Workday and Zoho Sales Order Management (used to complete the transaction):

- An attended bot (**Employee Work Address Update**) built for an HR Admin to quickly locate and update home office address details of employees, using interactive forms and local desktop automation.
- An Automation Co-Pilot process invocation (**Device Order for Employee**) built for an HR Admin to order hardware assets (such as laptops and keyboards) for employees directly in Workday.

1. Start the **Employee Work Address Update** automation used to enter the Employee ID of the person you want to update.

2. Enter the **Employee ID** to search Workday for the employee.

**Employee Details**

**Employee Data**

Employee ID: 21507      User ID: tstaff

**Person Data**

Position: System Administrator      Hire Date: 2020-03-11

First Name: Tim      Last Name: Staff

Email Address: timstaff@getnada.com

Address: 545 Tremont Street

City: Boston      State/Province: MA

ZIP: 02116      Country: USA

**Position Data**

Pay Type: Salaried

Management Level: 8\_Individual\_Contributor

Base Pay: 100000

Bonus Plan Amount: 0      Bonus Plan Percentage: 0

Total Compensation: 100000

Update Work Address

3. Enter the employee's address details using the provided form to update the employee data.

This example shows a simple address update. However, you can update other employee details based on the available APIs in your Workday instance, or by using the Automation Anywhere Universal Recorder.

#### 4. Click **Save Changes**.

The screenshot displays the 'Employee Details' form in Workday. The form is divided into several sections:

- Employee Data:** Employee ID (21507), User ID (tstaff).
- Person Data:** Position (System Administrator), Hire Date (2020-03-11), First Name (Tim), Last Name (Staff), Email Address (timstaff@getnada.com), Address (715 SW MORRISON ST), City (PORTLAND), State/Province (OR), ZIP (97205), Country (USA). A blue button labeled 'Update Work Address' is located below the address fields.
- Position Data:** Pay Type (Salaried), Management Level (8\_Individual\_Contributor), Base Pay (100000), Bonus Plan Amount (0), Bonus Plan Percentage (0), Total Compensation (100000). A blue button labeled 'Save Changes' is highlighted with a yellow border at the bottom left, and a blue button labeled 'Cancel' is at the bottom right.

At the bottom of the form, it says 'Powered by Automation Anywhere'.

The automation updates the employee data in Workday.

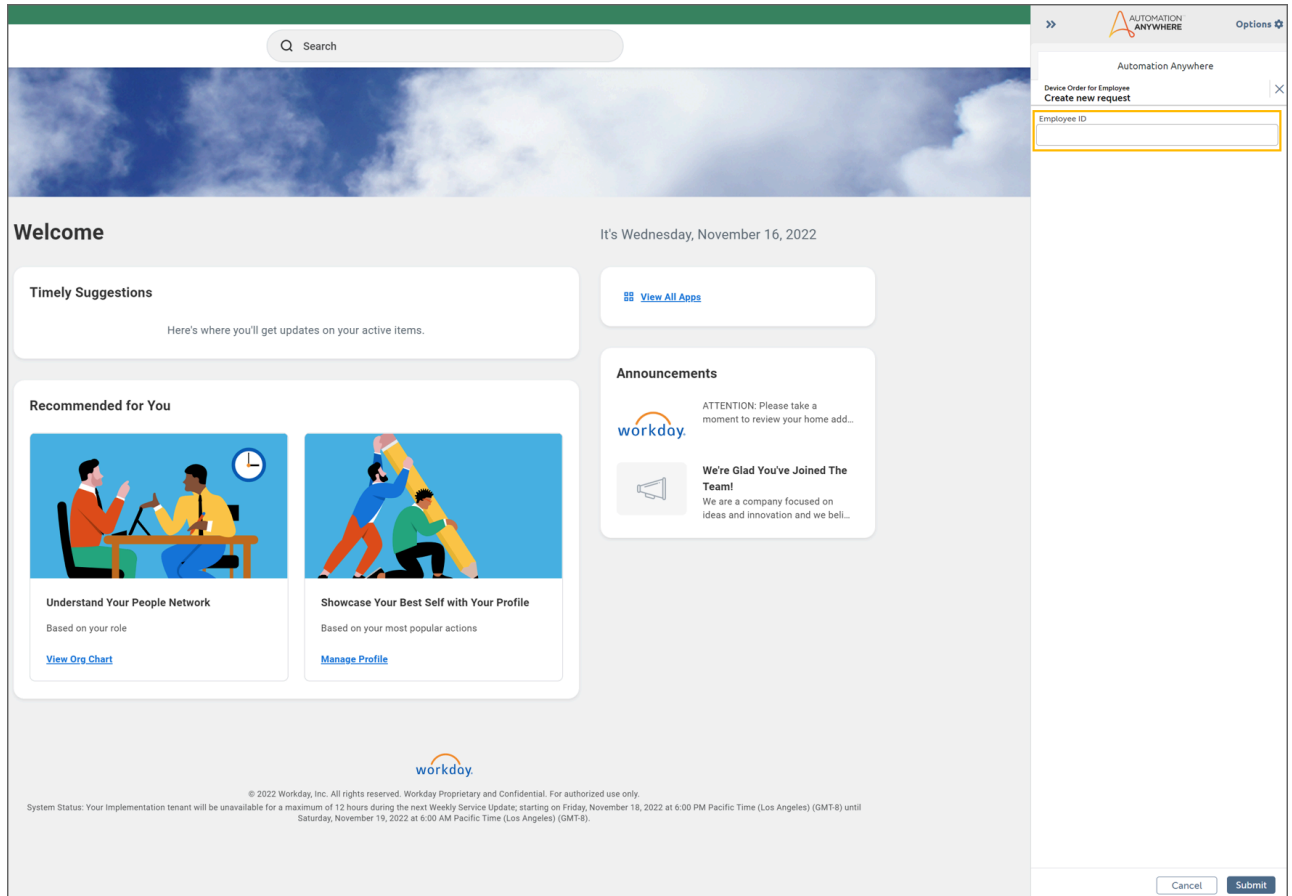

The second automation (Device Order for Employee) simplifies daily tasks of the HR Admin. This adds an automated process for device ordering that is embedded directly in the Workday application using the same sidebar. Typically, this task would require navigating procurement applications to locate and order devices, and while navigating the Workday application to capture shipping address details of the employee.

By bringing the ordering process into the primary application where daily tasks are performed, the task is simplified. Similar to the previous task, when the HR admin logs into Workday, the sidebar appears with the list of available automations their CoE has deployed.

#### 5. Locate the **New Device Order for Employee** automation displayed in the sidebar and click **Start**.

A new instance is created.

#### 6. Enter the **Employee ID** for a new order.

After submitting a valid Employee ID, the automation locates and returns the employee details within Workday.

7. Confirm the employee details and select the hardware items to order.

The screenshot displays the 'Automation Anywhere' interface for a 'Device Selection' task. At the top, the user is identified as 'Charlie Harrison'. Below this, the 'Employee Data' section contains two input fields: 'Employee ID' with the value '21507' and 'ZIP' with the value '97205'. The 'Available Assets to Order' section lists three items, each with a checkbox, a price field, and a quantity field:

- Jabra Evolve 65 UC Headset, \$199.99, Quantity: 0
- Microsoft Ergonomic Desktop Keyboard, \$121.99, Quantity: 0
- Microsoft Bluetooth® Ergonomic Mouse, \$69.99, Quantity: 0

At the bottom of the form, there are 'Submit' and 'Cancel' buttons on the left, and a 'Task Sequence' button on the right.

8. After the automation has created a new order in the company's order management system (Zoho Order Management), the automation returns the Sales Order number (SO-00012) for reference.

## Access Automation Co-Pilot in SAP and ServiceNow

Automation Co-Pilot makes a shared automation accessible for end users in SAP (via Chrome extension) and ServiceNow (via embedded widget). An employee submits an order request and a manager approves the request.

### Automation Co-Pilot

Business users can directly access authorized automations from their favorite business applications without having to open a new interface, or learn a new app. You can invoke Automation Co-Pilot as a widget in ServiceNow and as a sidebar in SAP. To make the widget accessible:

1. Create and configure the widget in your preferred application.
2. Assign any pre-built automations in Automation Co-Pilot required for teams to complete their daily tasks.

The widget populates assigned automations for specific roles.

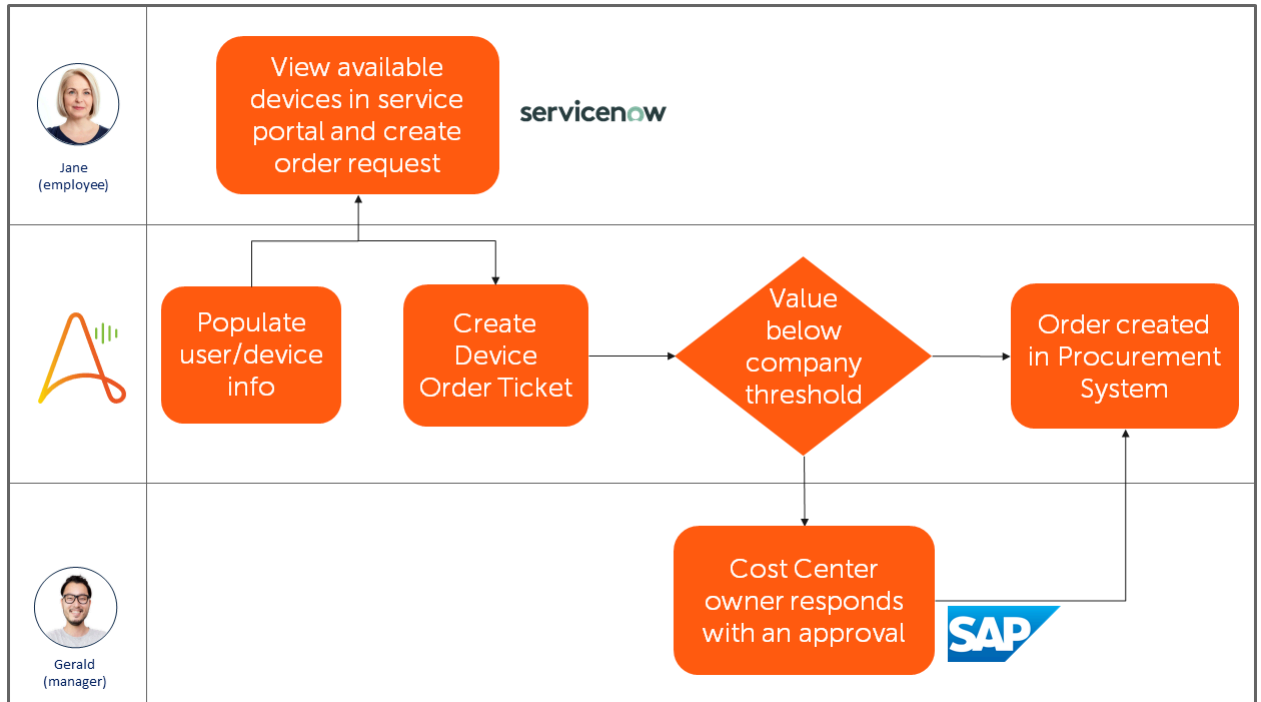

The diagram illustrates three ways to integrate Automation Anywhere into existing web applications:

- iFrame Widget for web apps supporting customization:** Shown as a sidebar menu with items like 'Change payment terms', 'Set up payment account', 'Automation name', 'Recent orders history', 'Check Delivery status', 'Satisfaction survey', and 'Look up competitor pricing'.
- Embed automation in any web application:** Described as 'Attended, unattended and process automations' with a 'Lightweight and responsive interface'. It requires 'Seamless authentication with OAuth 2.0 or SAML SSO'.
- Chrome Extension Widget for web apps not supporting customization:** Shown as a task list with items like '7730 Concur expenses to review', '7729 New financial dashboard approval', and '7733 biweekly checks to run for payroll'.

### Example Summary

A company employee (Jane) submits a request to order replacement hardware. Jane (operating in ServiceNow) uses the embedded widget to launch an automated bot to process the order, and submit for approval to a Cost Center Manager (Gerald). Gerald (operating in SAP) uses the embedded widget to launch automations that approve and complete the hardware shipment order.

The widget is visible in ServiceNow as a custom ServiceNow component that is placed into the Employee Service Portal page. The widget is invoked as a sidebar through the web browser. For users operating in SAP S/4HANA, the sidebar appears on a page load trigger.

## Setup

1. Complete the setup process flow for ServiceNow. See [Automation Co-Pilot using embedded widget overview](#) on page 3499.
2. Complete the setup process flow for SAP . [Automation Co-Pilot using Chrome extension](#) on page 3528.
3. Assign automations. See [Assign automations to teams](#) on page 3503.
4. The embedded widget can contain combinations of three types of automations:
  - Automation Co-Pilot Process invocation (with two human step forms). See [Deploy processes](#) on page 3578.
  - Attended bot (that can be deployed on the local device). See [Attended and unattended automation](#) on page 3490.
  - Unattended bot (triggered through Automation Co-Pilot process without human input). See [Create a process automation in Process Composer](#) on page 3684.

**Tip:** Sample code

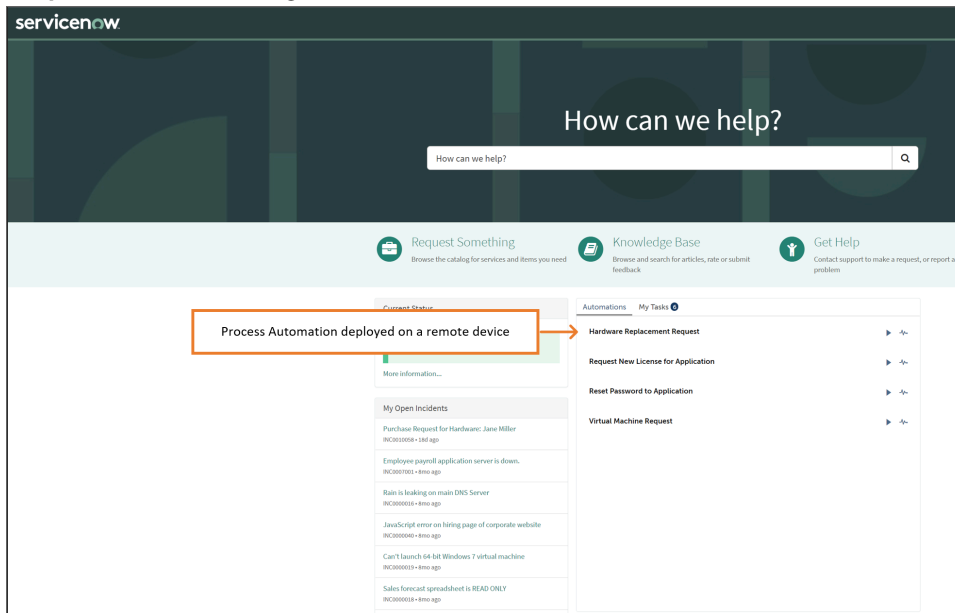

You can download the following sample code to test this example in your own environment. See [GitHub: ServiceNow](#) .

## Procedure

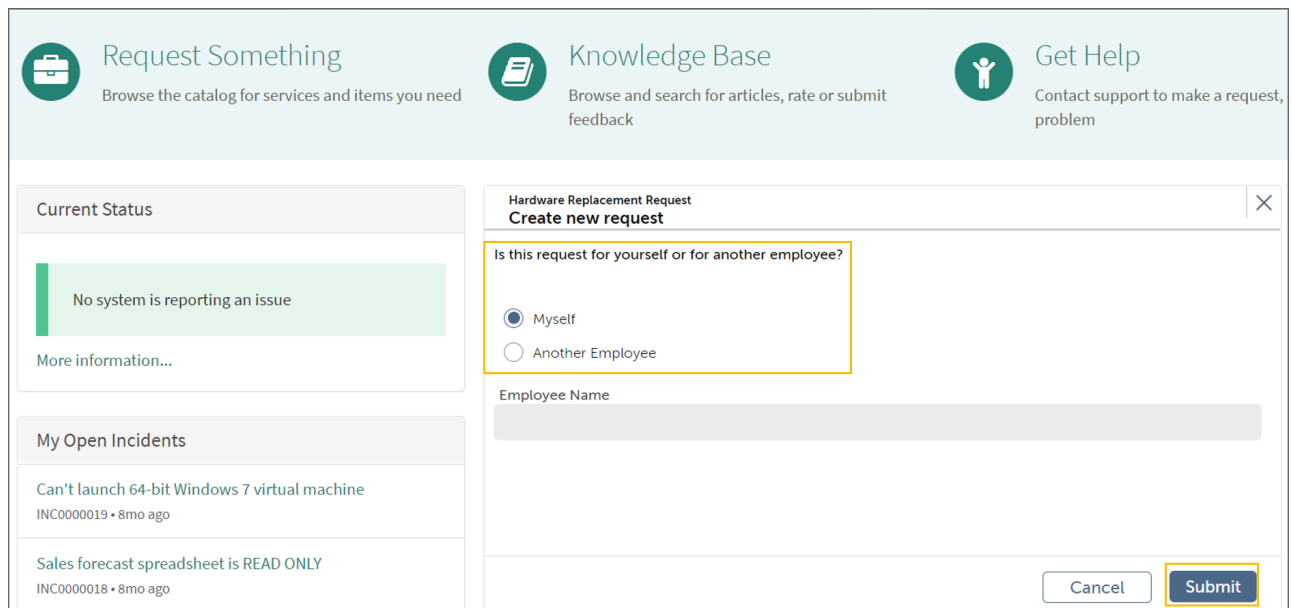

This embedded widget example includes the AARI Process automation type.

The **Hardware Replacement Request** Automation Co-Pilot process allows an employee access to the business ServiceNow Service Portal for IT requests. An employee can use the embedded widget to automate requests. Jane's order request includes replacement hardware such as: keyboards, mice, or laptops.

When Jane opens ServiceNow, they can see the automated process for **Hardware Replacement Request** within the widget.

1. Jane initiates the **Hardware Replacement Request** and is taken to an input page in the widget where they enter the information required to execute the automation.
2. Jane can select the request for self, or as another employee, and click **Submit**.

3. After submitting her request, the next automation connects Jane to the business HR system where Jane gathers employee details, such as shipping address. The system connects to the procurement system to retrieve the available items to order.

**Note:** This example includes these steps in the automation to reduce reliance on additional systems.

12-46 Employee Hardware Request

Microsoft Arc Mouse (Black)	118.99	0

Submit Cancel

Task Sequence

- This business rule was created in this automation example to check the total order value:  
If the total order value exceeds the company threshold of \$3000, then an approval is required from the cost center owner. This generates a request to Gerald.
- Gerald focuses on different tasks in the cost management application (SAP). The list of automations in the sidebar is focused on orders, inventory, and other sales related processes. When the widget generates Jane's request for Gerald, a toast message displays in the inbox for the new task in the widget.

Gerald selects **My Tasks** to view the request and continue with the Automation Co-Pilot approval process.

- Gerald approves the request and adds any comments, remaining in the SAP environment.

## Integrate Automation Co-Pilot with Microsoft Teams

Set up the Automation Anywhere app to access Automation Co-Pilot in the Microsoft Teams platform.

### Integrating Automation Co-Pilot in Microsoft Teams

Use the Automation Co-Pilot experience with Microsoft Teams (desktop or web app) directly from your workspace and access authorized automations from within Microsoft Teams without having to open a new interface or learn a new app.

#### Task summary

1. Download all files and edit the manifest.json file using your own URL for the Automation Workspace.
2. Create one zip file for all of the files.
3. Using the zip file, upload the Automation Anywhere app to your organization's app catalog in Microsoft Teams to make it available to end users for download.

---

**Note:** The Automation Anywhere app is not supported on mobile devices.

---

#### Prerequisites

- Create a copy of the URL for your organization's Control Room from the **Embed code** field in Automation Co-Pilot using embedded widget. You will replace the example in the manifest.json file with your URL. See, [Setup iFrame widget using Automation Co-Pilot](#) on page 3501.

---

**Note:** You must use the following parameter in your URL to force the use of the Teams SDK and auth code.

- If the embed code was generated with Tags, then add

```
&App=Teams
```

to the end of the URL.

- If the embed code was generated without Tags, then add

```
?App=Teams
```

to the end of the URL.

---

- Download all files from the [MS-Teams-Integration/Automation Anywhere/](#) GitHub folder to use in this setup process.
- Use admin roles and permissions to access your Microsoft Teams platform during the setup process.

1. Edit the manifest.json file by replacing all instances of `your-a360-domain` with the URL of your Control Room.

```

16 "description": {
17 "short": "AARI",
18 "full": "Use the AARI web interface from within MS Teams"
19 },
20 "icons": {
21 "outline": "outline.png",
22 "color": "color.png"
23 },
24 "accentColor": "#FFFFFF",
25 "staticTabs": [
26 {
27 "entityId": "ecad9d6d-55c8-4bd9-820c-aal1580b9e41",
28 "name": "AARI",
29 "contentUrl": "https://your-a360-domain/aari/#/embedded",
30 "scopes": ["personal"]
31 },
32 {
33 "entityId": "about",
34 "scopes": [
35 "personal"
36]
37 }
38]
39 "validDomains": [
40 "your-a360-domain"]

```

2. Create a zip file containing the contents of the **Automation Anywhere** folder and label it for uploading to Microsoft Teams.
3. Using the admin role and permissions in Microsoft Teams, upload the zip file.
  - a) From the **Apps** tab, click **Manage your apps** in the lower left corner.
  - b) Click **Upload an app**.

- c) **Note:** You must have admin privileges to upload directly. Users without admin privileges should work with their IT department to upload the package with proper authorization.

Select **Upload an app to your org's app catalog** to use the app immediately without review. Optionally, you can select **Submit an app to your org** to submit the app for review by your IT admin.

- d) Select the zip file you created in step 2.

4. Click **Add**.
5. When the App loads, you will be prompted to log in to the Automation Anywhere Control Room. Click **Log in** to continue.  
The login window closes and the Automation Co-Pilot interface is displayed.

The end user installs the Automation Anywhere app:

1. In Microsoft Teams, click the ellipsis button in the left sidebar and search for the Automation Anywhere app.
2. When prompted, log in to the Automation Anywhere Control Room and the Automation Co-Pilot interface is displayed.

## Automation Co-Pilot for Business Users FAQ

Answers to frequently asked questions (FAQs) for embedded instances of Automation Co-Pilot.

### Disable third-party storage partitioning

Automation Co-Pilot users should disable third-party storage partitioning from browsers (such as Google Chrome or Microsoft Edge) to enable communication to the embedded iFrame. Partitioning can cause users to experience the following situations.

- A user logs in successfully and a window displays for Automation Co-Pilot. The Log In window does not close and the Automation Co-Pilot window displays a spinner.

As of M113, third-party storage partitioning is enabled by default for some users. However, you can disable storage partitioning by setting a feature flag.

- If this policy is set to Allow Partitioning or unset, third-party storage partitioning might be enabled.

- If this policy is set to Block Partitioning, you cannot enable third-party storage partitioning. This policy can cause disruption with the communication of data between the iFrame and Automation Co-Pilot.

To disable third-party storage partitioning:

1. Navigate to the appropriate browser partitioning location:
  - For Google Chrome, navigate to: `chrome://flags/#third-party-storage-partitioning`. For more details, see [Storage partitioning](#).
  - For Microsoft Edge, navigate to: `edge://flags/#third-party-storage-partitioning`. For more details, see [Microsoft Edge Developer documentation](#).
2. Select **Disabled** from the drop-down.

## Allow pop-ups from Automation Co-Pilot

If the end user is not seeing the Log In window, it could be that the browser is blocking pop-up windows. The end user should add Automation Co-Pilot as a pop-up exception.

To manage pop-ups in Google Chrome:

1. From Chrome, navigate to a page where pop-ups are blocked.
2. In the address bar, click **Pop-up blocked**.
3. Click the link for the pop-up you want to see.
4. To always see pop-ups for the site, select **Always allow pop-ups and redirects from [site]** > **Done**.

## Using Automation Co-Pilot for Business Users on desktop

Use Automation Co-Pilot for Business Users through your desktop to manage routine tasks such as validating data, retrieving approvals, and managing escalations through bots.

---

**Note:** Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI) within the product.

---

The following workflow describes how to use Automation Co-Pilot to automate and manage your tasks:

1. Create a user:
  - The Control Room administrator creates a user with a Bot Creator license.  
[Create a user](#) on page 1845 | [Automation 360 licenses](#) on page 1511
  - The user logs in to the Control Room to start building bots.  
[Install Bot Agent and register device](#) on page 1450 | [Get started building bots](#) on page 3390
2. Create forms using the Interactive forms package:

- Interactive forms enable you to design forms for submitting and regrouping data from various applications.  
[Create a form](#)
- Link the form to a newly created bot or an existing bot using the Bot editor interface.  
[Add a form to bot](#) on page 3491

**3.** Add triggers to the bot:

Trigger loop enables you to add triggers that can run a task automatically when certain predefined events occur.

[Adding a trigger to run a bot](#) on page 2436

Additionally as a Bot Creator with an attended license, you can select how to locally execute bots on your desktop to ensure sensitive data remains secure within your On-Premises environment.

[Add Bot Task to a process automation](#) on page 3686

## Automation Co-Pilot Desktop Assistant

Attended Bot Runner users can use the Automation Co-Pilot Desktop Assistant application to access bots without logging into Control Room.

---

**Note:** Roles, permissions, and licenses may continue to reference Automation Anywhere Robotic Interface (AARI)] within the product.

---

Control Room administrator adds Active Directory (AD) users by selecting AD domain, providing environment details, and assigning a role and device license. Administrator can further deploy the Control Room RBAC by specifying role-based privileges and permissions at the bots and Bot Runner level.

Control Room RBAC on Bot Runner users facilitate a complete isolation based on pre-defined criteria such as users across various business units or departments. This also includes the privileges that is applied at a folder level to completely and seamlessly isolate bots of one department from the other.

In a typical scenario, triggering some specific bots to complete important tasks can be one of the daily routines for attended Bot Runner users. Entire process of signing into Control Room can be time consuming. Automation Co-Pilot Desktop Assistant reduces this effort considerably. When Bot Agent is installed on a device, an application shortcut on the desktop for Automation Co-Pilot Desktop Assistant is also created along with a **Start** menu icon.

Users with attended Bot Runner license can launch this application, use their AD credentials to sign in and review the list of available bots, and run the specific bot.

---

**Important:** Automation Co-Pilot Desktop Assistant application is not available for the Citizen Developer license.

---

## Sign in to Automation Co-Pilot Desktop Assistant

Use the Automation Co-Pilot Desktop Assistant application to directly run bots without signing into Control Room.

- Automation Co-Pilot service must be running in Control Room to use Automation Co-Pilot Desktop Assistant .

- This application is designed for users with either an attended license, an AARI license, or both. Attended Bot Runners can use their license to run bots, while users with an AARI license can run processes. Users with both licenses can run both bots and processes.

1. Click the **AARI** icon to open Automation Co-Pilot Desktop Assistant .
2. Use Automation 360 credentials to sign into the application.

All the bots that you have access to are listed.

3. Optional: Use the **Search** bar at the top to find a bot.
4. Optional: Click **Show pinned only** check box to list your pinned bots.

Ensure you pin (similar to favorites) the most used bots for a quick access.

5. Click **Launch** to run the bot.

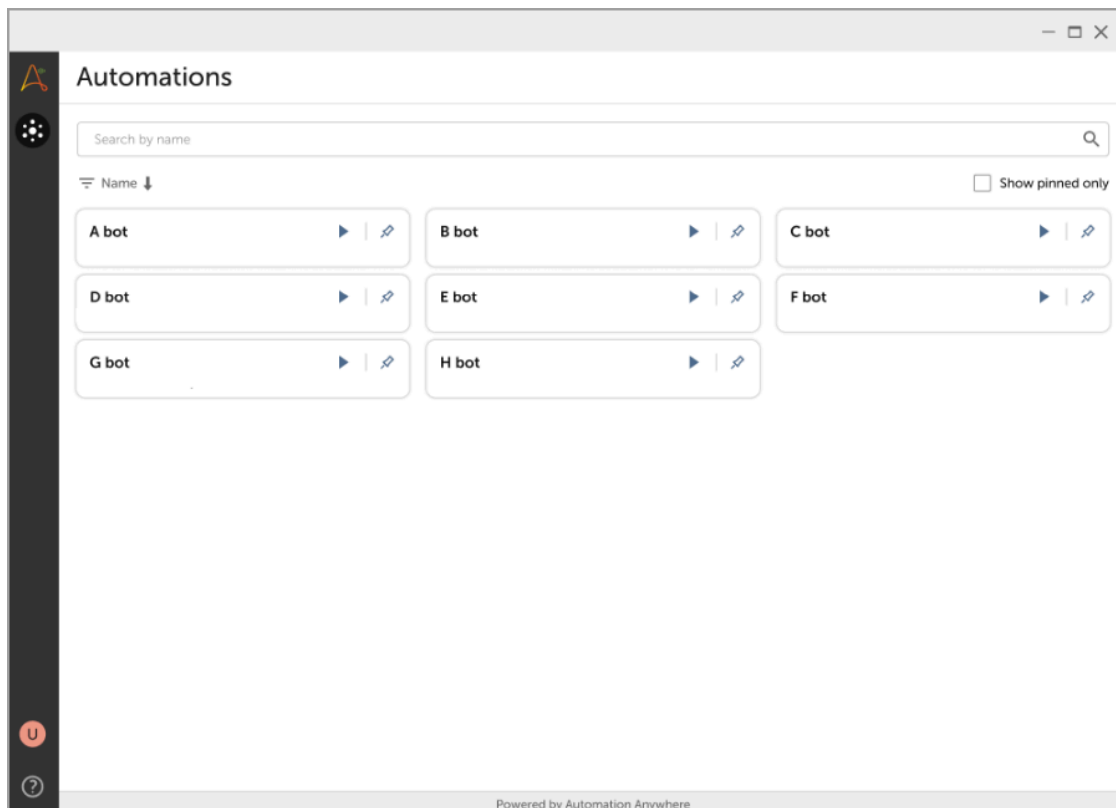

After the bot run is successful, a **Completed** message is displayed. You cannot launch another bot until this activity completes.

## Automation Co-Pilot Desktop Assistant automation activities

As an attended user who runs attended bots, you can perform several automation activities using Automation Co-Pilot Desktop Assistant .

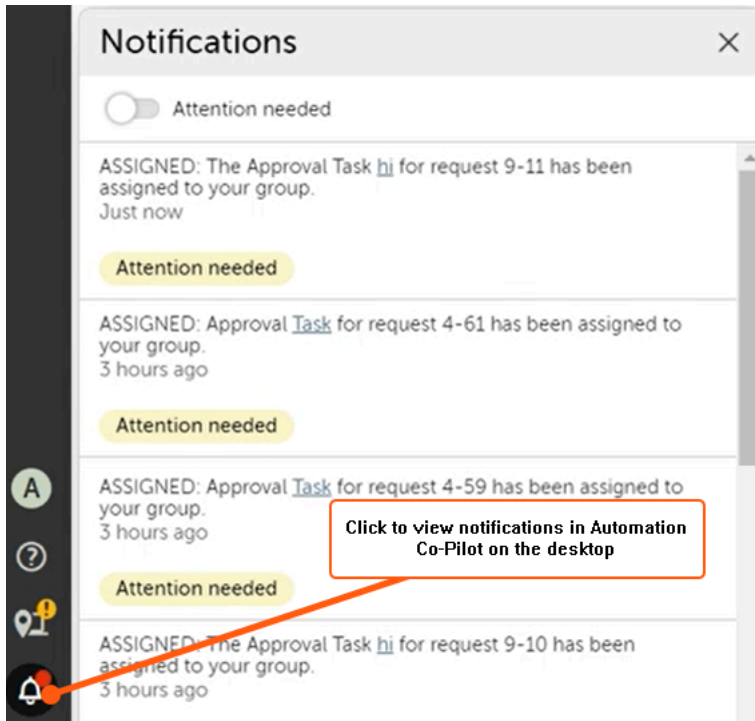

## Automations page overview

In Automation Co-Pilot Desktop Assistant , you can view a list of available bots for you to run in the **Automations** page.

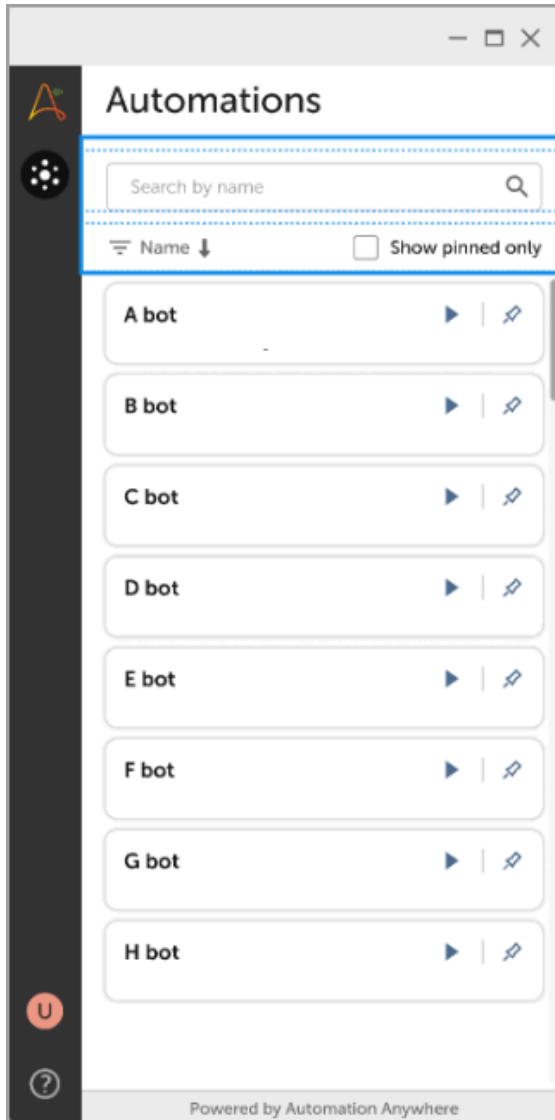

Based on your permission, you can view alerts and notifications from Automation Co-Pilot

through your desktop. To access the alerts, click the New notifications display with the (🔔) icon:

You can re-size the page to fit your screen and have its contents automatically adjust.

From the **Automations** page, you can also pin, sort, or search for bots.

## Key features

Continue pending automation

You can continue any pending automation that you started from different Automation Co-Pilot Desktop Assistant instances. If you start an automation from one instance and then reconnect to continue the automation on another instance, the automation will process.

This provides a consistent automation experience no matter which instance you use to access Automation Co-Pilot Desktop Assistant.

Consistent state

Automation Co-Pilot Desktop Assistant will remain in a consistent state regardless of how

View and run any available bots

many Automation Co-Pilot Desktop Assistant instances you use. The state will be updated to the latest state across all Automation Co-Pilot Desktop Assistant instances.

To view and run any available bots, simply click **Start** to start the automation.

View status or control bot progress in one page

After you run a bot, you can view its progress in real time.

The progress details of a bot run contains information such as:

- The name of the bot.
- The action that is currently being performed.
- The line number that is being executed.
- The total number of lines in the bot.
- Status of the bot run (% completed).

The progress details are displayed only when a bot is run on a local device by a user with Attended Bot Runner license.

You can also pause, start (resume), or stop the bot progress.

By presenting the status and bot controls on one unified page, this ensures consistency for each bot run.

---

**Note:** To use the bot controls, you must have the **Managed my activity** permission. Otherwise, you can view the controls only.

---

View detailed status

You can view the details of a bot status . For example, you can use the details to troubleshoot the automation if an error occurs.

## Queue automations

You can queue attended bots and manage multiple bot deployments.

## Queue page

In Automation Co-Pilot Desktop Assistant, the **Queue** page allows for you, an attended user, to view and manage your attended bots that are in multiple deployments. This helps keep track when you are deploying more than one bot at the same time.

The goal of this page is to help you manage on your pending queues at a quick glance.

## Benefits

Deploy more than one bot instance	You are able to deploy multiple bot instance and not limit yourself to just one bot deployment.
Identify when triggers are initiated	When you add triggers to your bots, the bots will automatically be placed in the queue.
Grants user direct control over queues	When your bots are in a queue, you have the ability to start and stop your queue at any time. You can also delete all bots from queue list using the <b>Delete all</b> function, or delete individual bots.
Continue queues where you left off	When you move devices or you accidentally disconnect your device while the queue has not been cleared up. You can always continue your deployment or progress when you log back.
Search for specific queues	You can search for specific queues using keywords and quickly identify queues that are on your list.

## Add Automation Co-Pilot URLs to trusted list

To ensure secure access to Automation Co-Pilot services, add URLs specific to the service to your safe recipients or trusted list.

### Automation Co-Pilot URLs list

Because Automation Co-Pilot service hosting uses dynamic IP addresses, we recommend you add the following complete URL instead of an IP address for Automation Anywhere services to your safe recipients or trusted sites list.

Service	Description	URL	Device
Telemetry	Allows performance and usage information to be gathered anonymously in order to improve product quality.	<ul style="list-style-type: none"> <li>cdn.pendo.io</li> <li>app.pendo.io/</li> <li>data.pendo.io/</li> <li>https://pendo-static-5673999629942784.storage.googleapis.com/</li> <li>https://pendo-io-static.storage.googleapis.com/</li> </ul>	Bot Creator and Co-Pilot User devices
Documentation	Allows documentation content to be displayed to the creator while building automations.	<ul style="list-style-type: none"> <li>https://iph.zoominsoftware.io/</li> <li>https://automationanywhere-be-dev.zoominsoftware.io/</li> <li>https://automationanywhere-staging.zoominsoftware.io</li> <li>https://docs.automationanywhere.com/</li> <li>https://automationanywhere-be-prod.automationanywhere.com</li> <li>https://*.youtube.com/</li> <li>https://*.wistia.net/</li> <li>https://*.wistia.com</li> </ul>	Bot Creator devices

Service	Description	URL	Device
Storage	Allows files to be stored and exchanged between Co-Pilot User and automations.	<ul style="list-style-type: none"> <li>• <a href="https://*.amazonaws.com/">https://*.amazonaws.com/</a></li> <li>• <a href="https://*.googleapis.com/">https://*.googleapis.com/</a></li> </ul>	Bot Creator and Co-Pilot User devices
Assets	Allows assets like fonts and icons to be correctly displayed in the user interfaces.	<ul style="list-style-type: none"> <li>• <a href="https://fonts.googleapis.com/">https://fonts.googleapis.com/</a></li> <li>• <a href="https://fonts.gstatic.com/">https://fonts.gstatic.com/</a></li> </ul>	Bot Creator and Co-Pilot User devices

## Using virtual window for picture in picture

You can set up and configure attended bots to run in a virtual window [picture in picture (PIP) mode] in Automation Co-Pilot.

### What is virtual window?

Virtual window is a feature in Automation Co-Pilot where you can configure your bots to run in a virtual window. This feature uses the Microsoft child sessions feature to render a second window (picture-in-picture mode) on your desktop. When you use this feature with Automation Co-Pilot, you can view a small window of your automations on your desktop, enabling you to interact or reference it as you work on other important tasks.

---

**Note:** Child sessions is a feature built by Microsoft to enable the picture-in-picture mode in Windows. Automation Co-Pilot uses the virtual window option to access this Microsoft child sessions feature. The automation experience remains the same and is maintained by Automation Co-Pilot for Business Users. To learn more about Microsoft child sessions, see [Microsoft Child Sessions](#).

---

### Why is virtual window important?

An Co-Pilot Admin can select virtual window to configure their bots and assign their teams to use. Team members can simply run their bots and the virtual window will automatically start the automation process. As an Co-Pilot Admin, you can automate while maintaining control and the ability to multitask without having to remain on a bot page or application, and waiting for the automation progress to complete.

While you automate with virtual window, your computing devices (such as your mouse and keyboard) remains available to use without blockers.

## Virtual window scenario

A small but busy customer success team at a large service company wants to address and automate hundreds of support tickets that are submitted each day.

With the proper configuration, Jake (an Co-Pilot Admin for the customer success team) can configure bots for each customer agent of his team to automate tasks and manage their multitasking duties to resolve other issues.

Jake is an Co-Pilot Admin

- He is an admin of a team and can manage bots and team assignments for members of his team.
- He plays the vital role of bots and teams configuration in Automation Co-Pilot for Business Users.
- He can select the virtual window option when configures bots for his team.

When Zoe (an Co-Pilot User and customer success agent) automates a customer request, would typically need to verify a lot of time-consuming customer information on one automation page. However, if Zoe could automate using a virtual window in Automation Co-Pilot, she would be able to multitask while the bot runs in her desktop background.

Zoe is an Co-Pilot User.

- She is a member of a team.
- She can run bots in a virtual window to automate her tasks.
- Her goal is to run bots and ensure her tasks are completed.

Zoe would be able to automate these daily operations:

- Customer requests
- Refund policy
- Updating customer information.

For details on each user roles and function, see [Users and team roles for Automation Co-Pilot](#) on page 3609.

For details on teams and functions, see [Team management](#) on page 3580.

## How to use virtual window

The following video provides a sample walk through of configuring bots and running in a virtual window, showing two personas (Co-Pilot User and Co-Pilot Admin) and their key tasks.

For a detailed procedure, follow these steps:

1. [Create a bot for a virtual window](#) on page 3573.
2. [Configure a bot to use virtual window](#) on page 3573.
3. [Run your bot with virtual window](#) on page 3573.

---

**Important:** In some cases when you deploy your bot using virtual window, the user credential window will prompt you to log in every time. As a workaround, you must log in to the user credential window and authenticate only one time, then log out or restart your

system. When you log in again and run your bot, the window does not prompt again. This is a known behavior for the Microsoft child sessions feature.

---

Triggers is not supported

The virtual window does not support triggers and does not work if bots contain triggers.

Solution to server manager error

When you encounter a server manager error when you run bots in virtual window, see [Solution for server manager error](#) on page 3574.

## Create a bot for a virtual window

In this example for picture in picture, Zoe is an Co-Pilot User with access to the Automation 360 Control Room for creation and check in of bots.

- Zoe has the Bot Creator license to create bots in the Control Room.
- Zoe has the Bot Creator license to check in bots in the Control Room.
- Zoe has access to the Control Room.

Zoe is a single persona that completes this task in cooperation with other personas to demonstrate the full procedure of the using the virtual window (see link at bottom of page).

1. Log in to the Control Room.
2. Create a bot.

Zoe can create any bot without triggers. She, like any developer, can run the bot without checking in.

To access this bot, Zoe and her customer success team will need to be assigned to this bot. As an Co-Pilot Admin, Jake can view and manage the bot that Zoe checked in, in Automation Co-Pilot for Business Users.

## Configure a bot to use virtual window

As the Co-Pilot Admin, Jake can configure bots for his team. Since Zoe has checked in a bot, Jake will be able to configure this bot to enable the virtual window option in Automation Co-Pilot.

- Jake has the system-created **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- Jake has access to Automation Co-Pilot for Business Users.

1. Log in to Automation Co-Pilot.
2. [Configure a bot](#) on page 3598.

Jake can configure the bot that Zoe has checked in and set the option to run a bot in a virtual window. Additionally, Jake can assign Zoe and her team to this bot for them to access it in Automation Co-Pilot.

After Jake has configured the bot and assigned it to Zoe, Zoe can then deploy this bot .

## Run your bot with virtual window

Zoe can run her assigned bots which have been configured to use virtual window. She can use Automation Co-Pilot Desktop Assistant to run these bots from her desktop.

Zoe has access to Automation Co-Pilot Desktop Assistant.

1. Log in to Automation Co-Pilot Desktop Assistant.
2. Run the configured bot.  
Zoe selects the bot that Jake had configured. When Zoe deploys the bot, a virtual window appears on her desktop.
3. Optional: Click the edit icon to edit the virtual window.  
By selecting the **edit** icon, Zoe can interact in real-time with her bot deployment through the virtual window.

### Solution for server manager error

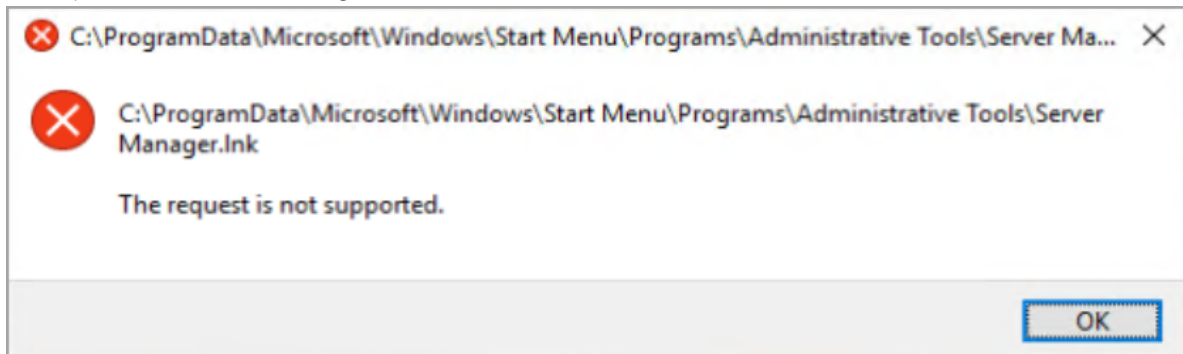

You might encounter a server manager error when you launch bots using the virtual window. This topic will help troubleshoot if you counter that problem.

You have successfully created a bot to deploy with virtual window. See [Using virtual window for picture in picture](#) on page 3571.

**Note:** Child sessions (picture-in-picture mode) is a Microsoft Windows feature. Virtual window is an Automation Co-Pilot feature that uses Microsoft child sessions.

When you deploy a bot with virtual window, you might encounter an error message that relates to the server manager. This does not occur for every instance but when it does occur, you can follow these steps to resolve this issue.

Example of the error message:

1. Modify the settings for the individual server as follows:
  - a) Open the server manager.
  - b) Navigate to **Sever Manager > Properties**.  
This page allows you to modify the setting at the individual server level.
  - c) Select the **Do not start Server Manager automatically at logon** setting.
2. Modify the settings at the central level by using group policy as follows:
  - a) Log in to domain controller.
  - b) Launch Group Policy Management console.  
You can start the Group Policy Management console when you navigate to **Server Manager > Tools > Group Policy Management**.

**Note:** If the Group Policy Management is not visible, then you can add this as a feature in **Server Manager > Add Roles and Features**.

- c) Create GPO in domain where all server machines belong.
  - d) Navigate to **Computer Configuration > Policies > Administrative Templates > System > Server Manager** in the Group Policy Management editor.
  - e) Right click the **Do not display Server Manager automatically at logon** setting.
  - f) Click **Edit**.
  - g) Select **Enabled** to enable the setting.
  - h) Click **OK** to close the Group Policy Management console.
- When the policy is applied, the server manager will not launch when you run your bot with virtual window.

---

**Note:** The policy will be applied based on the Group Policy refresh interval for your device. If the policy is not applied then run the **gpupdate /force** command.

---

## Automation Co-Pilot for Business Users on the web interface

The Automation Co-Pilot for Business Users on the web interface is an intuitive portal and dedicated workspace for the Co-Pilot User to create requests, run tasks, and for an Co-Pilot Manager to create manage team roles and deployment.

---

**Note:** Roles, permissions, and licenses might continue to reference Automation Anywhere Robotic Interface (AARI)] within the product.

---

Automation Co-Pilot for Business Users on the web interface provides an engaging experience with attended and unattended bots. It gives you a one-stop place to view and organize your documents and tasks, perform actions, and hand over the work to bots. In addition, it provides a process-centric approach to deliver automation.

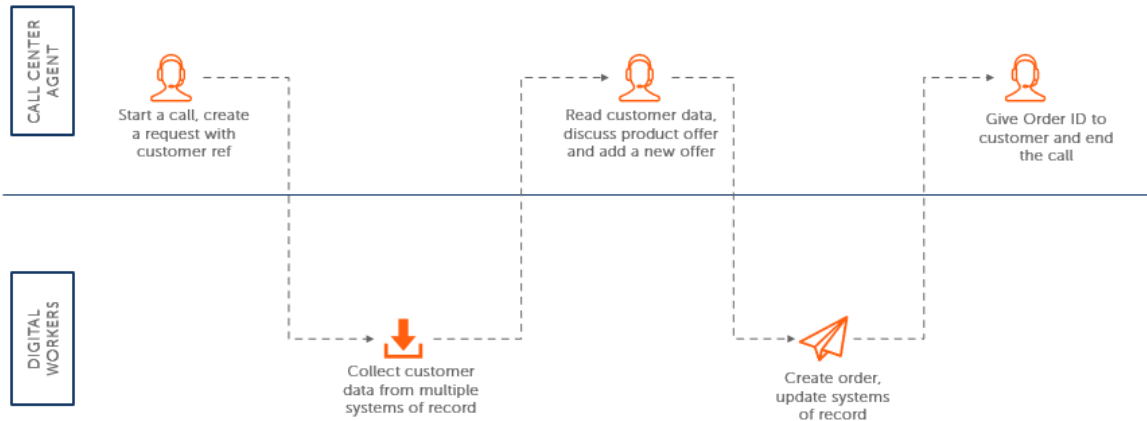

### Capabilities

Automation Co-Pilot for Business Users on the web interface helps you in the following ways:

- Start automation from an easy-to-use process catalog.
- Automate long-running workflows across multiple users and bots.
- Handle bot exceptions.
- Train users and reduce errors with guided automation.
- Multitask with humans and bots.
- Monitor and audit attended automation.

Automation Co-Pilot for Business Users on the web helps multiple users to collaborate with bots without disruption and without accessing your personally identifiable information (PII) data and confidential systems.

The following image illustrates the front-office automation capability:

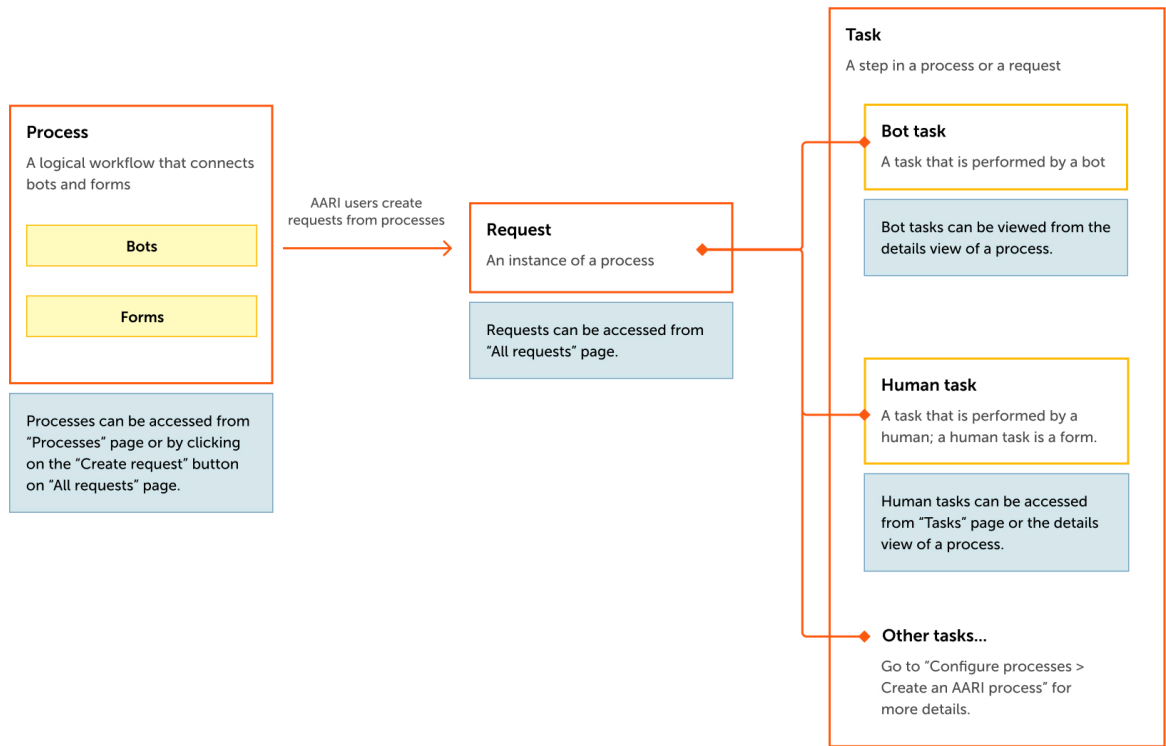

## Components

Automation Co-Pilot for Business Users on the web interface includes the following components:

Bots	The bots automate specific, repetitive, rule-based tasks.
Form	The form enables humans to invoke and interact with the bots through the customizable web interface.
Process	The process connects the bots and the forms together. The process contains the logic for triggering the bots and the forms and coordinating the flow of data between them.
Request	The request is an instance of a process. If the process defines a template of how bots and forms interact, a request is a specific instance of that template.
Task	Tasks are the steps that must be performed within a process. Processes can have two types of tasks: <ul style="list-style-type: none"> <li>• Bot task: A task that is performed by a bot.</li> <li>• Human task: A task that is performed by a human; a human task is a form.</li> </ul>

Review the following image to gain a better understanding of the relationship between these components.

## Architecture

The following images illustrate the architecture of Automation Co-Pilot for Business Users on the web interface:

Storage parameters for process automation are detailed in the following topic. [Cloud storage usage](#) on page 3711

## Setting up

The following workflow lists how to use Automation Co-Pilot for Business Users on the web interface to automate and manage your tasks:

1. [Configure processes](#)
2. [Deploy processes](#)

---

**Note:** To view the Automation Co-Pilot for Business Users on the web interface tasks in an interactive visual format, see [Get started with AARI](#).

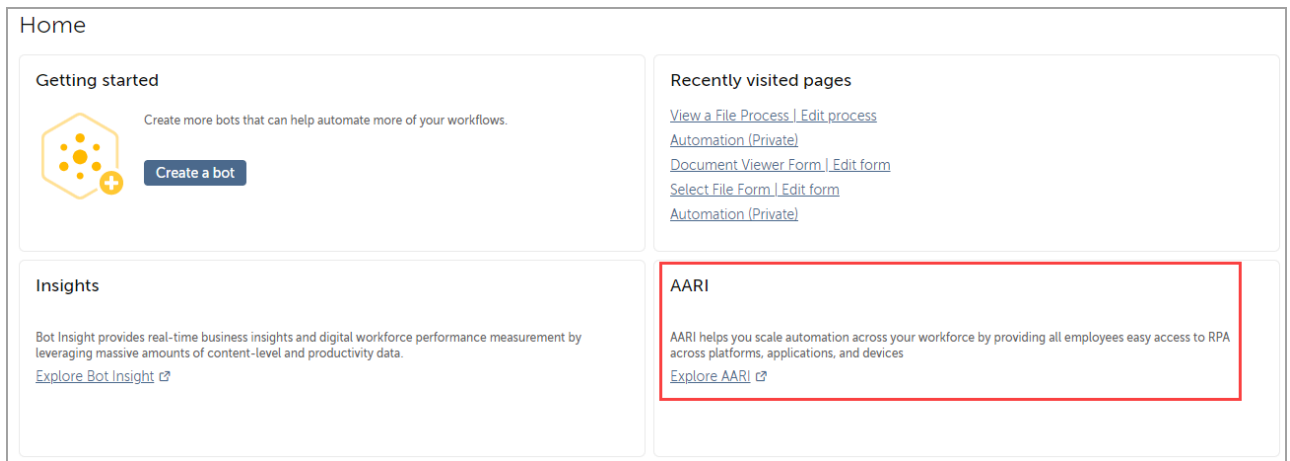

---

## Deploy processes

Automation Co-Pilot for Business Users on the web interface provides a dedicated workspace to organize processes, create requests, and run and view tasks. An Co-Pilot Manager can create new teams and manage team roles and deployment of tasks.

You can access Automation Co-Pilot from the Automation 360 home page by clicking the **Explore AARI** link which provides a shortcut

to Automation Co-Pilot for Business Users on the web interface.

The checked-in processes are available in Automation Co-Pilot for Business Users on the web interface and can be assigned to the teams so that the team members can create requests and complete tasks.

The three main components involved in deploying a process are as follows:

- [Team management](#) on page 3580
- [Manage a process in Automation Co-Pilot](#) on page 3581
- [Request management](#) on page 3582

## Deployment workflow

The following workflow describes the steps involved in deploying a process:

1. [Create a team and assign roles to team members](#) on page 3612.
2. [Assign a team to a process](#) on page 3589.
3. [Create a request and complete a task](#) on page 3587.

## Other tasks

Depending on the requirement, you can also perform the following tasks:

- As an Co-Pilot Manager, you can either assign or unassign tasks to your team members.  
[Assign or unassign a task](#) on page 3591.
- To clear the memory space, as an Co-Pilot User, Co-Pilot Manager, or Co-Pilot Admin, you can delete the requests that are no longer required.  
[Delete a request](#) on page 3588.
- To make process selection easier at the time of request creation, as an Co-Pilot User or Co-Pilot Manager, you can view, pin, or search for your assigned processes.  
[View and search for a process](#) on page 3591.
- As an Co-Pilot User, to quickly search for a specific request created, you can filter and search for that request.

[Filter and search for a request](#) on page 3592.

- As an Co-Pilot User, when you have many tasks created from multiple requests, you can filter and search for a specific task.

[Filter and search for a task](#) on page 3594.

- You can edit your process in the **Process** page of the web interface.

[Configure a process](#) on page 3599

- As an Co-Pilot Admin, you can edit bots to set parameters, enable virtual window, and assign teams to bots.

[Configure a bot](#) on page 3598

Related concepts

[Users and team roles for Automation Co-Pilot](#) on page 3609

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

[Reference ID properties](#) on page 3583

The reference ID is a unique key reference that help you identify your related processes and requests. The reference ID is also different for teams, process, and bots.

## Team management

Team management is an essential function of Automation Co-Pilot for Business Users on the web interface. The basis of request and process assignment is dependent on the team setup.

### Overview

The team configurable in Automation Co-Pilot helps business managers to define the following aspects:

- How a request can be created
- How a request is visible to the other users
- Who can read, update, or delete requests

### Team structure

A team contains users with specific team roles—**Admin**, **Owner**, and **Member**. The admin has the ability to modify their team. By default, the Co-Pilot Manager is the **Admin** of their team. They can create new teams, manage existing teams, assign team roles to their team. As an admin, an Co-Pilot Manager can add other admins to their teams. A team can have more than one admin but must have at least one admin. To access a process and create new requests, the Co-Pilot Manager must request the Co-Pilot Admin to assign the Co-Pilot Manager team to a process.

An Co-Pilot Admin can also simultaneously add multiple users with similar roles (custom role) to the team. The custom role in the Control Room is aligned with a team in Automation Co-Pilot, and the behavior of the enhanced team setup is as follows:

- The users added with the custom role are assigned a **Member** role within the team. This role cannot be changed to **Owner** or **Admin**.

- You cannot view these users added with the custom role in the **Users** tab of the **Manage > Team** page.
- If a user is added through the custom role and also added manually to the team, their role in the team will be the same as the role assigned to them manually. For example, if the user is a **Member**, they will continue to have the **Member** role whereas if the user is an **Owner**, they will be assigned the **Owner** role in the team.
- If the user is no longer part of a custom role, the user will also not be a part of the team.

For example, create a custom role (aari\_role\_finance) in the Control Room and add the required users (aari\_user1, aari\_user2, aari\_mgr1) to this role. You can now add this custom role, aari\_role\_finance, to a team in Automation Co-Pilot, and the users associated with this role are automatically added to the team. The team role of the users (aari\_user1, aari\_user2, aari\_mgr1) is **Member**. The team role of these users cannot be changed from **Member** to either **Admin** or **Owner**. If aari\_user2 is added as a part of aari\_role\_finance and also added manually through the **Users** tab and the role is **Owner**, then the team role of this user is retained as **Owner**.

## Team types

Each team is configured to a team type (shared or private) and depending on that type, requests that can be viewed and accessed by members of that team might change.

- **Shared**: All the requests can be viewed by admins, owners, and members of that team.
- **Private**: Requests can be viewed only by the users creating those requests and the owner and admin of the team.

The team roles are based on the Control Room role assigned to the user. Each team role has a subset of permissions and actions that can be performed by that role. These sets of permissions vary between the shared and private team types.

Related concepts

[Users and team roles for Automation Co-Pilot](#) on page 3609

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

## Manage a process in Automation Co-Pilot

A process contains bot and human tasks. An Co-Pilot Admin can manage and assign processes to teams to deploy processes or automate tasks.

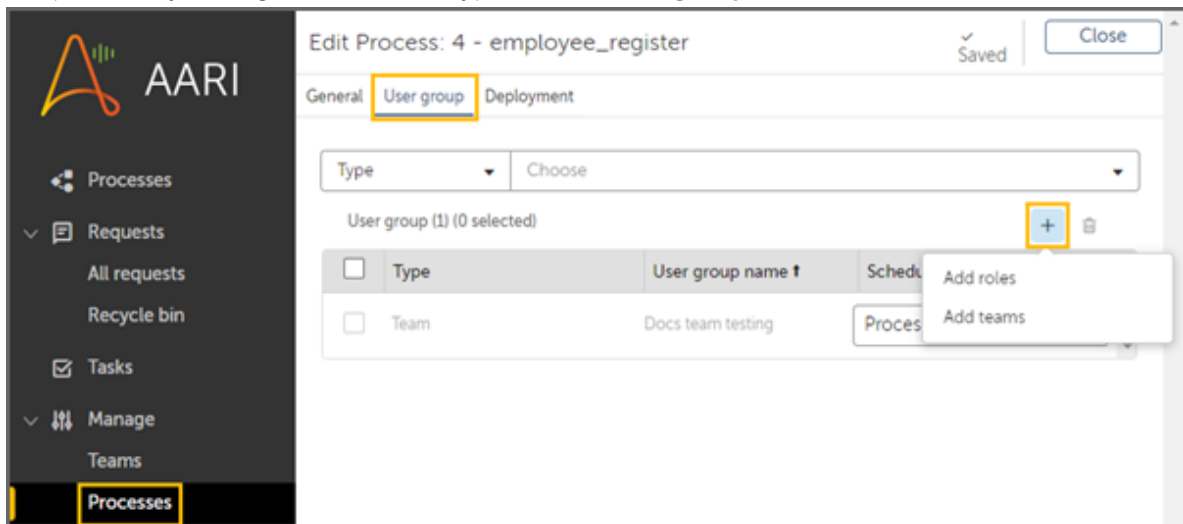

The Co-Pilot Admin performs global process management tasks. Such tasks include, but are not limited to:

- View the checked-in processes from the Control Room.
- Assign teams to a process for request creation.
- View and resolve pending requests and tasks.

You can view your requests on the **Processes** page. For easy access to a specific process, you can sort the processes by name in ascending or descending order and toggle the pinning of a process. The responsive view of the **Processes** page adjusts the display to your screen size. To guide with your team assignment, you can also reference the team from which a request is created by referring to the team name added in the process tile on the **Processes** page.

Select a process to begin editing and select who and how the process can be run. Find initial settings on the General tab. Enable users to run the process by adding role and team types on the **User group** tab.

## Request management

A request must be created to automate processes to complete assigned tasks. Members of a team create requests and complete the corresponding tasks.

Requests must always be created within a team. This ensures that the teams assigned to the same process cannot see each other data. By default, an Co-Pilot User, selected as an owner or member of their team, can create requests because their role has the **AARI license**, which enables them to access Automation Co-Pilot and create requests.

The structure of request creation is as follows:

- An Co-Pilot User (team owner or member) can access and view all the processes that are assigned to a team on the **Processes** page.

- The Co-Pilot User must provide all the required information in an **initial form**.
- The bots and human tasks run in the **request view** page, which contains high-level details of the tasks.
- The task information is displayed in the **Requests** page, for the Co-Pilot User to verify.
- The Co-Pilot User can view their requests on the **Requests** page. They can manage or sort their existing requests by using a filter.
- A request can be created by either a user or a bot on the **Edit Process** page. If the request is created by a user, the process is displayed on the **Processes** page. If the request is created through a bot, the user cannot create a request or view the process.

## Reference ID properties

The reference ID is a unique key reference that help you identify your related processes and requests. The reference ID is also different for teams, process, and bots.

### Overview

The main objective of the reference ID is to help the user quickly identify all associated processes and the number of requests created from a process.

#### Requests

A reference ID is created from a **Process key**, a unique text input, that a user can enter when they edit their process. When the user configures their process key, it creates a prefix that corresponds to their process.

#### Key enhancements:

- The **Reference** column in the **Requests** page shows the numbers of reference ID (e.g. **2-42, 98-10, MAIN-5**).
- The **Process key** and number of request iterations helps the user identify the sequential consistency among the number of requests for a given process (e.g. A **Finance** process with the **FIN** process key and number of new requests shows **FIN-1, FIN-2, FIN-3, FIN-10**).

#### URL enhancements:

- The **Requests** URL is now changed to `entity/ref/:ref` from `entity/:id`.
- You can access requests directly when you enter the **reference ID** (ex: `/aari/#/requests/all#/requests/ref/2-34`).
- If the user opens any request using **Request ID**, the URL now redirects using **Reference**. For example, consider the **Request ID** as 896 and **Reference** as 2-34 for a request. If the user views the request using the **Request ID** (`/aari/#/requests/all#/requests/896`), the URL will redirect using the **Reference** (`/aari/#/requests/all#/requests/2-34`).

#### Scenario - Create a process key to view reference ID

1. You edit a **Beta** process to create a **Process key** called **ALPHA**.
2. You create multiple requests from **Beta** process.
3. For each requests created from the **Beta** process, the **ALPHA** process key will iterate one time.
4. You access the **Requests** page and view the **Reference** column.

5. The **Reference** column shows **ALPHA-1, ALPHA-2, ALPHA-3**, this is the **reference ID**.
6. You can now view the **reference ID** for all related processes.

Bot/Process/Team

For **Bot, Process, and Team**, the function is different compared to **Request**. The **request ID** from a previous environment is now replaced by the **reference ID**, this is to improve the single tenant experience by making a logical sequence to a referential number.

URL enhancements:

- The **Edit Process** page now shows an updated URL (ex: /aari/#/manage/process/ref/96) where the user can directly access a process when they enter the **reference ID**.
- The **Edit Team** page now shows an updated URL (ex: /aari/#/manage/team/ref/123) where the user can directly access a team when they enter the **reference ID**.

## Update changes in Automation Co-Pilot for Business Users from Automation 360 v.21 or later versions

From version Automation 360 v.21 or later, there is a change in how the teams work in Automation Co-Pilot for Business Users on the web interface. Advanced team management now helps business managers define how a request can be created. They can also specify who can view or delete requests.

To ensure that there is no discontinuity in the existing behavior for users who had any access to a process or created requests from a process (regardless of existing team assignment), the following conditions should be maintained:

- The user access to create a request for a specific process is retained.
- The user access to view the requests from a process regardless of the team they were part of is also retained.

### How existing teams are changed

To maintain the current access to processes and the current teams, the existing teams remain with the following:

- Existing process assigned to them.
- Same members assigned to the team.
- The team type is configured to shared. This ensures that all the members of the team can view the migrated processes and requests.
- Members of the team have one of the following team roles:
  - Co-Pilot Manager or Co-Pilot Admin has the admin role
  - Co-Pilot User has the member role

To maintain the current access to requests, new teams are created for each process and the new team has the following:

- Existing processes assigned to the team are named "Teams Migrated for Process X" where X is the process ID. This helps reference the migrated processes. Teams are created for existing processes with this name.
- Users who had access to the process previously are assigned to this team regardless of their existing team assignment, and the team is assigned to the process.
- The team type is configured to shared.
- Members of the team have one of the following team roles:
  - Co-Pilot Admin
  - Co-Pilot Manager
  - Co-Pilot User

Previously, the Co-Pilot Manager could create requests without assigning the processes to teams. After the update, they must create teams and ask the Co-Pilot Admin to assign their team to a process in order to create new requests.

**Important:** After the migration process and the creation of the migrated team, in the request creation, there will be two processes (one for each team) for you to select. The two processes will have different behaviors for the request visibility.

## Example

The following scenario helps illustrate how the update works.

Consider a process named **Loan Closing** with process ID **47**. Georges has an Co-Pilot Admin role in the Control Room.

Before Update

Two teams HR and IT have access to the **Loan Closing** process and the team structure is as mentioned in the table below.

HR		IT	
User Name	Control Room Role	User Name	Control Room Role
Bob	Co-Pilot Manager	Grace	Co-Pilot Manager
Carol	Co-Pilot User	Steve	Co-Pilot User
Debby	Co-Pilot User	Debby	Co-Pilot User

The behavior before the update is as given below:

- Users from the HR team can see requests created in the IT team and vice versa.
- Bob and Grace can assign the processes that have been previously assigned to them by Georges to the HR and IT team respectively.
- Bob can manage the HR team and similarly, Grace can manage the IT team such as add members, assign processes, rename the team, so on.

After update

The two initial teams (HR and IT) still remain and additionally one new team (named **Team Migrated** for Process **47**) is created during the update. The team structure of all the three teams are mentioned in the table below:

HR			IT			Team Migrated for Process 47		
User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role	User Name	Team Role	Control Room Role
Bob	Admin	Co-Pilot Manager	Grace	Admin	Co-Pilot Manager	Bob	Admin	Automation Co-Pilot manager
Carol	Member	Co-Pilot User	Steve	Member	Co-Pilot User	Carol	Member	Automation Co-Pilot user
Debby	Member	Co-Pilot User	Debby	Member	Co-Pilot User	Debby	Member	Automation Co-Pilot user
					Co-Pilot User	Grace	Admin	Automation Co-Pilot manager
						Steve	Member	Automation Co-Pilot user

The behavior of the teams after the update is as given below:

- Members from the HR team cannot see the requests created in the IT team and vice versa anymore.
- As Debby is a part of both HR and IT team, this user can create requests in both the teams. Two different process cards are displayed to the user during request creation.
- Old requests created inside the HR and IT teams are treated like they were created inside the common team named Team Migrated for Process 47 which has only the Loan Closing process (47) assigned to it.
- Members from both HR and IT teams are all part of Team Migrated for Process 47 and so they can access the old requests. Deleting the team Team Migrated for Process 47 deletes the requests associated with it, so old requests access is removed and cannot be restored.
- Members from HR or IT team can create requests inside the team Migrated for Process 47 and those requests are visible to all the members of the HR and IT team.
- Bob and Grace can manage the HR and IT team respectively as well as jointly manage the Team Migrated for Process 47. This means they can add members to the team, rename the team, remove members from the team, so on.
- Bob and Grace can now only view the processes assigned to their teams by Georges.

**Important:** During the update, issues with team admin assignment might occur intermittently, whereby either the creator of the team is incorrectly assigned the member role instead of the team admin role or other team members are assigned the team admin role instead of the member role. After the update, the Co-Pilot Admin must always verify the team admin assignment.

The following example explains the team admin assignment issue:

Before update: Bob creates the HR team and has the Co-Pilot Manager role, with Carol, Debby, Grace, and Steve as team members and having Co-Pilot User roles.

After update: Bob is assigned the team admin role along with Carol. Debby, Grace, and Steve are assigned the team member roles. In this case, Carol is incorrectly assigned the admin role instead of the member role. The Co-Pilot Admin must verify the team admin assignment and change Carol's role to team member.

---

## Create a request and complete a task

An Co-Pilot User can create a new request from processes that is their team is assigned to, enter required information in an initial form, and complete tasks.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- Assigned the AARI license.
- Have access to Automation Co-Pilot.

**1.** Log in to Automation Co-Pilot as an Co-Pilot User.

As an Co-Pilot User, you are now assigned to a team with an owner or member team role, created by the Co-Pilot Manager or Co-Pilot Admin.

**2.** Navigate to the **Processes** page.

This page shows all available processes that your team was assigned to by the Co-Pilot Admin.

**3.** Select an assigned process.

The initial form appears and shows the required fields for you to complete. These fields are from supported interactive form elements.

---

**Important:** Processes now includes team names associated to the process that the team is assigned to. The **Team Migrated For Process** team name indicates that the process is available to team members who had previous access to that process, regardless of team assignment, before the Automation 360 upgrade.

---

**4.** Complete the required information to the initial form.

You can also fill your initial forms via the URL parameters that is for your **Date**, **Number**, **Text Box**, and **Time** elements.

**5.** Optional: To view the request in a different tab, select the **Open request in New Tab** option.

**6.** Click **Submit** to confirm the information and progress.

Optionally, you can click **Cancel** to discard your changes.

**7.** View the request view page.

Your process is now running, and you might be prompted to complete pending tasks in the request tabs.

**8.** Complete the required task information in the request tab.

As the bot completes its task, it might prompt you to take over and complete the remaining steps.

**9.** View your request status.

Your request is now completed.

**10.** Navigate to **Requests > All requests** to view all requests created in the team.

11. Optional: Click **Create request** button to create a new request from the **Request** page.

## Delete a request

An Co-Pilot User, Co-Pilot Manager, or Co-Pilot Admin can delete requests that are no longer required. Deleting requests helps clear the memory space. You can also recover a deleted request if necessary.

Ensure you have completed the following:

- Assigned a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
  - OR **AAE\_Robotic\_Interface Manager** for the Co-Pilot Manager.
  - OR **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- You must have a license and log in as the Co-Pilot User, Co-Pilot Manager, or Co-Pilot Admin.

Open requests can be deleted if they are part of a public process by changing the process settings.

The screenshot displays the AARI interface. On the left, a dark sidebar contains a navigation menu with items: Processes, Requests (with sub-items 'All requests' and 'Recycle bin'), Tasks, Manage (with sub-items 'Teams' and 'Processes' highlighted), Bots, Applications, and Extensions. At the top of the main content area, the title is 'Edit Process: 4 - employee\_register'. Below this are three tabs: 'General' (selected), 'User group', and 'Deployment'. The 'General' tab contains several settings: a 'Select tags' dropdown menu with a note 'Maximum number of tags: 500'; a 'Default assigned group' dropdown menu set to 'Docs team testing - Team' with a note 'The selected user group will be the default responder of the Request.'; a 'Request creation' section with a checked checkbox for 'by user' and an unchecked checkbox for 'by bot'; and a 'Request retention' section with a dropdown set to 'Disabled' and a text input set to '30' (with a note 'Min=1 Max=60'). At the bottom of the settings, there is a yellow highlighted checkbox labeled 'Allow Open Requests to be moved to the Recycle Bin'.

- An Co-Pilot Admin can delete any request. Requests that are in **Cancelled**, **Failed**, or **Completed** status can be sent to the recycle bin by other users.

**Note:** The Co-Pilot Admin is the only user who can permanently delete requests.

---

- The Co-Pilot Manager can delete requests of the team for which they are the owner.
  - The Co-Pilot User can delete only the requests they have created.
- 

**Important:** Files that are associated with a process are deleted when the request is deleted or are automatically deleted after 90 days.

---

1. Log in to Automation Co-Pilot.
2. Navigate to the **Request** tab.
3. From the list of requests, select the request or requests you want to delete and click the delete icon.  
A confirmation message appears to confirm the deletion.
4. Click **Yes, delete** to delete the selected requests.
5. Optional: To recover a deleted request or requests, perform these steps:
  - a) Navigate to the **Recycle Bin** tab.
  - b) Select the requests you want to recover and click the recover icon.  
A confirmation message appears to confirm recovery of the request.
  - c) Click **Yes, recover**.  
The requests are recovered and appear in the **Requests** tab.

## Assign a team to a process

An Co-Pilot Admin can configure processes in the web interface and assign teams to a process for request creation. They access the web interface to view and manage processes in the **Process Setup** page.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- Have access to Automation Co-Pilot.

As an Automation Co-Pilot admin, a key function is to assign teams to a process.

---

**Note:** If only the default team is assigned to a process, then another team must be assigned before the default team can be removed. See steps 11 to 14 to change a default team.

---

1. Log in to Automation Co-Pilot as an Co-Pilot Admin.
2. Navigate to **Manage > Process setup**  
The **Process Setup** page enables the Co-Pilot Admin to view all of the check-in processes from the Control Room and assign teams to a process.
3. Click on a process.  
An **Edit Process** window appears and shows related information about the process such as the process name, description, tags, and teams.
4. Edit the **Process name** field if necessary.
5. Optional: Enter a description in the **Description** field.
6. If no tags exist, input any tag name in the **Tags** field to attribute tags to the process.

Follow steps 7 and 8 to add existing tags, or you can skip to step 9.

7. Search for a tag description in the search bar.
8. Click **Add** as a new tag.  
A new tag will be added.
9. Select the scheduler user from the drop-down menu in the **Scheduler** field.

---

**Note:** The **Global scheduler** option is selected by default if a scheduler is not set for any process.

---

10. Select the **by user** (default) or **by bot** options in the **Request creation** field.
- 

**Important:** If the **by user** option is selected, then processes are visible in the **Processes** page for all Co-Pilot Users (owners or members of team). If the **by bot** option is selected, then the request is created by a bot or another process using the **Process Task** in the **Process Composer**. A team must be selected in the **Default team to take the bot created request** field, for requests to be created by that team.

---

11. Click the **+** (plus) icon to add teams to the process.  
The **Add teams** window appears to search for teams to add.
12. Search for a team in the search bar.
13. Click on their name to confirm the team.
14. Click **Add**.

A team is now successfully added to the process. A small **Default** label will appear next to the team selected as the default.

---

**Note:** If only the default team is assigned to a process, then another team must be assigned before the default team can be removed.

---

15. Optional: To remove a team, click the **trash** icon next to the team name.
16. Click **Save**.

## Bot setup for Bot Runner users

The Co-Pilot Admin can manage and assign bots to a team of attended Bot Runner users, for them to view bots in the Automation Co-Pilot Desktop Assistant.

The main purpose of this feature is to improve the bot assignment for attended Bot Runner users, to enable them to access only the bots that are assigned to their team by an Co-Pilot Admin.

This helps control which users can view or use a bot. However, if an attended Bot Runner user is not part of any team, they will be able to view and access all bots in Automation Co-Pilot Desktop Assistant.

For the Co-Pilot Admin to assign a team of attended Bot Runner users to a bot, they must have view permissions on folders containing the bot.

- The Co-Pilot Admin can access the **Bot Setup** page in the web interface to view all bots and assign them to a team. They can also assign multiple teams to a bot or remove teams from bots entirely.
- When new bots are added to this page, the bots can be assigned to a team of attended Bot Runner users.

- The attended Bot Runner users can view their assigned bots in Automation Co-Pilot Desktop Assistant.
- The attended Bot Runner user must have a role with access to the public folder where the bot resides.

## Assign or unassign a task

The Co-Pilot Manager and Co-Pilot User can assign specific tasks to their team. They can also unassign tasks.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface Manager** role for the Co-Pilot Manager.
- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- Have access to Automation Co-Pilot.

Co-Pilot Manager can assign tasks to all members who have access to a process. Co-Pilot User can assign tasks to other users in the same team. Both can unassign tasks.

1. Log in to the Automation Co-Pilot as an Co-Pilot Manager.
2. Navigate to the **Tasks** tab.
3. Select a task from the list.
4. Navigate to
  - **Unassigned**  
Tasks are unassigned by default.
  - **Assign to me**  
This option assigns the task to the current user.
5. Select the user.  
The task is now assigned.
6. Optional: Select **Unassigned**.  
The task is now unassigned.

## View and search for a process

Co-Pilot User can view, pin, or search their assigned processes.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- You are assigned the AARI license.
- You have access to Automation Co-Pilot.

1. Log in to Automation Co-Pilot as an Co-Pilot User.
2. Click **Create request** from the home page and choose from these options:

Option	Steps
View a process	View your assigned process in the <b>Select a process</b> window.  <b>Important:</b> A list of processes is available in the <b>All</b> tab by default and are assigned to your team by the manager.
View a pinned process	<ol style="list-style-type: none"> <li>a) Click the <b>pin</b> icon.</li> <li>b) Navigate to the <b>Pinned</b> tab.</li> <li>c) View your pinned process.</li> </ol>
Search for a process	<ol style="list-style-type: none"> <li>a) Click <b>Create request</b> from the home page.</li> <li>b) Navigate to the search bar.</li> <li>c) Enter your keyword.  The search bar dynamically searches your processes for common keywords. You can also search for tags.</li> <li>d) View the searched process.</li> </ol>

## Filter and search for a request

When an Co-Pilot User has created many requests, they can quickly search for a specific request in the **Requests** page.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User.
- You are assigned the AARI license.
- You have access to Automation Co-Pilot.

Follow these steps to quickly search or filter your requests:

1. Log in to the web interface as an Co-Pilot User.  
You are now in your home page, where you can view your requests.
2. Navigate to the **Requests** page and choose from these options:

Option	Steps
Sort	<p><b>a)</b> Click on a column.</p> <p>You can choose from: <b>Status, Reference, Process, Team, Request title Created , Updated</b> or <b>Tags</b>.</p> <p>The column is sorted to ascending order by default.</p> <p><b>b)</b> Optional: Click the same column again.</p> <p>The column is now sorted to descending order.</p> <p><b>c)</b> View your sorted requests.</p>
Search	<p><b>a)</b> Click <b>Status</b> (set by default).</p> <p>You can search by <b>Request title, Reference, Process, Tags, Data Privacy Tags</b> (Automation Co-Pilot Admin only), and <b>Team</b> .</p> <p><b>b)</b> Search for your request.</p> <p>The search bar dynamically searches for common keywords.</p> <ul style="list-style-type: none"> <li>• Enter the title in the <b>Request title</b> field.</li> <li>• Enter the reference key in the <b>Reference</b> field.</li> <li>• Enter a process name in the <b>Process</b> field.</li> <li>• Enter a tag name in the <b>Tags</b> field.</li> <li>• Enter a team name in the <b>Team</b> field.</li> <li>• Optional: Enter the query in the <b>Data Privacy tag</b> field.</li> </ul> <hr/> <p><b>Note:</b> This option is available only for the Automation Co-Pilot admin. The admin can update the field and manage any information about data privacy.</p> <hr/> <p><b>c)</b> Optional: Click <b>x</b> to clear searched keywords.</p> <p><b>d)</b> View the searched requests.</p>

Option	Steps
Filter	<p><b>a)</b> Click <b>Status</b> (set by default). You can filter by selecting from the drop-down menu.</p> <p><b>b)</b> Select from the drop-down menu. You can choose from <b>Completed, Failed, Cancelled,</b> and <b>Open</b>.</p> <p><b>c)</b> Optional: Click <b>x</b> to clear filtered keywords.</p> <p><b>d)</b> View your filtered requests.</p>
Date	<p><b>a)</b> Select <b>Created date</b> or <b>Updated date</b> field. The date range window appears.</p> <p><b>b)</b> Select the current date or specify any dates in the <b>From</b> and <b>To</b> fields.</p> <p><b>c)</b> Click <b>Submit</b>.</p> <p><b>d)</b> View your requests by the creation or modified dates.</p>

## Filter and search for a task

When an Co-Pilot User has created many tasks, they can quickly search for a specific task in the **Tasks** page.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface User** role for the Co-Pilot User .
- Assigned the AARI license.
- Have access to Automation Co-Pilot.

Follow these steps to quickly search or filter your tasks:

- 1.** Log in to Automation Co-Pilot as an Co-Pilot User.  
You are now in your home page, where you can view your tasks.
- 2.** Navigate to the **Tasks** page and choose from these options:

Option	Steps
Sort	<p><b>a)</b> Click on a column.</p> <p>You can choose from: <b>Status, Task Name, Assignee, Team, Request title, Reference, Task Created, Task Updated</b> .</p> <p>The column is sorted to ascending order by default.</p> <p><b>b)</b> Optional: Click the same column again.</p> <p>The column is now sorted to descending order by default.</p> <p><b>c)</b> View your sorted tasks.</p>
Search	<p><b>a)</b> Click <b>Status</b> (set by default).</p> <p>You can search by <b>Task Name, Request title, Reference, Data Privacy Tags</b> (Co-Pilot Admin only), <b>Assignee</b> , and <b>Team</b> .</p> <p><b>b)</b> Search for your task.</p> <p>The search bar dynamically searches for common keywords.</p> <ul style="list-style-type: none"> <li>• Enter a task name in the <b>Task Name</b> field</li> <li>• Enter the title in the <b>Request title</b> field.</li> <li>• Enter the reference key in the <b>Reference</b> field.</li> <li>• Enter an assignee name in the <b>Assignee</b> field.</li> <li>• Enter the team name in the <b>Team</b> field.</li> <li>• Optional: Enter the query in the <b>Data Privacy tag</b> field.</li> </ul> <hr/> <p><b>Note:</b> This option is available only for the Co-Pilot Admin. The admin can update the field and manage any information about data privacy.</p> <hr/> <p><b>c)</b> Optional: Click <b>x</b> to clear searched keywords.</p> <p><b>d)</b> View the searched tasks.</p>

Option	Steps
Date	<p><b>a)</b> Select <b>Created date</b> or <b>Updated date</b> field. The date range window appears.</p> <p><b>b)</b> Select the current date or specify any dates in the <b>From</b> and <b>To</b> fields.</p> <p><b>c)</b> Click <b>Submit</b>.</p> <p><b>d)</b> View your tasks by the creation or modified dates.</p>
Preset filters in Table view	<p><b>a)</b> Navigate to the <b>Table view</b> tab (set by default)</p> <p><b>b)</b> Click <b>My Completed tasks</b>, <b>My Pending tasks</b>, or <b>Unassigned tasks</b>.</p> <p><b>c)</b> View your filtered tasks.</p>
Filter in Table view	<p><b>a)</b> Click <b>Status</b> (set by default) or <b>Type</b>.</p> <p><b>b)</b> Select from the drop-down menu. For <b>Status</b>, you can choose from <b>Pending</b>, <b>Cancelled</b>, and <b>Completed</b>. For <b>Type</b>, you can choose from <b>Form</b> and <b>Validation</b>.</p> <p><b>c)</b> View your filtered tasks.</p>

Option	Steps
Filter in Detail view	<p><b>a)</b> Navigate to the <b>Detail view</b> tab.</p> <p><b>b)</b> Click <b>Filter</b>.</p> <p><b>c)</b> In the dedicated filter window that appears, configure your contents from these filter options:</p> <ul style="list-style-type: none"> <li>• Choose a preset filter from <b>My Completed tasks</b>, <b>My Pending tasks</b>, and <b>Unassigned tasks</b>.</li> <li>• Select a date in the <b>Created date</b> or <b>Updated date</b> fields.  You can select the current date or specify any dates in the <b>From</b> and <b>To</b> fields.</li> <li>• Select a status in the <b>Status</b> option.  You can choose <b>Pending</b> , <b>Cancelled</b>, and <b>Completed</b>.</li> <li>• Enter a task name in the <b>Task Name</b> field.</li> <li>• Enter a name in the <b>Request title</b> field.</li> <li>• Enter a name in the <b>Created by</b> field.</li> <li>• Enter the reference key in the <b>Reference</b> field.</li> <li>• Select a type in the <b>Type</b> option.  You can choose <b>Form</b> and <b>Validation</b>.</li> <li>• Enter a name in the <b>Assignee</b> field.</li> <li>• Optional: Enter the query in the <b>Data Privacy tag</b> field.</li> </ul> <hr/> <p><b>Note:</b> This option is available only for the Co-Pilot Admin. They can update the field and manage any information about data privacy.</p> <hr/> <p><b>d)</b> In the task list, you can filter your task with more sort options:</p> <ol style="list-style-type: none"> <li><b>1.</b> Click <b>Task Created</b> (set by default).</li> <li><b>2.</b> Select in the <b>Sort By</b> field from <b>Status</b>, <b>Task Name</b>, <b>Reference</b>, <b>Title</b>, and <b>Task Created</b> options.</li> <li><b>3.</b> Select in the <b>Order</b> field from <b>Ascending</b> (set by default) and <b>Descending</b> orders.</li> </ol> <p><b>e)</b> Optional: Click <b>x</b> to clear any custom filter keywords or tags.</p> <p><b>f)</b> View your filtered tasks.</p>

## Configure a bot

This task shows you how to edit a bot to set parameters as well as to manage team members.

1. Log in to Automation Co-Pilot.
2. Navigate to **Manage > Bot**.
3. Click on an available bot.  
This opens the **Edit Bot** page in the **General** tab.
4. Specify a name in the **Bot display name** field.
5. Reference the file name in the **Bot file name** field

---

**Note:** The field is grayed out and cannot be modified as this field is to help you reference the name of this bot file.

---

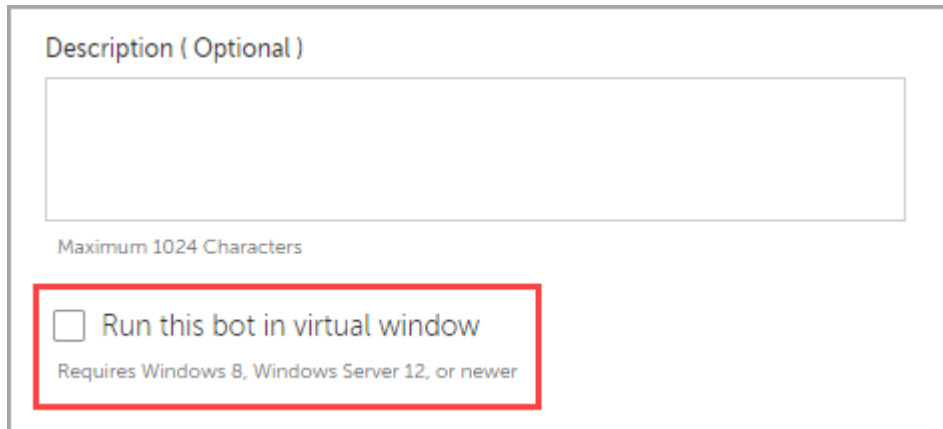

6. Reference the URI in the **Uri** field

---

**Note:** The field is grayed out and cannot be modified as this field is to help you reference the URI of this bot.

---

7. Optional: Enter a description for your bot.
8. Optional: Select the **Run this bot in virtual window** check box.

The screenshot shows a configuration form for a bot. It features a text input field labeled "Description (Optional)" with a maximum character limit of 1024. Below this field is a checkbox labeled "Run this bot in virtual window" with a red border around it. Underneath the checkbox, it states "Requires Windows 8, Windows Server 12, or newer".

This option enables the Microsoft Windows child sessions [Picture-in-Picture (PIP)] feature. This feature enables attended users to run bots in Automation Co-Pilot Desktop Assistant on a virtual desktop window, while they continue to work on other applications. For more information on Automation Co-Pilot Desktop Assistant, see [Automation Co-Pilot Desktop Assistant](#) on page 3563.

Attended users can also use the PIP feature to run attended bots from the iFrame widget in their web applications, see [Embed automations in your application using Automation Co-Pilot](#) on page 3496.

---

**Important:** Microsoft Windows 8, Microsoft Windows Server 12, or any of the later versions are required for virtual window. Here are some of the existing limitations of using the PIP feature:

- Another instance of your current browser cannot be used on Windows Desktop and the virtual window at the same time.

For example, if you are using an instance of Google Chrome on your Windows Desktop, the same cannot be used in the virtual window. In order to use Google Chrome in the virtual window, ensure you close this browser on your Desktop.

- When a virtual window is initiated, you might be logged out of your connected Global Protect software. However, the Task Bot will continue to run in the virtual window.
- Applications that allow single log in are restricted to the corresponding main or virtual windows.
- After a bot starts, it runs in the virtual window and is completely independent of the main instance.

- 
9. Optional: Select **Delete bot** to delete this bot.

---

**Important:** This option will permanently delete your bot.

---

10. Click on the **Teams** tab.  
This page allows you to manage your team members.
11. Click the **Add (+)** button.  
This **Add Teams** page appears.
12. Select an available team.
13. Click **Add & save** to confirm your choice.  
A team has now been assigned to this bot.
14. Optional: Select a team and click **Delete** (recycle) button to remove a team.
15. Optional: Select the search bar and filter by **Team**, **Description**, and **Request visibility** from **Private** or **Shared**.
16. Click **Close**.  
Your settings are saved automatically.

## Configure a process

This task shows you how to edit a process to create a process key, set a default team, as well as enable the option to delete a process.

1. Log in to Automation Co-Pilot.
2. Navigate to **Manage > Process**.
3. Click on an available process.  
This opens the **Edit Process** page in the **General** tab.
4. Specify a name in the **Process name** field.
5. Specify the description in the **Description** field.
6. Enter a customer key (if applicable) in the **Process key** field.

**Important:** The process key must be one to five characters long and in alphabetical order. The process key can only be defined once, and after when the process key is defined, it cannot be modified later by the user.

7. Add tags to your process in the **Tags** field.  
Tags allow you to filter out automations and display only a subset of automations from the entire list. This will let you call and access only the tagged automations in your embedded widget.
8. In the **Tags** field:
  - a) Click the **Tags** field.
  - b) Specify your tags with unique keywords, such as **Cases** or **Reports**.
  - c) Select the **Add as new option** from the drop-down to add a new tag.  
The keyword will automatically generate a new tag if it does not exist. The search result is displayed in real time.

**Edit Process: 34 - Order Status**

General Teams Deployment

Process name

Order Status

Maximum 255 Characters

Description ( Optional )

Maximum 1024 Characters

Process key ⓘ

Enter 1-5 alphabetical characters. Once saved, the Process Key cannot be changed.

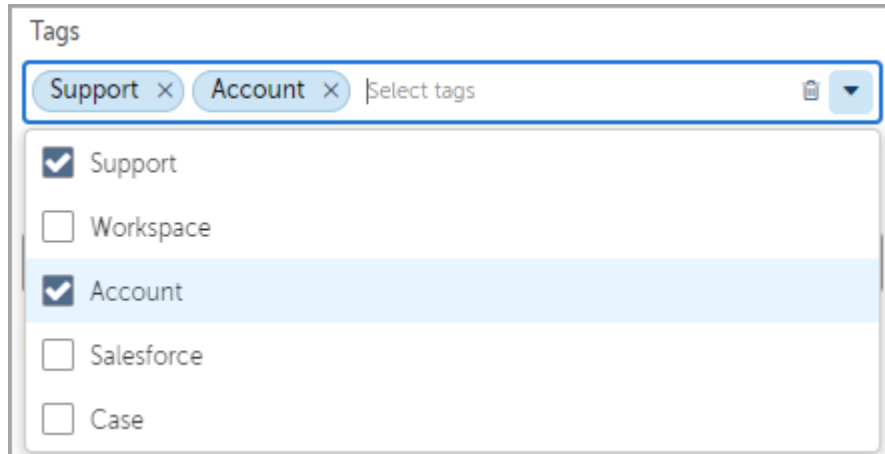

Tags

Cases

No result found. [Add as new tag 5/500](#)

- d) Select an existing tag from the drop-down.

- e) Select the trash bin icon to delete your tags in the field.
- f) If your tags are not listed, you can use the **Search All** option to search for the related keywords.

---

**Note:** Only the Co-Pilot Admin can view and create tags.

---

**9.** Specify the team in the **Default team** field.

By default the first team that is added to the process is automatically set as the default team. You can change the team by selecting from the drop-down menu.

**Important:** A default team cannot be deleted from a process. For the admin to remove a default team (e.g. Team 1), they would need to set another team (e.g. Team 2) as the default team, then remove the original team (e.g. Team 1) from the process.

Ex: You can select **Recruitment Director** in the drop-down menu.

**10.** Choose between the **by user** and **by bot** in the **Request creation** field.

**11.** In the **Request retention** field:

- Select **Disabled**, **Immediate**, or **Custom** from the first drop-down menu to specify whether the completed request is moved from the **Request** page to the **Recycle bin**.

For example, you can select **Disabled** to prevent your requests from being moved to the **Recycle bin** or select **Immediate** for all current completed requests to be moved without delay.

**Note:** When you select the **Immediate** option, it can take a maximum time of one hour before the request is moved to the **Recycle bin**.

- Select **Immediate** or **Custom** from the second drop-down menu to specify the number of days when the requests is permanently deleted in the **Recycle bin**.

Ex: You can select the **Custom** option and specify **30** to represents thirty days when the request is deleted in the **Recycle bin**.

- Select the check box option to allow open request to be moved to the **Recycle bin**.

**12.** Click **Close**.

Your settings are saved automatically.

## Understanding the Business user

A business user is typically a non-technical employee who learns to build intelligent automation software bots to handle their workflows. Automation 360 provides business users with accessible, no/low-code, automation tools they can use on their own, every day.

### Overview

Business users help organizations improve business KPIs by automating manual processes across multiple use cases and transforming institutional knowledge into automations. AARI enables these business users to automate and streamline processes with no-code drag-and-drop RPA. With AARI, organizations can:

- Eliminate application switching: Search through multiple systems to find the required information and present all data on a single screen
- Eliminate data and departmental silos: Connect across back and front office systems and users with no/low-code automation
- Scale automation to new use cases Process owners can automate on their own and design how employees should interact with the AARI workflow.

Source: [Automation Anywhere Corporate site \(Business user solution\)](#)

Using AARI, a business user leverages automation built by bot developers (bots, forms, processes) and interact with applications (for example, web, Microsoft Excel, SFDC) that transfer data between group of users and bots, providing an automation service catalog and acting as a request management tool.

Business users can be:

- AARI Admin: act like a Process Owner from business side
- AARI Manager: act like a Team Owner from business side
- AARI User: act like an simple operator from business side

### Tasks and goals of a business user

Tasks	Goals
Daily <ul style="list-style-type: none"> <li>• Select processes and create cases</li> <li>• Follow steps (fill out forms) and escalate issues</li> <li>• Process the assigned documents/tasks</li> </ul>	<ul style="list-style-type: none"> <li>• Efficiently complete daily work by handling large quantity of repetitive tasks</li> <li>• Simplify the daily workflow</li> </ul> Quickly access tools to complete work
Special assignment <ul style="list-style-type: none"> <li>• Record, edit, and submit a workflow process</li> </ul>	

## AARI workflows

- AARI Admin
  1. Task 1
  2. Task 2
  3. Task 3
- AARI Manager
  1. Task 1
  2. Task 2
  3. Task 3
- AARI user
  1. Task 1
  2. Task 2
  3. Task 3

## Approvals in Automation Co-Pilot

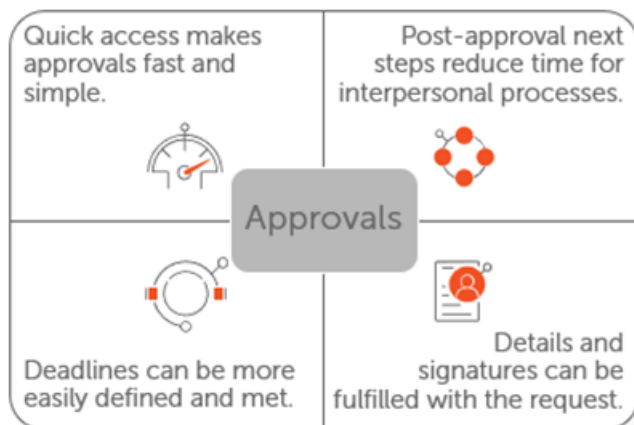

The Approval task is a designated process flow provided by Automation Co-Pilot that routes notifications and process data to specific users that can quickly address complex and urgent hand-offs.

---

**Note:** To activate the Approval task for Cloud or On-Premises deployments, you need to purchase the Enterprise license. Contact your customer service manager for more details.

---

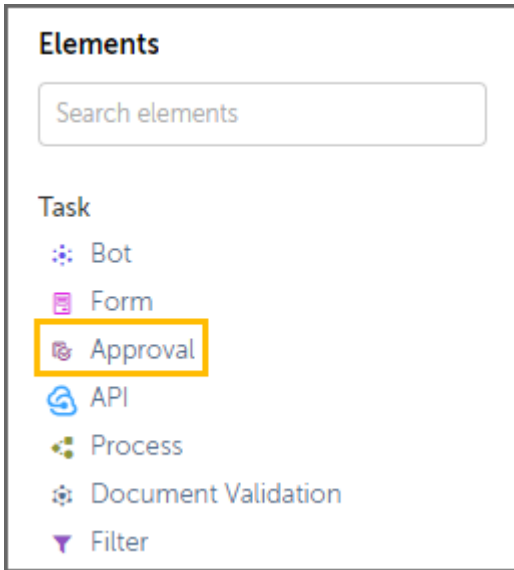

The Approval task provides the following benefits:

You can use the Approval task feature to approve tasks quickly and directly. The need for approvals applies to many business tasks. With the Approval task, users can submit and receive approvals while staying notified of progress, without breaking concentration from streamlined work flow. Additionally, decision making becomes simplified when managers can quickly review

the information of a task requested for approval, and they can directly respond with attachments and comments. This human interaction has a designated space within Automation Co-Pilot and the Process Composer for configuring and automating across applications and roles.

Find the approval task in Process Composer.

The Approval task is a process element that you can add and configure in the Process Composer. This enables functionality in Automation Co-Pilot for business users and decision makers to share information within the automation, improving response time that can otherwise take longer to resolve due to the complex nature of cross-functional decision making.

By running an Approval task, each team member can leverage their unique role and responsibilities in a single streamlined automated task. This means the experience for approving contributors is tailored to the function of their role, while business users continue their familiar automated experience with the added benefit of immediate updates and details when requests are approved. Consider the relationships for the following personas:

Table 8: Relationships of personas and the Approval task

Persona	Experience
 <p>Automation Admin Jake</p>	<p>Plan</p> <p>Assign users to roles/teams. Decide on resources used and permissions users have during automation.</p> <ul style="list-style-type: none"> <li>• Configure the resources such as device and runAs in a comprehensive way.</li> <li>• Assign a process to a Role within Control Room.</li> <li>• Assign global values to group variables used inside a process per a role/team basis.</li> </ul>

Persona	Experience
 <p>Pro Developer</p> <p>Marcus</p>	<p>Create</p> <p>Create the automated process and configure who receives approval requests.</p> <ul style="list-style-type: none"> <li>• Assign group variables to a Human Task inside a process.</li> <li>• Select the role or team where a request needs to be created when using the Process package in a bot.</li> <li>• Select the role/team where a request needs to be created when using the Process Task.</li> </ul> <p><a href="#">Add Approval Task to a process automation</a> on page 3693</p>
 <p>Business user</p> <p>Bria</p>	<p>Request</p> <p>Runs the task when engaging customers and requests approvals from relevant team members.</p> <p><a href="#">Using and sorting the Tasks view</a> on page 3606</p>
 <p>Team manager</p> <p>Tomas</p>	<p>Approve</p> <p>Approves requests from business users.</p>

## Workflow

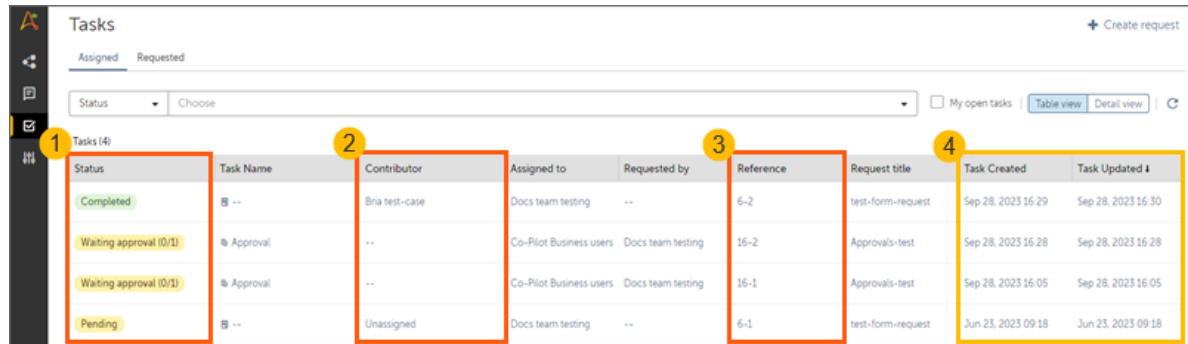

The following steps describe the basic workflow to configure an approval task.

1. Create your teams for business tasks. [Create a team and assign roles to team members](#) on page 3612
2. Optionally, add the relevant team to a single Global Value, of variable type user group. [Create a global value](#) on page 2503
3. In Process Composer, configure the approval task in your process using the pre-built user group. [Add Approval Task to a process automation](#) on page 3693
4. Save your changes to the process.
5. Run the approval task in Automation Co-Pilot.

## Using and sorting the Tasks view

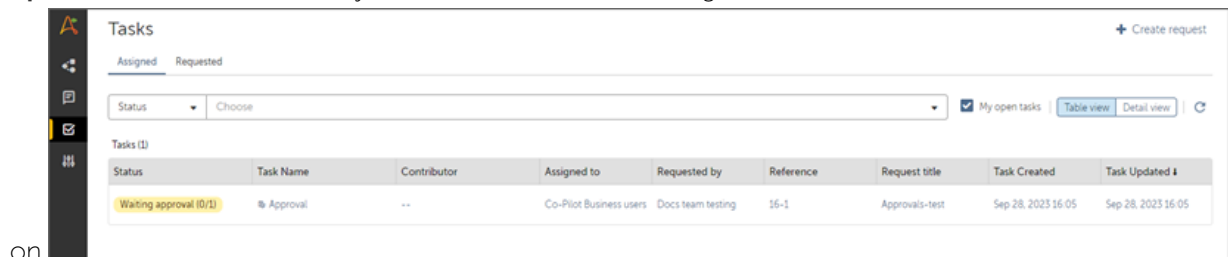

Use the task view to filter by status and contributors and find an approval task or reference ID for quick response in Automation Co-Pilot.

The **Tasks view** offers quick reference of the status and contributors for tasks run in Automation Co-Pilot, including the individual reference ID of the process. At a glance, you can check the responses of an approval task, relevant dates and times, and who is contributing or assigned to a task. Click any of the column headers to sort tasks in ascending or descending order based on the data type of the column.

Column	Data	Details
1	Status	View what status the task is in to gauge your response.
2	Contributor	View the user that contributed to the task for further details or follow up.
3	Reference	View the reference ID for identifying specific requests.
4	Create, Updated	View dates and times of tasks

To quickly view your tasks that are open, simply select **My open tasks** and find the task you want to continue working

Further details on status and notifications can be found in the following topic. [Automation Co-Pilot status and notifications](#) on page 3607

## Automation Co-Pilot status and notifications

With process event notifications enabled, users are alerted to changes in tasks and requests.

Ensure notifications for process events are turned on to receive the following alerts. [Getting started with Notifications](#) on page 2344

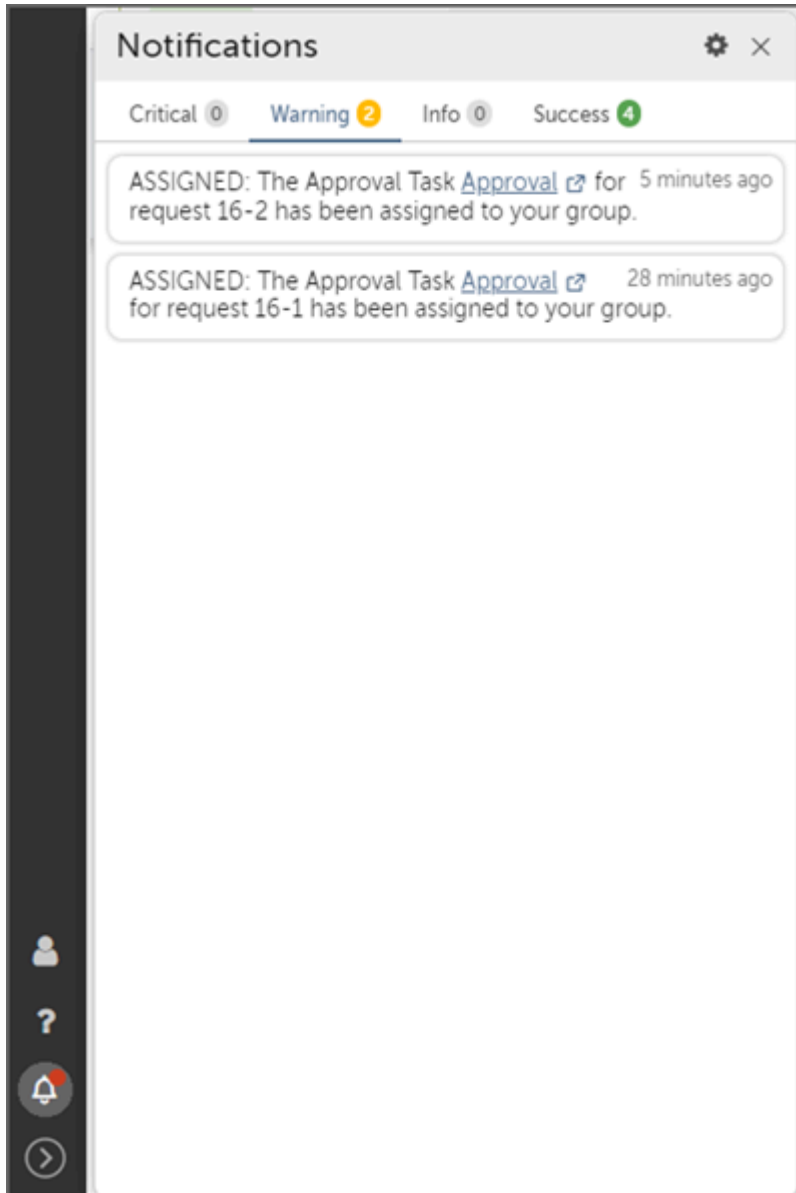

While in Automation Co-Pilot, notifications prompt users to respond to priority events and streamline time-sensitive tasks. These notifications are consumed by Automation Co-Pilot for ease of use. Notifications include a link to the relevant task and display information on the latest event of that task.

The following are examples of the status a task can have in Automation Co-

In-progress task status		In-progress task status	
<b>Pending</b>	<b>Pending</b> Task is pending response by the user (me).	<b>Completed</b>	<b>Completed</b> Task is successfully completed.
<b>In progress</b>	<b>In progress</b> Bot/API task is on going.	<b>Failed</b>	<b>Failed</b> Task is not successfully completed due to Bot/Process error.
<b>Queued</b>	<b>Queued</b> Task is queued up for Bot execution.	<b>Cancelled</b>	<b>Cancelled</b> Task is cancelled by user.
<b>Waiting approval (0/2)</b>	<b>Waiting approval</b> Approval Task is pending response.	<b>Expired</b>	<b>Expired</b> Task is expired due to response timeout.
		<b>Approved</b>	<b>Approved</b> Approval task is approved.
		<b>Declined</b>	<b>Declined</b> Approval task is declined.

Pilot.

The notifications panel groups the alerts by severity. The following are some examples of events and their corresponding severity.

Event	Severity
Queued	Info
Waiting approval	Info
Completed	Success
Assigned	Warning
Failed	Critical

## Users and team roles for Automation Co-Pilot

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

**Note:** Roles, permissions, and licenses might continue to reference Automation Anywhere Robotic Interface (AARI) within the product.

### Users and their roles

The admin should assign each user with respective roles, permissions and AARI license for Automation Co-Pilot and the product features to run smoothly across devices and business organization. Primary roles involved in this set up are as follows:

- The Control Room Admin creates users and assigns Automation Co-Pilot roles (Co-Pilot Admin, Co-Pilot Manager, and Co-Pilot User) with the AARI licenses.  
[Create users for Automation Co-Pilot](#) on page 3610
- The Co-Pilot Admin creates scheduler users and allocate any Control Room resources required to run processes.  
[Configure scheduler user for Automation Co-Pilot](#) on page 3618

There are two main types of users that run Automation Co-Pilot. They can be broadly categorized into developers that build bots and process automations using the Process Composer, and end users that run automations using Automation Co-Pilot.

The following table illustrates the relationship between users, system-created roles, and permissions for accessing Automation Co-Pilot.

Persona	Role	Permissions
 <p>Automation Admin Jake</p>	<b>AAE_Admin</b>	Operates in the Control Room to: <ul style="list-style-type: none"> <li>• Create and manage users.</li> <li>• Assign AARI license to users.</li> <li>• Create and assign roles to users.</li> </ul>
	<b>AAE_Robotic Interface Admin</b>	Operates in Automation Co-Pilot to: <ul style="list-style-type: none"> <li>• Configure scheduler user and allocate Control Room resources (device pool and unattended Bot Runners) to a process in the configuration setup stage.</li> <li>• Perform the following global team and process management tasks in the process deployment stage:                             <ul style="list-style-type: none"> <li>• Create, view, and modify all teams.</li> <li>• Assign teams to processes.</li> </ul> </li> </ul>

Persona	Role	Permissions
 <p>Pro Developer</p> <p>Marcus</p>	<b>AAE_Basic</b>	Operates in the Process Composer and Automation Co-Pilot to: <ul style="list-style-type: none"> <li>• Create a process.</li> <li>• Check in a process.</li> <li>• Check out a process.</li> <li>• Run a private process.</li> <li>• Delete a process.</li> <li>• Import a process.</li> <li>• Export a process.</li> </ul>
 <p>Team manager</p> <p>Tomas</p>	<b>AAE_Robotic Interface Manager</b>	Operates in Automation Co-Pilot to: <ul style="list-style-type: none"> <li>• Create and view teams.</li> </ul> <hr/> <b>Note:</b> Requires the AARI license. <hr/> <ul style="list-style-type: none"> <li>• Add members to or remove members from the teams.</li> <li>• Assign owners to the teams.</li> <li>• Function as default admin for the teams they create.</li> <li>• Request AARI admin to assign their team to processes.</li> </ul>
 <p>Business user</p> <p>Bria</p>	<b>AAE_Robotic Interface User</b>	Operates in Automation Co-Pilot to: <ul style="list-style-type: none"> <li>• Create and access requests.</li> <li>• Submit and access tasks.</li> </ul>

## Create users for Automation Co-Pilot

A Control Room Admin can create users and assign the required system roles for Co-Pilot Admin, Co-Pilot Manager, and Co-Pilot User to use Automation Co-Pilot for business processes.

Ensure that you have purchased the AARI license for your business users.

**Note:** These roles are only applicable for Automation Co-Pilot.

1. From your local machine, log in to your Control Room as administrator.
2. Navigate to **Administration > Users**.
3. Click the **Create user** icon located at the top-right of the **Users** table.

The **Create user** page is displayed.

- In the **General Details** section, enter the following user details:

Enable User	Select this check box to enable the user to log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Enter and confirm a password for the user. Ensure the password adheres to company password policies.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

- In the **Select Roles** section, you can select any number of roles from the **Available roles** column:

Available role	Select this role
Co-Pilot Admin	<b>AAE_Robotic Interface Admin</b>
Co-Pilot Manager	<b>AAE_Robotic Interface Manager</b>
Co-Pilot User	<b>AAE_Robotic Interface User</b>
User-created	Custom role

- Click the right arrow to move the role to the **Selected** column.
- In the **Allocate a device license** section, select the following for the role:

Role	Action
Admin	Retain the default <b>None</b> . The user with the administrator role has access to the Control Room and Automation Co-Pilot.
Manager	Retain the default <b>None</b> for administrative tasks only. Optionally, assign the Automation Co-Pilot user license for this user to create a request, submit tasks, and create and view teams. The user with the manager role has access to Automation Co-Pilot.

Role	Action
User	<p>Assign the AARI license.</p> <p>Optionally, assign the attended Bot Runner license to run local bots or use the desktop interface.</p> <p>The user has access to Automation Co-Pilot.</p>

8. In the AARI licenses section, select the **AARI User** check box.
9. Click **Create user**.  
The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

## Create a team and assign roles to team members

An Co-Pilot Manager is a team admin who can create new teams, add members to their team, and assign new team roles. Co-Pilot Admin can also configure a team but does not have a team role.

Ensure you have completed the following:

- Provided a system-created **AAE\_Robotic\_Interface Manager** role for the Co-Pilot Manager.

---

**Note:** In addition, the Co-Pilot Manager requires the AARI license.

---

- Provided a system-created **AAE\_Robotic\_Interface Admin** role for the Co-Pilot Admin.
- Have access to Automation Co-Pilot.

1. Log in to Automation Co-Pilot as an Co-Pilot Manager or Co-Pilot Admin.
2. Navigate to **Manage > Team**.  
The **Team** page enables you to view all of your teams and provides the option to create a new team.
3. Click **Create new team**.  
A **Create new team** window prompts to enter the team details.
4. Enter a team name in the **Team Name** field.
5. Optional: Enter a description in the **Description** field.
6. Select a user from the drop-down in the **Team admin** field.
7. In the **Request Visibility** field in the **General** tab, select **Shared** or **Private**.  
If you select the **Shared** option, then all the requests that are created are accessible to members of the team. If you select the **Private** option, then a request will be available only to the member who created that request and the owners and admins of the team.
8. Add members to the team by choosing one of the following options:

Option	Steps
Users	<p><b>a)</b> Click the <b>+</b> (plus) icon. The <b>Add members</b> window appears. Use it to search for members to add.</p> <p><b>b)</b> Search by using name, email, username, or role in the search bar.</p> <p><b>c)</b> Select the member from the displayed list.</p> <p><b>d)</b> Click <b>Add &amp; save</b>. Members are now successfully added to the team.</p> <hr/> <p><b>e)</b> <b>Optional:</b> To remove a team member, select the member and click the <b>trash</b> icon.</p> <hr/> <p><b>f)</b> Navigate to <b>Roles</b> next to each member name. Each member's team role is set to <b>Member</b>, by default.</p> <p><b>g)</b> Click <b>Member</b> to change the team role when applicable.</p> <p><b>h)</b> Select <b>Member, Owner, or Admin</b> to designate the team role.</p> <hr/> <p><b>Important:</b> A team must have at least one <b>Admin</b> as a member. Only the Automation Co-Pilot manager can be assigned the <b>Admin</b> team role because the roles are based on the Control Room roles assigned to the user. A team, however, can have more than one admin.</p> <hr/>
Roles	<p><b>a)</b> Click the <b>+</b> (plus) icon. The <b>Add roles</b> window appears. Use it to search for roles to add.</p> <p><b>b)</b> Search for a role in the search bar.</p> <p><b>c)</b> Select the role from the displayed list.</p> <p><b>d)</b> Click <b>Add &amp; save</b>. Roles are now successfully added to the team.</p> <hr/> <p><b>e)</b> <b>Optional:</b> To remove a role, select the role and click the <b>trash</b> icon.</p> <hr/>

9. Optional: Click the **Processes** or **Bots** tabs respectively to view the assigned processes or bots.
10. Click **Close**.
11. Optional: To edit an existing team, click the team's name in **Team** column within **Team Setup** page.  
The Co-Pilot Manager or Co-Pilot Admin can edit a team to update their team setup or click **Delete** to erase the team entirely.

See, [Users and team roles for Automation Co-Pilot](#) on page 3609

## Manage roles and teams for Automation Co-Pilot

A variety of permissions are available to grant access to user-created roles and administer Automation Co-Pilot privileges to meet policies for security and organization.

Ensure that you have the **View and manage MY teams** and **View and manage ALL teams** permission (AAE\_Admin) to create and edit respective teams. See, [Create a role](#) on page 1855

### Teams in Automation Co-Pilot

Automation Co-Pilot enforces role-based access control (RBAC). User-created roles can be customized for unique business needs and deliver specific privileges to focus product features on assigned roles.

Unlike system-created roles, administrators can create a role and customize permissions needed for a specific type of user. When creating a role, the following table offers details of the product behavior associated with permissions.

In addition to granting privileges, roles can be used as a group type in Automation Co-Pilot. Consider creating a role to be used as a valid input for a group (to include all users with the role) when assigning teams, tasks, or a process to users. All components of the product recognize the group and behave accordingly.

### Team members and permissions

The following table lists the users, and their roles and permissions in a team.

**Note:** These roles require the AARI license.

Team role	Control Room role	Team type	Permissions
<b>Note:</b> The <b>AAE_Robotic Interface Manager</b> role sets the Co-Pilot Manager to automatically have an <b>Admin</b> team role. A license is required.	<b>AAE_Robotic Interface Manager</b>	<b>Shared</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View all</li> <li>• Delete all</li> <li>• Assign all</li> <li>• Modify team</li> </ul>
		<b>Private</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View all</li> <li>• Delete all</li> <li>• Assign all</li> <li>• Modify team</li> </ul>
Owner	<b>AAE_Robotic Interface User</b>	<b>Shared</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View all</li> <li>• Delete all</li> <li>• Assign all</li> </ul>

Team role	Control Room role	Team type	Permissions
		<b>Private</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View all</li> <li>• Delete all</li> <li>• Assign all</li> </ul>
Member	<b>AAE_Robotic Interface User</b>	<b>Shared</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View all</li> <li>• Delete</li> <li>• Assign all</li> </ul>
		<b>Private</b>	<ul style="list-style-type: none"> <li>• Create</li> <li>• View</li> <li>• Delete</li> <li>• Auto-assign</li> </ul>

### Example

Consider two teams, Finance and HR, and their team roles as listed in the following table:

Finance (private)		HR (shared)	
User	Role	User	Role
User A	Owner	User X	Member
User B	Member	User Y	Member
User C	Member	User Z	Owner

For any process, keep in mind the following:

- User A can view and delete all the requests created inside the team Finance.
- Users B and C can view and delete only their requests inside the team Finance.
- Users X, Y, and Z can view all the requests but can delete only their request inside the team HR.
- User Z can view and delete all the requests created inside the team HR.

See also, [Create a team and assign roles to team members](#) on page 3612

## Scheduler users and device pools in Automation Co-Pilot

To assist running routine automation in Automation Co-Pilot, a process or bot automation can be run by a scheduler user at a set time. This can be combined with devices in a device pool to improve deployment efficiency.

### Definition and key concepts

The scheduler user is not a human user, rather a middleman that helps allocate resources. This user tells Automation Co-Pilot two necessary details during deployment: the device and a runner license.

- Scheduler user have one scheduler role.
- Scheduler role has 1:many **Run as users** defined.
- Scheduler role is the consumer of 1:many **Device Pool**.

Table 9: Setup requirements

Role	Requirements
Admin	<ul style="list-style-type: none"> <li>• Set up of users should be handled by an admin.</li> <li>• Have the <b>AAE_Pool Admin</b> system role, or a user-created role with respective permissions to create and administer Bot Runners, Bot Creators, and device pools.</li> </ul>
Scheduler user	<ul style="list-style-type: none"> <li>• Be an owner or a consumer of a device pool.</li> <li>• Have a Run as user associated (own a role with at least one runner set in Run as section).</li> </ul>
Bot Runners	<ul style="list-style-type: none"> <li>• Have the runner license.</li> <li>• Have credentials to the device in the pool.</li> <li>• Have permission to view and run bots; meaning, have a role granting that permission.</li> <li>• Have access to the public bot file (and its folders); meaning, have a role granting that folder.</li> </ul> <p><b>Note:</b> There is nuance to the last two bullets. The scheduler user is the one who should meet these requirements, as the runner will use authority from the scheduler.</p>

### Scheduler, Run as user, and devices

When the scheduler deploys automation, the Run as users (Bot Runners) and the devices used to deploy a bot adhere to the following principles.

- The scheduler user determines who and where the bot will deploy, based on configurations set across the device pool and unattended Bot Runners of each automation.
- Using your configurations, the system will analyze the available capacity of resources (user and device) and determine the best fit for deployment.
- Typically, Run as users have a default device. If no device is set for these users, a device pool must be used.
- The device pool includes multiple machines where automation can be deployed, increasing availability of resources at time of scheduled deployment. The automation is deployed on an available device in the device pool.
- Each automation scheduled will be deployed a single time using the best fit of Run as user and device. When more automations are scheduled than there available resources, the excess automation is queued until resources are available. For example, if three bots are scheduled and only two devices are available, two bots are deployed and the last bot is queued for the next available device.

This system allows for efficient and flexible deployment of bots across multiple devices and users.

### Hierarchy of scheduler users: process, global, team

When there are multiple schedulers such as team, process, and global schedulers, the system uses a hierarchy to determine which one to use.

1. Team Scheduler: This is the first scheduler that the system checks. If a team scheduler is defined, it will be used for the deployment of the automation.
2. Process Scheduler: If a team scheduler is not defined, the system will then check for a process scheduler. If a process scheduler is defined, it will be used for the deployment.
3. Global Scheduler: If neither a process scheduler nor a team scheduler is defined, the system will default to the global scheduler.

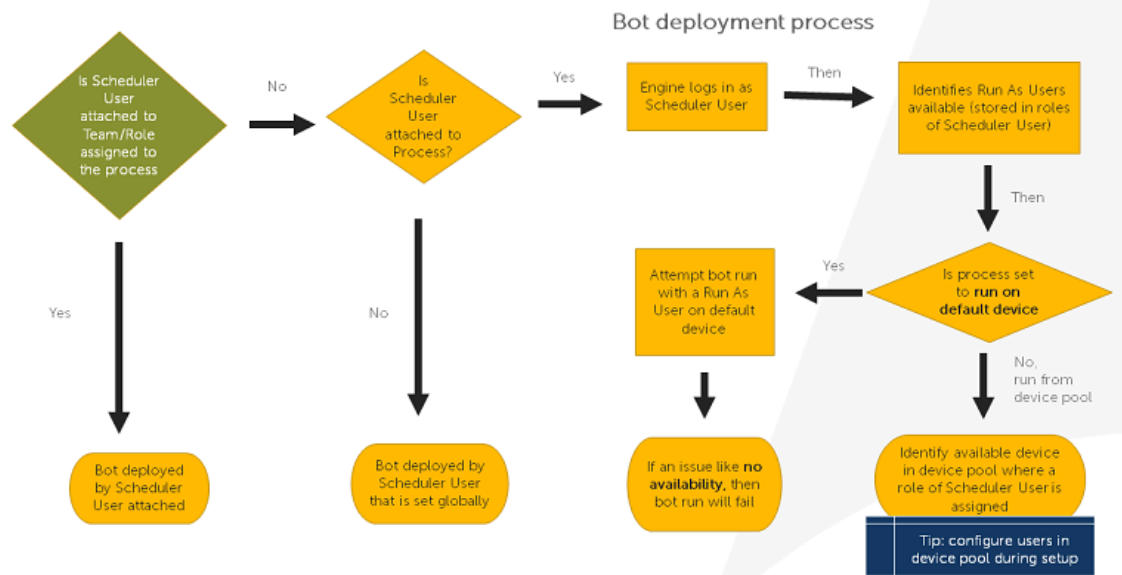

This allows for flexibility and control over deployment at different levels.

### Sequence of deployment

The bot deployment process is determined based on two factors:

- How the scheduler user (**per-process scheduler** or **global scheduler** user) is attached to the team or role assigned to the process.
- Whether device pools have been previously defined.

The following process flow illustrates the priority and effect of a scheduler user and defined device pool on bot deployment.

With these principles in mind, you are ready to configure the scheduler user. [Configure scheduler user for Automation Co-Pilot](#) on page 3618

## Configure scheduler user for Automation Co-Pilot

To help deploy automation, you can configure a dedicated user as a scheduler user. A scheduler user can be a **global scheduler** or a **per-process scheduler** that allocates the Control Room resources (devices and unattended Bot Runners) for Automation Co-Pilot.

To assist running routine automation, a process or bot can be configured to be run by a scheduler user at a set time. This can be combined with devices in a device pool to improve deployment efficiency.

Update cycles for scheduling

When a scheduler user or device pool is modified, it can take up to ten minutes for the system to use updated configurations in process orchestration. To work around this cycle, users can manually overwrite the cache with new edits to manually update scheduler user configurations.

1. In the Control Room, go to **Manage > Process**.
2. From your selected process, click **Edit > Save**.

---

**Note:** Without this update, users can wait up to ten minutes before running automation with the modified user.

---

Establishing a scheduler user

Requires both the following procedures.

- In the Control Room, the Admin must create a designated custom role with a user assigned to that role.

**Note:** The role that you assign to the scheduler user cannot be shared with any other user (such as Bot Runner or an Admin user).

---

- In Automation Co-Pilot configure the bot or process to be run by the scheduler user.

Complete these steps before attempting to deploy automation using the scheduler user in Automation Co-Pilot.

1. The AARI Admin should create and customize a scheduler role, configured with the **AARI scheduler** permission set, and create a user that is assigned with the scheduler role. Users with this role will be displayed during configurations for scheduling. See, [Create a scheduler user with a role in the Control Room](#).
- 

**Note:** The role that you assign to the scheduler user cannot be shared with any other user (such as Bot Runner or an Admin user).

---

2. If the scheduler user is attached to a process, you can add the scheduler user to a device pool. For more details, click [About device pools](#) on page 1997 and [Create device pools in the Control Room](#).
- 

**Note:** The Co-Pilot Admin is the device pool owner and can select a custom role (**AARI-pool-scheduler**) in **Device Pool Consumers**.

---

3. After you have configured a scheduler user and a device pool in the Control Room, you can [assign a scheduler user to a process in the web interface](#) in Automation Co-Pilot.

## Create a scheduler user

Configure a user-created role to run bots as a scheduler user in Automation Co-Pilot.

You must be an Co-Pilot Admin to perform this task.

With a scheduler user, bots and processes can be deployed at set times to complete routine tasks.

1. Log in to Control Room as an Co-Pilot Admin.
  2. Navigate to **Administration > Roles**.
  3. Create a custom role.  
**AARI-pool-scheduler**  
[Create a role](#) on page 1855.
    - a) Set the permissions to **View my bots, View packages, Run my bots**, and **AARI Scheduler**.
    - b) In the **Bots** tab, select the folders that contain the bots to be run by the scheduler user, that you want to give access to with run and view permissions. Set the required bot permissions for the role at the folder level.
    - c) Select the unattended users in the **Run As** section.
    - d) Save your changes.
  4. Create a user.  
**AARI-scheduler-user**
- 

**Note:** This user does not require any license.

---

5. Assign the custom role you created to this user.

## AARI-pool-scheduler

### Assign a scheduler user to a process

You can configure a scheduler user (team scheduler, per-process scheduler, or global scheduler) to allocate the Control Room resources (devices and unattended Bot Runners) to Automation Co-Pilot. This scheduler user is a dedicated user who helps in process deployment.

Ensure that you have created the scheduler user and the device pool.

1. Log in to Automation Co-Pilot as an Co-Pilot Admin.  
Alternatively, you can navigate to Automation Co-Pilot through the Control Room by clicking the **settings page** link in the **Manage > Device pools** screen. This will automatically navigate you to the Automation Co-Pilot screen, with you logged in as an Co-Pilot Admin.
2. Select a scheduler user by choosing one of the following options:  
The process uses the device pool and unattended Bot Runners configured with this user for each bot deployment.

By default, **Global scheduler** is selected if you have not set a **Scheduler** for any process.

By default:

- a) **Team** scheduler user is selected.
- b) **Process** scheduler user is selected if **Team** scheduler user is not defined.
- c) **Global scheduler** user is selected if the **Team** and **Process** scheduler users are not defined

Scheduler Type	Steps
Team	<ol style="list-style-type: none"> <li>a) Navigate to <b>Manage &gt; Process</b>.</li> <li>b) Select the process to configure the scheduler user. The <b>Edit Process</b> page will open.</li> <li>c) Navigate to the <b>Team</b> tab.</li> <li>d) Select a scheduler user from the drop-down menu in the <b>Scheduler</b> field. The <b>Process scheduler</b> is selected by default.</li> <li>e) Click <b>Save</b>.</li> </ol>

Scheduler Type	Steps
<b>Scheduler</b> (per-process scheduler)	<p><b>a)</b> Navigate to <b>Manage &gt; Process</b>.</p> <p><b>b)</b> Select the process to configure the scheduler user. The <b>Edit Process</b> page will open.</p> <p><b>c)</b> Navigate to the <b>Deployment</b> tab.</p> <p><b>d)</b> Select a scheduler user from the drop-down menu in the <b>Process scheduler</b> field. The <b>Global scheduler</b> is selected by default.</p> <p><b>e)</b> Select the <b>Deployment</b> type.</p> <p><b>f)</b> Click <b>Close</b>. The setting saves automatically.</p>
<b>Global scheduler</b>	<p><b>a)</b> Navigate to <b>Manage &gt; Process</b>.</p> <p><b>b)</b> Select the process to configure the scheduler user. The <b>Edit Process</b> page will open.</p> <p><b>c)</b> Navigate to the <b>Deployment</b> tab.</p> <p><b>d)</b> Select the <b>Global scheduler</b> user from the drop-down menu in the <b>Process scheduler</b> field. The <b>Global scheduler</b> is selected by default.</p> <p><b>e)</b> Select the <b>Deployment</b> type.</p> <p><b>f)</b> Click <b>Close</b>. The setting saves automatically.</p>

**Important:** If scheduler users had their role removed or do not have sufficient permissions to access a file:

- a)** The Control Room Admin will see an audit log of the change.
- b)** The Co-Pilot Admin will see an error message for an invalid scheduler then must reassign a new scheduler user.
- c)** The Co-Pilot User will see an error message for the process.

## Configure deployment type for bots

You can configure the deployment type for your bot tasks. This determines how the bots in the process will be deployed. You can also define the mapping between run-as user and the device.

This mapping will help take care of constraints if any in your organizational set up such as credential constraints requiring one-to-one mapping between devices and run-as user.

1. Navigate to **Manage > Process**.
2. Select the process.
3. Select the **Deployment** tab.
4. In the **Deployment type** field, select one of the following options:
  - **Run on pool of device** - The bot deploys on the available device in the device pool. It overrides the default device of the user.
  - **Run only on default device** - The bot deploys only on the default device of the user. In this option, the unattended Bot Runner user should own the default device. If the device is jointly owned by the unattended Bot Runner user along with another licensed user, the device is not used as the unattended Bot Runner user is considered to have no default device. If the scheduler user has multiple unattended Bot Runner users and one of those users does not have a default device, the bot deployment fails.
5. Click **Close**.

## Automator AI

Automator AI is a suite of on-demand, generative AI-powered intelligent automation capabilities that allows both citizen and professional developers to build enterprise-grade automations faster and better, thereby making it easier for our customers to scale automation programs and accelerate their Return on automation (ROA).

---

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

---

**Important:** This feature will be available with the Cloud rollout for Automation 360 v.31 release.

---

### Overview

Automator AI is built directly into the Automation Success Platform and is available on-demand to both citizen and professional developers to build their automations using the power of generative AI (GenAI).

Automator AI is a comprehensive orchestration framework utilizing multiple GPT models specialized in automation creation. These models serve as agents, capturing pertinent information about ongoing automations and the customer environment. The framework delegates tasks based on the requirements of the customer request, generating personalized automations. To enhance reliability, the models are dynamically grounded with automation tasks, reducing the risk of errors. Additionally, a built-in validation layer ensures adherence to best practices. The

system incorporates learning from human feedback to autonomously enhance the quality and completeness of automations over time.

Automator AI has the following capabilities:

Co-Pilot for Automators:

Describe your automation goals using Co-Pilot for Automators to transform your ideas into optimized, compliant, and personalized automations accelerating the ROI realization and scaling the automation program. Build automations in the Bot editor and Process Composer.

Suggest next actions:

Suggest next actions, a generative AI-based feature, helps accelerate automation development in an organization to achieve a higher level of productivity and build automations easily. Get real-time suggestions on next steps for your automations in the Bot editor.

## Benefits

Scale automation development: Expand your automation programs by helping Professional Developers and Citizen Developers accelerate automation development and empower business users to build automations with no-code to meet daily business requirements.

Safeguard with governance: Build compliant automation fast with built-in user access controls and compliance checks to ensure you get the right automations that meets your enterprise's governance requirements.

## Licensing requirements

To activate and use Automator AI, you need:

1. A valid license.
2. Bot Creator user with:
  - Role: **AAE\_Basic** and **AAE\_Bot Developer**.
  - Device License: Bot Creator or Citizen Developer.

---

**Important:** For information on how we approach data security, see: [Data security for generative AI - FAQ](#) on page 1178.

---

## Co-Pilot for Automators

Co-Pilot for Automators is an on-demand, intelligent automation assistant. Developers can accelerate building automation by describing goals in natural language for Co-Pilot for Automators to create and update their automation.

Co-Pilot for Automators is embedded directly within the Automation Workspace. The user can build enterprise-level automation with an interactive instruction-based conversation using Co-Pilot. It is non-intrusive, allowing developers to continue building or editing automation without interference while helping accelerate building automation. This provides users with the flexibility to decide when and how to use this feature.

Co-Pilot for Automators follows these principles to ensure maximum efficiency and ease-of-use:

- embedded conversational experience for building automation with natural language
- ensures low-learning curve for quick adoption
- built-in guardrails with enterprise-tuned AI models that only allow Automation 360 tasks

## Leveraging capabilities

Developers can overcome common challenges and expedite development by leveraging Co-Pilot for Automators when and where support is most impactful. Co-Pilot for Automators can assist in selecting and sequencing automation tasks and actions to reach development goals. With Co-Pilot for Automators, developers simply need to describe the automation scenario for necessary elements or actions to be added in proper order. Consider the following areas where Co-Pilot for Automators is highly impactful.

Process Composer [Co-Pilot for Automators in Process Composer](#) on page 3626

- Create the complete automation or edit part of the process.
- Add a new task (Process, Bot, Form, API, Approval) to the end of the process and map dependencies.
- Add a learning instance from Document Automation to the end of the process.
- Set the conditions of dependencies.
- Update supported properties of an existing node. [Known limitations in Process Composer](#) on page 3630

Bot editor [Co-Pilot for Automators in Bot Editor](#) on page 3630

- Create the complete automation or edit part of the bot.
- Add a new action to the end of the automation. When adding an action, variables for mandatory attributes are automatically created.
- Update properties of an action.
- Create and reference variables to edit properties.
- Add and update the conditions of control flows (loop and if/else actions).
- [Known limitations in Bot editor](#) on page 3632

## Availability

A license is required for Automator AI to enable Co-Pilot for Automators. Licenses are available in all Cloud regions. When enabled, Automator AI features are available to all users with these roles and device license:

- Role: AAE\_Basic and AAE\_Bot Developer
- Device License: Bot Creator or Citizen Developer

---

### Note:

- Co-Pilot for Automators is optimized for use in English. There might be limited functionality in other languages.
- This capability is powered by an ensemble of AI/ML and large language models (LLM), and requires specific data attributes to be sent to sub-processors for completing the user requests. See Automation Anywhere Data Processing Addendum for details.

- For more information see [Data security for generative AI - FAQ](#) on page 1178.
- For details about Cloud and On premise licenses, see [Automator AI Platform Base](#) on page 20.

## Response messages

Co-Pilot for Automators is configured to respond with standardized messages when users send prompts. These interactive messages help developers with crafting and editing prompts. Consider the following message behaviors from Co-Pilot for Automators.

- Reject instructions not related to automation.
- Respond with user-friendly messages.
- Accept feedback on the output.

Automation Co-Pilot Response Message	Description	User Action Required
Success! Do the results meet your needs?	Automation Co-Pilot has successfully created the automation, and is asking for feedback.	Provide feedback by clicking Yes or No.
Automation updated. Do the results meet your needs?	Automation Co-Pilot has successfully updated the process or bot, and is asking for feedback.	Provide feedback by clicking Yes or No.
Thanks for your feedback.	Acknowledgment for the Yes/No feedback provided by the user.	None
The prompt is unrelated to Automation Anywhere capabilities. Please rephrase your prompt.	The user has entered a prompt that seems unrelated to Automation 360.	Correct the instruction.
Your request timed out. This could be due to high traffic. Please try again later or simplify your prompt. If the issue persists contact Support.	The error could have been caused due to time-out, API connection error or external call to the LLM model. The error is not caused due to Automation Anywhere system error. In such cases, Automation Co-Pilot retries the user request automatically before responding with this message.	Wait for a few minutes and try again. If that does not work then reduce the message length by breaking it into smaller chunks or re-wording it.

Automation Co-Pilot Response Message	Description	User Action Required
Unable to render. Please further detail the automation scenario in your prompt. Consider using the standard names of actions and tasks.	User prompt for creating or editing an automation could not be processed as Automation Co-Pilot was unable to identify the required automation entities such as tasks, packages or actions.	Modify the instruction to correctly describe your automation scenario.
An unexpected error occurred, please try again. If the error persists, edit your prompt or contact Support.	Automation Co-Pilot was unable to understand the request.	Try rewording the instruction.
Approval task feature is unavailable. Please verify your license, role, permission and try again.	Automation Co-Pilot did not have proper privileges to include this feature in the automation.	Ensure the admin has granted this user the appropriate license and permissions.
API task feature is unavailable. Please verify your license, role, permission and try again.	Automation Co-Pilot did not have proper privileges to include this feature in the automation.	Ensure the admin has granted this user the appropriate license and permissions.

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

## Co-Pilot for Automators in Process Composer

As variables and complexity are introduced to a process automation, developers can describe the automation scenario with natural language prompts to save time.

Co-Pilot for Automators offers a dialog box to receive command prompts, recognize the necessary nodes and changes, then edit the process accordingly. This can save time and cognitive effort when compared to the traditional select and enter method of development.

Prerequisite: See [Availability](#) on page 3624

### Capabilities

Co-Pilot for Automators supports the following features in the Process Composer. Consider describing the following in a natural language prompt.

Add an Approval Task.

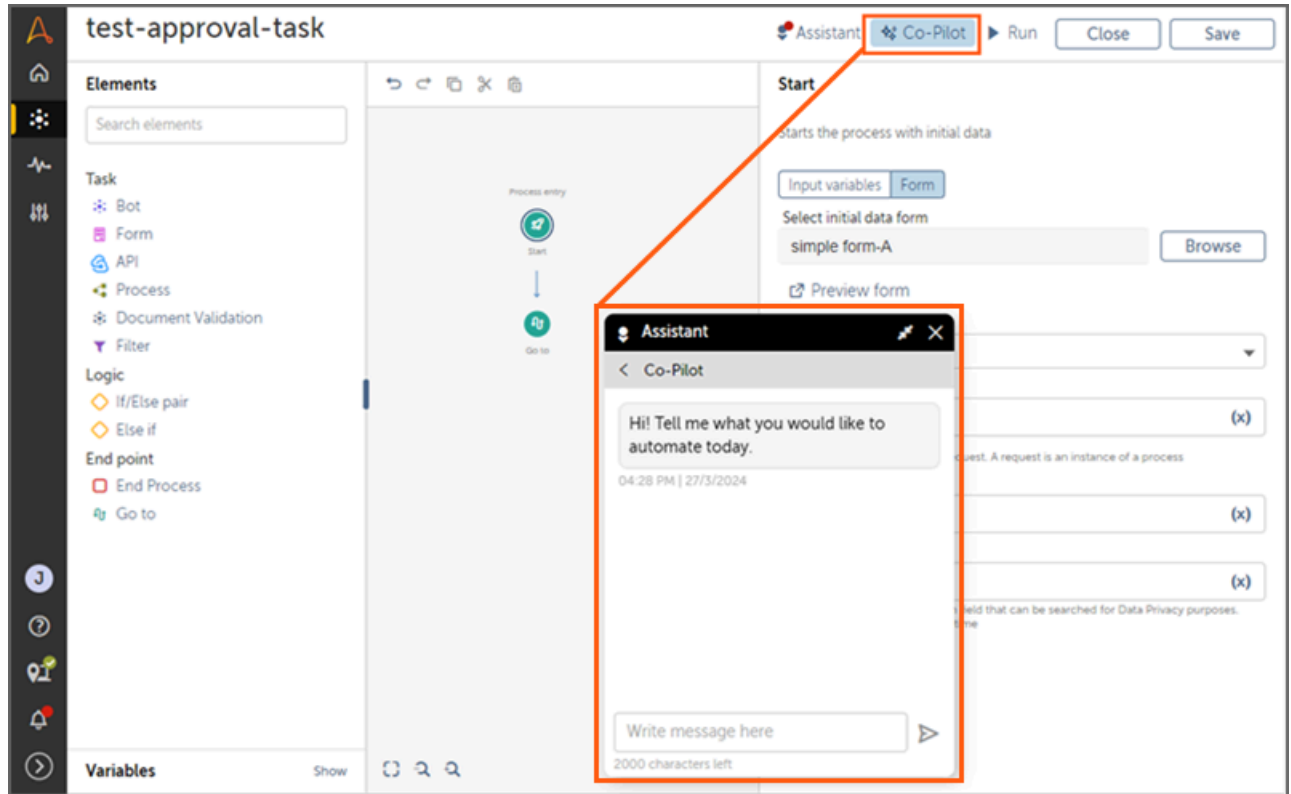

Users can add an Approval Task to the process. Some manual configuration is required to assign users, roles, and teams for the requests and approvals. Also, the form used in the Approval Task should pre-exist to easily attach during configuration.

Add an API Task.	Users can add any API task, existing in the Control Room, by referencing the title of the API task. The closest match and add the API task to the end of the process.
Add a Document Automation learning instance.	Add a relevant learning instance referenced in Document Automation. <a href="#">Support for learning instance in process task</a> on page 3628
Add and edit conditions of a node.	Describe the conditions of a node for the process flow, such as: boolean, string, datetime, numeric.
Update operation for supported properties.	Update a supported property of a node by detailing the change and the node where changes should apply. <a href="#">Known limitations in Process Composer</a> on page 3630

## Build automation in Process Composer

The following steps describe creating a new process and editing automation with Co-Pilot for Automators.

1. Log-in to the Control Room with a valid user account and navigate to **Automation > Create new > Process**.
2. Enter a name and the folder where you want your process to be saved. Click **Create & edit** to open the process in the Process Composer and enter your initial data in the start element.
3. Open Co-Pilot for Automators by clicking the **Co-Pilot** button or **Assistant > Co-Pilot**.

4. In the **Co-Pilot** dialog box, describe your automation scenario. When complete, click **Send** or use Ctrl+Enter for your instruction to be generated on the canvas.

For example, you can describe an invoice processing automation as Add the scan invoices bot. If values are greater than 100, then send email to test@email.com, else save data to new excel sheet.

5. Co-Pilot for Automators analyzes the prompt, generates the automation using necessary elements, and responds in the dialog box with a message.

---

**Note:** In this example, Co-Pilot for Automators matched the prompt to existing bots in the repository and mapped them to the bot tasks. Co-Pilot also added a process task and the developer mapped the child process to it manually.

---

6. Provide feedback to Co-Pilot for Automators by clicking **Yes** or **No** in the dialog box.
7. To further edit your automation, describe any changes and specific node of your automation scenario within the Co-Pilot dialog box.
8. Finally, review, save, and test your automation to ensure accuracy.

### Support for learning instance in process task

When you enter a prompt in the Co-Pilot chat window that refers to a data extraction or data processing task from documents, the system can detect the relevant learning instance process in Document Automation and add the task to a process in the Process Composer with the details.

This feature can automate creating a process in the Process Composer referencing a single or multiple learning instances based on the data processing task required.

Let us go over a use case to understand how the feature works.

A customer had made an online purchase from the Walmart store and would like to return the items as they do not meet requirements. The customer has reached out to the customer service agent, starting the return process. The customer service agent will run a process automation that has been created in the Automation Anywhere Process Composer to run the return process.

- Ensure there's a learning instance created in Document Automation configured to extract receipt data from Walmart receipts with the learning instance name Walmart.
- You have permission to access the learning instance.
- You have Co-Pilot for Automators license to access and use the Co-Pilot feature.

These are steps for creating a process for this use case using Co-Pilot for Automators.

1. Log-in to the Control Room with a valid user account and navigate to **Automation > Create new > Process**.
2. Enter the name Extract receipt information and the folder where you want your process to be saved. Click **Create & edit** to display the process outline in the Process Composer with the start and end elements.
3. Click the **Co-Pilot** button or click **Assistant > Co-Pilot** to open the chat window.
4. In the chat window, enter this prompt: Create a process to extract details from Walmart receipts. If approved, send an email. and click **Send** or use the Ctrl +Enter shortcut key when you are done.
5. Automation Co-Pilot analyzes the prompt, and generates the process outline with the correct Walmart learning instance reference.

Based on the process automation created in the Process Composer with Co-Pilot for Automators, the Extract receipt data node referencing the Walmart learning instance with details displays in the panel to the right. The **Input value** fields for the learning instance are specific to Document Automation.

6. You can provide feedback to Automation Co-Pilot by clicking **Yes** or **No**.
7. You can also edit the process further by entering additional prompts describing process nodes you want to add.

8. Review your process automation, save it, and test it to ensure that it works as expected.

## Known limitations in Process Composer

While building a process, Co-Pilot for Automators can accelerate development. However, not all properties are currently supported.

Properties of the following task elements are currently not supported.

**Note:** Properties of the **Start** node must be updated manually. Co-Pilot for Automators can create and update downstream nodes in the process, including properties of the nodes.

Task type	Property not supported
Form	<ul style="list-style-type: none"> <li>• Priority</li> <li>• Auto assign</li> <li>• Task requester and assignment</li> <li>• File upload storage</li> <li>• Form buttons (add button)</li> <li>• Show task in "Requested" task list for the request creator</li> <li>• Custom Task requester and Assignment (default is supported)</li> </ul>
Bot	<ul style="list-style-type: none"> <li>• Priority</li> </ul>
Filter	<ul style="list-style-type: none"> <li>• Filter type</li> <li>• Filter Criterion</li> <li>• Variable to be filtered</li> </ul>
Approval	<ul style="list-style-type: none"> <li>• Action buttons</li> </ul>
Document validation	<ul style="list-style-type: none"> <li>• Auto Assign</li> <li>• Document ID</li> <li>• Task requester and assignment</li> </ul>

## Co-Pilot for Automators in Bot Editor

Natural language prompts can make developing sophisticated bot automation simple and fast.

Prerequisite

See [Availability](#) on page 3624

## Capabilities

Co-Pilot for Automators supports the following features in the Bot editor. Consider describing the following with a natural language prompt.

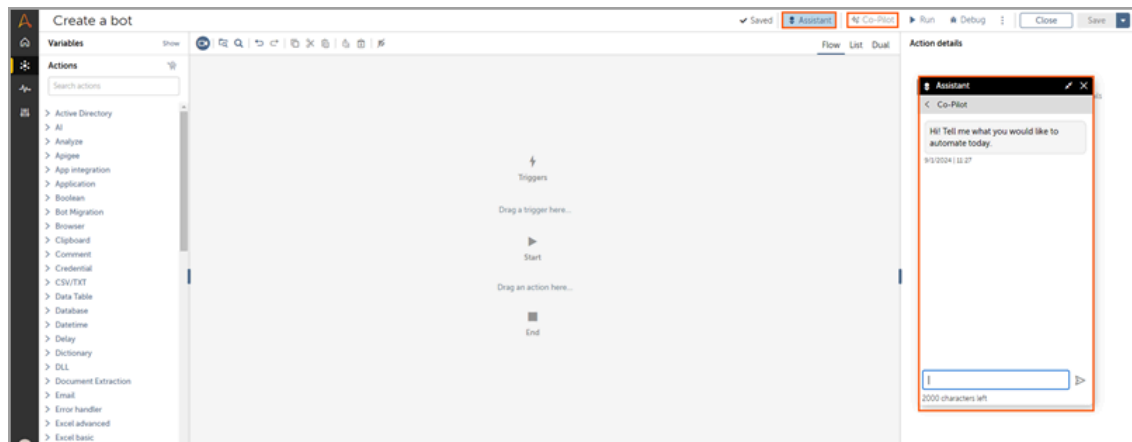

- Create an action and automatically create variables for mandatory attributes of the action.
- Describe and reference existing variables in prompts using the established variable tag (ex. `$variable_name$`).
- Create an action and a variable, and map them together with a single prompt (ex. Connect to Salesforce and set username to `$salesforceUserName$`).
- Update attributes of an action in the Bot editor.
- Specify the conditions of loop and if/else actions to describe the behavior of the bot and match the built-in iterators (ex. For each: file in a folder, row in a database table).

## Procedure

Follow these steps to create or edit automation in the Bot editor with Co-Pilot for Automators.

1. Log-in to the Control Room with a valid user account and navigate to **Automation > Create new > Task Bot**.
2. Enter a name and folder where you want your bot to be saved. Click **Create & edit** to display the bot outline in the Bot editor with the start and end elements.
3. To open Co-Pilot for Automators, click the **Co-Pilot** button or click **Assistant > Co-Pilot**.

Access Co-Pilot in the Bot editor.

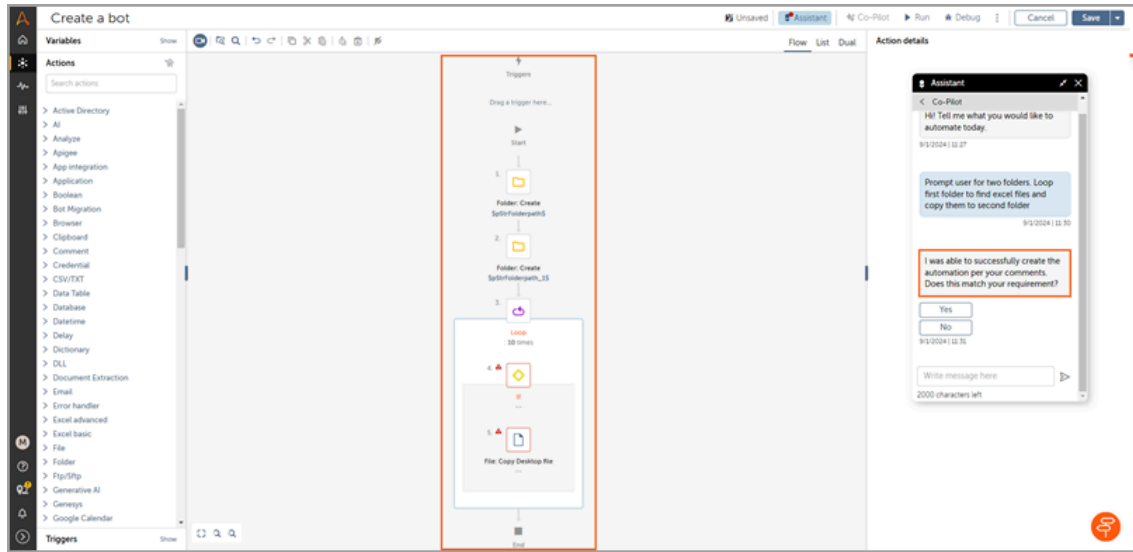

4. Within the **Co-Pilot** chat window, describe your automation scenario and click **Send** or use the Ctrl+Enter shortcut key when you are done.

For example, you can describe a file-copy automation with Prompt user for two folders. Loop first folder to find excel files and copy them to second folder.

5. Automation Co-Pilot analyzes the prompt, automatically generates the automation, and responds with a success message.

Automate in the Bot editor.

6. Provide feedback to Automation Co-Pilot by clicking **Yes** or **No**.
7. If needed, edit your automation by further describing your automation scenario within the Co-Pilot chat window.
8. Finally, review your automation, save it, and test it to ensure that the automation works as expected.

### Known limitations in Bot editor

While building a bot automation, Co-Pilot for Automators can accelerate development. However, not all functions are supported.

The following functionality is currently not supported by Co-Pilot for Automators.

Element	Limitations
Packages	<ul style="list-style-type: none"> <li>Custom packages and Bot Store packages are not supported.</li> </ul>
Actions	<ul style="list-style-type: none"> <li>The <b>Step</b> action cannot be added via prompts.</li> <li>An existing <b>Task Bot</b> cannot be linked to <b>Run Task Bot</b> action via prompts.</li> <li><b>Recorder</b> or <b>Capture</b> action properties cannot be auto-populated via prompts.</li> <li><b>Loop</b> action defaults to 10.</li> </ul>
Location/Line	<ul style="list-style-type: none"> <li>Updates cannot be restricted to a specific line.</li> <li>New actions can be added only in the last line.</li> </ul>
Properties	<ul style="list-style-type: none"> <li>A limited set of properties for some actions cannot be assigned or modified via prompts.</li> </ul>

## How to write a good prompt

Co-Pilot for Automators lets you explore different variations of a prompt so you can determine what works best for you. If the initial results do not meet your need, you can undo or delete the automation, rephrase your prompt, and run it again.

Follow these principles to get better and more relevant results from Automation Co-Pilot.

Write unambiguous instructions

Automation Co-Pilot aims to understand your intent from the instruction (or prompt) you send. Providing clear and specific instructions reduces guesswork and produces better results.

When instructed with `Send Email` in the Bot editor, Automation Co-Pilot uses the Email command package to execute this prompt. If your intention was to send an email with Microsoft 365 Outlook, then the correct prompt would be `Send Outlook email` action.

Be direct

Provide direct instructions and refrain from requesting or "thinking aloud".

Instead of saying `can you please help me to create an automation to send email`, rephrase your prompt to say `create an automation to send email to demo@demo.com with subject 'this is a demo'`.

Break down complex actions

If the automation scenario involves multiple steps, break them down into smaller, more manageable tasks.

Instead of saying `Insert salesforce records into database and check record for email info to send email`, rephrase your prompt to say `Get records from Salesforce. For each record, insert it into the database. If the record contains an email address, send an email to demo@demo.com. If not, add a comment. If an error occurs when the bot performs these operations then show a message box.`

Add additional context where possible

Specifying the task type or action in your prompt will accurately identify the automation step.

Using a prompt to say `Open excel C:/temp/MyFile.xlsx` would ensure that Automation Co-Pilot uses the Excel action to open the specified file.

## Examples of prompts

These are example prompts for common patterns observed in automations built by developers. Though these prompt patterns create optimal outputs, we recommend tweaking them as needed for the automation you are building.

Bot editor Examples:

- `Open a folder. Loop through each file. Copy the file names and add it in a excel file`
- `connect to database using myname/mytoken account`

- open browser google.com
- create a bot that sends email to \$EmailTo\$, CC \$EmailCC\$, from \$EmailFrom\$, subject 'Bot Started', message 'The bot has now started'
- run excel macro "TestMacro" on C:\Temp\MacroFile.xls. Then switch to excel Main worksheet and get all cells
- Prompt for the user to select the folderpath. Loop through the selected folder including subfolders. If any excel file is found, then check for the worksheet 'Main'. if available save it as a PDF in the same folder
- get records from salesforce. for each salesforce record, insert a record into the database. if the record contains an email, send an email. if not, add a comment. if an error occurs when the bot performs these operations show a message box
- Sharepoint Operations:
  - authenticate sharepoint with Client ID as \$ClientID\$, Client Secret as \$ClientSecret\$, Tenant ID as \$TenantID\$
  - create sharepoint folder COPILOT at /SiteName/Folders/FA
  - upload file to sharepoint
- \* If / ElseIf / Else:
  - If response is A, connect to database and read data. Else, send email to \$EmailTo\$
  - If response is A, connect to database and read data. Else if response is B, open www.google.com. Else, send email to \$EmailTo\$
- Error Handler:
  - open excel C:\temp.xlsx. When error occurs, send an email
  - open excel C:\temp.xlsx. When error occurs, send an email to me@myorg.com
  - open excel C:\temp.xlsx and get all rows. If error occurs when performing these operations, send an email
  - add try-catch
  - add error handler
- Use Excel Advanced package to load the data from 'SalesData.xlsx' located in the 'C:\Reports' folder. Write this data into XYZ oracle database.
- Prompt user for two folders. Loop first folder to find excel files and copy them to second folder.
- Create a bot to copy data from a table in database to excel.

#### Process Composer Examples:

- Create a new customer profile in the CRM system. The name, email address, and phone number will be provided by a user via a form.
- Read the list of automotive parts from a pdf using a document automation task, use a bot to search these parts in a website, and email the collected information
- Start with a form to enter patient information. Then filter out patients that are 75 years old and older. Finally, add a bot to save the information in an excel spreadsheet.

- Get data from an invoice. If the name starts with "new", check the price. If the price is above 1000, send an email and If the price is below 500, then go to the first task. Otherwise, save the data to Excel file. If the invoice doesn't start with new, validate the document.
- Add a form task for EntryForm.
- Add a bot task for botInput.

## Co-Pilot for Automators FAQs

Refer to this FAQ for general queries on the behavior and functionality of building with natural language.

### General

What is Co-Pilot for Automators?	It is an on-demand, intelligent automation assistant, accessible from within the Automation Workspace. Developers can describe their automation in English language and have Automation Co-Pilot create or update the automation.
What is the intended use of Co-Pilot for Automators?	It is intended to help developers build their automation quickly and easily. Developers are always in control of building and finalizing their automation.
How do I access Co-Pilot for Automators?	In the Automation Workspace, click <b>Co-Pilot</b> , or <b>Assistant &gt; Co-Pilot</b> . If you are unable to see these options, verify you have sufficient permissions and an Automator AI license for your user account. Contact Support to purchase a license.
How do I build or update a process with Co-Pilot for Automators?	See <a href="#">Co-Pilot for Automators in Process Composer</a> on page 3626
How do I build or update a bot with Automator AI?	See <a href="#">Co-Pilot for Automators in Bot Editor</a> on page 3630
Who can use Co-Pilot for Automators?	See <a href="#">Availability</a> on page 3624
Is Co-Pilot for Automators available in On-Premises installation?	Co-Pilot for Automators is currently a Cloud-only capability and is not available for On-Premises environments.
How is usage of Co-Pilot for Automators tracked?	Each prompt or instruction sent to Automation Co-Pilot is counted as one unit. These units are aggregated for all users across tenants and tracked against the available license capacity.

## Known limitations

The following limitations apply to the current product version:

- Co-Pilot for Automators is currently optimized for English language only. Prompts written in other languages can produce incomplete or inaccurate results.
- Prompts are not saved and hence conversation history cannot be retrieved when the screen is refreshed or a new session is started.
- Long prompts can sometimes result in time-outs.

Process Composer: see, [Known limitations in Process Composer](#) on page 3630

Bot editor: see, [Known limitations in Bot editor](#) on page 3632

## Suggest next actions

Suggest next actions, a generative AI based feature, helps accelerate automation development in an organization to achieve a higher level of productivity and build automations easily.

---

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

---

Citizen Developers can automate business processes for their daily work. When designing and developing automations, a big challenge for these developers is using the right set of actions in the correct sequence. Professional developers too face a similar challenge when building complex automations. This challenge leads to longer cycles of automation development and compromises the quality of the automation.

**Suggest next actions** helps developers overcome this challenge by providing real-time suggestions for the steps that might come next when building automations. Based on your business requirements, you (as a developer) can use this feature to accelerate the process of building automations and build them better by using the next best step in your automation.

---

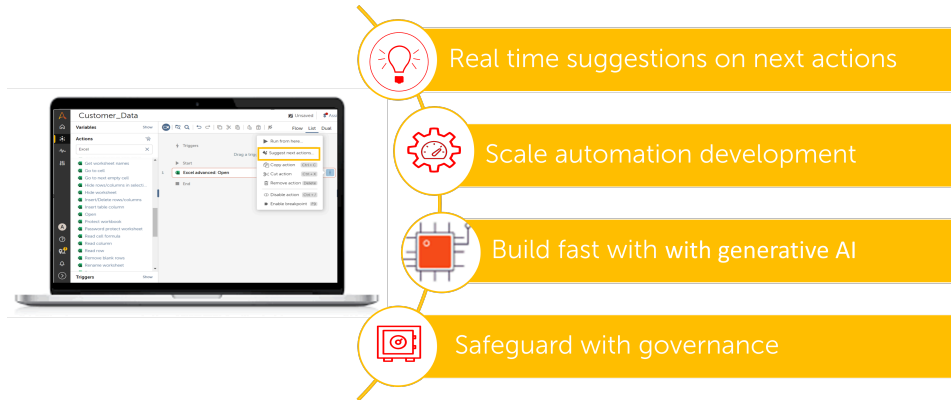

**Note:** If role-based access (RBAC) is set at a package level, and you do not have access to a particular package, then **Suggest next actions** does not display the packages or actions in the suggested list. This feature is only available to customers who are on Cloud Control Room instances.

---

## Benefits

The benefits of this feature are as follows:

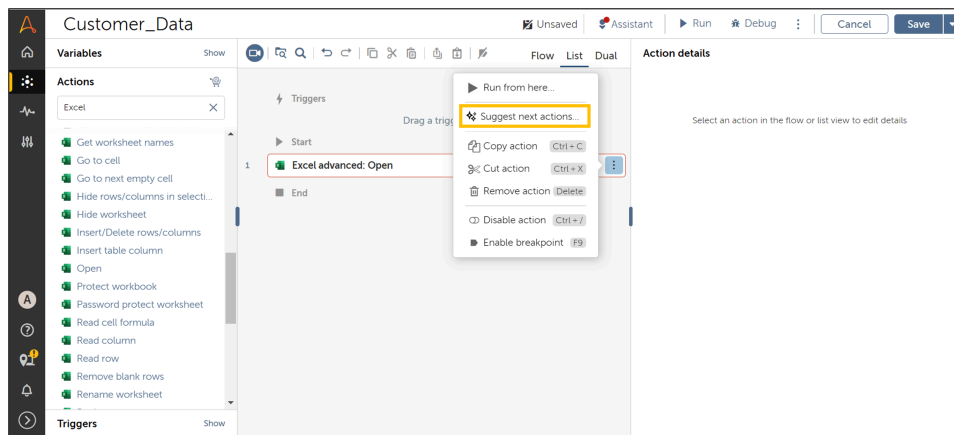

- Simplifies the process of creating automations for Citizen Developers as their ideas can be transformed into optimized automation.
- Allows developers, from a novice to an expert, to build effective automations.
- Reduces time to develop automations.
- Helps build efficient and high-quality automations over a period of time.
- Quickly expand your automations programs by accelerating professional developers and empower even more business users to build with no-code.

## How Suggest next actions works

Let us understand how **Suggest next actions** works with the help of an example. Consider a scenario where you as a developer want to automate some of the operations performed using Microsoft Excel, that is open an Excel worksheet, read through the rows in the sheet, and update it with calculated values.

1. In the Bot editor, drag or double-click **Excel advanced** > **Open**.
2. Click the three vertical ellipsis next to action and select **Suggest next actions**.

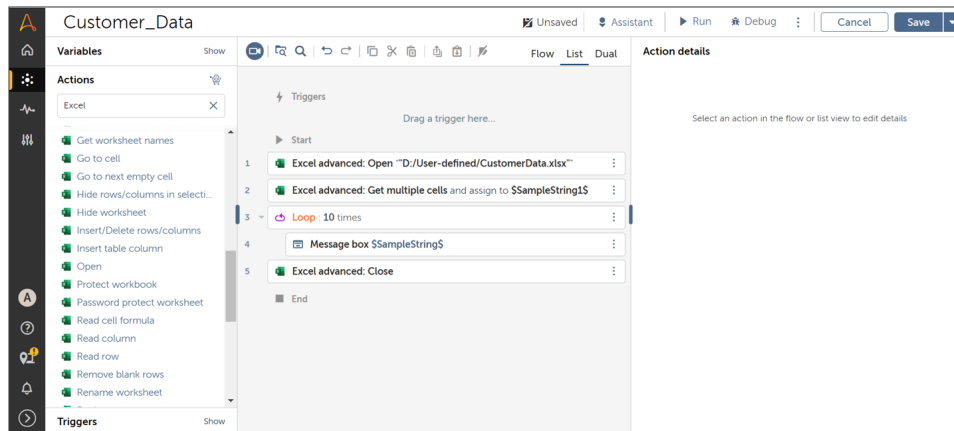

The **Suggest next actions** window shows a set of next possible actions. These suggestions are contextual; that is it understands the business context based on existing actions to provide meaningful recommendations.

3. You can either select individual check boxes to add an action in the Bot editor or click **Select all actions** to add all the recommended actions at once, thereby saving time. You can also click the refresh icon to view alternate set of recommended actions.

4. Click **Add actions** to add the selected action or actions to the automation.

## Suggest next actions - best practices

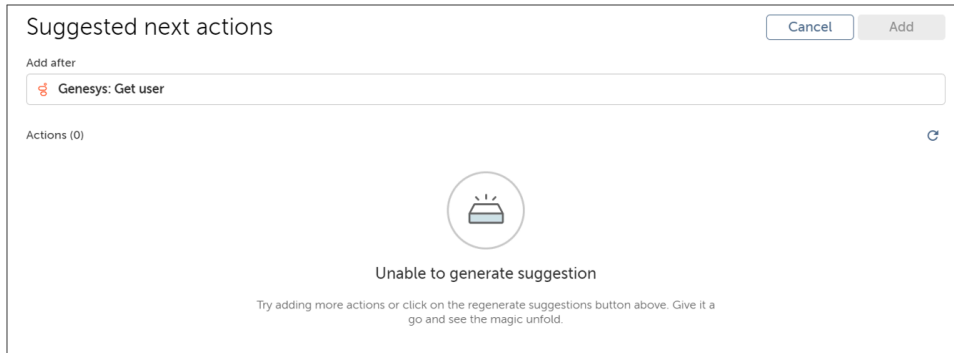

Review some best practices when using the **Suggest next actions** feature.

Keep in mind the following best practices when you use the **Suggest next actions** to get optimum results.

- GenAI-based suggestions are contextual to the selected action and other existing actions in the automation.
- The AI model provides better suggestions when enough actions are available in the automation to provide the context of the use case being automated.

For example, if you add just one action and look for suggestions, the suggestions might be different from the use case being automated. However, if there are enough actions to provide better context to the use case, the recommendations are likely to be more specific to the use case.

- Limited support is available for actions such as IF/ELSE, Loop, and Step. When you use IF/ELSE and Loop actions, we recommend selecting the condition and iterator, respectively, to get accurate suggestions.
- If suggested actions are not displayed in the **Suggested next actions** window and the following message is displayed, you can either try requesting suggestions again or add more actions before requesting for suggestions.

- If only a few suggested actions are required, use check boxes to choose the actions selectively.

## Suggest next actions FAQ

Review this FAQ for details and answers to questions on the **Suggest next actions** feature.

### General

How is Suggest next actions different from building with natural language?

Developers can use natural language to build automations through a chat-based interface, and they can provide instructions to create a new automation, modify it, add properties, and so on. **Suggest next actions** compliments the natural language capability to make development easier, particularly when developers need help identifying the next set of actions based on context.

What type of automations can use Suggest next actions?

Currently, only Task Bot and API Task supports **Suggest next actions**. We plan to extend this capability to other automation types in upcoming versions.

Is there a limit on how many actions will be suggested?

Yes, only 5 actions (excluding those added inside IF/ELSE, Loop, and Step) are suggested at a maximum at any given time.

Is there a limit on how many times I (as a user) can request suggestions?

No, there is no limit on the number of times the suggestions can be requested.

Will the customer's data be passed on to Automation Anywhere servers?

The customer's data is not passed on to Automation Anywhere servers. Only the

automation metadata is used to provide suggestions of actions.

Can I request more suggestions if I am not satisfied with the suggested actions?

You can repeat the step to get a different set of suggested actions.

Do I need additional permissions to get this feature?

No additional permissions are required other than Bot Creator or Citizen Developer.

## Known behavior and limitations

The following limitations apply to **Suggest next actions**:

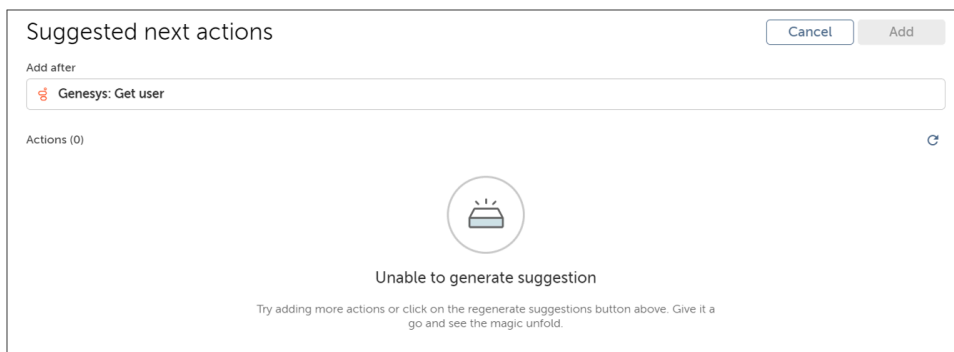

- Currently, 5 actions (excluding those added inside IF/ELSE, Loop, and Step) are suggested at a maximum at any given time.
- The suggested actions do not contain pre-filled properties per the existing actions in the automation. Properties will be empty or set to default values.

For example:

- **Database > Connect** action will have a default session name and user-defined as the default connection mode.
- Condition in the If action will be empty while the iterator in the Loop action will default to Loop for 10 times.
- Actions from different packages that serve similar operations, such as Excel basic and Excel advanced, Email, and Microsoft 365 Outlook, can also be suggested.

For example, when you select **Excel > Open**, the suggestions can include **Excel advanced > Read now** or **Excel advanced > Go to cell**.

- In some instances suggestions might not generated due to a lack of similar use cases in the training data. In such cases, the developer will be notified that no suggestions are available (as shown in the following image):

- Note that the text from the **Comment** action is not considered for generating suggestions.

## Security and architecture for Automator AI

Find details about data flow, security, and architecture related to Automator AI.

### Security

Does Automator AI interact with publicly accessible Large Language Models (LLM)?

Automator AI does not use any publicly accessible LLMs. It accesses Microsoft Azure OpenAI LLMs licensed to Automation Anywhere.

Which external AI services are being used by Automator AI?

Automator AI currently uses Microsoft Azure OpenAI LLMs along-with custom LLMs that are hosted on Amazon SageMaker.

What data is sent from Automator AI to external AI services?

User text prompt is sent to Microsoft Azure OpenAI LLM. Usage Data is sent to both Microsoft Azure OpenAI and Amazon SageMaker. Definitions of Usage Data and Customer DataSee can be found at the following. [Data security for Generative AI – FAQ](#)

In which regions are the prompts processed?

Automation Anywhere A360 cloud tenants are mapped to a corresponding Azure OpenAI region. User prompts entered in Automator AI are sent to this mapped Azure OpenAI region for processing. See the following mapping table for reference.

Table 10: Region mapping table

Automation 360 Cloud tenant region	Azure OpenAI region (primary)	Azure OpenAI region (disaster recovery)
US, LATAM	US	US
EU, Africa, Middle East	EU	EU
APJ, India, Singapore	Japan	Not available
Australia	Australia	Not available
Canada	Canada	Not available

Does Automation Anywhere permit vendors to train their LLMs on data from user text prompts submitted to Automator AI?

Automation Anywhere does not allow third-party vendors to store or train LLMs with the prompts or automation metadata sent to them via Automator AI.

How does Automation Anywhere ensure that user text prompts are not used by its vendors to train the vendors' LLM models or improve vendors' services?

Automation Anywhere uses Microsoft Azure OpenAI for processing user text prompts. The following guide confirms that incoming prompts to the Microsoft Azure OpenAI models are not stored or used to improve Microsoft services and Automation Anywhere has opted out of abuse monitoring by Microsoft. [Azure OpenAI Data, Privacy and Security guide](#)

Does Automation Anywhere train its own AI models with prompts submitted to Automator AI?

Automation Anywhere currently does not use the user text prompts or any other Customer Data for training its own AI models.

Does Automation Anywhere store the prompts submitted to Automator AI?

Prompts submitted by users are currently not stored.

Do any additional vendors have access to data submitted to Automator AI?

See Exhibit C of the following addendum for a list of vendors who have access to Customer Data submitted to Automator AI. The applicable vendors will have Intelligent Automation Co-Pilot for Automators in the Applicable Services column. [Data processing addendum \(DPA\)](#)

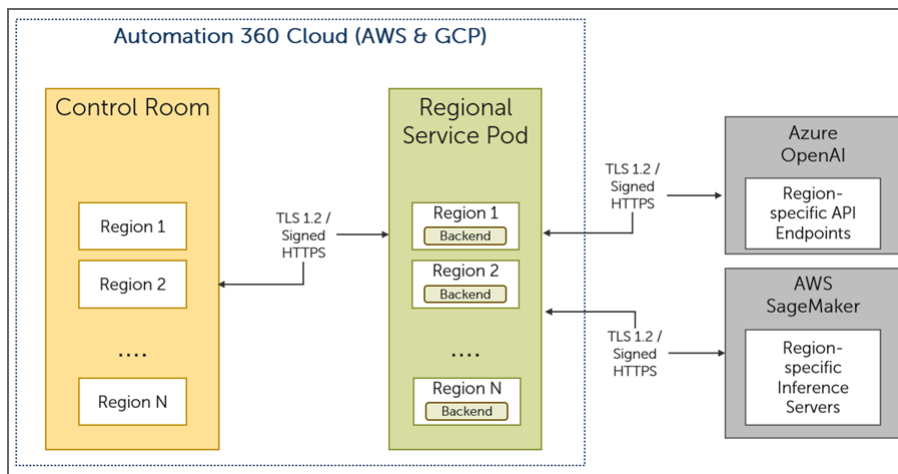

Will Automation Anywhere enter into a Business Associate Agreement (BAA) for the processing of Protected Health Information (as defined by C.F.R. § 160.103) (PHI) with respect to PHI, which a customer submits to Automator AI?

Yes. Typically, our BAA is automatically incorporated into our [Cloud Automation Agreement](#). Please reach out to your Customer Success Manager (CSM) or Sales Executive (SE) to check whether you have a BAA in place, and if not, they will get you a copy of our BAA.

Will Automation Anywhere enter into a Data Processing Agreement (DPA) for the processing of Personal Data which a customer submits to Automator AI?

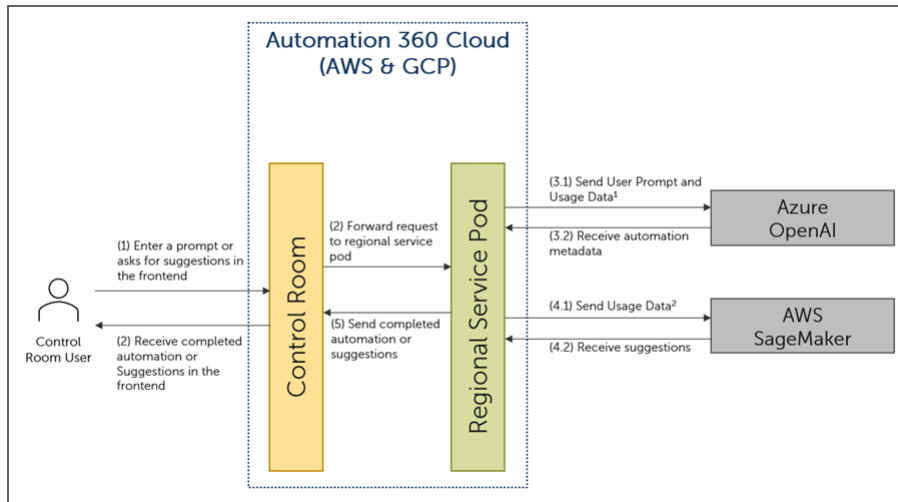

Yes. Typically, our DPA is automatically incorporated into our [Cloud Automation Agreement](#). See, [Cloud Automation Agreement](#). Please reach out to your Customer Success Manager (CSM) or Sales Executive (SE) to check whether you have a DPA in place, and if not, they will get you a signed copy of our DPA. See terms of our DPA in the following. [Automation Anywhere DPA Agreement](#)

## Architecture

- Backend contains AI Orchestration and API Management services.
- Regional Service Pods are aligned to Control Room regions in AWS or GCP.
- Each Regional Service Pod is mapped to corresponding Azure OpenAI and AWS SageMaker region-specific endpoints.

## Data flow

<sup>1</sup> Usage data includes names and descriptions of process tasks, command packages and command actions.

<sup>2</sup> The definition of Usage Data can be found at the following [Data security for Generative AI FAQs](#)

## Generative Recorder

When web applications undergo changes or have dynamic UI elements, the bots automating them might not work reliably. The Recorder actions could fail because they might not find the UI elements at runtime. With the new Generative Recorder fallback mechanism, you can automate such dynamic web pages more reliably.

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

## Availability

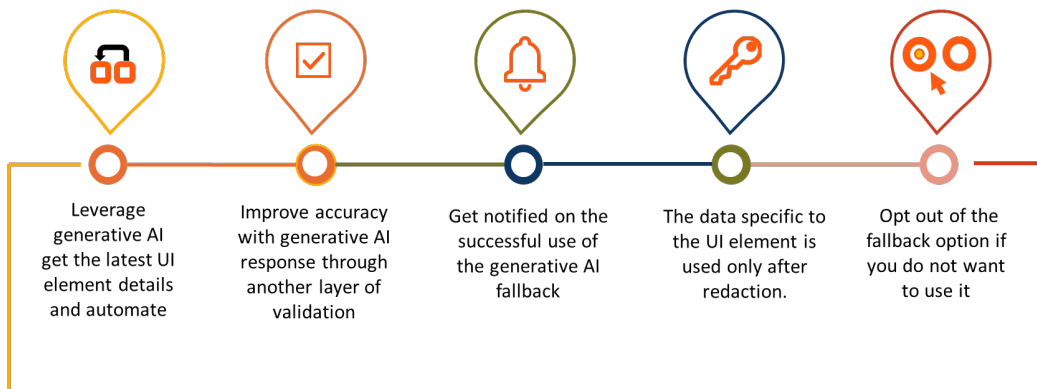

A license is required for Automator AI to enable Generative Recorder. Licenses are available in all Cloud regions. When enabled, Automator AI features are available to all users with these roles and device license:

- Role: AAE\_Basic and AAE\_Bot Developer
- Device License: Bot Creator or Citizen Developer

**Note:** This feature is available with AWS and GCP Cloud.

## Benefits of generative AI

- **Fallback:** When Recorder is not able to automate a web UI element, leverage generative AI and native fallbacks to get the latest UI element details and automate.
- **Secure:** The data specific to the UI element is used only after redaction and anonymization. Business application data that is not related to the automated UI element is not used.
- **Validate:** Process generative AI response through another layer of validation to help improve fallback accuracy.
- **Optional:** If you do not want to use the fallback option, you can opt out.
- **Traceable:** Citizen developer, Professional developers, and Automation admins will be notified on the successful use of the generative AI fallback.

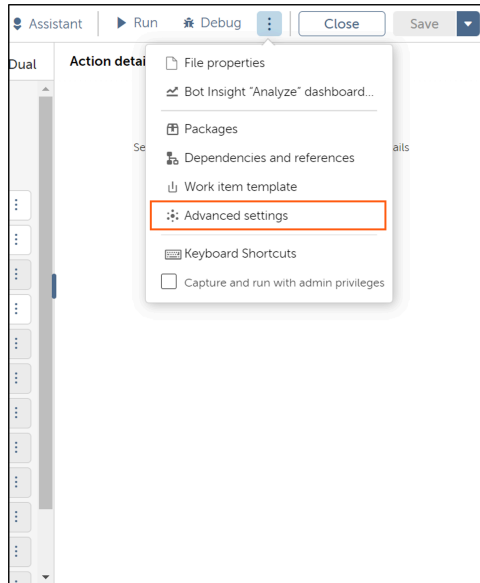

## Generative AI-based fallback

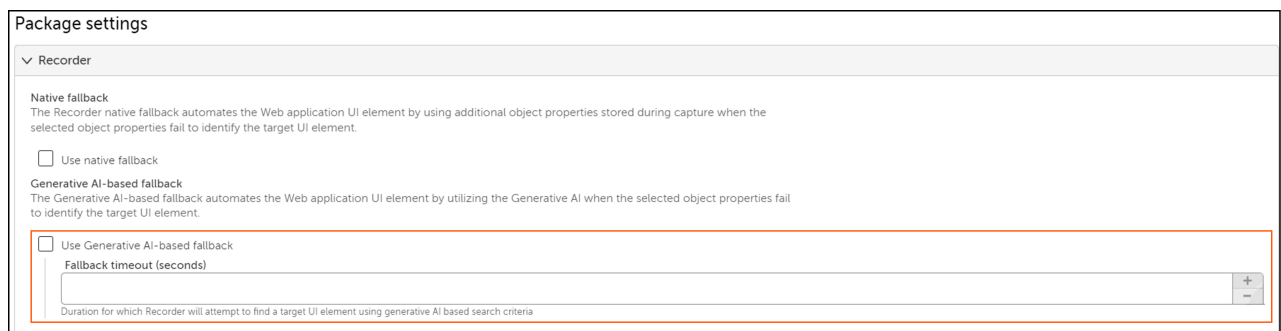

If the object on which you want to execute an action is not detected within the specified timeout, you can leverage generative AI based fallback to automate the specific dynamic webpages, decreasing the possibility of the Recorder action failure in the bot due to UI element changes or dynamic properties.

When generative AI fallback is enabled, a call request is sent to a generative AI model and the response is then routed through another round of validation and then used for fallback. To enable the generative AI capability:

1. From the Bot editor, navigate to **Advanced settings > Package settings**.

2. In the **Package settings** > **Recorder**, enable the **Use Generative AI-based fallback** option.

#### Note:

- These are bot level settings. Hence, when you enable generative AI-based fallback, all the capture actions occurring in that specific bot will use these same settings with a time out of 30 seconds.
- Ensure that you use at least one **Recorder** > **Capture** action in the bot to load the Recorder package specific settings.

## Recorder native fallback

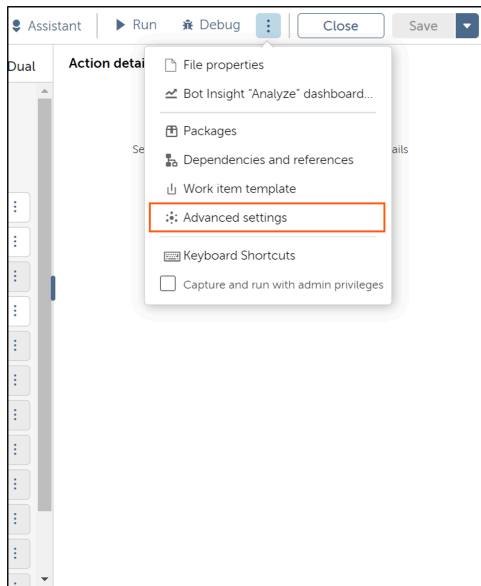

When you try to automate dynamic web applications where the properties of the controls change frequently, the Recorder might fail to automate such applications as the DOMXPath property value changes with every page refresh. To automate such scenarios, enable the Recorder native fallback support.

Recorder native fallback feature generates multiple XPath's while capturing the object which are then stored and validated to ensure if they can be used for the current business application. The reliable and relevant XPath's are then used during bot execution.

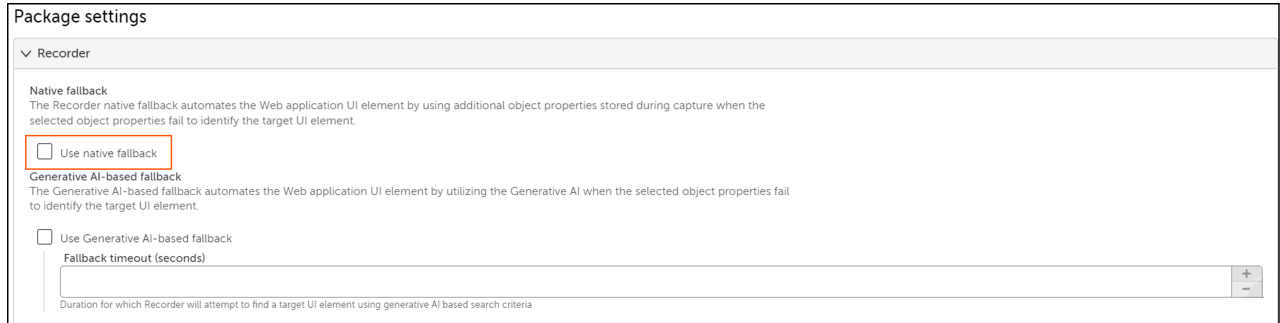

**Note:** This feature is currently supported only for HTML technology in Google Chrome and Microsoft Edge browsers.

To enable the native fallback capability:

1. From the Bot editor, navigate to **Advanced settings > Package settings**.

2. In the **Package settings > Recorder**, enable the **Use native fallback** option.

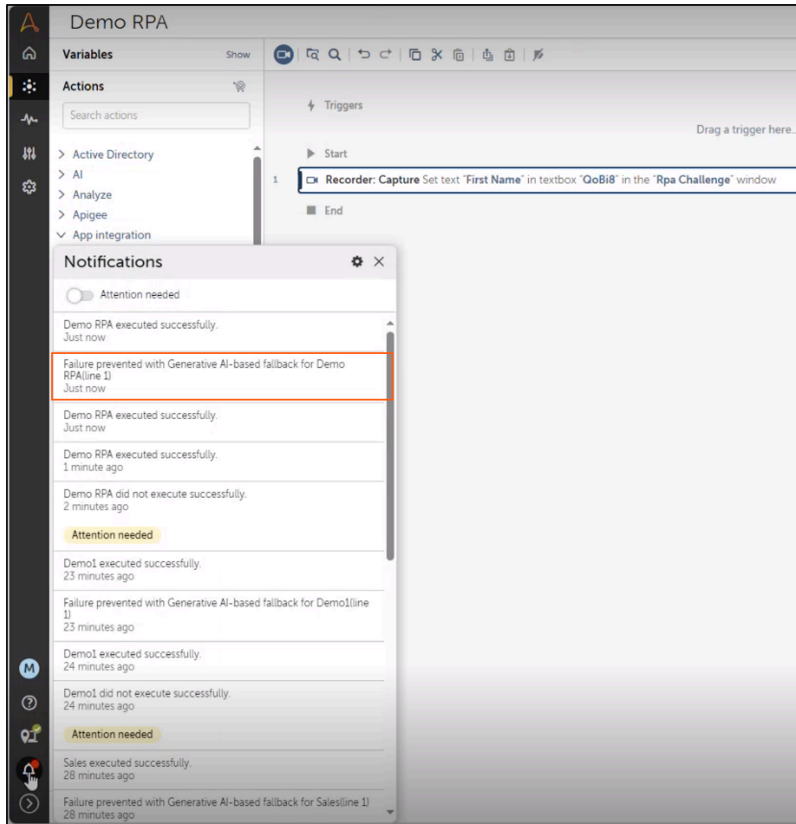

**Note:** When both **Use native fallback** and **Use Generative AI-based fallback** options are selected, the bot first uses the native fallback to execute actions on the captured object. If the bot is unable to detect the control with native fallback support, it will then fallback to generative AI.

## Audit logs and notifications

In the Bot editor, every time a generative AI fallback is used, the **Notifications** panel and the **Audit logs** show an alert.

Every time a generative AI fallback was successful, you will receive a notification along with the specific line number. This mechanism will enable you to monitor and keep a track of successful executions of generative AI and take actions accordingly.

## About Process Composer

Process Composer is an environment that leverages multiple products across the Automation 360 platform to deliver an Intelligent Automation experience.

Professional and Citizen Developers can use the Process Composer's low-code features to collaborate and build end-to-end process automations. Process Composer displays correct data to the appropriate users and exchanges that data across multiple teams. Using a single, drag-

and-drop visual interface, developers can quickly build long-running process automations that combine bots, forms, document processing, integrations, and API Tasks.

## Benefits of Process Composer

Professional and Citizen Developers can:

- Optimize complex workflows: Simplify business operations across departments by automating multi-user, multi-step tasks and approvals.
- Empower employee experience: By transforming end-to-end processes, combine robotic tasks with connecting APIs and can insert humans-in-the-loop where needed.
- Boost operational productivity for the organization: Time between tasks decreases, service level agreements (SLAs) are enforced, and teams are promptly alerted within their application of choice.

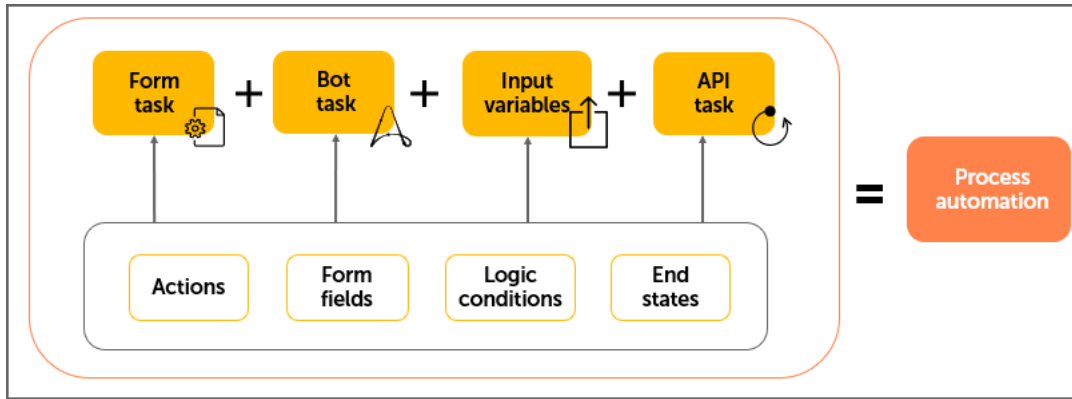

## Process Composer components and elements

Process Composer is comprised of three components:

- Process discovery component: You use Process Composer to discover processes, and then learn (reference) from them. An asset generated from [Process Discovery](#) can be a process workflow that gets translated into a process automation in Process Composer.
- Process automation design component: You create and design process automations which link bots and forms together. Additionally, the process automation contains the logic that triggers the bots and forms, and coordinates the flow of data between them. A process automation contains the following elements:
  - Request: A specific instance of a process automation that defines a template of how bots and forms interact.
  - Initial data: Fed into the process typically entered by a user and consumed through a [form](#) as the first step.
  - Sequence of steps in a process automation: Which can contain any of the following process automation elements:
    - Form Task: Completed by users which enable them to invoke and interact with the bots through the customizable web interface.
    - Bot Task: Previously built in the Bot builder and available to select in Process Composer. The bots automate specific, repetitive, and rule-based tasks.
    - API Task: Task that connects to a specified API and retrieves data for the process automation to consume. When invoked from a process automation, API Tasks provide a faster response than a Bot Task when called in the same process automation.
    - Approval Task: Task that alerts a responder to approve shared data.
    - Document Validation: Task that requires document approval.
    - Input, output, and meta variables: Includes shared data in the process automation.
  - Logic conditions: Such as the `IF/ELSE` pair or `ELSE if` to include internal and conditional branching of the process automation.
  - End states: Closes each request (specific instance of a process automation) with a status such as: completed, failed, or canceled.

- Process automation management component: After you have created a process automation, you can check it in to deploy and make available to other users in the web interface. Additionally, you can import, export, run, delete, and check out process automations.

Related concepts

[Users and team roles for Automation Co-Pilot](#) on page 3609

Users with specific roles and permissions can use different features in Automation Co-Pilot to automate business processes as per requirement.

## Process Composer roles and permissions

As an Admin, you can create custom Process Composer roles in the Control Room and set very granular user permissions to fit within any specific organizational security policies. You are not required to use the default system-defined roles provided by applications.

You can define users with specific roles and permissions to use different features in Process Composer and Automation Co-Pilot to automate business processes as per your organization's requirements. For specific roles and permissions related to Automation Co-Pilot, click [Users and team roles for Automation Co-Pilot](#) on page 3609.

Users can be broadly characterized into the following categories:

- Users who access the Automation 360 Control Room to build automation processes in the Process Composer.
- End-users who run automation processes using Automation Co-Pilot for Business Users from the Cloud or desktop.
- The Admin or team manager persona who is responsible for configuring Automation Co-Pilot for Business Users.

As a Control Room Admin, you can create users and assign them the following Process Composer roles and permissions related to tasks, requests, and processes:

Table 11: Process Composer roles and permissions

Role Type	Available Permissions
AAE_Robotic Interface User	User has the ability to: <ul style="list-style-type: none"> <li>• Reassign my group tasks</li> <li>• Delete my requests</li> </ul>

Role Type	Available Permissions
AAE_Robotic Interface Manager	User has the ability to: <ul style="list-style-type: none"> <li>Reassign my group tasks</li> <li>Delete my requests <ul style="list-style-type: none"> <li>Delete my group requests</li> </ul> </li> </ul>
AAE_Robotic Interface Admin	User has the ability to: <ul style="list-style-type: none"> <li>View and manage all processes</li> <li>View all requests from public processes <ul style="list-style-type: none"> <li>View all requests from public and private processes</li> </ul> </li> <li>Delete my requests <ul style="list-style-type: none"> <li>Delete my group requests</li> <li>Delete all requests</li> </ul> </li> <li>View all tasks from public processes <ul style="list-style-type: none"> <li>View all tasks from public and private processes</li> </ul> </li> <li>Reassign my group tasks <ul style="list-style-type: none"> <li>Reassign all tasks</li> </ul> </li> </ul>

For details on how to create users and configure permissions to access features, see the following:

- [Create a user](#) on page 1845
- [Create a role](#) on page 1855

## Supported behaviors for tasks and elements in Process Composer

Process Composer tasks, logic conditions, and end points support copy, paste, and cut behaviors from the Bot editor. This also includes the ability to double-click and replace items on the canvas.

### Supported behaviors

**Note:** The functionality of these behaviors are the same for both Process Composer and Bot editor with the exception of some specific task types.

Copy	Use <b>CTRL + C</b> to copy data from the task.
Paste	Use <b>CTRL + V</b> to paste copied data in your task.

Cut	Use <b>CTRL + X</b> to copy and remove data from your task.
Double-click to add	Double-click a task to add data to it.

## Copy behavior

When you copy a task or element in the canvas, these behaviors will occur:

Task types	Behavior
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If</li> <li>• Else if</li> <li>• End process</li> <li>• Go to</li> </ul>	Properties are retained in the clipboard.
Else	Task is not retained in the clipboard.

## Paste behavior

When you paste a task or element in the canvas, these behaviors will occur:

Task types	Node selected	Behavior
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	None	Task is attached to the last node located before the end point ( <b>End process</b> or <b>Go to</b> ).
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	Task is attached to the last node placed before the end point ( <b>End process</b> or <b>Go to</b> ).

Task types	Node selected	Behavior
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation</li> <li>• If</li> <li>• Else if</li> <li>• Else</li> </ul>	Task is attached to the node.
<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation</li> <li>• If</li> <li>• Else if</li> <li>• Else</li> <li>• None</li> </ul>	Paste is not allowed or disabled.
<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	Task replaces the selected node.
Else if	<ul style="list-style-type: none"> <li>• If</li> <li>• Else if</li> </ul>	Task is added as a new <b>Else if</b> node in the same line as the <b>If</b> or <b>Else if</b> , and located in the last position before the <b>Else</b> .
Else if	<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation</li> <li>• End Process</li> <li>• None</li> </ul>	Task is not added to the canvas because this action is invalid.

## Cut behavior

When you cut (remove) a task or element in the canvas, these behaviors will occur:

Task types	Behavior
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> </ul>	Task is removed from the canvas by deletion but the clipboard retains the task with all the properties .
<ul style="list-style-type: none"> <li>• If</li> <li>• Else if</li> </ul>	Task is removed from the canvas by deletion but the clipboard retains the task with all the properties. All child nodes are deleted from the canvas.
Else	Task is not removed or retained in the clipboard.
<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	Task is removed from the canvas by deletion but the clipboard contains the task with all the properties.

### Double-click to add behaviors

When you double-click a task or element in the canvas to add data to it, these behaviors will occur:

Task types	Node selected	Behavior
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	None	Task is attached to the last node located before the end point ( <b>End process</b> or <b>Go to</b> ) of the main branch (farthest left).
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	<ul style="list-style-type: none"> <li>• End process</li> <li>• Go to</li> </ul>	Task is attached to the last node located before the end point ( <b>End process</b> or <b>Go to</b> ).
<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation Task</li> <li>• If/Else pair</li> </ul>	<ul style="list-style-type: none"> <li>• Bot Task</li> <li>• Form Task</li> <li>• Filter Task</li> <li>• Document Validation</li> <li>• If</li> <li>• Else if</li> <li>• Else</li> </ul>	Task is attached to the selected node.

Task types	Node selected	Behavior
<ul style="list-style-type: none"> <li>End process</li> <li>Go to</li> </ul>	<ul style="list-style-type: none"> <li>Bot Task</li> <li>Form Task</li> <li>Filter Task</li> <li>Document Validation</li> <li>If</li> <li>Else if</li> <li>Else</li> <li>None</li> </ul>	Double-click is not allowed or disabled.
<ul style="list-style-type: none"> <li>End process</li> <li>Go to</li> </ul>	<ul style="list-style-type: none"> <li>End process</li> <li>Go to</li> </ul>	Task replaces the selected node.
Else if	If	Task is added as a new <b>Else if</b> node in the same line as the <b>If</b> or <b>Else if</b> and in the last position before the <b>Else</b> .
Else if	<ul style="list-style-type: none"> <li>Bot Task</li> <li>Form Task</li> <li>Filter Task</li> <li>Document Validation</li> <li>Else if</li> <li>End Process</li> <li>Go to</li> <li>None</li> </ul>	Task is not added to the canvas because this action is invalid.

## Construct URL parameters for supported elements

You can construct URL parameters for the following supported elements: **Date**, **Number**, **Text Box**, and **Time**.

### Supported elements to construct URL parameters

You can call a specific process using its ID and pass parameters through the URL to populate the initial forms based on the form field ID. This population method is also supported for initial forms in the iFrame widget for Automation Co-Pilot for Business Users using the embedded widget.

**Note:** The URL value will always overwrite the default value of the form fields.

Data format: The following data format is accepted for certain elements:

- The **Text Box**, **Text Area**, and **Rich Text Editor** elements accept the **String** type data.
- The **Number** element accepts the **Double** type data.

- The **Date** and **Time** elements accept the **RFC 8601** date (local time) type data (for example, 2021-06-10T00:00:00.000).
- The **Radio Button** and **Dropdown** elements accept the **String** type data.
- The **Check Box** element accepts the **String** type data.

Parameter Mapping: The following parameter mappings differ for certain elements:

- For the **Text Box**, **Text Area**, and **Rich Text Editor** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
  - `TextBox1=MyValue`
  - `TextArea2=MyLooooooooooooongValue`
  - `RichTextEditor3=AnUnformattedString`
- For the **Number** element, the **Element ID** shows the value after the element ID becomes the default element or input value. For example: `Number2=123.99`.
- For the **Date** and **Time** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
  - `Date1=2021-06-10T00:00:00.000`
  - `Time0=2021-06-10T23:59:17.000`
- For the **Radio Button** and **Dropdown** elements, the **Element ID** shows the value after the element ID becomes the default element or input value. For example:
  - `RadioButtonGroup3=TheDefaultOption`
  - `Dropdown0=TheDefaultOption`
- For the **Check Box** element, the **Element ID** shows the value after the element ID becomes the default element or input value. For example: `CheckBoxGroup1_1=TheOption2`.

Delimiter: You can use the **&** symbol as a delimiter between parameters.

## Password element behavior

You can use the **Password** element to add password fields to your forms to process in the web interface.

## Element behavior

To use in the web interface, the **Password** element has the following specific behaviors:

- The value of the password field is encrypted when a user submits a form (initial form or as part of a **Form Task**).
- When another user accesses the same form after submission (read-only view of initial form or **Form Task**), they cannot view the password field because it is encrypted.
- Since the password field values are encrypted, you cannot use them in the **If/Else** condition of a process automation.
- Only the encrypted password field values are stored in the database; the decrypted values are not stored.
- When you pass the encrypted password field value through a credential variable input to a bot inside the process automation, the encrypted password field value is decrypted by the

bot during deployment by using an instantaneous key from the credential vault. No other configuration is required.

When you create a form and use this password element, the element is similar to the **Text Box** element except that your text inputs in these fields are now masked.

The **Password** element contains these key form properties:

- **Element ID**

- This field can be edited or overwritten by the user who created the form.
- The field takes a unique default value (for example, the default value could be **password1**).

---

**Note:** The Bot Creator can reference this field for internal use.

---

- **Element label**

- This field can be edited or overwritten by the user who created the form.
  - You can set a default label (for example, **Password**).
- You have the option to make password fields required or read only.

## Conditional actions, rules, and elements

Using rules, you can add conditional actions, such as **If**, **And/Or**, and **Then** to various elements in a form.

For the **Checkbox** and **Radio Button** elements, the rules are triggered only if the corresponding presets are selected. For example, if a form has two mutually exclusive options, such as **Yes** and **No**, the rules associated with these options are triggered only if you select one of the two options.

**Attention:** Rules are not supported for the following elements:

- Dynamic Area
- Hyperlink
- Image
- Select file
- Select folder
- Snapshot
- Table

---

**Note:** The change label action in the form rules now applies to the **Button** element. This form rules will automatically apply to the button where you set the rules. The rules editor is now applicable to the **Table** element. The rules editor and conditions applies for each individual columns while any actions you set are applied for each row in the row level.

---

Consider a scenario where you are creating a user sign in/registration form. You can add a rule to one of the form elements to enable an option to sign in as an existing user or register a first time user.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click **Create new > Form**.

3. In the **Create form** page, enter a name for the new form.  
Forms are saved in the \Bots\ folder by default. (Optional) Click **Choose** to change the default folder.
4. Click **Create & edit**.
5. Drag the following elements into the form:
  - **Dropdown**: In the **Element label** field, enter 'Select user type' and in the **Add dropdown content** field, add 'Existing user' and 'New user'.
  - **Text Box**: Add two elements and name them 'User name' and 'Register'.
  - **Password**: Add one element.
  - **Button**: Add two elements and name them 'Save' and 'Cancel'.
6. On the right pane, click **Form rules > Add rule**.  
You can use this option to add rules to the form elements. In this scenario, add two rules.
7. For **Rule1**, update the following fields:  
Rule 1 is applied when an existing user tries to sign in. If the user clicks **Select user type > Existing user**, the **Register** text box is made unavailable. Use the **If** menu to set the following conditions:
  - a) **Select user type** as the element condition in the first drop-down menu
  - b) **Choice is** in the second drop-down menu
  - c) **Existing user** in the third drop-down menu

---

**Note:** The **If** conditions are supported on the following elements:

- **Dropdown**
- **Checkbox**
- **Radio Button**
- **Date**
- **Time**
- **Hyperlink**

---

Use the **Then** menu to set the corresponding actions:

- a) The **Register** text box in the first drop-down menu  
All the available elements in the form on which the rules are supported are listed in this field. For the **Dropdown** element in the **Then** menu, you can use the **Assign** option to append or overwrite values at bot runtime.
- b) **Disable** in the second drop-down menu

8. On **Rule1**, click the vertical ellipsis (⋮) for the following options:
  - **Add rule below**: Add a new rule below **Rule1**.
  - **Duplicate rule**: Add a duplicate of **Rule1**.
  - **Delete rule**: Delete **Rule1**.

If you added more than one rule, the following additional options are enabled to toggle the rules:

- **Move up**

- **Move down**
- **Move to top**
- **Move to bottom**

9. For **Rule2**, update the following fields:

Rule 2 is applied for a first-time user. If a user clicks **Select user type > New user**, the **User name** and **Password** text boxes are made unavailable. Use the **If** menu to set the following conditions:

- a) **Select user type** as the element condition in the first drop-down menu
- b) **Choice is** in the second drop-down menu
- c) **New user** in the third drop-down menu

Use the **Then** menu to set the corresponding actions:

- a) The **User name** text box in the first drop-down menu
- b) **Disable** in the second drop-down menu
- c) The **Password** text box in the third drop-down menu
- d) **Disable** in the fourth drop-down menu

10. Optional: If you want to interchange the sequence of these two rules, drag **Rule1** below **Rule2** or **Rule2** above **Rule1**.

You can also click the ellipsis (...) next to **Add rules** to select one of the following options:

- **Collapse all**: Collapses the rules. Is enabled only if you have expanded any of the available rules.
- **Expand all**: Expands the rules.

11. Click **Save**.

The new registration form is created and is ready to be linked to a bot.

## Example: Use Checkbox element in a form dynamically

You can use the **Checkbox** element in the form to select multiple options in a form during bot runtime.

You must:

- Have a Bot Creator license.
- Be assigned a custom role with create folder permission.

In this example, you create a process to register new employee details in the company database. The initial form contains basic information such as:

- Name
- ID
- Date of birth
- gender
- location

Additionally, the initial form has only two options (San Jose and Tokyo) for the location field. You will make the location field dynamic during the request creation to be able to add a new location (India) for those employees whose ID falls within the 100 to 200 range.

1. Log in to the Control Room as a Bot Creator user.
2. Create the initial form.
  - [Create a form](#) on page 3666.
  - a) On the left plane, select **Automation**.
  - b) Select **Create new > Form**.
  - c) Enter the form name as `employee_register_initial_form`.
  - d) Enter the folder location as `Bots\Employee Registration`.  
To change where your form is stored, select **Choose** and follow the prompts.
  - e) Select **Create & edit**.
  - f) Add the following **Elements** and corresponding **Element label** in the form.

Element	Element label
<b>TextBox</b>	Full Name
<b>Number</b>	ID
<b>Date</b>	Date of Joining
<b>Dropdown</b>	Gender

For the **Dropdown** element, enter `Male, Female` in the **Enter list items separated by commas** field.

- g) Select **Save**.
  - h) Select **Close**.
3. Create a second form.
    - a) In the same folder location, select **Create new > Form**.
    - b) Enter the form name as `employee_location`.
    - c) Select **Create & edit**.
    - d) Drag the **Checkbox** element into the form.
    - e) Enter the name in the **Element label** field as `Employee location`.
    - f) Click the **plus** icon in the **Checkbox content** field and add the locations `San Jose` and `Tokyo`.
    - g) Select **Save**.
    - h) Select **Close**.
  4. Create a new bot.
    - a) In the same folder location, select **Create new > Bot**.
    - b) Enter the bot name as `dynamic_checkbox`.
    - c) Select **Create & edit**.

5. Create the following variables:
  - emp\_id: Number type; use as input
  - emp\_location: List type, String subtype; use as output; click the **plus** and add two values San Jose and Tokyo
  - emp\_dyn\_location: String type, add the default value India

The default values are San Jose and Tokyo however if the employee ID falls between 100 and 200, then location India is selected.

6. Use the **If** action to configure the conditional statement.
  - a) Double-click or drag the **If** action.
  - b) Select **Number** from the **Condition** drop-down list.
  - c) In the **Source value** field, insert the variable \$emp\_id\$.
  - d) Select **Greater Than (>)** as the **Operator**.
  - e) Enter 100 in the **Target value** field.
  - f) Click **Add condition** and select **And**.
  - g) Select **Number** from the **Condition** drop-down list.
  - h) In the **Source value** field, insert the variable \$emp\_id\$.
  - i) Select **Less Than (<)** as the **Operator**.
  - j) Enter 200 in the **Target value** field.
  - k) Click **Save**.
7. Add the **List** package into the **If** container to insert the new location as per the defined condition.
  - a) Drag the **List > Add item** action.
  - b) In the **List variable** field, select the variable in which to add the list item emp\_location.
  - c) In the **Item to be added** field, select the variable that contains the value to add emp\_dyn\_location.
  - d) Select **Save**.
  - e) Select **Close**.
8. Create a new process automation.
  - a) In the same folder location, select **Create new > Process**. See [Create a process automation in Process Composer](#) on page 3684.
  - b) Enter the process automation name as employee\_register.
  - c) Select **Create & edit**.
  - d) Select **Start** to add an initial form to the process automation.
  - e) In the **Select initial data form** field, browse and select the initial form: employee\_register\_initial\_form.
  - f) Provide **Request title** as Employee Registration.
  - g) Drag the **Bot Task** into the Process Composer from the **Task** field.
  - h) In the **Bot Task** panel and **Element name** field, enter a name Location.

- i) Enter the **Task name** as Generate location.
  - j) In the **Select Task Bot** field, browse and select the bot you created `dynamic_checkbox`.
  - k) In the **Input values** field, select the input variable `emp_id`.
  - l) Drag the **Form Task** into the Process Composer from the **Task** field.
  - m) In the **Form Task** panel and **Element name** field, enter a name `location_form`.
  - n) Enter the **Task name** `Employee location form`.
  - o) In the **Select form** field, browse and select the form you created `employee_location`.
  - p) Select **Add button**.
  - q) Specify `OK` for the **Button label** and `Primary` for the **Button style**.
  - r) Select the **Feed data into form** check box as `Employee Location[CheckBoxGroup0]`.  
Set the two variables from the bot as output variables.
  - s) In the **List of options** field, select the output variable `Location.output[emp_location]$`.
  - t) In the **Default value** field, select the output variable `Location.output[emp_dyn_location]$`.
  - u) Select **Save**.
  - v) Select **Close**.
9. Deploy the process automation.
- a) Select **Run** to create a request for the process automation.
  - b) Enter the values for the initial form.
  - c) Select **Submit**.

The process automation deploys and if the employee ID falls between the values 100 to 200, then Employee location field will have a new option of India making this option dynamic. If the employee ID is not between the values 100 to 200, the Employee location field will have only two options, San Jose and Tokyo.

## Supported variable types in Process Composer

The core part of any process automation in Process Composer is how data moves (flows) between each task. To run properly, tasks require variables.

### Variable types

These variable types are supported in a process automation in Process Composer:

Input	Use this variable type to return values that went "in" a task.
Output	Use this variable type to return values that came "out" of a task.

Meta Use this variable type to return high-level details about the request of a task.

**Note:** You can use hidden variables to conceal data. For details on how to configure hidden variables, see [Create hidden variables in a form](#) on page 3664.

## Variable entities

The following entities can hold variables:

Global	Global values span across the tenant and all variable types, and use this form: <code>`\${variableName}`</code> .
Request	Requests hold meta-type variables only and use this form: <code>`\${meta variable name}`</code> . This meta-type variable value is from the request.
Task	Tasks can hold three types of variables (input, output, meta) and use these forms: <ul style="list-style-type: none"> <li><code>`\${task}.&lt;input output&gt;[&lt;variable name&gt;]`</code>: This input or output variable value is read from the task.</li> <li><code>`\${task}.&lt;meta variable name&gt;`</code>: This meta-type variable value is read from the task.</li> </ul>

## Date time variables

Name	Entity	Description
createdOn	Request, Task	Shows the date when the request or task was created. Example: <code>`\${createdOn}`</code> or <code>`\${Approval_Task.createdOn}`</code>
updatedOn	Request, Task	Shows the date when the request or task was last updated. Example: <code>`\${updatedOn}`</code> or <code>`\${Approval_Task.updatedOn}`</code>

## Dictionary variables

Name	Entity	Description
assignedTo	Task	Shows information about the user who is assigned to the task. Dictionary key: {id}, {username}, {email} Example: \$Approval_Task.assignedTo\$
createdBy	Request	Shows information about the user who created the request. Dictionary key: {id}, {username}, {email} Example: \$createdBy\$

## Number variables

Name	Entity	Description
executionCount	Task	Shows the number of times the task was run. Example: \$Name_Bot.executionCount\$
id	Request, Task	Shows the numerical ID of a request or task. Example: \$id\$ or \$Approval_Task.id\$
assignedTo{id}	Task	Shows the numerical ID of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{id}\$
createdBy{id}	Request	Shows the numerical ID of the user who created the request. Example: %createdBy{id}\$

## String variables

Name	Entity	Description
status	Task	Shows the label of the button clicked (action) for a form task or the bot return code for a bot task (equal to <b>failed</b> when the bot fails). Example: %Approval_Task.status\$ or \$Name_Bot.status\$

Name	Entity	Description
title	Request, Task	Shows the title of the request or task. Example: %title\$ or %Approval_Task.title\$
type	Request	Shows the task type (equal to <b>BOT</b> for bot tasks and <b>FORM</b> for form tasks). Example: %Task.type\$
assignedTo{username}	Task	Shows the username of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{username}\$
createdBy{username}	Request	Shows the username of the user who created the request. Example: \$createdBy{username}\$
assignedTo{email}	Task	Shows the email of the user who is assigned to the task. Example: \$Approval_Task.assignedTo{email}\$
createdBy{email}	Request	Shows the email of the user who created the request. Example: \$createdBy{email}\$

### User-defined variable

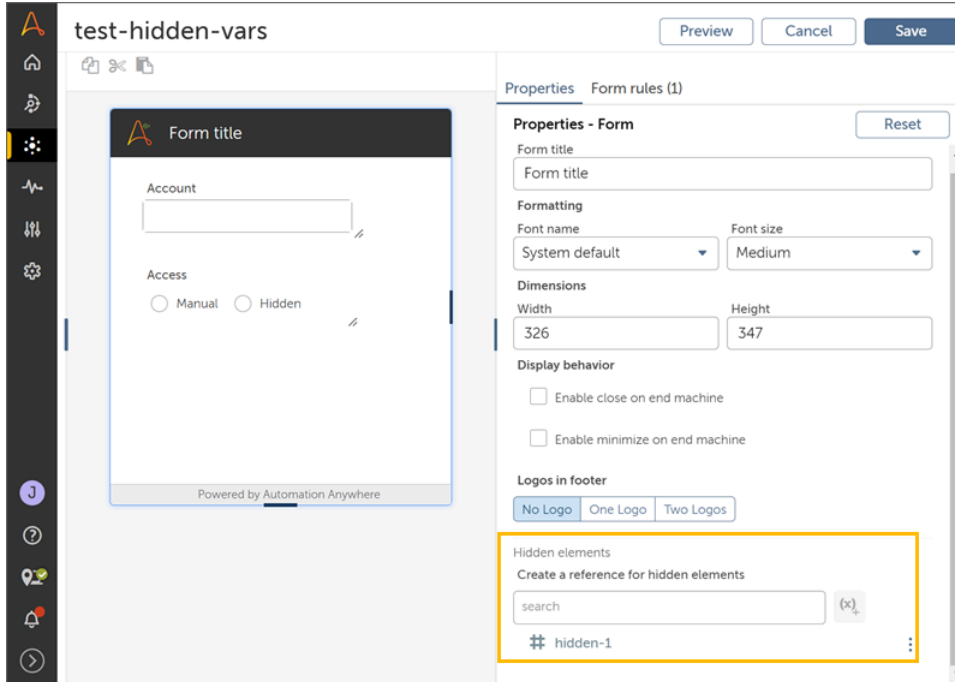

Name	Entity	Description
Any	Task	Stores Boolean, Data table, Date time, File, Number, Record, String, or Window data types.  Use this variable type when you are uncertain of the action data type.

### Create hidden variables in a form

You can create hidden elements in a form to access hidden variables in a process automation in Process Composer.

Hidden variables are supported in rules, all variable types, and If/Else conditions. To create a new hidden element (variable), select the **Properties - Form**. You define hidden elements (variables) in a form by selecting **Create a reference for hidden elements**. Enter data for the new hidden variable.

After you create the reference, you can access the hidden variables using the variable picker in the Process Composer.

**Note:** For URL inputs, use the label ID of the hidden variable name as the key for the URL input.

To enable task bots to use hidden variables, create an input variable when building the bot and assign the hidden element as the input for the variable in Process Composer.

## Create a form

As a Bot Creator, you can create a form to provide interaction between humans and bots. You enter required data using any of the supported form elements that can be rendered in the web interface. Additionally, you can add or remove form actions when creating a process.

---

**Note:** As a user, you can interact with the form only when it is assigned to you. If the form is unassigned, it is not enabled and is read-only. To edit the form, you can assign the form to yourself or to any team member who has access to the process. After editing the form, the assignee can submit the form or use any other action options. After the form is submitted or an action option is used, the request view displays the next step or task.

---

- You must have a Bot Creator license.
- You must be assigned a custom role with the create folder permission.

Forms in Automation Co-Pilot can be displayed in two scenarios:

- **Case creation:** This is the initial form that is displayed when you want to create a new case and enter the required business data.
- **Form step:** This form is displayed to show information and prompt for additional inputs.

Forms can be used in automation on both Automation Co-Pilot for desktop and on the web. However, these two versions handle forms differently. Developers should be aware of the differences when these versions render forms. [Building forms for web and desktop](#) on page 3667

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click **Create new > Form**.
3. In the **Create form** page, enter a name for the new form.  
Forms are saved in the `\Bots\` folder by default. Click **Browse** to change the default folder.
4. Click **Create & edit**.  
The form builder page appears with a single row **Column** layout.
5. Drag any of the supported elements (for example: Checkbox, Document, Table, and so on) into the form from the **Elements** panel on the left.
6. If you want to delete a row, click the vertical ellipsis in the form layout and click **Delete row**.
7. Confirm the delete action in the confirmation message.
8. Use the **Properties** panel on the right to update or change the form properties.
9. Click **Save**.
10. Click **Close**.

[Create a process automation in Process Composer](#) on page 3684

Related tasks

[Example: Use Select File to upload or download a file for web](#) on page 3703

This example describes how to use the **Select File** element to upload or download files that are passed in the initial forms in the web interface.

## Building forms for web and desktop

Forms can be used in both Automation Co-Pilot versions, desktop and on the web. However, developers should be aware of differences in version support for form elements.

Many form elements render the same, considered common, across desktop and web versions of Automation Co-Pilot. Elements that render differently can vary in function and appearance. Some elements are only supported in a specific version. Consider the following table for further details.

Table 12: Form elements supported in web and desktop

Element	Behavior in web	Behavior in desktop
Text box	common	common
Text area	common	common
Rich text area	common	common
Label	common	common
Number	common	common
Drop down	common	common
Check box	common	common
Radio button	common	common
Date	common	common
Time	common	common
Button	common	common
Select file	common	common
Table	common (interface differs)	common (interface differs)
Hyperlink	Opens a new tab only.	Open in specified browser (Current version opens Electron browser).
Document	Works only with the file uploaded with <b>select file</b> . Does not support default file property.	Additionally works with local files. Supports default file property.
Image	Works only with the file uploaded with <b>select file</b> .	Additionally works with local files.
Select folder	Not supported	Supported
Dynamic area	Not supported	Supported
Snapshot	Not supported	Supported
Drop down multi-select	Supported	Not supported

## Using the Button element

Use the **Button** element in the form builder to validate or cancel a form during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Button** into the form.
4. Enter the name of the element in the **Button-text** field.
5. Optional: Enter the hint text and tooltip.
6. Use the **Button types** drop-down menu to set the type of the button element.  
For example, consider you have two buttons, Save and Cancel. Use **Primary** for Save and **Secondary** for Cancel. Or, if you want the button element to appear as a link during bot runtime, select **Subtle**.
7. Optional: Use the following **Advance behavior** option:
  - **Disallow button click when this form is first loaded**: Enable this option to disable the button element when the form is displayed for the first time during bot runtime.
  - **Validate all form fields when this button is clicked**: Enable this option to validate all available fields of the form when a user clicks this button element during bot runtime.
8. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
9. Click **Save**.

## Using the Checkbox element

Use the **Checkbox** element in the form builder to enable users to select multiple options in a form during bot runtime.

When working with check box outputs, the process builder should apply the following format when mapping keys to options.

A check box output will be a dictionary variable(var) that pairs key:value

The option ID is set by the system as:

**CheckBoxGroupX\_Y**

This check box output variable can be set to direct the flow of bots in the process

Key is the option ID.

Value is a boolean (false = not selected).

CheckBoxGroupX is defined by the check box group ID (see in Form Builder).

Y is the order of the option.

Example: `CheckBoxGroup0_0` The first option of the `CheckBoxGroup0` element.

Ex. `key1:true` then bot1, `key1:false` then bot2

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.

2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Checkbox** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Use the **Checkbox content** fields to add multiple check boxes and enter a name for each one of them.  
For example, if you are creating a sales chart form, use this field to add three check boxes and enter `Product 1`, `Product 2`, and `Product 3`.
7. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
  - If you have multiple check boxes in the form and want a default selection during bot runtime, select the **Make default selections** check box, and select the necessary option.
8. Use the **Formatting** field to set the vertical or horizontal layout of the check boxes.
9. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
10. Click **Save**.

## Using the Date element

Use the **Date** element in the form builder if the user must schedule a date in the form during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Date** into the form.
4. Enter the name of the element in the **Element label** field.
5. Select a default date using the **Default value** field.
6. Optional: Select the **Use the local system date when form is loaded** check box to set your system date as the default value.
7. Select one of the following formatting options:
  - **Use locale date format setting**: The date is displayed in the format set on the user's machine.
  - **Manual input**: Select the date format to be displayed from the drop-down menu.
8. Enter the hint text and tooltip for the formatting option.
9. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.

- Select the **Make field uneditable** check box to make the element a read-only option.
10. Optional: Click one of the following options:
    - **Reset**: Clears all the element customization and sets the default.
    - **Delete**: Deletes the selected element.
  11. Click **Save**.

## Using the Document element

Use the **Document** element in the form builder to render a document that you want to preview with a form.

---

**Note:** Only one **Document** element can be used in a form. Files supported are PDF and image file types (JPG, PNG, etc.).

---

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Document** into the form.
4. Enter the correct URL or the document location address in the **Default file** field.
5. Use the **Formatting** drop-down menu to set the position of the document element in the form.
6. Optional: Enter a specific width for the element in the **Dimensions** field.
7. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
8. Click **Save**.

## Using the Dropdown element

Use the **Dropdown** element in the form builder to provide multiple options in the form during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Dropdown** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Use the **Add dropdown content** field to enter the items that must appear in the drop-down menu during bot runtime.

7. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
  - If you have multiple items in the drop-down element and want a default selection during bot runtime, select the **Select default list item** check box, and select the necessary option.
8. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
9. Click **Save**.

## Using the Dropdown Multi-Select element

You can use the Dropdown Multi-Select element to add a dropdown menu in your form for multiple selection.

1. Drag the Dropdown Multi-Select element to your form.  
The properties view will appear to allow for you to configure your element.
2. Specify the name of the label in the **Element label** field.  
By default this is named to **Multi select dropdown**.
3. Optional: Specify the hint in the **Hint below field**.  
The maximum limit is 30 characters.
4. Optional: Specify the hint in the **Tool tip**.  
The maximum limit is 200 characters.
5. Specify a list of items that you want to include for the dropdown menu in the **Add dropdown content** section.  
You can specify as much as you need, as long as the items ends with a comma. Duplicates will be automatically deleted.

---

**Note:** When using the Dropdown Multi-Select element to add a dropdown menu in your form, if a Set Focus action is triggered from rules, then you must press the space bar to execute the Set Focus action on the Multi-select dropdown element.

---

6. Select any of the following in the **Advanced behavior** section.
  - **Make field required**
  - **Make field uneditable**
  - **Select default list item**
7. Click **Save** to save your configuration.
8. Optional: Click **Reset** to clear all fields.
9. Optional: Click **Delete** to remove this element from the form.

## Using the Dynamic Area element

Use the **Dynamic Area** element in the form builder to display content that is not part of the form itself during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Dynamic Area** into the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Placeholder text** field to enter the text that must appear if this element is empty during bot runtime.
6. Enter a specific height of the element in the **Height** field.  
The default dimension value is set to 120 and enables a scroll bar if the additional content exceeds this value.
7. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
8. Click **Save**.  
The **Dynamic Area** action is available during bot runtime to render this field.  
See [Interactive forms package](#) on page 2918.

## Using the Hyperlink element

Use the **Hyperlink** element in the form builder if you want to assign a URL during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Hyperlink** into the form.
4. Enter the text to be displayed for the URL in the **Display text** field.
5. Enter the link in the **URL** field.
6. Use the **Open in browser** drop-down menu to select a browser to open the URL.  
If you select Google Chrome, the URL opens in Google Chrome during bot runtime.
7. Optional: Enter the hint text and tooltip for the check box element.
8. Click **Save**.

## Using the Image element

Use the **Image** element in the form builder to enable users to attach an image file to the form. For example, you can use this element to add a company logo to the form during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Image** element into the form.
4. Enter the id in the **Element ID** field.
5. Enter the name of the element in the **Element label** field.
6. Optional: Enter a value in the **Height** field to adjust the height.
7. Optional: Add a help text.
  - Enter a text in **Hint below field**.
  - Enter a text in the **Tool tip** field.
8. Upload an image, or drag to the canvas, in the **Select image file to upload** field.  
An image must first be uploaded to the Control Room (use the **Upload** tab to access your local file). Then you can select the image file from the **Browse** tab.

---

**Note:** In Automation 360 v.26, where you must specify a local image for the **Image** element (**Desktop or network path to retrieve image** field), you must use the browse feature in the image property to upload the image.

---

Properties Form rules (0)

**Properties - Image**

**Element settings**

Element ID

Element label

**Formatting**

Height

**Help text option**

Hint below field 30 characters max

Tool tip 200 characters max

**Select image file to upload**

This is useful for showing default images when working with web-forms

9. Click **Save**.

## Using the Label element

Use the **Label** element in the form builder to add a read-only field in the form at bot run time.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Label** into the form.
4. Enter the name of the element in the **Element label** field.
5. In the formatting section, select your formatting options:
  - **Font size**: Set the size of the font.
  - **Emphasis**: Set the font emphasis such as bold, italics, and so on.
  - **Font color**: Set the display colour of the font.

- **Text alignment:** Set the text alignment within the element.

The screenshot shows the 'Properties - Label' configuration window. At the top, there are 'Reset' and 'Delete' buttons. Below them is the 'Element settings' section with an 'Element ID' field containing 'Label0'. The 'Element content' section contains the text 'Label'. The 'Formatting' section, highlighted with a yellow border, includes: 'Font size' set to 12, 'Emphasis' set to None, 'Font color' set to Black, and 'Text alignment' set to Left. The 'Help text option' section at the bottom has a 'Tool tip' field with a '200 characters max' limit.

6. Optional: Enter a tooltip that appears when the user points to the element.
7. Click **Save**.

## Using the Number element

Use the **Number** element in the form builder if the form must have a field that allows the user to enter only numeric values during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Number** into the form.
4. Enter the name of the element in the **Element label** field.
5. Set the default value for the element.

6. Enter the minimum and maximum number of characters that users can enter in this field during bot runtime.
7. Optional: Enter the hint text and tooltip for the check box element.
8. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
9. Use the **Formatting** options to enable users to enter negative values, trailing zeroes, and comma during bot runtime.
10. Use the **Decimals** drop-down menu to set the number of decimal places.
11. Use the **Special characters** field to enter the prefix and suffix labels for the element.
12. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
13. Click **Save**.

## Using the Password element

Use the **Password** element in the form builder if the form must have a confidential or masked field. This element uses the masking feature by default and Credential Vault encryption to transfer data during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Password** to the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Formatting** field for additional options:
  - **Standard**
    - Set the character limit for password using the **Min** and **Max** fields.
    - Enable additional security options for the password.
  - **Custom**
    - Click the **Add regular expression** option and enter a custom password in the **Regular expression** field.
    - Optional: Enter the same custom password in the **Test Content** field, and click **Test regular expression** to verify it works correctly.
6. Optional: Enter the hint text and tooltip.
7. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.

- Select the **Make field uneditable** check box to make the element a read-only option.
8. Optional: Click one of the following options:
    - **Reset**: Clears all the element customization and sets the default.
    - **Delete**: Deletes the selected element.
  9. Click **Save**.

---

**Note:** Use the view icon  in the **Password** field to hide or reveal the password during runtime.

---

## Using the Radio Button element

Use the **Radio Button** element in the form builder if you want to enable users to select only one of the available options from a field during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Radio Button** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Enter the names of the radio buttons that will be displayed during bot runtime.  
For example, if you are creating a client information form, use this field to add two radio buttons and enter `Male` and `Female`.
7. Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
  - If you have multiple radio buttons in the form and want a default selection during bot runtime, select the **Make default selections** check box, and select the necessary option.
8. Use the **Formatting** field to set the vertical or horizontal layout of the radio buttons.
9. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
10. Click **Save**.

## Using the Rich Text Editor element

Use the **Rich Text Editor** element in the form builder to insert a text editor in the form that provides various options to edit the content during bot runtime.

1. On the left pane, click **Automation**.

A list of available and forms is displayed.

2. Click an existing form or click **Create new > Form**.

The form builder page appears.

3. Drag **Rich Text Editor** into the form.
4. Enter the name of the element in the **Element label** field.
5. Set the default value for the element that must appear in the element during bot runtime.
6. Enter the minimum and maximum number of characters that users can enter in this field during bot runtime.
7. Optional: Enter the height for the input area of the field and tooltip for the element.
8. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
9. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
10. Click **Save**.

## Using the Select File element

Use the **Select File** element in the form builder to enable users to attach a file to the form. For example, if the registration form requires a new user to attach a photograph, you can use this element in the form.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Select File** into the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Select the format type** field to set one of the following options for upload file format:
  - **Supported Type**: If you select this option, in the **Enter file formats separated by commas** field, ensure that you enter the file types that the user can upload when the bot runs. For example, if you want to allow only `.png` and `.jpeg` file types, enter them in the **Enter file formats separated by commas** field.
  - **Unsupported Type**: If you select this option, in the **Enter file formats separated by commas** field, ensure that you enter the file types that will not be supported during upload when the bot runs. For example, if you want to restrict users from uploading `.txt` and `.ppt` file types, enter them in the **Enter file formats separated by commas** field.
6. Optional: Select **Enable file download** if you want the users to be able to download the file. An interactive icon displays for downloading the file in the preserved format. The file name displays as a hyperlink to download the file in TEMP format.
7. Optional: Enter the hint text and tooltip for the element.
8. Optional: Choose one of the following **Advance behavior** options:

- Select the **Make field required** check box to ensure users must select this element during bot runtime.
  - Select the **Make field uneditable** check box to set the element as a read-only option.
9. Optional: Choose one of the following options:
- **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.

10. Click **Save**.

When you click **Preview** during bot runtime, the system default application is used to display the selected file.

For example, if Microsoft Excel is set as the default application and you use **Select file** to upload a `.xlsx` spreadsheet, the selected document is displayed in Microsoft Excel when you click **Preview** during bot runtime.

Users can click **Browse** to select a file or drag a file into the **Select File** element during bot runtime.

## Using the Select Folder element

Use the **Select Folder** element in the form builder to enable users to upload a folder that contains a specified file type during bot runtime.

---

**Note:** This element is not currently visible in process automation. Instead of this element, we recommend using the **Select File** element (multiple files cannot be selected).

---

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Select Folder** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Select the **Show list of supported files in the folder** check box.  
If you select this option, the supported file types are displayed below the **Select folder** form element during bot runtime.
6. Enter the supported file types for this element during bot runtime.  
For example, if you want to allow users to only upload folders that contain documents or text files, enter `doc` and `txt`.
7. Optional: Enter the hint text and tooltip for the element.
8. Optional: Choose one of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users must select this element during bot runtime.
  - Select the **Make field uneditable** check box to set the element as a read-only option.
9. Click **Save**.  
Users can click **Browse** to select a folder or drag one into the **Select Folder** element during bot runtime.

## Using the Snapshot element

Use the **Snapshot** element in the form builder to provide the users a screen capture option on the form during bot runtime. The file is saved in the .jpg format.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Snapshot** into the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter the hint text and tooltip for the check box element.
6. Optional: Choose one of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users must select this element during bot runtime.
  - Select the **Make field uneditable** check box to set the element as a read-only option.
7. Enter a filepath in the **Desktop path to save snapshot** field where the snapshot file must be saved during bot runtime.  
Optionally, you can either allow the user to create a folder if the filepath is not available or change the destination folder of the snapshot file.
8. Enter the suffix text for the snapshot file.  
For example, if this element is used to capture sales information, enter `sales`. The snapshot file is then saved with the text `sales` added at the end.
9. Optional: Choose one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
10. Click **Save**.  
When you click **Preview** during bot runtime, the system default application is used to display the snapshot file.  
  
For example, if Microsoft Photos is set as the default application to open .jpg files, the snapshot file is displayed in Microsoft Photos when you click **Preview**.

## Using the Table element

Use the **Table** element in the form builder to insert a customizable table in the form that can be used to populate data during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Table** to the form.
4. Enter the name of the element in the **Element label** field.
5. Optional: Enter hint text for the element in the **Hint below field**.

For example, enter `View outpatients details` if the table is used to capture a list of outpatients.

6. Optional: Specify your tooltip in **Toop tip** field.  
When you add a tooltip and hover, your specified text is displayed.
7. Use the **Rows before scrolling** field to enter the minimum number of rows the table element must have before a scroll bar is added during bot runtime.
8. Optional: Select the **Enable row selection (Column 0)**.  
This will add a check box column in the first column of the table. This also provides a better user experience when multiple rows are needed to be highlighted or picked by the user (instead of asking the user to select from a drop-down).

---

**Note:** The column is a boolean type where true = row selected. This provides a true/false boolean whether a row is selected or not, thus giving a form or bot to access this data. Further details at bottom of page.

---

9. Add or remove the total number of columns.
10. Click **Column settings** for additional options.
11. In the **Column settings** page, click the **Form element type** drop-down menu to set the element type.  
For example, if you select **Dropdown**, use the **Add dropdown content** field to enter the items that must appear in the drop-down menu during bot runtime.
12. Optional: Click **Make columns width equal**.
13. Optional: Select any of the following **Advance behavior** options to enable them:
  - **Make table uneditable:** Enables a read-only view during bot runtime.
  - **Include table actions:** Enables users to add, remove or edit table rows during bot runtime.  
  
If you use the table actions to delete all the rows from a table and then add a new row, the columns and rows of the table appear misaligned. Drag and resize any column to reset the alignment.
  - **Enable column filtering:** Enables users to search and filter the content for all the available columns during bot runtime. This enhances the search for content that is referenced by the column values.
14. Click **Save**.

#### Row selection

The row selection setting of the table element performs the expected behavior during bot execution. If row selection is enabled, the first column for the table is always expected to be boolean (selected or unselected). The following example demonstrates the difference in table data (four column table: `Col0 = TextBox`, `Col1= Date`, `Col3 = Number`, `Col4 = TextArea` ).

Table 13: Row selection setting in the table element

Setting	Datatable in the bot will have the following datatype
Disabled	<code>Col0 = String</code> , <code>Col1 = DateTime</code> , <code>Col3 = Number</code> , <code>Col4 = String</code>

Setting	Datatable in the bot will have the following datatype
Enabled	Col0= Boolean, Col1 = String, Col2 = DateTime, Col4 = Number, Col5 = String

## Using the Text Area element

Use the **Text Area** element in the form builder to insert a text field in the form for users to enter alphanumeric characters during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Text Area** into the form.
4. Enter the name of the element in the **Element label** field.
5. Use the **Default value** field to enter the default text to be displayed in the element.
6. Optionally, enter the parameters for minimum and maximum number of characters you want to allow in this field during bot runtime (ex. 1 to 100).
7. Enter the height for the input area of the field.
8. Optional: Enter the hint text and tooltip for the check box element.
9. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
10. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
11. Click **Save**.

## Using the Text Box element

Use the **Text Box** element in the form builder to insert a text box in the form.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Text Box** into the form.
4. Enter the name of the element in the **Element label** field.
5. Enter the default text that must appear in the element.

For example, if this field is used in a registration form, enter `First name`, which is displayed during bot runtime.

6. Use the **Formatting** field for additional options:
  - **Standard**  
Set the character limit using the **Min** and **Max** fields.
  - **Custom**
    - Click the **Add regular expression** option and enter a custom text in the **Regular expression** field.
    - Optional: Enter the same custom text in the **Test Content** field, and click **Test regular expression** to verify it works correctly.
7. Optional: Enter the hint text and tooltip for the element.
8. Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.
  - Select the **Make field uneditable** check box to make the element a read-only option.
  - Select the **Mask data** check box if you want the field to be masked by special characters when the user enters data during bot runtime.
9. Optional: Click one of the following options:
  - **Reset**: Clears all the element customization and sets the default.
  - **Delete**: Deletes the selected element.
10. Click **Save**.

## Using the Time element

Use the **Time** element in the form builder to set the time in the form during bot runtime.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click an existing form or click **Create new > Form**.  
The form builder page appears.
3. Drag **Time** into the form.
4. Enter the name of the element in the **Element label** field.
5. Select a default time using the **Default value** field.
6. Optional: Select the **Use the local system time when form is first displayed** check box to set your system time as the default value.
7. Use one of the following formatting options:
  - Set the time to **12 Hours** or **24 Hours** format.
  - Enter the hint text and tooltip.
8. Optional: Enable any of the following **Advance behavior** options:
  - Select the **Make field required** check box to ensure users select this element during bot runtime.

- Select the **Make field uneditable** check box to make the element a read-only option.
9. Optional: Click one of the following options:
    - **Reset**: Clears all the element customization and sets the default.
    - **Delete**: Deletes the selected element.
  10. Click **Save**.

## Create a process automation in Process Composer

As a Bot Creator, you create and design process automations which consist of human and bot tasks listed as elements in the Process Composer.

- You must have a Bot Creator license.
- You must be assigned a custom role with the create folder permission.

---

**Note:** Each task, logic condition, and end point supports the copy, paste, and cut elements from the Bot editor. Additionally, you can double-click to add and replace items on the canvas. See [Supported behaviors for tasks and elements in Process Composer](#) on page 3650.

---

1. Create a process automation:
  - a) From your local machine, log in to your Control Room as a Bot Creator.
  - b) From the left pane, click **Automation**, and then click **Create new > Process**.
  - c) In the **Create process** page, enter a name for the new process automation. By default, process automations are saved in the `\Bots\` folder. Click **Browse** to change the default folder.
  - d) Click **Create & edit**.
  - e) Click the process automation name to rename it.
2. To add initial form and data to the process automation, click **Start**.
3. From the **Start** panel:
  - a) Browse and **Input variables** or **Select initial data form**.
  - b) Select the File upload storage.

**AARI Storage** is default for process automation and **Document Workspace Storage** is default for document automation.
  - c) In the **Request title** field, enter text or insert a variable as an input variable. A dynamic title is created for this request that will display in the web interface and serve as a reference.

---

**Note:** You can use a Reference ID such as `ref ID = $RefId$`. Reference ID is a **Meta** variable type.

The screenshot shows a dialog box titled "Insert a variable". It has three main sections: "Variable Source" with a dropdown menu set to "Request"; "Variable type" with radio buttons for "Input", "Output", and "Meta" (which is selected); and "Variable" with a dropdown menu. Below these is a search bar with a magnifying glass icon. Underneath the search bar is a list of variables: "Created By - DICTIONARY", "Created On - DATETIME", "Updated On - DATETIME", "Reference ID - STRING" (highlighted in yellow), "Request ID - NUMBER", and "Request Title - STRING".

- d) In the **Task name** field, enter the name of the task.  
You can use a Reference ID such as `task ref ID = $RefId$`.
  - e) In the **Data privacy tag** field (same as a PII [Personally Identifiable Information] tag), enter a text or variable to generate hidden custom output.
  - f) Click **Apply**.
4. [Add Bot Task to a process automation](#) on page 3686.  
The Bot Task runs a bot with inputs and outputs.
  5. [Add Form Task to a process automation](#) on page 3688.  
The Form Task displays a form that requires interactions by a user.
  6. You can add these optional elements to the process automation:
    - [Add API Task to a process automation](#) - Use the API Task to enable API calls for inputs and outputs.
    - [Add input variables to a process automation](#) on page 3690 - Use input variables to start a process without having to build a form as the point of entry for a process automation.
    - [Add Filter Task to a process automation](#) on page 3692 - Use the Filter Task to filter a variable based on your specific criteria.
    - [Add Process Task to a process automation](#) on page 3692 - Use the Process Task to run a process automation.
    - [Add Document Validation to a process automation](#) on page 3699 - Use the Document Validation Task to display a validator for a document that requires validations.
    - [Add Approval Task to a process automation](#) on page 3693 - Use the Approval Task to share requests with decision makers before the process is completed.
  7. You can add logical conditions to include internal and conditional branching of the process automation. Drag the condition from the **Elements** panel. You can select an **If/Else** pair or **Else if**.
  8. From the **Condition** panel, you can add these optional fields:
    - a) Add a description in the **Description** field.
    - b) Add a message in the **Display message** field. As a result, the display message you enter is shown in the request view page in the web interface.
    - c) Click **Add Condition** to add a condition.

You can select a condition from these available types: **Boolean**, **Datetime**, **Number**, or **String**.

d) Click **Apply**.

9. [Add End Point to a process automation](#) on page 3700.

You can add End Point to end a process automation with a selected status (such as: completed, failed, or canceled) or add Go to to navigate to other tasks in the process automation.

You have now configured your process automation!

10. To preview your bot or forms information in the Process Composer (**Edit process** page) in both your public and private workspace:

a) Click the vertical ellipsis next to the **Bot Task** or the **Form Task**.

b) Select either the **Preview bot** or **Preview form** option.

In the public workspace, these options display the **Bot name preview** or **Form name preview** page where you can quickly view a bot or form.

In the private workspace, these options display the **Edit Task Bot** or **Edit form** page where you can make changes to your Bot Task or form.

#### Related tasks

[Create your first bot](#) on page 1595

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

[Create a form](#) on page 3666

As a Bot Creator, you can create a form to provide interaction between humans and bots. You enter required data using any of the supported form elements that can be rendered in the web interface. Additionally, you can add or remove form actions when creating a process.

#### Related reference

[About the Automation Co-Pilot process in Document Automation](#) on page 3889

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an Automation Co-Pilot process. Review the following guide to understand the logic.

## Add Bot Task to a process automation

As a Bot Creator, you can create a Bot Task to execute inside a process automation.

1. Add a **Bot Task** to the process automation by dragging the element from the **Element** panel.

2. From the **Bot Task** panel:

a) Enter a name in the **Element name** field.

b) Enter the task name in the **Task name** field.

The task display name appears in the web interface as a reference. You can use a Reference ID such as `ref ID = $RefId$`.

c) Optional: Select the **Hide this task after completion** check box.

After task completion, the user does not see the **Bot Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.

- d) Browse and select the Task Bot in the **Select Task Bot** field.
- e) In the **Run bot and dependencies using** section, select a label version.

You can select **Latest version** (default) or **Production label**.

The bot deploys the version that you select.

- f) In the **Bot priority** section, you can review your bot priority level.

---

**Note:** The bot priority level is a read-only label that shows **Low**, **Medium**, or **High** depending on the priority level that was set for the bot.

---

**Important:** If the priority of a task bot was changed, you need to browse for the task bot again to reflect the correct priority status for an existing Process Composer process automation.

---

- g) As a Bot Creator, you can select how the **Bot Task** executes; locally on the request creator's desktop or remotely.

From the **Bot Task execution mode** drop-down, you can select the following modes:

- **Remote execution:** (default) When selected, the local bot executes remotely based on your Global/Process Scheduler settings and generates a corresponding entry in the Audit log. With remote execution, automations can run independently while users work on other tasks and are notified in Automation Co-Pilot when the automations have completed.
- **Local execution (main window):** When selected, the local bot executes on the main window of the request creator's device and generates a corresponding entry in the Audit log. The request must be created by a user with an attended license and have selected a default device; otherwise, the Bot Task execution mode defaults to **Remote execution**. Local execution enables sensitive data to remain On-Premises and incur no queue times on local desktops.
- **Local execution (child window):** When selected, the local bot executes on a child window of the request creator's device and generates a corresponding entry in the Audit log. The request must be created by a user with an attended license and have selected a default device; otherwise, the Bot Task execution mode defaults to **Remote execution**. Local execution enables sensitive data to remain On-Premises and incur no queue times on local desktops.

---

**Note:** When creating variables, **Execution mode** is considered a `String` variable source.

---

Once the local bot task has been deployed, a progress bar displays showing the bot progress details and status in real time.

- h) Optional: In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.

Select the **Input values** check box and specify a variable.

The variable input expected by the bot is mapped with the variable that will be populated when creating the request.

1. Select a task in the **Process task** field.

2. Select a type in the **Variable type** field. You can select **Input**, **Output**, or **Meta**. When you select the Use as input check box, the process automation passes data into the input variables, and when you select the Use as output check box, the process automation retrieves data from the output variables after the bot execution. See [Supported variable types in Process Composer](#) on page 3661.
3. Specify your variable in the **Variable** field.

---

**Note:** Reference ID is a **Meta** variable type.

---

4. Click **Apply**.

3. Click **Save**.

You have now configured the **Bot Task** in your process automation.

## Add Form Task to a process automation

You can add a Form Task to configure the settings of a process automation.

Forms used in process automation are containers for human input during run time of attended automation. When added to the process flow, these containers are available to receive and send data that other elements can use over the course of the end to end process flow. Users wanting forms for unattended automation, where data is collected and consumed by bots without human input, should use interactive forms. [Interactive forms package](#) on page 2918

1. Add the **Form Task** to the process automation by dragging the element from the **Element** panel.
2. From the **Form Task** panel, perform these steps:
  - a) Enter a name in the **Element name** field.
  - b) Enter the task name in the **Task name** field.

The task display name is displayed in the web interface as a reference. You can use a Reference ID such as `ref ID = $RefId$`.
  - c) Select the **Hide this task after completion** check box.

After task completion, the **Form Task** is not displayed to the user in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
  - d) Select the **Make the form read-only** check box.

The **Form Task** does not require any input and moves automatically to the next task.
  - e) Select the **Assign this task to the user who created this request** check box.

The task is automatically assigned to the user creating this request in the web interface.
  - f) Select the **Auto-assign this task to** check box. You can select the following options from the drop-down:
    - **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
    - **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

- g)** In the **Task expiration time** field, select the time option.  
You can select the following options: **No expiration** (default), **1 hour**, **1 day**, **1 week**, **2 week**, **30 days**, and **Custom**.

**Note:** If you choose the **Custom** option, you must specify the time by the number of days, hours, and minutes. The maximum is **45 days**, and the minimum is **1 minute**. Days range from 0 to 45 days, and hours range from 0 to 23 hours. For minutes, if the hours and days are set to **0**, minute range is 1 to 59 minutes. However, if the hours and days are not set to **0**, then the minute range is 0 to 59 minutes.

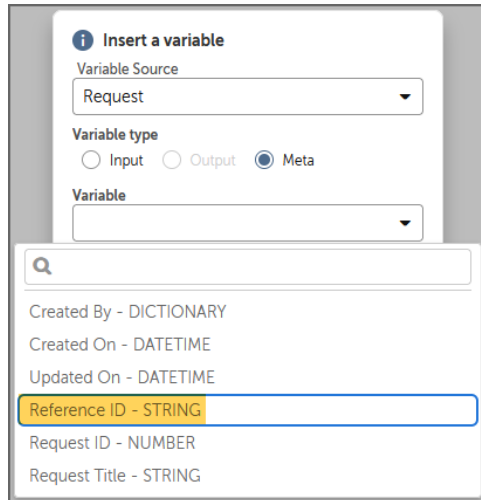

- h)** In the **Select form** field, browse and select the second form created.  
This form displays the result.
- i)** In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.
- j)** In the **Add form button** field, specify your button details.
- Specify a name in the **Button label** field.
  - Select a style in the **Button style** field.
- You can choose between **Primary**, **Secondary**, or **Cancel**.
- Click **Add button** to add any additional buttons.

For example, these buttons display in the fixed footer of the form during the form task:

The screenshot shows a 'Test buttons view' window with a sidebar on the left containing navigation icons. The main content area is titled '2-2 | Process: UI changes'. It features a notification panel on the left with two 'Request created' entries. The main form area contains several input fields: 'Name', 'ID', and 'Mailing address'. Below these is a table for 'Accounts' with columns for 'Business', 'Industry', and 'Revenue', which is currently empty. There is also a 'Date' field with a calendar icon and a 'Status' field with radio buttons for 'Open', 'Pending', 'Closed', and 'Disputed'. At the bottom of the form, four buttons are visible: 'Escalate', 'Approve', 'Decline', and 'Cancel', which are highlighted with a red rectangular box.

- k)** Select the check box in the **Feed data into form** field.
- Select a task in the **Process task** field.
  - Select a type in the **Variable type** field.  
You can choose **Input**, **Output**, or **Meta**.
  - Specify your variable in the **Variable** field.

**Note:** Reference ID is a **Meta** variable type.

The screenshot shows a dialog box titled "Insert a variable". It has three main sections: "Variable Source" with a dropdown menu set to "Request"; "Variable type" with three radio buttons: "Input", "Output", and "Meta" (which is selected); and "Variable" with a dropdown menu. Below these sections is a search bar with a magnifying glass icon. Under the search bar is a list of variables: "Created By - DICTIONARY", "Created On - DATETIME", "Updated On - DATETIME", "Reference ID - STRING" (highlighted with a blue border and a yellow background), "Request ID - NUMBER", and "Request Title - STRING".

4. Click **Apply**.

3. Click **Save**.

You have now configured the Form Task in your Process Composer process automation.

## Add input variables to a process automation

As a Pro developer, you can use input variables to start a new process automation without using a form.

Using input variables, you can start a process automation without having to build a form as the point of entry for a process. You define input variables directly within the process automation itself which is particularly useful if your process automation requires complex variable types such as a dictionary, table, or a list. For example, without any human intervention, you can easily and efficiently:

- Schedule a process automation to run overnight.
- Trigger a process automation by email.
- Launch a process automation from another system such as Salesforce or SAP.

Additionally, you can use input variables with the Create Request API and Create Request command package.

## Create and add input variables to a new process automation

To create and add input variables to a new process automation:

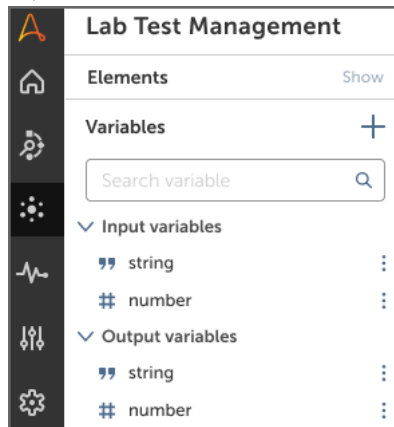

1. From the panel on the left, click Show at the bottom to open the Variables panel.
2. From the Variables panel, click the plus (+) icon. The Create Variable dialog displays for you to create a new input variable.

---

**Note:** You cannot select an existing variable as an input variable; you must create a new one.

---

3. Enter the name of the new variable in the Name field.
4. Select your variable type from the Type drop-down. Click [Supported variable types in Process Composer](#) on page 3661 for more details.
5. Optional: Enter the variable description in the Description field.
6. Click Use as input.
7. Based on the variable type you selected, you might need to enter additional information to define the input variable.
8. Click Create. The input variable that you created displays in the Variables panel under the Input variables section. You can expand or collapse the lists of input and output variables.

Repeat steps 2 through 8 to create any additional input variables for your process automation.

## Start a new process automation using input variables

After you have created the input variables, you can start a new process automation using the initial data provided by the input variables:

---

**Note:** You cannot add input variables when you start a process automation using initial data from a form. To create input variables, you must click Input variables as the Initial data selection.

---

1. From the Start panel on the right, click Input variables.
2. Click Run to run the process automation.

---

**Note:** If you start a process automation using initial data from an existing form and then change the form, all existing input variables will be overridden. This might cause validation errors due to invalid variables.

---

## Edit or delete input variables

To edit or delete input variables after you create them:

1. From the Variables panel, click the action menu (vertical ellipsis) next to the variable you want to edit or delete.

2. Click Edit variable or Delete variable.
  - If you edit the variable, you can change the Description or Default value fields only. Click Apply to save the changes.
  - If you delete the variable, it is automatically removed from the Input variables list.
3. You can rerun or close the process automation with the updated variables.

---

**Note:** If you have attached a form, input variables are auto-generated based on the form fields. You cannot delete these variables, however you can edit the variable description only.

---

## Add Filter Task to a process automation

You can add a Filter Task to apply a filter to a process automation variable in Process Composer.

1. Add the **Filter Task** option to the process automation by dragging the element from the **Task** panel. The filter task applies a filter to the process automation variable.

For example, you have a table as an output of a form, and your output has an **Approved** column that contains **Yes** or **No** data in the rows, the filter task will be able to retrieve only rows with **Yes** as an output of the filter task.
2. From the **Filter Task** panel:
  - a) Enter a name in the **Element name** field.
  - b) Enter the task name in the **Task display name** field.

The task display name displays in the web interface as a reference.
  - c) Optional: Select the **Hide this task** check box.

After task completion, the user does not see the **Filter Task** in the web interface.

To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
  - d) Enter a variable in the **Variable to be filtered** field.
  - e) In the **Filtered type** field, select an option.

For example, for a dictionary variable, the **Check each key/value pair in the dictionary** or **Check entire dictionary** options are available for you to select.
  - f) In the **Filter criterion** field, select a condition.

After you select a condition, specify the **Source variable**, **Operator**, and **Target value** fields.
3. Click **Save**.

You have now configured the Filter Task in your Process Composer process automation.

## Add Process Task to a process automation

You can add a Process Task to configure the settings for a process automation.

1. Add the **Process Task** option to the process automation by dragging the element from the **Task** panel.
2. From the **Process Task** panel:

- a) Enter a name in the **Element name** field.
- b) Enter the task name in the **Task name** field.  
The task display name appears in the web interface as a reference.
- c) Optional: Select the **Hide this task from users** check box.  
After task completion, the user does not see the **Process Task** in the web interface.  
  
To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
- d) Select either the **Public folder** or **Private folder** and browse and select the process.
- e) Select the user group to which you want to assign the request:
  - **Role:** Click **Choose** to search for the role you want to assign and then click **Select**.
  - **Team:** Click **Choose** to search for the team you want to assign and then click **Select**.
  - **Variable:** Click the small **(x)** to the right of the text box to select a **Variable Source** and **Variable** from that source. The Variable option is only valid for Global Variables of type User Group. Global values enable users to reuse identical values between bots instead of creating new variables for each bot. As a process builder, you can select a user group variable within the process to populate the required user group input fields of a Task (such as: Form, Process, or Approval). For more details, click [Global values](#) on page 2502 and click [Create a global value](#) on page 2503 to learn how to create a global value for a user group. Click **Add**.

---

**Note:** If user group that you specify does not have access to the process, the request will be assigned to the default user group during runtime.

---

- f) In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.

### 3. Click **Save**.

You have now configured the Process Task in your Process Composer process automation.

## Add Approval Task to a process automation

You can configure an approval task to share requests with decision makers before the process automation is completed.

---

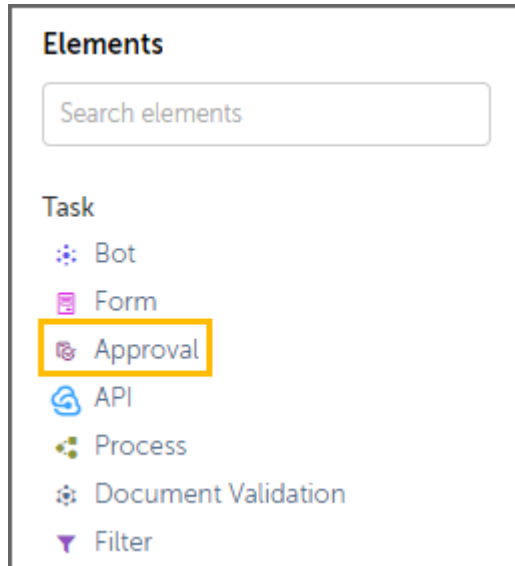

**Note:** To activate the Approval task for Cloud or On-Premises deployments, you need to purchase the Enterprise license. Contact your customer service manager for more details.

---

The need for approvals applies to many business tasks such as time-off or purchasing requests. Developers can use the Approval task to automate a process where users can submit and receive approvals, while staying notified of progress, without breaking from the streamlined work flow.

The developer will need a pre-built form for the approval task that can receive data from the process. This is labeled the **Approval content form** and is used to pass data to the responder approving the task.

1. From the Control Room, open an existing process automation or create a new process automation to launch the Process Composer.
2. Add the **Approval** task to the end of your process automation.

3. Select the **Approval** task element in your flow to open the configurations panel and enter the **Element name**.
4. Enter the **Task name**.
5. Select the users for the Task requester and assignment.

**Task requester and assignment**

Default Custom

**Task requester** **Send**

Task requester(s) will be able to see this task and its status from their "Requested" task list.

Request creator

The assigned group of the request  
Assigned group is the user group responsible for a request. It is specified either by admin during process setup (default group) or by users or bots when initiating a request.

Specify user group

Role Team Variable

Docs team testing X Choose

**Assign this task to** **Receive**

Request creator

The assigned group of the request  
Assigned group is the user group responsible for a request. It is specified either by admin during process setup (default group) or by users or bots when initiating a request.

Specify user group

Role Team Variable

Co-Pilot Business users X Choose

**Note:** The **task requester** represents the user group (role, team, individual user) that sends the task for response. **Assign** the task to the user group that receives the request and responds. See, [User configurations for an approval task](#) on page 3696.

**Default** will send approval requests to default users set by the admin. When you select **Custom**, you can enable these options to the **Specify user group** for the approval.

- **Role:** Select a pre-built Custom role to add users that have the selected role assigned. [Create a role](#) on page 1855
- **Team:** Select the pre-built Team to add users in the selected Team. [Assign members to a team](#) on page 3504
- **Variable:** Select a pre-built Global value to add users from that user group to the configuration. [Create a global value](#) on page 2503

6. Enter the **Number of approvals** you want required for this task to complete.
7. Select your pre-built **Approval content form**.
8. Select the **Action buttons** for the responder to approve and decline the task.
9. Select each box and enter the inputs to **Feed data into form**.
10. **Save** the process automation.

## User configurations for an approval task

For appropriate users to run, approve, and contribute to an approval task, it is important to use the labels recognized by the Process Composer.

In the **Process Composer > Approval task**, configurations for users are recognized as assigned, requested, and contributors of the task during run time for multiple-user collaboration.

The following table can be used to configure and assist decisions when routing the approval to roles and teams. The User column displays the label recognized in the process configuration. The Details column describes the parameters for that configuration.

- User who requests a task (Task requestor).
- User who assigns a task (Task assigner).
- User who is assigned to a task (Task assignee).
- User who contributes to a task (Task contributor).

User	Details
Request Creator	<p>When the request is created using the interface (Automation Co-Pilot) the user who created the request.</p> <ul style="list-style-type: none"> <li>Request Creator is required to be part of the Assigned Group.</li> </ul> <p>When request is created by other means (API, Create Request command, CoE approval use case, etc.)</p> <ul style="list-style-type: none"> <li>Request Creator is not required to be part of the Assigned Group and only needs the execute permission.</li> </ul>
Request Assigned Group	<p>The role or team where the request is created.</p> <pre>= createdByTeam</pre> <p>Example: Request POC-2 from Process (POC) created under Team 202.</p> <ul style="list-style-type: none"> <li>Team 202 is the Request Assigned Group.</li> <li>This group has read access to the request created in their workspace.</li> </ul>
Task Assigner	<p>The role or team that needs to respond to the task (Received).</p> <p>Example: Form Task from a request is assigned to Role 301.</p> <ul style="list-style-type: none"> <li>Role 301 is the Task Assigner.</li> <li>Users from Role 301 can see the task in the Assigned tab.</li> </ul>
Task Requester	<p>The role, team or user (request creator) that requests the task to response (Sent).</p> <p>Example: Form Task from a request is requested by Team 403.</p> <ul style="list-style-type: none"> <li>Team 403 is the Task Requester.</li> <li>Users from Team 403 can see the task in the Requested tab.</li> </ul>

User	Details
Contributor	<p>Users who contributed (or are contributing) to the Task.</p> <ul style="list-style-type: none"> <li>Form and Document Validation Task (Contributor is populated before submit) <ul style="list-style-type: none"> <li>When status is <code>Pending</code>, Contributor is the user assigned or locked to the task. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=assigneeID</code></div> </li> <li>or <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>lockedBy</code></div> </li> <li>When status is <code>Completed</code>, Contributor is the user who submitted the task <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=submittedBy</code></div> </li> </ul> </li> <li>Approval Task (Contributor is populated after submit) <ul style="list-style-type: none"> <li>When status is <code>Waiting Approval (0/2)</code>, Contributor is empty.</li> <li>When status is <code>Waiting Approval (1/2)</code>, Contributor is the userID of user that approved the task.</li> <li>When status is <code>Approved</code>, Contributor is the array of all users who approved the request. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=approvedBy</code></div> </li> <li>When status is <code>Declined</code>, Contributor is the user who declined the request. <div style="background-color: #f0f0f0; padding: 2px; margin: 5px 0;"><code>=declinedBy</code></div> </li> </ul> </li> </ul>

## Visibility and actions of an Approval task

Task sequence:

- Any user who is part of the **Responder Group** can see the task as it progresses through the sequence.
- Tasks, other than the current Approval Task, are not visible to the **Responder Group**.

Possible actions for the task:

- **Comments history**

Displays a history of the Approval or Reject comments

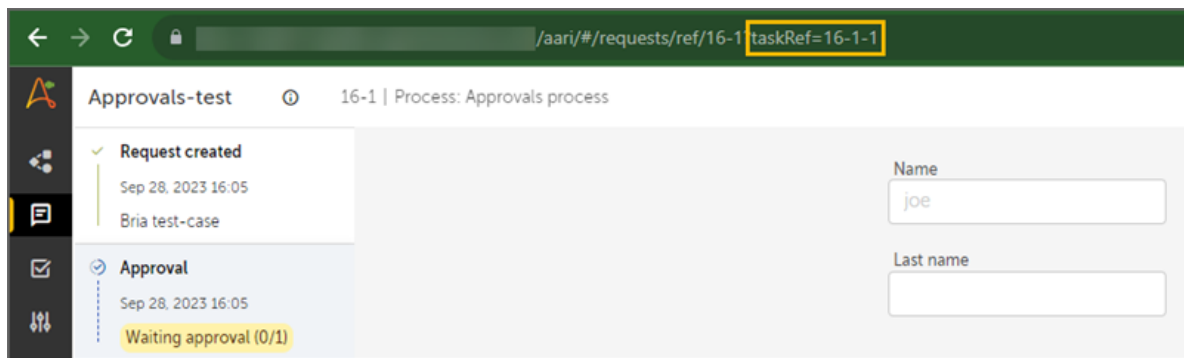

- **Approve**

- Submits the task with an **Approve** status
- Adds a comment when submitting an approval

- **Reject**

- Submits the task with a **Reject** status
- Adds a comment when submitting a rejection notice

In cases where users want to notify someone of a specific task, the task reference ID can be found in the URL of an active task.

## Add Document Validation to a process automation

You can add a Document Validation Task to configure the settings of a process automation.

1. Add the **Document Validation Task** option to the process automation by dragging the element from the **Task** panel.
2. From the **Document Validation Task** panel:
  - a) Enter a name in the **Element name** field.
  - b) Enter the task name in the **Task name** field.  
The task name appears in the web interface as a reference.
  - c) Optional: Select the **Hide this task from users** check box.  
After task completion, the user does not see the **Document Validation Task** in the web interface.  
To display the hidden task, select the **View hidden tasks** check box in the tasks view page of the web interface.
  - d) Optional: Select the **Auto-assign this task to** check box. You can select the following options from the drop-down:
    - **The user who created the request:** The task is automatically assigned to the user creating the request in the web interface.
    - **The user who opens this task:** The task is automatically assigned to the user who opens the task in the web interface.

- e) Specify the ID in the **Document ID** field.
- f) Optional: In the **Data privacy tag** field, enter a text or variable to generate hidden custom output.  
Select the **Input values** check box and specify a variable.
  1. Select a task in the **Process task** field.
  2. Select a type in the **Variable type** field.  
You can select **Input**, **Output**, or **Meta**.
  3. Specify your variable in the **Variable** field.

3. Click **Save**.

You have now configured the Document Validation Task in your Process Composer process automation.

## Add End Point to a process automation

You can add End Point to close your Process Composer process automation or add Go to to navigate to other tasks in the process automation.

You can add the **End point** by dragging the **End process** or **Go to** from the **End point** panel to your process automation.

- From the **End point: End process** panel:
  - a) Select the type in the **End process status** field.  
You can select between **Completed**, **Failed**, or **Cancelled**.
  - b) Optional: Specify a name in the **Update request title** field.
  - c) Optional: Add a message in the **Display message** field.  
The display message you enter is shown in the last step of your task in the request view.
  - d) Click **Apply**.
  - e) Click **Save** to save the process automation.
- From the **End point: Go to** panel:
  - a) In the **Select target task** option, specify the task by choosing **Bot Task** or **Form Task**.
  - b) Select the **Override the task assignment setting** check box and from the drop-down, and then select either **Unassign the task** or **Assign the task to the user who created the request**.  
Depending on your choice, the task is unassigned or the user creating the request can automatically view the task assigned to them in the web interface.
  - c) Click **Save** to save the process automation.

## Example: Upload and view PDF file

This example describes how to use forms to upload and view a PDF file.

You must have the following:

- A Bot Creator license assigned with a custom role that has the create folder permission.
- Access to the Automation Workspace.
- A system-created **AAE\_Robotic\_Interface User** role with the AARI user license for the Co-Pilot User.
- Access to the web interface.

Create two forms and a process automation.

1. Log in to the Automation Workspace as a Bot Creator.
2. Create your first form. See [Create a form with the Select File element](#) on page 3701.
3. Create your second form. See [Create a form with the Document element](#) on page 3702.
4. Create a process automation with data from the two forms. See [Create a process automation to view files](#) on page 3702.
5. Run your process automation. Click **Run** in Process Composer.
6. The initial form opens in a separate tab for you to interact. Click **browse** to select a file.
7. Navigate to the file path in your local machine and select a PDF file.

---

**Important:** File size is limited to 50 MB.

---

8. Click **Open** to open the PDF file in your form.
9. Click **Submit**.
10. Click **Done** to confirm the file upload.

The PDF file is successfully uploaded.

## Create a form with the Select File element

You can create a form by using the **Select File** element to select files.

1. Continuing with this example, create the first of two new forms and name it **Select File Form**.
2. Drag and drop the **Select File** element into your form designer from the **Elements** column. The **Properties - Select File** dialog displays with relevant fields.
3. Enter **Upload a file** as the label in the **Element label** field.
4. Specify **PDF** as the file format in the **Enter supported file formats separated by commas** field.
5. Click **Save** to save your form session.
6. Click **Close** to close the current form dialog.
7. Click [Create a form with the Document element](#) on page 3702 to continue the example.

## Create a form with the Document element

You can create a form using the **Document** element to select files.

1. Continuing with the example, create the second of two forms and name it **Document Viewer Form**.
2. Drag and drop the **Document** element into your form designer from the **Elements** column. The **Properties - Form** dialog displays with relevant fields.
3. Optional: Modify your document dimensions or keep the system default settings.
4. Click **Save** to save your form session.
5. Click **Close** to close the current form dialog.
6. To continue the example, click [Create a process automation to view files](#) on page 3702.

## Create a process automation to view files

Create a new process automation to the files.

1. Create a new process automation and name it **View a File Process**. Use Process Composer to design the new process automation.
2. Click the **Start** node (green icon) to add the first node as the entry to your process automation. The **Start** dialog displays with relevant fields.
3. Click the **Browse** option in the **Select initial data** field to search for a form.
4. Click the **Browse** tab in the **Find a form** dialog.
5. Select the **Select File Form** form that you previously created as the first form.
6. Click **Choose** to confirm.
7. Enter **Select File** as the title in **Request title** field. Leave the rest of the entries as is.
8. Click **Save**.
9. Drag and drop the **Form Task** from the **Task** column to your process automation. The **Task: Form Task** dialog displays.
10. Enter **File** as the element name in the **Element name** field.
11. Click the **Browse** option in the **Select form** field to search for a form.
12. Click the **Browse** tab in the **Find a form** dialog.
13. Select the **Document Viewer Form** form that you had previously created as the second form.
14. Click **Choose** to confirm.
15. Specify your button details in the **Add form button** field.  
You can specify **Upload** as the **Button label** and keep the **Primary** setting as the **Button style**.
16. Select the **Document[Document0]** option in the **Feed data into form** field. This displays as a check mark your selected option.
17. Click **Insert a variable** in the blank field.
  - a) Select **Request** as your variable source.
  - b) Select **Input** as your variable type.
  - c) Select **Upload a file[File0]-File** as your variable type. This option should automatically be defined for you to select.
  - d) Click **Add** to add and confirm your variable.

18. Click **Save** to save your session.

## Example: Use Select File to upload or download a file for web

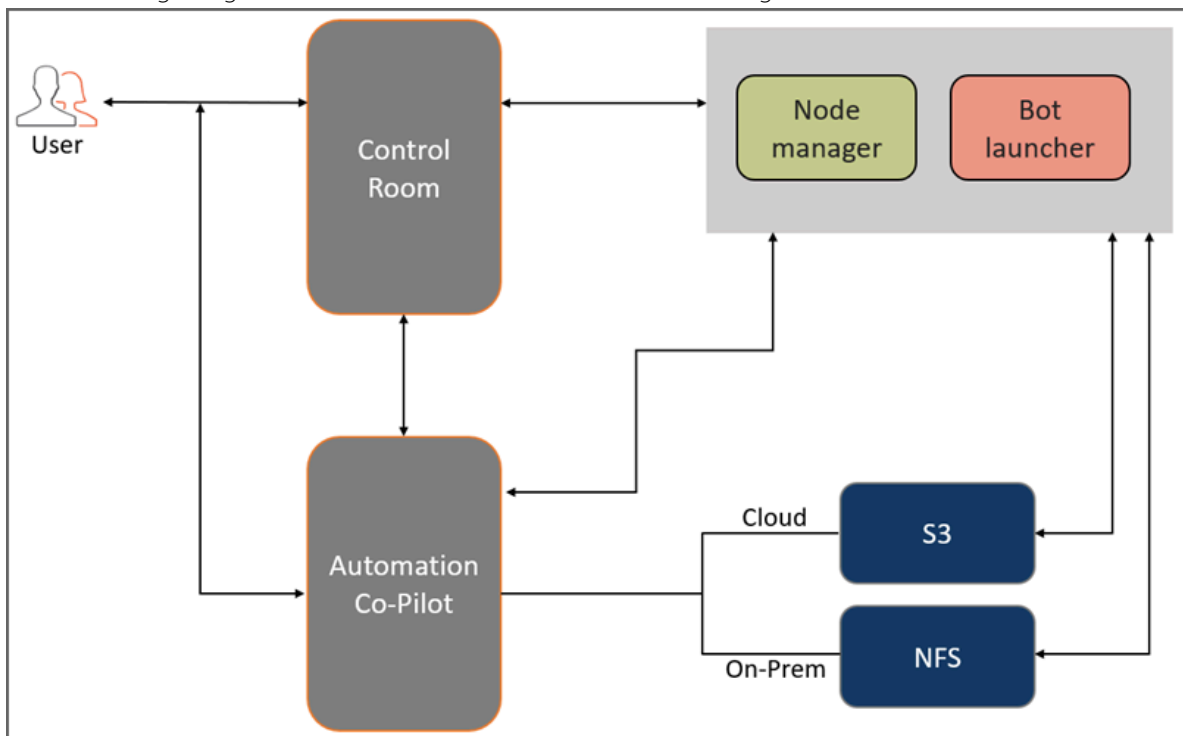

This example describes how to use the **Select File** element to upload or download files that are passed in the initial forms in the web interface.

Before you can upload or download a file using Select File, you must have the following:

- A Bot Creator license with a custom role assigned that has the create folder permission.
- Access to the Automation Workspace.
- A system-created **AAE\_Robotic\_Interface User** role with the AARI user license for the Co-Pilot User.
- Access to the web interface.

### File storage service architecture and considerations

The following image describes the architecture of the file storage service:

Before you use file storage, review the following storage elements:

Table 14: File storage service, quotas, and life cycle

Storage element	Description
Cloud file storage service	<ul style="list-style-type: none"> <li>• Uses NFS of the Control Room server. Files are in this location: C:\ProgramData\AutomationAnywhere\Server Files\storageservice</li> <li>• Files are categorized by user, consumer (AARI or IQBOT), and dates</li> </ul>
On-Premise file storage service	<ul style="list-style-type: none"> <li>• Uses Amazon S3 services</li> <li>• Storage is migrating to Google Cloud Platform</li> </ul>
Quotas	<p>For all editions (Community, Enterprise Cloud, and Enterprise On-Premise), the following quotas apply to storage:</p> <ul style="list-style-type: none"> <li>• Max File Size = 50 MB</li> <li>• Max Storage Size <ul style="list-style-type: none"> <li>• Base = 250 MB</li> <li>• Additional capacity per licensed AARI User = 1 GB</li> <li>• The Community edition is capped at 250 MB, and a company with 100 active users is capped at 100 GB + 250 MB.</li> </ul> </li> </ul>
File life cycle	<p>A file in storage is deleted when:</p> <ul style="list-style-type: none"> <li>• The request where the file was uploaded is deleted. However, when the request is inside the Recycle Bin, the file remains in storage.</li> <li>• Ninety days have passed since the file was uploaded in storage (regardless of the status of the request).</li> </ul>

To upload or download a file using **Select File**, complete the following:

1. Log in to the Automation Workspace as a Bot Creator.
2. Create a form where the file can be accessed. See [Create a form to view documents](#) on page 3705.
3. Create a bot that can call and store the input file. See [Create a bot with Get Storage file action](#) on page 3706.
4. Create a process that allows users to run the bot and access the file. See [Create a process automation to select a file input](#) on page 3708.

5. Run the process and access the file. See [View uploaded file](#) on page 3711.

## Create a form to view documents

Create a form to upload files and view documents.

1. Create the first of two new forms and name it **File Form**. The new form dialog displays for you to design your form.
2. Drag and drop the **Select File** element into your form designer from the **Elements** column. The **Properties - Select File** dialog displays with relevant fields.

The screenshot shows the Automation Anywhere form designer interface. On the left, the 'Elements' column contains various form components, with 'Select File' highlighted and a yellow circle '2' next to it. The central canvas shows a form titled 'File form' with a blue dashed box containing the text 'Drop file here or browse'. On the right, the 'Properties - Select File' dialog is open, showing fields for 'Element ID' (File0), 'Element label' (Select a file (PDF) with a yellow circle '3'), 'Select file format type' (Supported Type selected), and 'Enter file formats separated by commas' (PDF with a yellow circle '4'). Other fields include 'Enable file download' (checked), 'Hint below field' (30 characters max), and 'Tool tip' (200 characters max). The 'Advance behavior' section has 'Make field required' and 'Make field uneditable' options.

3. Enter **Select a file (PDF)** as the label in the **Element label** field.
4. Specify **PDF** as the supported file format in the **Enter supported file formats separated by commas** field.
5. Click **Save** and close the current dialog.

6. Create the second form and name it **View Document Form**.

7. Drag and drop the **Document** element into your form designer from the **Elements** column. Optionally, you can use the **Image** element instead of the **Document** element to add an image to your form.

**Note:** The **Document** and **Image** elements provide the same functionality but use different file formats. The file size should not exceed 150 kb (similar to a logo image) and the supported file types are: PNG, JPG, JPEG, and GIF.

8. Optional: You can specify the window formatting and dimensions in the **Properties - Document** window.

9. Click **Save** and close the current window.

You have now successfully created a form with the **Select File** and **Document** elements.

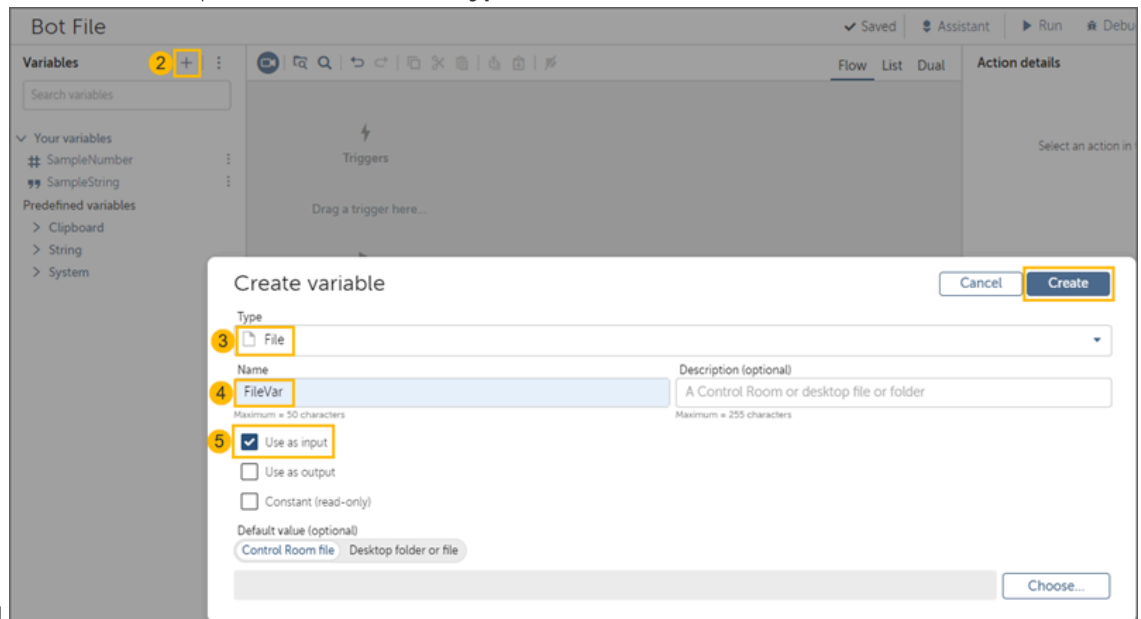

To continue this example and create a bot, see [Create a bot with Get Storage file action](#) on page 3706.

## Create a bot with Get Storage file action

This procedure describes how to build a bot using the **Get Storage file** action in Process Composer.

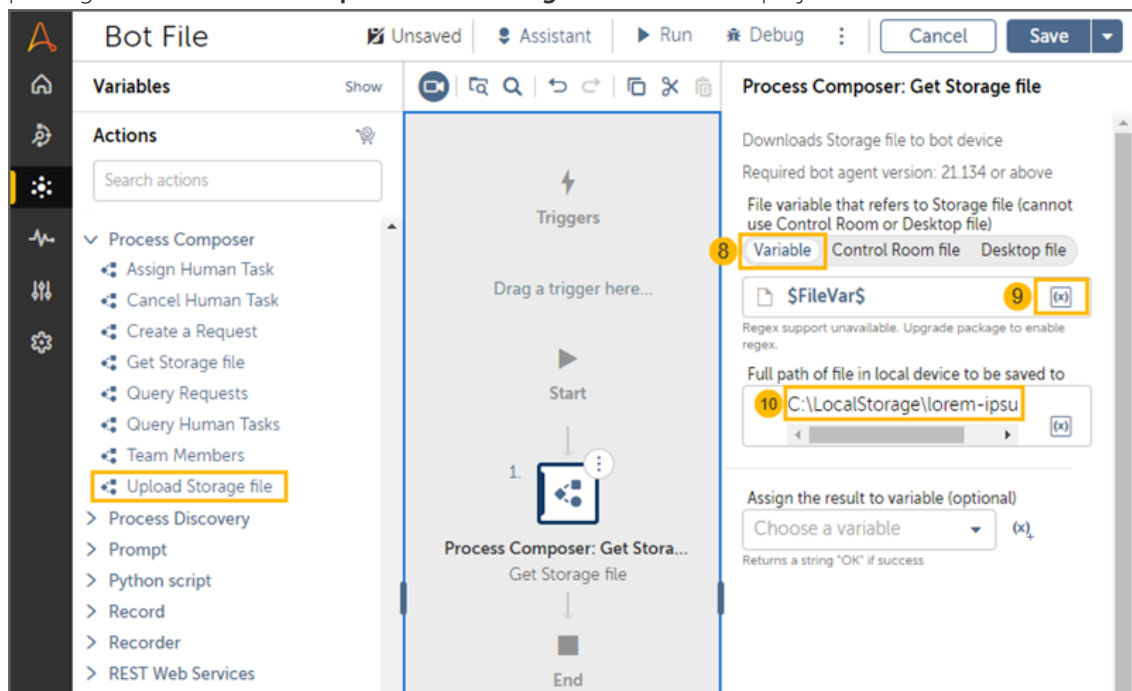

1. Create a new bot and name it **Bot File**. The new botwindow displays for you to create a bot.
2. Select the plus (+) icon in the **Variables** field. The **Create variable** window displays.

3. Select **File** in the drop-down menu in the **Type**

field.

4. Enter **FileVar** as the variable name in the **Name** field.
5. Select **Use as input** only.
6. Click **Create**.
7. Drag the **Get Storage file** action from the **Process Composer** package. The **Process Composer: Get Storage file** window displays.

8. Select **Variable**.
9. Select the **FileVar** that you had previously created.
10. Specify the path in the **Full path of file in local device to be saved to** field.

**Important:** The full path of the file includes the name of the file, for example: C:\aari\output\filename.pdf.

**11.** Click **Save**.

You have successfully created a bot with the **Get Storage file** action.

To continue the example and create a process, see [Create a process automation to select a file input](#) on page 3708.

## Create a process automation to select a file input

This procedure describes how to create a process automation to select a file input.

This process automation uses the elements that you previously created from the following topics:

- [Create a form to view documents](#) on page 3705
- [Create a bot with Get Storage file action](#) on page 3706

1. Create a new process automation and name it **Process To Download File** in Process Composer.
2. Click **Process entry**. The **Start** window

displays.

3. Click **Browse** in the **Select initial data form** field.
4. Set the initial form as **File Form** that you had created.
5. Enter the request title and task name.
6. Click **Save** and close the current window.

7. Drag and drop the **Bot Task** into your process automation from the **Elements** panel. The **Task: Bot Task** window displays.

The screenshot shows the 'Process To Download File' automation editor. The 'Elements' panel on the left lists various task categories. The central canvas displays a process flow starting with 'Start', followed by a 'Bot Task Get-file' element, and ending with 'Completed'. The 'Task: Bot' configuration window is open, showing the following fields and values:

- Element name:** Get-file
- Task name:** Get-file-task
- Bot queue timeout:** 24 hours, 0 minutes
- Select bot:** Bot File
- Run bot and dependencies using:** Latest version
- Bot priority:** Medium
- Data privacy tag (optional):** (empty)
- Input values:** FileVar

8. Enter your element and task name in the **Element name** and **Task name** fields.
9. Click **Browse** in the **Select bot** field and set this as the **Bot File** that you previously created.
10. Set your input value as **Download**.
11. Select the **FileVar** that you had previously created, and set the variable as the document you uploaded as the variable.
12. Click **Save** and close the current window.
13. Drag and drop the **Form Task** into your process automation from the **Element** panel. The **Task: Form Task** window displays. Enter

your element and task name in the **Element name** and **Task name**

The screenshot displays the 'Process To Download File' configuration window. On the left, the 'Elements' panel lists various task types like Bot, Form, Approval, API, Process, Document Validation, Filter, Logic (If/Else pair, Else if), and End point (End Process, Go to). The central area shows a flowchart starting with 'Start', followed by a 'Bot Task Get-file', then a 'Form Task Human-task-form', and finally 'Completed'. The right-hand 'Task: Form' configuration panel is detailed with the following settings:

- Task: Form**
  - Hide this task after completion
  - Make the form read-only
  - The form will require no input. The next task will execute automatically.
- Task requester and assignment**
  - Default (selected) | Custom
  - The assigned group of the request will be responsible for completing this task. By default, this task will only be shown in the "Assigned" task list.
  - Show this task in "Requested" task list for the request creator
- Task contributor**
  - 13 The user who opens this task
- Select form**
  - View Document Form | 14 Browse
- Preview form**
  - Preview form
- Task expiration time**
  - No expiration
  - If form is not submitted within the specified time, this Task will expire and no longer accept submissions. The Task will return an EXPIRED status.
- Data privacy tag (optional)**
  - (x)
  - Used only as an additional hidden field that can be searched for Data Privacy purposes. Variables will be populated at runtime
- Add form button**

Button label	Button style
16 OK	Primary

  - 15 Add button
- Feed data into form**
  - 17  Document[Document0]
  - \$Get-file.input[FileVar]\$ (x)

fields.

14. In the **Select Form** field, select the **View Document Form** that you previously created.
15. Click the **Add button** option.
16. Specify your button labels and style using the **Button label** and **Button style** fields.
17. Select **Document** in the **Feed data into form** field. Alternatively, you can select **Image** if you had used the **Image** element instead.
18. Enter the file variable to feed into the form.
19. Click **Save** and close the current window.

You have successfully created a process automation to view files.

To continue to upload a file, see [View uploaded file](#) on page 3711.

## View uploaded file

Run your process automation and upload a file to view it.

The following video shows a sample process automaton:

1. Click **Run** to run your process automation from Process Composer.

The initial form window for the **Process To Download File** process automation displays with the **Select a file (PDF)** option for you to upload a file.

2. Click **browse** to select a PDF file in the initial form. You have uploaded your file to the initial form.

---

**Important:** File size is limited to 50 MB.

---

3. Click **Submit**. The request view page displays and the tasks are running. One of the process automation steps will display a preview of the file that was uploaded.
4. Click **Done** to confirm. The PDF file is downloaded to the local machine at the file path you set.
5. Navigate to folder on your local machine (for example: `C:\aari\output`) where you had specified the file path. The downloaded file should now display in the folder location.
6. Click the PDF file to view your file. You have successfully uploaded and viewed the file.

## Cloud storage usage

This topic describes the cloud storage usage details based on the file size that you upload.

### Cloud storage usage details

You can use the **Select File** element to upload files that are stored on the cloud. However to store these files on the cloud, the files must meet the following specific requirements:

Cloud storage quota

The files uploaded by users are based on the maximum file and storage sizes. The cloud storage quota consists of the following:

- The file size for when a user uploads a file using the **Select File** element cannot be greater than 50 MB.

---

**Important:** The file limit is attached to a **Select File** element only; not to a request.

Additionally, you can upload only one file for each **Select File** element. However, there is no limit to the number of **Select File** elements that you can add to a form.

---

- The cloud storage can store a maximum of 250 MB of data per tenant.
- 

**Note:** This is set by default. The storage limit is per tenant and not per user.

---

- The storage for each tenant is extended to an additional 1 GB for every AARI user license that is allocated in the tenant.

**Important:** These storage restrictions are applied only to the process automation when used in Automation Co-Pilot use cases. However, there are no storage capacity restrictions for Automation Co-Pilot Desktop Assistant storage and use cases.

---

### Retention Policy

The retention policy for files that are uploaded to the cloud storage is as follows:

File will be deleted 90 days after the time of the file upload.

When a request is deleted, the request and the associated file are permanently deleted and not just sent to the recycle bin.

---

**Note:** This is supported for requests which have only one associated file, not multiple files.

---

## Working with process automations in Process Composer

Depending on the business requirements, a Bot Creator can perform other tasks with using a process automation in Process Composer.

After a process automation has been created in Process Composer, a Bot Creator can perform the following tasks:

- Test and [Run a process automation](#) on page 3714: Before you check in a process automation, you can test the process automation by running it in a private or public workspace using the Run option in the Process Composer. The bots in the process automation running in a private workspace execute from the default device of the Bot Creator. When a Bot Creator executes the process automation, they can create a request, enter data in the initial form, and then run their request from the private workspace.
  - Requests created from the process automation executed in a private workspace can be viewed only by the Bot Creator user who created the request.
  - Requests created from the process automation executed in a public workspace can be viewed by the Automation Co-Pilot Admin. Managers and users can view the requests only if they have access to the process automation.
- [Check in a process automation](#) on page 3713: To make a process automation available to other users, you can check in a process automation from a private workspace to a public workspace.
- [Check out a process automation](#) on page 3713: If there is a change in a business requirement, you can check out the process automation from a public workspace to your own private workspace and make changes to the process automation.
- Access a process automation from one Control Room to another by either importing or exporting the process automation:
  - For example, if you developed a process automation and tested it in the staging area and it is now ready for production, you can [Export a process automation](#) on page 3719 from the staging area.
  - Similarly, you can import the exported process automation into the production area. See [Import a process automation](#) on page 3716.

- [Delete a process automation](#) on page 3720: If a business requirement becomes redundant, you can delete the process automation.
- After creating a process automation, you can create an output variable to [Display child process automation output](#) on page 3720 in the parent process automation. The end process can then call the output variable.

## Check in a process automation

Bot Creators can check in a process automation from the private workspace to the public workspace to make it available for other users.

- You must have a Bot Creator license.
- You must be assigned a custom role with the following permissions:
  - Required: Check-in and check-out permission
  - Optional: Create folder permission
  - Optional: View packages permission
- To check in a process automation with dependent folders and files, ensure you have the following:

- Create folder permission.

If you are checking in a process automation from your private workspace and if the folder containing the process automation does not yet exist in the public workspace, then you must have the create folder permission to successfully check in the process automation.

- Check-in permission on the dependency folder.

---

**Important:** If a bot is checked out, edited, and then checked in again, the changes to the bot are reflected immediately. Whereas, if you follow the same procedure for forms, the changes to forms are only reflected when the entire process automation is checked in again.

---

1. Log in to the Control Room as a Bot Creator user.
2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
3. Select the process automation you want to check in, open the actions menu (vertical ellipsis), and click **Check in process**.
4. In the **Check in Process** dialog, add your comment and click **Check in**.  
The process automation displays in the same folder structure in the public workspace.

## Check out a process automation

Bot Creators can check out a process automation from the public workspace to create an editable copy of the process automation.

- Ensure you have the Bot Creator license to check out a process automation to your private workspace.
- To check out a process automation with dependent folders and files, you must have the following:

- Create folder permission
  - Check-out permission on the dependency folder
1. Log in to the Control Room as a Bot Creator user.
  2. In the public workspace, click **Automation**.  
The **Automation** page is displayed with the list of folders or files containing the process automations.
  3. Select the process automation, open the actions menu (vertical ellipsis), and click **Check out process**.  
The process automation appears in the same folder structure in the private workspace.

## Run a process automation

In the Control Room, as a Bot Creator, you can run a process automation from the **Process Composer** in the private workspace.

Best practices:

- When the process automation is executed in the private workspace, the Bot Creator can create a request and enter data in the initial form.

In the private workspace, the bots are executed on the default device of the Bot Creator.

- Requests created from the private workspace can be viewed only by the user creating the request.

The Co-Pilot Admin cannot view the process automations executed from the private workspace in the process management page.

- When process automation 1 (parent) calls process automation 2 (child), two requests are generated:
  - Request started by the parent process automation to the child process automation shows the status as pending.
  - Second request started by the child process automation requires the user to complete the first request to proceed.

User must first complete the 2nd request (child process automation) so the callback goes to process automation 1 (parent). The user can then continue with process automation 1 to complete the task.

1. Log in to the Control Room as a Bot Creator user.
2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
3. Click the process automation name.
4. When the process automation opens in the **Process Composer**, click **Run**.  
A dialog opens prompting you with the initial form.

## Move a process automation between folders

After a process automation has been created in Process Composer, a Bot Creator or Citizen Developer user can move the new process automation from one folder to another within a private workspace.

You can move new process automations only. You cannot move any process automations that have the following statuses:

- Cloned
- Checked in
- Checked out
- Edited

**Note:** You cannot move a process automation in a public workspace.

To move a new process automation from one folder to another folder within a private workspace:

1. Log in to the Control Room as a Bot Creator or Citizen Developer user.
2. On the left pane, click **Automation**.  
A list of available bots and process automations displays.

**Note:** You can move process automations only; you cannot move bots.

3. Select the new process automation that you want to move to a different folder.
4. From the right of the selected process automation, open the actions menu (vertical ellipsis) and click the **Move process** icon.

5. From the Find a Folder dialog, select the folder you want to move the process to. If you are unsure, you can click Search or Browse to help locate the folder you want.

6. Click **Choose** to move the process automation to the new folder path. The process automation displays in its new folder under the files and folders list. As a result, this event is logged in the Control Room for Automation 360 as a Move file audit entry which shows the old and new path of the process automation. For log details, see [Audit events list](#) on page 2292.

## Import a process automation

As a Bot Creator, you can import a process automation from one Control Room to another.

- To import process automations, ensure that you have the following permissions:
  - Import bots permission
  - Create folder permission (if required)
  - Manage package permission
  - Check-in to public workspace permission if you are importing to the public workspace
  - Check-out permission (if the process with the same name exists in the target Control Room)
- The process automation directory path is case-sensitive. As a result, ensure that the export and import paths use the same case in the Control Room to avoid any process automation execution failure.

In this task, the required process automation is already exported and an email is received with a link to the zip file containing the package to import.

Any previously exported process automation is located in the public repository. It must be imported and checked in so that it can be deployed from the new Control Room.

The imported process automation will be available in the public repository.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click **Import bot**, browse, and then select the process automatoin to import.

---

**Note:** This option applies to both bots and processes.

---

3. Select the option to import a process automation into the private or public workspace.
4. Set the option for importing the process automation based on whether a previous version of the process automation resides in the destination location.  
During the import, if a file already exists, you can skip the process during import or overwrite the existing process and file.
5. Click the **Import bot** icon.
6. Click **Check in**.  
On completion, the imported process automation is placed in the public repository and is ready to deploy from the new Control Room.

## Import process automation dependencies

When you import a process automation, you might encounter some issues where the import might not work as intended. This topic describes scenarios on how to successfully import a process automation.

### Import process automation scenarios

For these scenarios, a **Parent** process automation has dependencies with a **Child** process automation and a **Test** form, and needs to import from **Environment A** to **Environment B**. The goal is to successfully import from **Environment A** to **Environment B**.

Scenario parameters

- **Parent** process automation uses the **Child** process automation and both use the **Test** form in **Environment A**.
- The export **Child-only** zip file contains the **Child** process automation and the **Test** form.

---

**Note:** You have to manually export the proper files.

---

- The export **Parent-only** zip file contains the **Parent** process automation and the **Test** form.
- The export **Parent-and-Child** zip file contains the **Parent** process automation, the **Child** process automation, and the **Test** form.

Scenario A (Best case)

1. **Environment B** has no files.
2. Import **Child-only** zip file into **Environment B**. The files of **Child** process automation and **Test** form will now exist in the repository.  
Automation Co-Pilot receives a bulk import event of **Child** process automation and **Test** form files, and a new process automation called **Child Process** is successfully created.
3. Import **Parent-only** zip file into **Environment B**. The files of **Parent** process automation and **Test** form will now exist in the repository.  
Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** exists in Automation Co-Pilot, the **Parent Process** is successfully created.
4. Your import is successful because the **Child Process** and **Parent Process** are created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** was successful because the **Child-only** zip file was imported before the **Parent-only** zip file, therefore the **Child Process** and **Parent Process** were successfully created in Automation Co-Pilot.

This is the best case scenario for a successful import.

Scenario B (Conditional case)

1. **Environment B** has no files.
2. Import **Parent-only** zip file into **Environment B**. The files of **Parent** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** does not exist, this failed to create a **Parent Process**.

3. Import **Child-only** zip file into **Environment B**. The files of **Child** process automation and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of **Child** process automation and **Test** form files. A new process called **Child Process** is successfully created.

4. Import **Parent-only** zip file again with **Overwrite existing files into** option selected to **Environment B**. The files of **Parent** process automation and **Test** form will be overwritten in the repository.

Automation Co-Pilot receives a bulk import event of **Parent** process automation and **Test** form files. Because **Child Process** now exists in Automation Co-Pilot, **Parent Process** is now successfully created.

---

**Important:** If the **Overwrite existing files into** is not selected, then no bulk import event is generated because files of **Parent** process automation and **Test** form already exist in repository. Therefore, **Parent Process** cannot be created in Automation Co-Pilot.

---

5. Your import is successful because the **Child Process** and **Parent Process** are created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** can fail if the **Parent-only** zip file was imported before the **Child-only** zip file. Since the **Parent Process** can only be created if the required dependencies from the **Child Process** exist, and the **Child Process** did not exist in the repository, then the **Parent Process** could not be created.

As a workaround to successfully create the **Parent Process**, you can import the **Parent-only** zip file again by selecting the **Overwrite existing files into** option to overwrite the existing repository (only after the **Child Process** was created). This workaround succeeds conditionally only if you selected the **Overwrite existing files into** option. If you did not select this option, then the **Parent Process** cannot be created.

To avoid this issue, you should use Scenario A for a successful import experience.

Scenario C (Worst case)

1. **Environment B** has no files.
2. Import **Parent-and-Child** zip file into **Environment B**. The files that contain the **Parent** process automation, **Child** process automation, and **Test** form will now exist in the repository.

Automation Co-Pilot receives a bulk import event of the **Parent** process automation, **Child** process automation, and **Test** form files. However, because the **Parent** process automation and **Child** process automation relations are not known from the bulk import event, the **Parent** process automation might be processed first. Since the **Child Process** does not exist, then this failed to create a **Parent Process**.

3. Your import failed because the **Child Process** and **Parent Process** were not created in Automation Co-Pilot.

In this scenario, the import from **Environment A** to **Environment B** failed because the **Parent-and-Child** zip file was imported. The bulk import event does not understand the relation between the **Parent** process automation and the **Child** process automation, and might process the **Parent** process automation before the **Child** process automation. As a result, the **Parent Process** cannot

be created because the **Child Process** does not exist; therefore, no new process automation is created in Automation Co-Pilot.

To avoid this issue, you should use Scenario A for a successful import experience.

## Export a process automation

As a Bot Creator, you can export a process automation from one Control Room to another.

- Only process automations within the public workspace can be exported. To export a process automation, check the process automation into the public workspace.
- Ensure that you have the correct role and permissions to export the process automation, including the **View package** permission.
- To receive the link to the exported package through email, enable SMTP. See [Email server settings](#) on page 2685.
- To export the process automation from one Control Room to another, both Control Rooms must be the same version.

The Control Room maintains a maximum of 10 GB of historical export files in the download directory. To maintain this threshold, files are deleted on a first-in/first-out basis.

1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
2. Click the **Export bot**, browse the public directory, and then select the process automation to export.

---

**Note:** This option applies to both bots and process automations.

---

The selected process automation and the required dependencies are displayed.

3. Click **Next**.  
The process automation and its dependencies are ready for export and displayed in the **Review Dependencies** window.
4. Click **Next**.  
All related packages are displayed.
5. Select the necessary packages associated with the process automation to export.  
You can select **Exclude process packages** to remove all packages from the export.
6. Click **Export bots and files**.  
If you have configured SMTP, an email is sent containing a link to the zip file of the exported package.  
If you have not configured SMTP, perform the following steps to access the link to the zip file of the exported package:
  - a) Navigate to **Activity > Historical**.
  - b) Search and view the historical activity of the exported package.
  - c) Click **Download exported zip file**.  
A link to download the zip file is displayed.
7. Use the link to download the zip file and save it to a location for importing it to another Control Room.

Import the process automation to another Control Room.

## Delete a process automation

As an Co-Pilot Admin or a user with **Delete from Public** permission, you can delete a process automation from the public workspace.

When deleting a process automation, consider the following:

- You can delete process automations that have open requests.

After a process automation is deleted, you cannot access the process automation even if the requests still exist. The scheduled bots can still be executed, but the forms cannot be submitted. If you republish the same process automation, the old requests can be restored and team permissions can be created again.

- You cannot delete checked-out process automations.

**1.** Log in to the Control Room as an Co-Pilot Admin or a Bot Creator user.

**2.** On the left pane, click **Automation**.  
A list of available and forms is displayed.

**3.** Select the process automation you want to delete, open the actions menu (vertical ellipsis), and click **Delete process**.

You must first delete the process automation before you can delete the bots or forms within the process automation.

**4.** Select **Yes, delete** to confirm.

When the process automation is deleted from the public workspace, it is removed from the process management page in the web interface. Additionally, if the process automation is already assigned to any Co-Pilot User or team, access is removed after the process automation is deleted from the public workspace.

## Display child process automation output

Bot Creators can create an output variable to display the output of a child process automation in the parent process automation.

After a Bot Creator has created a process automation in Process Composer, they can create an output variable that can be used in the end process.

- To create an output variable:
  - a)** Navigate to the **Output variables** section.
  - b)** Click **Show**.
  - c)** Click the plus (+) icon.  
The **Create variable** dialog displays.
  - d)** Enter the name of the variable in the **Name** field (for example, **output**).
  - e)** Select your variable type in the **Type** field (for example, **String**).
  - f)** Optional: Enter the variable information in the **Description** field.
  - g)** Optional: Enter a default variable in the **Default value** field.

You need to insert a variable:

- a) Select a source in the **Variable source** field (for example, **botTask**).
  - b) Select **Output** as a **Variable type** option.
  - c) Select a variable in the **Variable** field (for example, **output**).
  - d) Click **Yes, insert** to confirm your changes.
- h) Click **Create**.
- You have now created a new output variable! This output variable is now included in the **User-defined** variables in the **Output variables** section.
- To edit or delete an existing output variable:
    - a) Navigate to the **Output variables** section.
    - b) Select the three dots icon next the user-defined output variable (for example, **output**).
    - c) Optional: Select the **Delete variable** to delete the current variable.
    - d) Select the **Edit variable** to edit the current variable.  
The **Edit variable** window prompts you to add any new changes to your current variable.
    - e) Click **Apply** to save your changes.

## Process Composer and Co-Pilot for Business Users

As a Bot Creator user, you can create a process automation in Process Composer and then run the process automation in Automation Co-Pilot as an automated task.

[Automation Co-Pilot for Business Users](#) on page 3495 is a user-interface that enables real-time communication between users and bots. Using Automation Co-Pilot for Business Users, you can automate repetitive and time-consuming tasks, navigate controls, and input data when interacting with a customer.

As a Bot Creator user, you can configure a process automation in the **Process Composer** in the **Control Room**. Using the **Process Composer** drag-and-drop interface, users can create process automations and configure when a bot should be executed. It also displays correct data to users and exchanges that data across multiple teams.

The following video shows how to create a process automation in **Process Composer** and then launch it in **Automation Co-Pilot for Business Users** as an automated task:

To learn how an insurance company used **Automation Co-Pilot for Business Users** and **Process Composer** to generate a policy quote for a new homeowner, see [Scenario: Generating insurance quote with Automation Co-Pilot and Process Composer](#) on page 3856.

## API Task

API Task is an API-based cloud automation solution that harnesses the power of APIs to facilitate seamless data exchange between disparate systems and applications at an unprecedented speed.

Key benefits of API Tasks:

- Cloud-only: Leverage the scalability, security, and reliability of Automation Anywhere's managed Cloud infrastructure, without the need for on-premise hardware or maintenance. (Available only for Cloud, not On-Premises.)
- Managed by Automation Anywhere: Our team takes care of the entire Cloud operation, ensuring smooth performance and seamless updates.
- Flexible integration: Trigger your API Tasks from forms, processes, or as dedicated endpoints.

API Task's real-time data exchange capabilities enable it to adapt to dynamic environments and respond promptly. Use API Tasks to create automations using packages that are supported on Automation 360 Cloud. For instance, API Tasks work with our packages that do not intervene with the file system such as Salesforce, ServiceNow, Workday, REST, and SOAP to automate workflows and processes. You cannot use an API Task to automate a desktop operation.

---

**Note:**

- Available with AWS Cloud only.
  - API Tasks, unlike Task Bots, benefit from running entirely in the Cloud, managed by Automation Anywhere, eliminating the need for local Bot Runner devices.
  - Currently, API Task is available in the US East, US West, Europe, and Sandbox (US, Europe). It will be released to additional regions in future releases.
  - Every cloud customer receives 100 API Task executions per Control Room as their free base entitlement. The base entitlement also includes two concurrent executions, meaning you can run two API Tasks simultaneously. For higher execution limits and additional concurrencies, you need to purchase the Enterprise SKU or an API Task Overage SKU. Contact your customer service manager for more details.
- 

You can create an API Task in the API editor just like Task Bots. This API Task can then be invoked in either a form or a process depending on your specific requirements.

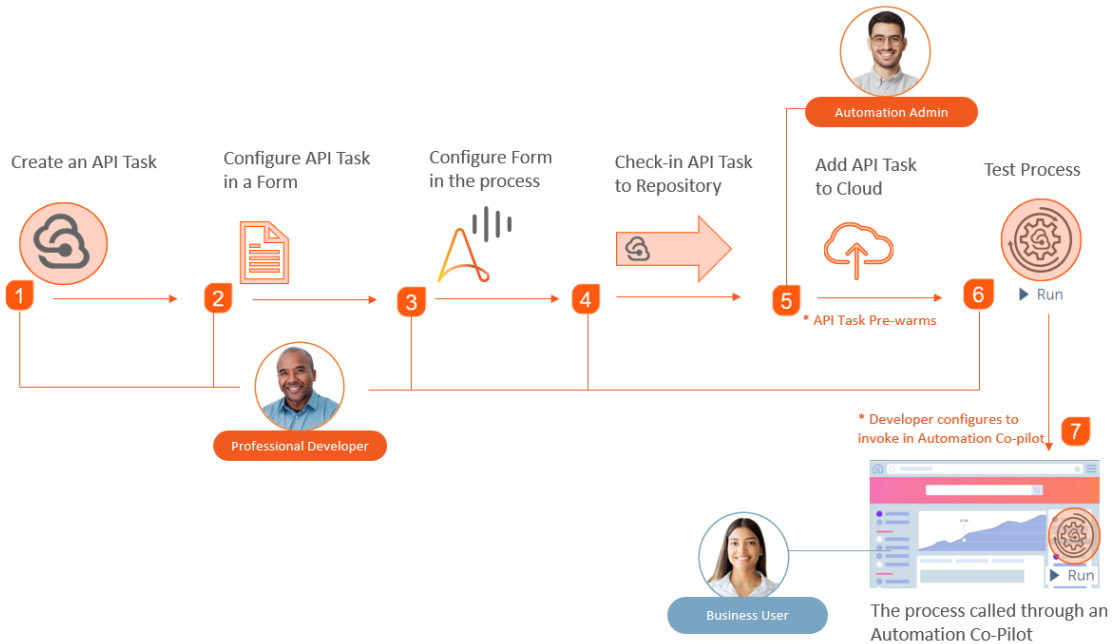

### Invoking API Task in form

Invoking an API Task in a form provides you with an immediate response after the initial run, ensuring that your processes receive immediate attention. During the initial run, the API Task or API Tasks within the Process are deployed in the cloud, enabling subsequent requests to be processed without any delay. To ensure optimal performance and scalability, API Tasks are intelligently pre-warmed on a dynamic number of cloud devices, to adapt to your concurrency needs. The diagram below describes the workflow to follow while invoking an API Task within a form.

---

**Note:** Pre-warming is a process in which the admin or a team manager adds the API Tasks to the cloud and the API Tasks are pre-deployed in cloud devices. The cloud devices are managed on the Automation 360 infrastructure.

---

### Real-Time Response: Empowering Users with Instantaneous Results

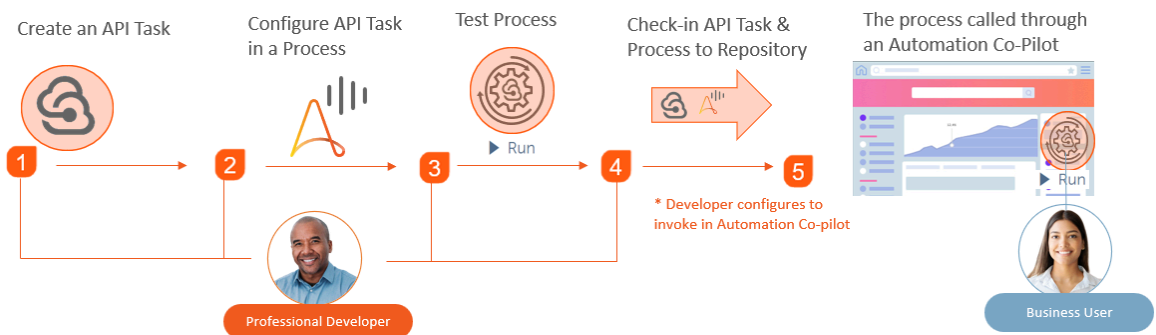

- Ideal for Forms: When users expect immediate response.
- Key Features:
  - Pre-configured cloud device allocations for seamless execution.
  - Strict concurrency limits for optimal performance.
  - 1-minute execution cap for rapid completion.

Item	Description
1	Create an API Task (API Task in form) on page 3725
2	Configure an API Task in a form on page 3728
3	Configure a form with API Task in a process on page 3729
4	Check in API Tasks to Repository on page 3730
5	Add API Task to Cloud on page 3731
6	Test Process (API Task in form) on page 3732

Item	Description
7	Invoke the API Task through an Automation Co-Pilot, see <a href="#">Automation Co-Pilot for Business Users</a> on page 3495

### Invoking API Task in process

Invoking an API Task in a process provides the flexibility to execute API Tasks in the background, allowing your processes to continue without interruption. This approach is particularly useful for tasks that can take longer to complete, as it ensures that your overall workflow remains efficient. The diagram below describes the workflow to follow to build a process that invokes an API

Task.

On-Demand Execution: Effortless automation within processes

- Ideal for Processes: When tasks can run asynchronously, aligning with longer workflows.
- Key Features:
  - Intelligent queuing for excess requests, ensuring execution as devices become available.
  - Concurrency limits for resource optimization.
  - Extended 15-minute execution window for more complex tasks.

Item	Description
1	<a href="#">Create an API Task (API Task in Process)</a> on page 3733
2	<a href="#">Configure API Task in process</a> on page 3735
3	<a href="#">Test Process (API Task in process)</a> on page 3736
4	<a href="#">Check in API Tasks to Repository</a> on page 3730
5	Invoke the API Task through an Automation Co-Pilot, see <a href="#">Automation Co-Pilot for Business Users</a> on page 3495

Unlike Attended or Unattended deployments, API Tasks leverage cloud-based bots (API Tasks) for deployment, eliminating the need for physical devices. This headless approach offers scalability and flexibility, enabling you to automate your processes from anywhere, at any time. The below table shows and compares the various deployments.

Attended Deployment	Unattended Deployment	Headless Deployment (API Task)
Requires a physical device to execute tasks, suitable for tasks that require human interaction.	Requires a physical device to execute tasks, suitable for tasks that can be completed independently.	Cloud-based deployment eliminates the need for physical devices, offering scalability and flexibility.

## Invoking API Task in form

### Create an API Task (API Task in form)

Create an API Task with the packages available in the Control Room in the API Task editor. You can create an API Task with actions from packages that are supported on Automation 360 Cloud.

You must have a Bot Creator license.

This topic describes how to create an API Task by using an API that takes a ZIP code in the USA as input and returns the place and state name as output. You can create an API Task with the actions that are specific to your use case.

1. Log in to your instance of the Automation Anywhere Control Room as a Bot creator.
2. Create a new API Task:
  - a) From the left pane, click **Automation**.
  - b) Click **Create new > API Task**.
  - c) In the **Create API Task** window, enter the API Task name.
  - d) Accept the default folder location: `\Bots\`.  
To change where your API Task is stored, click **Choose** and follow the prompts.
  - e) Click **Create & edit**.
3. Create a ZipCode variable as an input that will be used in the ZIP code URL.
4. Use the **Get method** action to retrieve the place and state of a ZIP code.

---

**Note:** Pre-built packages are available for most common enterprise applications. For a list of supported packages, see [Table 1](#).

---

- a) Double-click or drag the **REST Web Services > Get method** action.

The screenshot displays the 'API Task - ZIP Code' configuration in Automation Anywhere. The task flow is as follows:

- Start
- REST Web Services: Get method... request for URI "https://api.zi...
- Json: Start session Start JSON session using Text i...
- Json: Get node value from the JSON path "places[0]..."
- Json: Get node value from the JSON path "places[0]..."
- End

The configuration panel for the 'REST Web Services: Get method' action is shown on the right:

- URI: `https://api.zippopotam.us/us/${ZipCode$}`
- Authentication Mode: No Authentication
- Header: No headers
- Advanced options:
  - Capture failure response
  - Allow insecure connection when using https
  - Warning: Transferred data may be visible to attackers
  - Wait for action to complete (in milliseconds): 60000
- Assign the output to a variable: pDictZipCodeApiResponse

- b) Enter the following URI. \$ZipCode\$ in the URI is the input variable created in [Step 3](#).

```
https://api.zippopotam.us/us/$ZipCode$
```

**Note:**

You can call multiple APIs within a single API Task. This can simplify your automation and reduce the need for multiple separate tasks. For instance, you can call API 1 to fetch product data, API 2 to fetch pricing data, and then API 3 to create a quotation within the same API Task.

- c) In the **Authentication Mode** drop-down list, select **No Authentication** because this endpoint does not require authentication.

**Note:** Typically, endpoints require authentication to ensure that only authorized applications can access the data. Select an appropriate authentication mechanism to allow access to the endpoint you want to access.

- d) Create the variable `pDictZipCodeApiResponse` in the **Assign the output to a variable** field. For more information on creating a variable, see [Create a variable](#) on page 2488.

**Note:**

- The complete API JSON response is assigned to this dictionary variable: `pDictZipCodeApiResponse`.
- The following variable types are not supported for API Tasks: File, Window, and Form.

- From the Actions pane, drag the **JSON > Start session** action and drop it into the canvas below the **REST Web Services** action.
  - In the **Data Source** field, select **Text** and enter `$pDictZipCodeApiResponse{Body}$`.
  - In the **JSON Object session** field, selection **Local session** and enter `Default`.

You now have the entire `Body`. The next task is to extract the required fields from the body. The following shows a sample JSON `Body`:

```
{
 "post code": "90210",
 "country": "United States",
 "country abbreviation": "US",
 "places": [
 {
 "place name": "Beverly Hills",
 "longitude": "-118.4065",
 "state": "California",
 "state abbreviation": "CA",
 "latitude": "34.0901"
 }
]
}
```

- Extract the `place name` from the JSON.
  - From the Actions pane, drag the **Json > Get node value** action and drop it into the canvas below the **Json > State session** action.
  - Specify the nodes to be extracted. For example, to extract the place, you can use `places[0].["place name"]`

- c) Create a variable Place and assign the output to this variable.
7. Extract the `state` from the JSON.
  - a) From the Actions pane, drag the **Json > Get node value** action and drop it into the canvas below the **Json > State session** action.
  - b) Specify the nodes to be extracted. For example, to extract the place, you can use `places[0].["state"]`
  - c) Create a variable State and assign the output to this variable.
8. Click **Save**.

To test the API Task, click the **Debugger**. While debugging, the local device is used to execute the API Task. The API Task created in this sample retrieves the Place and State for any ZIP code inputs.

## Configure an API Task in a form

Create and configure a form to invoke the API Task and map the API Task variables to the required fields in the form.

- You must have a Bot Creator license.
- You must first create an API Task to invoke it in the form.

This topic describes how to invoke an API Task in a form. In this example, you will create a ZIP code form that invokes an API Task to retrieve the `place` and `state` details based on the ZIP code input provided. The form created is executed through a process. You can create a form with the fields that are specific to your use case.

1. Navigate to an existing form or create a new form where you want to invoke an API Task. For more details, see [Create a form](#) on page 3666.

Name this form as API Task - ZIP Code Form.
2. Design a Form: Use the form elements to construct an interactive form based on your use case. In this example, the form is designed for mapping the ZIP code variables from the API Task.
  - a) From the **Elements** column, drag the **Text Box** element and drop it into your form designer.

The **Properties** tab appears with the relevant fields on the right side of the screen.
  - b) Enter an **Element label**. For example: **Zip code**.
  - c) Drag the **Button** element and drop it the designer below the **Zip code** text box. Enter a name for this button in the **Button-text (required)** field as **Submit**.
  - d) Additionally, drag two more **Text Box** elements and name them Place and State.
3. Add the **Form rules**. Form rules provide the conditions required for each element in the form. You can set form rules using the if and then conditions and specify the actions that will be executed when the conditions are met. In this example, the form rules are configured so that when a **Zip code** is entered and **Submit** button is pressed, the place and state element box will retrieve the values from the API Task variables. During execution, the API Task will not perform as expected if the form rule conditions are not satisfied.
  - a) Click the **Form rules** tab.

- b) If desired, enter a name for the rule. (For example, API Task call).
- c) Enter an **If** condition to validate if the button is

The screenshot displays the configuration of an API Task within a form rule. The left pane shows a preview of the 'Zip Code API Task' form with fields for Zip Code, Place, and State, and a Submit button. The right pane shows the 'Form rules (1)' configuration. Under the 'If' condition, the 'Submit - Button0' is selected with the condition 'Is clicked'. Under the 'Then' clause, 'Form actions' are selected, and 'Get value from API Task' is chosen. The 'API Task input variables mapping' table shows 'TextBox0' mapped to 'ZipCode'. The 'API Task output variables mapping' table shows 'Place-name' mapped to 'TextBox1' and 'State' mapped to 'TextBox2'.

pressed.

- d) To define the **Then** clause, select **Form actions** and then from the drop-down, select **Get value from API call**.
- e) You can map variables associated to the API Task to a form using the **Add variable mapping** option.

**Note:** If you edit a published API Task and add additional variables after you have checked the task in, the variables will not display in the form. You must check-in the API Task after adding the variables.

- f) Click **Browse** to select a specific API Task to perform a specified operation. In this example, an API Task (API Task - Zip Code ) is selected to retrieve the Place and State of any Zipcode.

## Configure a form with API Task in a process

You can add a form that invokes an API Task in a process automation.

- You must have a Bot Creator license.
- You must have created and configured a form with an API Task embedded before adding it into a process. For more details, see [Configure an API Task in a form](#) on page 3728.

Efficiently Integrate API Tasks into Processes for Streamlined Data Retrieval:

This example demonstrates how to leverage the API Task - ZIP code, previously configured within a form ([Configure an API Task in a form](#) on page 3728), within a process automation workflow. For a detailed guide on incorporating forms into your processes, see [Add Form Task to a process automation](#) on page 3688. Notably, invoking an API Task offers significantly lower latency compared to calling a Task Bot. This method allows for flexible creation of process automations that integrate forms with corresponding API Tasks tailored to your specific needs.

1. Create a new process.
  - a) Access the Control Room on your local machine, logging in as a Bot Creator.
  - b) Navigate to the left pane and select **Automation**.
  - c) Click **Create new > Process**.
  - d) On the **Create process** page, provide a descriptive name for the new process, such as ZIP code process.  
Processes are saved in the \Bots\ folder. Click **Browse** to change the default folder. You can place the process in the same folder as the associated API Task and form for better organization.
  - e) Click **Create & edit** button to proceed.
2. Define Process Start with Initial Form and API Task
  - a) Click **Start (Process entry)** to add an initial form with an embedded API Task. The **Start** configuration options appear on the right side of the screen.
  - b) Click **Browse to Select initial data form**. For this example, select the API Task - ZIP code form that you previously created in [Configure an API Task in a form](#) on page 3728.
  - c) In the **Request title** field, enter any text. For example: ZIP code details request.
3. Click **Save**.

## Check in API Tasks to Repository

To make an API Task available, check in the API Task from the private workspace to the public workspace. Perform this operation after adding the API Task to a form and process.

Ensure the following prerequisites are met for you to check-in an API Task.

---

**Note:** A bot developer can test a process without checking in the API Tasks.

---

- Bot Creator license to check in an API Task to the public workspace.
- A custom role with the following permissions:
  - Required: Check in permission at the folder level and at the corresponding parent folder level in the public workspace.
  - Optional: Create folder permission.
  - Optional: View packages permission.
- To check in an API Task with dependent folders and files, ensure you have the following:
  - Create folder permission.

If you are checking in an API Task from your private workspace and if the folder in which the API Task is present does not yet exist in the public workspace, you must have create folder permission to successfully check in the API Task.

- Check in permission on the dependency folder.
  - Ensure that your private and public workspaces have the same folder structure so that when you check in an API Task from your private workspace, it will appear in the same folder structure as in the public workspace.
1. Log in to the Control Room as a Bot Creator user.
  2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  3. Choose to check in either one API Task, or multiple API Tasks simultaneously.
    - Select the API Task that you want to check in, click the actions menu (vertical ellipsis), and click **Check in** API Task.
    - Select the API Task that you want to check in and click **Check in checked items**.
- 
- Note:** You can check in up to 10 items at a time.
- 
4. In the **Check in** window, add your comment and click **Advanced options**. Select the dependencies you want to check in and click **Check in**.  
The API Task appears in the same folder structure as in the public workspace and directly referenced dependencies are automatically checked in.

## Add API Task to Cloud

After an API Task is checked in, you must add the API Task to cloud for you to make it available for testing or using it within an Automation Co-Pilot.

You must have admin privileges to add an API Task to the cloud.

To enable API Tasks in cloud, do the following:

1. Navigate to **Administration > Settings > Cloud device management**.
2. In the **Concurrency management**, increase or decrease the API Tasks concurrency limit.  
Control Room gives you complete control over concurrency with flexible limits that adjust based on your license tier. By default, you have one dedicated session for each API Task in forms and processes, ensuring smooth performance and efficient resource utilization.
3. In the **API Tasks in Forms**, move your mouse over the plus sign and click **Add API Task allocation**.
4. In the **Find an API Task**, click **Browse** and locate the API Task you want to add to the cloud. For example, `API Task - ZIP code`.

---

**Note:** A default run-as-user (apitaskrunner) is automatically assigned to each API Tasks added to the **Cloud device management**. To change the default user, click the actions menu (three vertical ellipsis) located to the right of each allocated device session and click **Assign run-as user** and select a user. For more information on apitaskrunner, see [Run as user for API Task \(apitaskrunner\)](#) on page 3738.

---

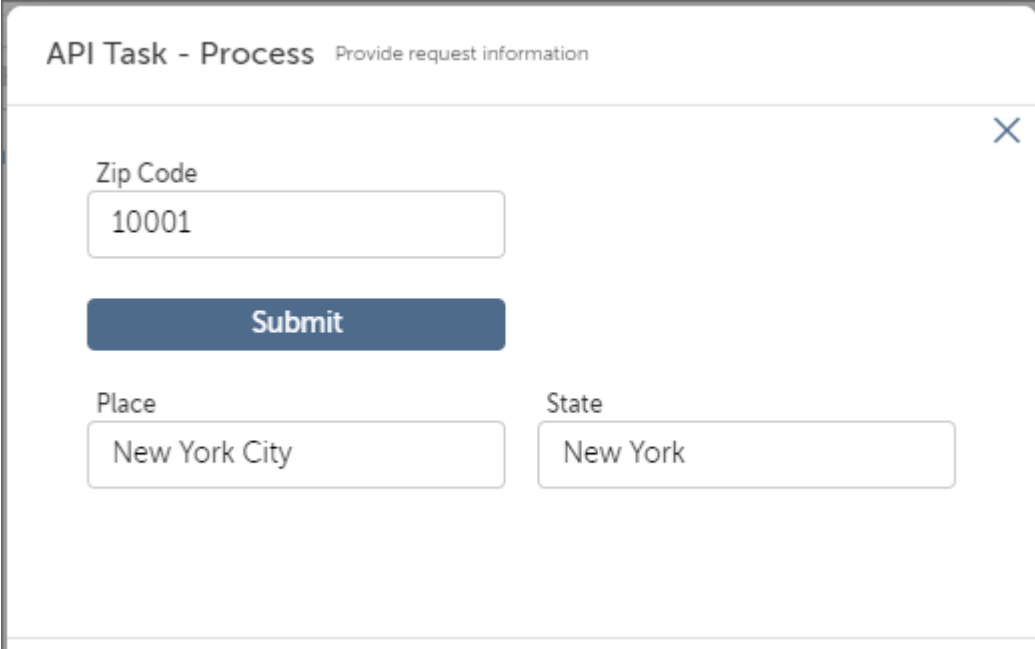

To learn about **Cloud device management** (Concurrency management and Adding API Task to form), see [Cloud device management \(API Task\)](#) on page 1972.

## Test Process (API Task in form)

Once you have configured a form with an API Task you will be able to test the process.

This topic describes about testing the process after it has been configured with API Tasks.

1. Make sure you have configured a form as described in [Configure a form with API Task in a process](#) on page 3729. For example, API Task - ZIP code.
2. Click **Run** to run the process. In our example, the running process invokes the form containing an API Task and then invokes an API Task directly in the process.  
A form appears. Enter a Zip Code and click **Submit** to retrieve the Place and

The screenshot shows a web form titled "API Task - Process" with the subtitle "Provide request information". The form has a close button (X) in the top right corner. It contains the following fields and buttons:

- A "Zip Code" input field containing the text "10001".
- A dark blue "Submit" button.
- A "Place" input field containing the text "New York City".
- A "State" input field containing the text "New York".

State.

The Place and State are retrieved.

Thus, API Tasks, embedded within forms, unlock real-time automation for seamless user experiences and immediate response.

## View API Task run time audit logs

You can view the audit logs after adding API Tasks to a form to see the various events that occurred as part of the pre-warming process.

To view the audit logs, log in to the Control Room as an admin and navigate to **Administration > Audit log**. A deployed API Task includes the following event types:

- API Task Warm Up Started
- Run bot deployed
- Bot sent to device
- Device acquired by user
- Run bot deployed

- API Task Warm Up Completed

**Audit log** Export items to CSV

Time filter: Last 24 hours

Status Choose

Events (650 of 1796)

Status	Time	Item name	Event type	Event started by
Successful	13:49:35 IST 2023-08-30	API Device Pool 01 1693241118	API Task Warm Up Completed	apitaskrunner
Successful	13:49:35 IST 2023-08-30	ServiceNow Incident 2023.08.30	Run bot deployed	apitaskrunner
Successful	13:49:27 IST 2023-08-30	ServiceNow Incident 2023.08.30	Device acquired by user	apitaskrunner
Successful	13:49:27 IST 2023-08-30	ServiceNow Incident 2023.08.30	Bot sent to device	apitaskrunner
Successful	13:49:27 IST 2023-08-30	ServiceNow Incident 2023.08.30	Run bot deployed	apitaskrunner
Successful	13:49:25 IST 2023-08-30	API Device Pool 01 1693241118	API Task Warm Up Started	apitaskrunner

## Invoking API Task in process

### Create an API Task (API Task in Process)

Create the essential API Tasks for your automation, utilizing the readily available packages within the API Task editor.

You must have a Bot Creator license.

This topic describes the first step of crafting the API and Bot Tasks that will orchestrate the automation process. In this example, let us consider a sending a "Hello World" message using an API Task to Microsoft Teams.

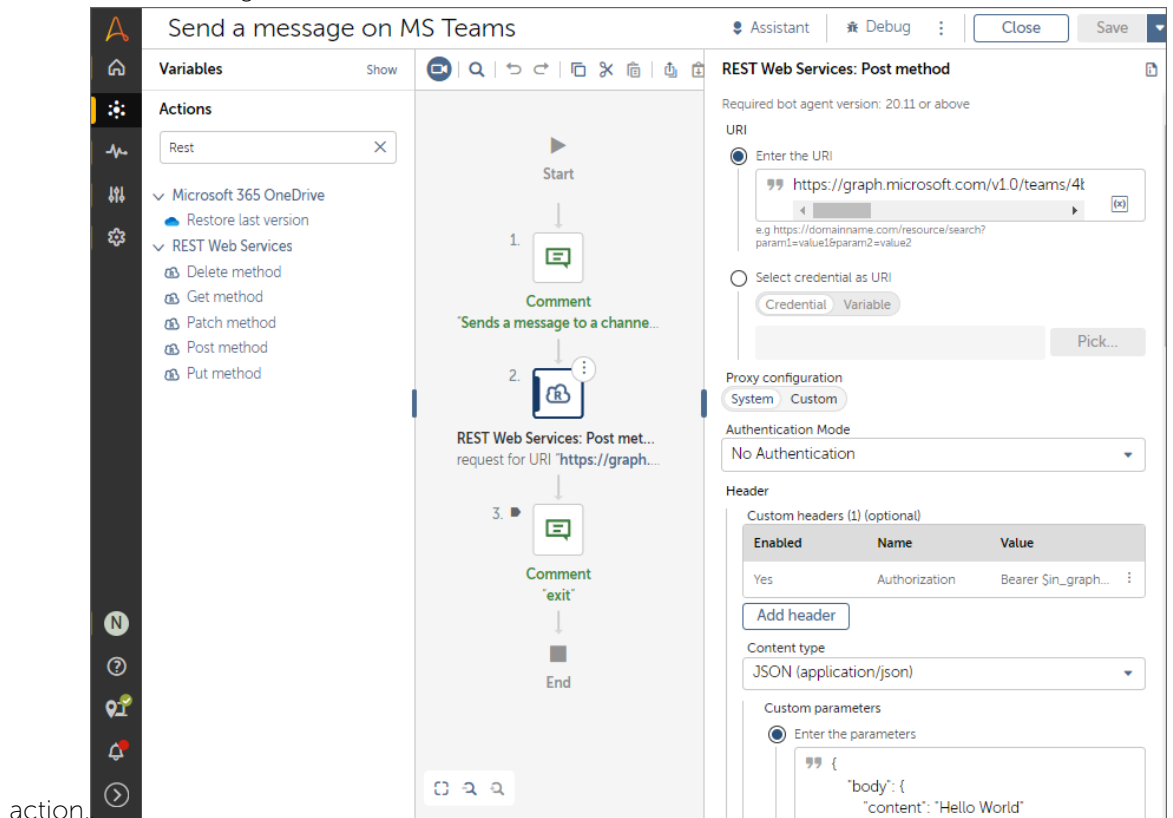

1. Log in to your instance of the Automation Anywhere Control Room as a Bot creator.
2. Create a new API Task:
  - a) From the left pane, click **Automation**.
  - b) Click **Create new > API Task**.
  - c) In the **Create API Task** window, enter the API Task name.
  - d) Accept the default folder location: `\Bots\`.  
To change where your API Task is stored, click **Choose** and follow the prompts.
  - e) Click **Create & edit**.

In this example, an API Task is created that calls an API to send a "Hello World" message on Teams.

3. Use the **Post method** action to send a message in Teams.

**Note:** Pre-built packages are available for most common enterprise applications. For a list of supported packages, see [Table 1](#).

- a) Double-click or drag the **REST Web Services > Post method**

action.

- b) You can use the Graph API to send a chat message on Teams. For more information, see <https://learn.microsoft.com/en-us/graph/api/chat-post-messages>.

**Note:**

You can call multiple APIs within a single API Task. This can simplify your automation and reduce the need for multiple separate tasks. For instance, you can call API 1 to fetch product data, API 2 to fetch pricing data, and then API 3 to create a quotation within the same API Task.

- c) In the **Authentication Mode** drop-down list, select **No Authentication** and click **Add header** to input the bearer token. In this example, the bearer token is stored in a variable (in\_graph\_bearertoken).

**Note:** Typically, endpoints require authentication to ensure that only authorized applications can access the data. Select an appropriate authentication mechanism to allow access to the endpoint you want to access.

- d) Under **Content type**, make sure **JSON (application/json)** is selected and enter the following JSON in **Custom parameters**.

```
{
 "body": {
 "content": "Hello World"
 }
}
```

- e) Assign the output of the API to a variable (o\_teams).

## Configure API Task in process

You can directly configure API Tasks within a process automation.

An admin prerequisites:

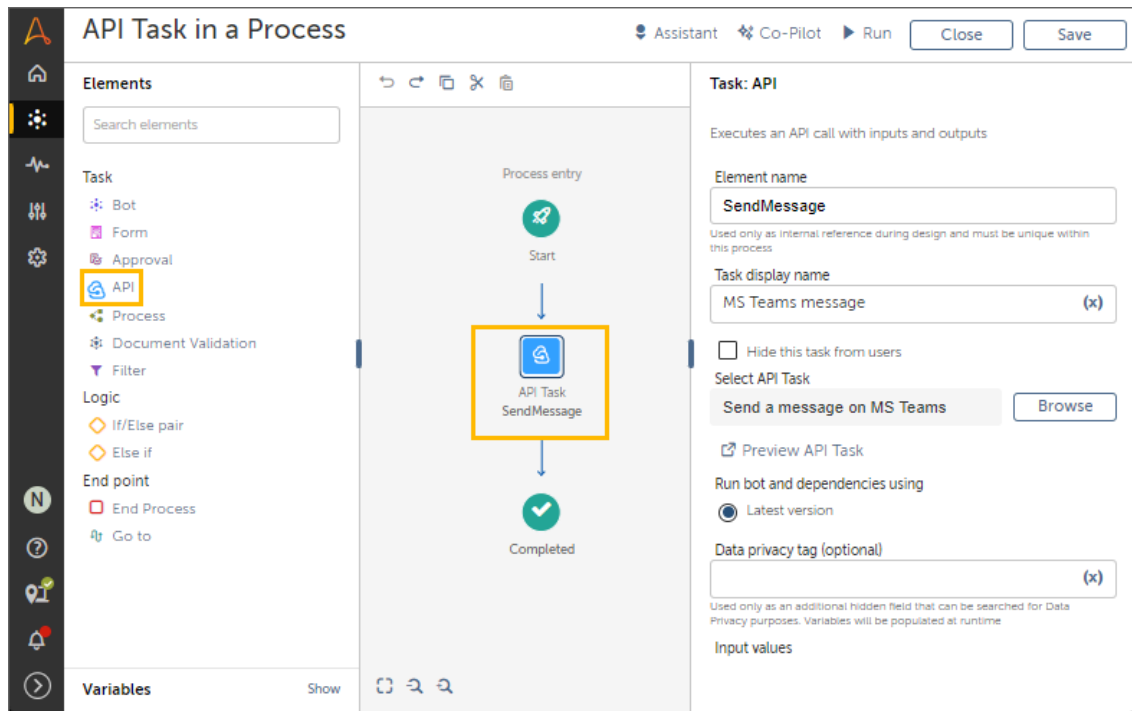

- You must have admin privileges to add an API Task to the cloud.
- To facilitate communication between Control Room and cloud devices, a Control Room admin needs to perform the following actions to Generate a registration key to use for bulk bot agent installation:
  - Navigate to **Administration > Settings > Bot agent bulk install**.
  - click **Edit**, the **Generate a new key** option is selected by default.
  - Click **Save changes** to generate a registration key.

A bot creator prerequisites:

- You must have a Bot Creator license.
- If you have configured a form with API Tasks, then make sure to [Configure an API Task in a form](#) on page 3728.

This example delves into sending a Microsoft Teams chat message via API Tasks within your process:

1. Create a new process.
  - a) Access the Control Room on your local machine, logging in as a Bot Creator.
  - b) Navigate to the left pane and select **Automation**.
  - c) Click **Create new > Process**.
  - d) On the **Create process** page, provide a descriptive name for the new process. Processes are saved in the `\Bots\` folder. Click **Browse** to change the default folder. You can place the process in the same folder as the associated API Task and form for better organization.
  - e) Click **Create & edit** button to proceed.

2. Define a process with an API Task
  - a) Drag and drop the **API** element.
  - b) In the **Element name** field, enter a name. For example: SendMessage.
  - c) Enter a Task display name.
  - d) Click **Browse** to locate and select an API Task. Select the API Task created in [Create an API Task \(API Task in Process\)](#) on page 3733.

The example invokes an API Task that sends a message to Microsoft Teams.

## Test Process (API Task in process)

This topic will walk you through testing a process that has been configured with API Tasks.

- You have successfully configured API Tasks within your process as outlined in the [Configure API Task in process](#) on page 3735.
- You have a basic understanding of testing the process.

This is an essential step to ensure that your process is working as expected and properly communicating with external applications.

1. Locate the process ([Configure API Task in process](#) on page 3735) you want to test and click **Run** to run the process. This will start the process execution.
2. Observe API Task Execution: The API Task sends a chat message - "Hello World" to the specified channel.

## Check in API Tasks to Repository

To make an API Task available, check in the API Task from the private workspace to the public workspace. Perform this operation after adding the API Task to a form and process.

Ensure the following prerequisites are met for you to check-in an API Task.

---

**Note:** A bot developer can test a process without checking in the API Tasks.

---

- Bot Creator license to check in an API Task to the public workspace.
- A custom role with the following permissions:
  - Required: Check in permission at the folder level and at the corresponding parent folder level in the public workspace.
  - Optional: Create folder permission.
  - Optional: View packages permission.
- To check in an API Task with dependent folders and files, ensure you have the following:
  - Create folder permission.

If you are checking in an API Task from your private workspace and if the folder in which the API Task is present does not yet exist in the public workspace, you must have create folder permission to successfully check in the API Task.
  - Check in permission on the dependency folder.
- Ensure that your private and public workspaces have the same folder structure so that when you check in an API Task from your private workspace, it will appear in the same folder structure as in the public workspace.

1. Log in to the Control Room as a Bot Creator user.
2. On the left pane, click **Automation**.

A list of available and forms is displayed.
3. Choose to check in either one API Task, or multiple API Tasks simultaneously.
  - Select the API Task that you want to check in, click the actions menu (vertical ellipsis), and click **Check in** API Task.
  - Select the API Task that you want to check in and click **Check in checked items**.

---

**Note:** You can check in up to 10 items at a time.

---

4. In the **Check in** window, add your comment and click **Advanced options**. Select the dependencies you want to check in and click **Check in**.

The API Task appears in the same folder structure as in the public workspace and directly referenced dependencies are automatically checked in.

## Run as user for API Task (apitaskrunner)

Automation Anywhere creates a user called apitaskrunner to establish the Run as user context for API Tasks

This allows API Tasks to run on the cloud without requiring individual user licenses, saving costs and simplifying management. The apitaskrunner user has the AAE\_API Task Runner role associated with it. The following permissions are assigned to this role:

- View packages
- Register device
- View Users and Roles basic information
- View and manage my Bot runners, Bot creators, and device pools: Create device pools
- Bots: View, Run, Export, Import, Label, Cancel Checkout
- Bots tab: Select all on Bots folder
- Devices: View and manage ALL device(s)

---

**Note:** A default run-as-user (apitaskrunner) is automatically assigned to each API Tasks added to the **Cloud device management**. To change the default user, click the actions menu (three vertical ellipsis) located to the right of each allocated device session and click **Assign run-as user** and select a user.

---

## Invoking API Task as endpoint

### API Task real-time endpoint

Instantly invoke API Tasks with a real-time endpoint. You can generate an API Task execution URL along with a token to start an API Task execution through an API endpoint.

### Key benefits

- Programmatic deployment: Invoke API Task from anywhere real-time using your preferred API client.
- Response time: Designed for low latency with near real-time response rates, aiming to provide responses almost instantly (typically within milliseconds).
- Processing:
  - Automations are loaded into cloud and ready to accept requests at all times. This allows for quick processing and response.
  - Premium license helps to scale your automation and provide access to a larger pool of cloud resources that can execute multiple instances of your API Task, boosting concurrency and enabling you to handle more API Task requests simultaneously.
- Use cases:
  - Ideal for interactive situations like chatbots
  - real-time fraud detection
  - Online case creations

- or any use case where instant response is crucial

## Prerequisites

- Make sure to create your API Task. For more details on creating an API Task, see [Create an API Task \(API Task in form\)](#) on page 3725.
- You must have checked-in your API Task. For more details on checking in your API Task, see [Check in API Tasks to Repository](#) on page 3730.

The following sample code snippets provide you with a procedure to deploy an API Task real-time to a cloud device. You can also pass variables to API Tasks when they are deployed.

Step 1: <a href="#">Authenticate</a> on page 3739	Authenticate access to your Control Room instance.
Step 2: <a href="#">Create an API Task allocation (admin)</a> on page 3740	An admin can create an API Task allocation.
Step 3: <a href="#">(Optional) List API Task allocation (admin)</a> on page 3740	An admin can list all the API Task allocations.
Step 4: <a href="#">Generate Task Execution URL/Token</a> on page 3742	Generate the URL and Token to deploy your API Task.
Step 5: <a href="#">Execute API Task</a> on page 3743	Execute your API Task with the unique URL generated along with the token..

## Authenticate

Authenticate to get access to your environment. This commonly involves access tokens or API keys.

```
POST https://{ControlRoomURL}v1/authentication
```

```
Header: X-Authorization: <<authentication token>> or Authorization:
Bearer <<bearer token>>
```

There are two distinct authentication flows for interacting with the API Task real-time endpoint:

### 1. Bot Developer Authentication (API Task Execution):

This flow allows bot developers to generate a URL and token ([Generate Task Execution URL/Token](#) on page 3742) for executing an API Task ([Execute API Task](#) on page 3743).

All API calls must contain either an authentication token from Authentication API (generates JSON Web token) or a bearer token from OAuth services. You cannot use both together in an API.

### 2. Admin Authentication (API Task Allocation):

This authentication is required for administrators to allocate ([Create an API Task allocation \(admin\)](#) on page 3740) the API Task in the cloud, so that a bot developer will be able to execute the API Task.

## Create an API Task allocation (admin)

**Note:** You need admin rights to create an API Task allocation.

After an API Task is checked-in, you can add the API Task to cloud. This API endpoint adds the API Task to cloud and creates a resource allocation for your API Task to run. The corresponding section that details the API Task allocation within the Control Room is [Add API Task to Cloud](#) on page 3731. The API Task allocation is done after an API Task is created. For more information creating an API Task, see [Create an API Task \(API Task in form\)](#) on page 3725.

```
PUT https://{ControlRoomURL}orchestrator/v1/hotbot/config/create
```

Request body:

```
{
 "fileId": "5",
 "runAsUserOrNone": 3,
 "concurrencyLimit": 2
}
```

Response:

```
{
 "fileId": "5",
 "runAsUserOrNone": 3,
 "concurrencyLimit": 2
}
```

Request/Response parameters

Parameter	Type	Required	Description
fileId	Integer	Yes	ID of the automation to be deployed.
runAsUserOrNone	Integer	No	The apitaskrunner to establish the RunAsUser context for API Tasks. For more information on apitaskrunner, see <a href="#">Run as user for API Task (apitaskrunner)</a> on page 3738.  <b>Note:</b> This RunAsUser does not require a Bot Runner license.
concurrencyLimit	Integer	No	Maximum number of concurrency to run for a given real-time (hotbot) request.

## (Optional) List API Task allocation (admin)

**Note:** You need admin rights to list the API Tasks allocation.

This API endpoint lists all the API Tasks allocations within your Control Room. You can confirm if a particular API Task is added to the API Task allocation list before proceeding to generate API Task Execution URL with token.

POST <https://orchestrator/v1/hotbot/config>

Request body:

```
{
 "page": {
 "offset": 0,
 "length": 100
 }
}
```

Request parameters

Parameter	Type	Required	Description
page	object	No	object (PageRequest) Pagination rules, allows you to filter based on desired page
offset	Integer	No	Page starting index.
length	Integer	No	Page length.

Response:

```
{
 "list": [
 {
 "fileId": "149",
 "filePath": "Automation Anywhere\\Bots\\Zip Code API Task",
 "fileName": "Zip Code API Task",
 "runAsUserOrNone": "12",
 "concurrencyLimit": 1
 },
 {
 "fileId": "180",
 "filePath": "Automation Anywhere\\Bots\\API_task_String 01 1708025672.bot",
 "fileName": "API_task_String 01 1708025672.bot",
 "runAsUserOrNone": "12",
 "concurrencyLimit": 3
 },
 {
 "fileId": "184",
 "filePath": "Automation Anywhere\\Bots\\API_task_Rest 01 1708026445.bot",
 "fileName": "API_task_Rest 01 1708026445.bot",
 "runAsUserOrNone": "12",
 "concurrencyLimit": 5
 }
],
 "page": {
 "offset": 0,
 "total": 3,
 }
}
```

```

 "totalFilter": 3
 }
}

```

Response parameters

Parameter	Type	Description
fileId	Integer	ID of the automations.
filePath	String	The file path of the automations
fileName	String	The file name of the automations.
runAsUserOrName	Integer	The apitaskrunner to establish the RunAsUser context for API Tasks. For more information on apitaskrunner, see <a href="#">Add API Task to Cloud</a> on page 3731.
concurrencyLimit	Integer	Maximum number of concurrency to run for a given real-time (hotbot) request.

## Generate Task Execution URL/Token

This API endpoint generates task execution URL and Token with which you will be able to deploy an API Task.

```
POST https://orchestrator/v1/hotbot/config/accessdetails
```

Request body:

```

{
 "botRepositoryPath": [
 "Automation Anywhere\\Bots\\My-API-Task"
]
}

```

Request parameters

Parameter	Type	Required	Description
botRepositoryPath	String	Yes	Repository path of the API Task.

Response:

```

{
 "accessDetails": {
 "Automation Anywhere\\Bots\\My-API-Task": {
 "url": "https://hotbot-2689-knative-0a665343-88e9-17be-8189-936dad5d0144.prod-ause1-ee.my.automationanywhere.digital/execute",
 "headers": {
 "X-Authorization":
 "eyJhbGciOiJSUzUxMiJ9.eyJzdWIiOiJzODAiLCJ0ZW5hbnRVdWlkIjoimGE2NjUzNDMtODhLOS0xN2JlLTZkPjBfDDk1Wg0k8RqAzzsL6bK7B0tLp_jY1NgQvdaO5Yra647-94JV2cY8Vbe5H7zObia3S9oQ9dFXrnmSSSYvkaNcwx1Ev3J7lymqnH8Xc73s-TTgyeRlXiI714Ii62DJ_vKBEUvNM47V0H1FQk6xIfpzJAMMDRFZWO3MUvowgD4L-

```

```

06xre0RLapCYOSVtH_0CbM0VBfNkuwDAnF1kQeCtpWIvv_nETy7A-
UdSox9GqtDp9h2E1k1-
v3KJ8kEru7qT4fWZ1suzFPL7XzqkALCP39N7fxOpz1CfHYGPooLRHcFLGIPxpqi1bkfsn-
Xk2BfQ"
 }
}
},
"errors": {
}
}

```

Response parameters

Parameter	Type	Description
url	String	URL - This is the container endpoint for your next request to deploy your API Task.
X- Authorization	String	Contains the token that you need to provide in the headers as X-Authorization.

#### Note:

Once you generate the API Task execution URL as well as the necessary headers to execute the API Task, you can send a deploy requests via the generated URL. If you specify inputs, make sure that for the automation to successfully receive these mapped-in values, the variable for that automation must be marked as input. Additionally, the name of the variable in the automation has to match the value that is being mapped in the request body.

## Execute API Task

Execute your API Task with the unique URL generated along with the token.

```

POST https://hotbot-2689-
knative-0a665343-88e9-17be-8189-936dad5d0144.prod-ause1-
ee.my.automationanywhere.digital/execute

```

```

Header: X-Authorization:

Xk2BfQ

```

Request body:

```

{
 "botInput": {
 "iStrZipCode": {
 "type": "STRING",
 "string": "76131"
 }
 }
}

```

```

 }
 }
}

```

Request parameters

Parameter	Type	Required	Description
botInput Object			
type	Any	No	By default it is STRING. Possible values for type includes: STRING, NUMBER, BOOLEAN, FILE, ITERATOR, LIST, DICTIONARY, TABLE, VARIABLE, CONDITIONAL, WINDOW, TASKBOT, DATETIME, UIOBJECT, RECORD, EXCEPTION, CREDENTIAL, COORDINATE, IMAGE, REGION, PROPERTIES, TRIGGER, CONDITIONALGROUP, FORM, FORMELEMENT, HOTKEY, and WORKITEM.

Response:

```

{
 "hotBotResult":{
 "botOutput":{
 "State":{
 "type":"STRING",
 "string":"California"
 },
 "Place":{
 "type":"STRING",
 "string":"San Jose"
 }
 }
 }
}

```

Response parameters

Parameter	Type	Description
hotBotResultObject		Object containing the API Task output.

## API Task on-demand endpoint

Invoke API Tasks instantly with an endpoint. This dynamically launches and executes API Tasks on demand using the deploy API in conjunction with the on-demand request. This

approach streamlines workflows and improves resource efficiency compared to traditional static deployments.

## Key benefits

- Programmatic deployment: Deploy API Task from anywhere on-demand using your preferred API client.
- Processing:
  - Automations are activated only when needed, ensuring optimal resource utilization. This means they are not constantly deployed in the cloud, reserving resources. Instead, they are loaded and executed upon each request.
  - During high-volume periods, automations are placed in a queue and executed as soon as devices become available, ensuring smooth operations even under heavy load. You can view the progress of the automations in the Activity page.
  - Premium license helps to scale your automation and provide access to a larger pool of cloud resources that can execute multiple instances of your API Task, boosting concurrency and enabling you to handle more API Task requests simultaneously.
- Ideal use cases:
  - Batch processing jobs (such as analyzing sales data, generating reports)
  - Scheduled tasks
  - Situations where immediate response is not critical

## Authenticate

Acquire the requisite authentication credentials to interact with the deploy API. This commonly involves access tokens or API keys. The following sample deploys an API Task on-demand to a cloud device. You can also pass variables to bots when they are deployed.

```
POST https://{ControlRoomURL}/v4/automations/deploy
```

```
Header: X-Authorization: <<authentication token>> or Authorization:
Bearer <<bearer token>>
```

All API calls must contain either an authentication token from Authentication API (generates JSON Web token) or a bearer token from OAuth services. You cannot use both together in an API.

## Compose the On-Demand Request

Request:

```
{
 "botId": 121,
 "automationName": "SAMPLE_APITASK",
 "description": "My first API Task deploy using api",
 "botLabel": "string",
 "executionType": "RUN_NOW",
```

```

"automationPriority": "PRIORITY_MEDIUM",
"headlessRequest": {
 "numberOfExecutions": 1,
 "queueOnSlotsExhaustion": false,
 "sharedRunAsUserId": 12
},
"botInput": {
 "inputVar": {
 "type": "STRING",
 "string": "PassingString"
 }
}
}

```

**Note:**

Automation deploy requests can be made without any input fields. If you specify inputs, make sure that for the API Task to successfully receive these mapped-in values, the variable for that automation must be marked as input. Additionally, the name of the variable in the API Task has to match the value that is being mapped in the request body.

## Request parameters

Parameter	Type	Required	Description
botId	Integer	Yes	ID of the automation to be deployed.
automationName	String	No	Name of the automation to be deployed. You can enter a name to easily identify your automation. Such as <code>SAMPLE_APITASK</code> , <code>FIRST_API_TASK</code> , <code>apitask-on-demand</code> .
description	String	No	Description of the automation being deployed. For example: <code>My first API Task deploy using api</code>
botLabel	String	No	Label for the automation being deployed.
executionType	String	No	Execution type associated with the bot.
automationPriority	String	No	The automation priority. By default it is set to <code>PRIORITY_MEDIUM</code> . Possible values for <code>automationPriority</code> include: <code>PRIORITY_MEDIUM</code> , <code>PRIORITY_HIGH</code> , and <code>PRIORITY_LOW</code> .
headlessRequest	Object		
numberOfExecutions	Integer	No	Number of executions to run for a given on-demand (headless) request.
queueOnSlotsExhaustion	Boolean	No	Specifies whether the deployment has to be queued.

Parameter	Type	Required	Description
sharedRunAsUser	String	No	The apitaskrunner to establish the RunAsUser context for API Tasks. For more information on apitaskrunner, see <a href="#">Run as user for API Task (apitaskrunner)</a> on page 3738.  <b>Note:</b> This RunAsUser does not require a Bot Runner license.
botInput Object			
type	Any	No	By default it is STRING. Possible values for type includes: STRING, NUMBER, BOOLEAN, FILE, ITERATOR, LIST, DICTIONARY, TABLE, VARIABLE, CONDITIONAL, WINDOW, TASKBOT, DATETIME, UIOBJECT, RECORD, EXCEPTION, CREDENTIAL, COORDINATE, IMAGE, REGION, PROPERTIES, TRIGGER, CONDITIONALGROUP, FORM, FORMELEMENT, HOTKEY, and WORKITEM.

## Response

```
{
 "deploymentId": "320a2149-aa44-41ab-af9b-f9343ae2581b",
 "automationName": "SAMPLE_APITASK"
}
```

## Response parameters

Parameter	Type	Description
deploymentId	String	The deployment Id created.
automationName	String	Name of the deployed automation. If this name is not supplied in the request, a random name is assigned to the deployed automation.

You can test this endpoint in the Swagger interface, which is included in all your Control Room instances.

**Tip:** Access Swagger by navigating to your Control Room instance and adding `/swagger/` at the end of the URL.

```
https://{{ControlRoomURL}}/swagger/
```

View the activity page in your Control Room to track your on-demand (headless) execution progress from Queued >> In Progress >> Completed.

Activity (1 of 1)				
<input type="checkbox"/>	Status	Item name	Automation priority	Progress
<input type="checkbox"/>	Queued	_ODD_APITASK_20DEC...	Medium	0%   Line 0 of 0

For more details on deploy API, see [Bot deploy API \(V4\)](#).

## API Task FAQs

Review the FAQs to learn more about API Tasks.

How does an API Task execute compared to a Task Bot?

API Tasks execute in the Automation 360 Cloud, unlike Task Bots, which use the bot runner devices on the customer's infrastructure. API Tasks do not perform desktop interactions like Task Bots and can start quickly and potentially run faster than Task Bots.

In addition, the product is General Data Protection Regulation (GDPR) and California Consumer Privacy Act (CCPA) compliant. API Task is also part of the platform that is SOC 2 compliant. All API Task data is encrypted and we also provide encryption for both moving and static data.

If one of the devices goes down in my API device pool, would another be spun up automatically?

Yes, everything is managed for you.

What is the lifespan of the devices that spin up?

Your API device pool's resources are available for the duration of your configuration.

Does anything need to be set up on the deployment machine?

API Tasks execute on the Automation 360 Cloud devices; therefore, no customer devices on their infrastructure need to be set up.

Do I need to perform any device installation?

Cloud devices run on clusters managed by Automation Anywhere. There is no device installation required by the customer.

Is there a timeout for the API Task execution?

For real-time API Tasks, the timeout is 1 minute. For on-demand API Tasks, the timeout is 15 minutes..

What kind of data and for how long does the information persist on the cloud devices?

Transient data does not persist; only the API Task metadata is saved.

Why the run option is not available in the API Task editor?

The API Task editor does not have the run option as an API Task cannot be deployed individually. You must invoke the API Task in a form or process. Then run the process to deploy the API Task.

How do I find errors in my API Task?

To verify if your API Task logic is correct, you can use the debugger tool and watch the output variables. You can also use the error handler package actions to check for any errors in the API Task.

What is pre-warming?

Pre-warming is the process of pre installing the API Task logic and commands on Cloud devices preparing it to handle incoming requests. During warming, all API Task dependencies including libraries are installed beforehand. This is beneficial since it eliminates the need to check for dependencies before deploying the API Task. Hence, API Tasks run with very low latency. API Tasks that are invoked in a form must be pre-warmed on a Cloud device for it to execute successfully. Before you execute a process that has the form (API Task attached), you can check if the API Task is pre-warmed in the audit logs. For more details, see [View API Task run time audit logs](#) on page 3732.

What is the license model for API-Tasks?

Every cloud customer receives 100 API Task executions per Control Room as their free base entitlement. The base entitlement also includes two concurrent executions, meaning you can run two API Tasks simultaneously. For higher execution limits and additional concurrencies, you need to purchase the Enterprise SKU or an API Task Overage SKU. Contact your customer service manager for more details.

What are the packages supported for API Tasks?

The following Cloud compatible packages are supported in Automation 360 Control Room for API Tasks in v.30 release.

Table 15: API Tasks supported packages

Package name	Version
<a href="#">Apigee action package</a> on page 2568	2.0.1 or later
<a href="#">Boolean package</a> on page 2585	2.9.0 or later
<a href="#">Comment package</a> on page 2607	2.14.0 or later
<a href="#">Credential package</a> on page 2603	1.6.0 or later
<a href="#">Data Table package</a> on page 2607	4.8.0 or later

Package name	Version
<a href="#">Database package</a> on page 2621	5.1.0 or later
<a href="#">Datetime package</a> on page 2639	2.12.1 or later
<a href="#">Delay package</a> on page 2647	3.8.0 or later
<a href="#">Dictionary package</a> on page 2648	3.12.0 or later
<a href="#">Error handler package</a> on page 2709	2.11.3-20230316-162433 or later
<a href="#">Generative AI packages</a> on page 2786	1.1.0 or later
<a href="#">Genesys package</a> on page 2836	2.0.0 or later
<a href="#">Google Calendar package</a> on page 2869	2.12.0 or later
<a href="#">Google Drive package</a> on page 2871	2.13.0 or later
<a href="#">Google Sheets package</a> on page 2880	2.14.0 or later
<a href="#">If package</a> on page 2902	3.6.2-20230316-161323 or later
<a href="#">Json package</a> on page 2952	1.4.1 or later
<a href="#">List package</a> on page 2965	2.11.0 or later
<a href="#">Loop package</a> on page 2975	3.7.5-20230316-155504 or later
<a href="#">Microsoft 365 Calendar package</a> on page 3003	2.13.3 or later
<a href="#">Microsoft 365 Excel package</a> on page 3013	2.13.3 or later
<a href="#">Microsoft 365 OneDrive package</a> on page 3034	2.13.3 or later

Package name	Version
<a href="#">Microsoft 365 Outlook package</a> on page 3044	1.1.5 or later
<a href="#">Number package</a> on page 2994	3.8.0 or later
<a href="#">Process Composer package</a> on page 3084	7.30.1-20230809-171715 or later
<a href="#">Record package</a> on page 3104	1.8.2 or later
<a href="#">REST Web Service package</a> on page 3154	3.15.0 or later
<a href="#">Salesforce package</a> on page 3166	2.0.1 or later
<a href="#">ServiceNow package</a> on page 3211	2.0.1 or later
<a href="#">SharePoint package</a> on page 3227	2.1.2 or later
<a href="#">SOAP Web Service package</a> on page 3277	3.17.0 or later
<a href="#">Step package</a> on page 3278	2.5.0-20230105-135537 or later
<a href="#">String package</a> on page 3279	5.8.0 or later
<a href="#">Wait package</a> on page 3348	4.9.0 or later
<a href="#">Workday package</a> on page 3355	1.2.0 or later
<a href="#">XML package</a> on page 3379	3.11.0 or later

## Preprocessing error messages

If you encounter any preprocessing errors, review the cause and perform the required action to resolve the error.

If you build a bot that has more than 2,000 lines of code, and if the bot uses descendant actions such as **Loop > Continue** or **Break** actions, pre-processing errors can occur. To prevent pre-

processing errors, we recommend that you break the larger bot into smaller bots, and run the **Task Bot > Run** action from any other bot.

**Note:**

- From Automation 360 v.23, if an error occurs when you run a bot, a preprocessing or runtime error is shown. Note that preprocessing of child bots does not occur in sequence because these bots are referred in the parent bot and are sometimes in complex nested workflows. Therefore, the errors might be displayed in any sequence for these child bots. The parent bot cannot proceed further until all the errors in the child bots are resolved.
- The following scenarios are applicable only to Automation 360 v.21 or earlier releases. For v.22, Only the Catch action scenario is applicable, so review the probable cause.

Cause	Action required
A mismatch occurred and we did not find the expected variable data type.	Use an inline expression or a separate action to convert to the correct variable data type. <a href="#">Variables overview</a> on page 2478
A "\$" is being read as a variable but no such variable exists.	Use "\$\$" to escape the dollar sign and try again.
The bot is calling another bot, but we did not find the child bot at the specified location.	Check the path and try again.
We found a Catch action that is not contained by a Try action.	Ensure that each Catch action is contained by a Try action.
We found a Try action that does not contain a Catch action. Each Try action requires at least one Catch action inside it.	Ensure that each Try action contains a Catch action.

## Build advanced bots and packages

Learn how to build action packages and advanced bots that include custom features such as scripting, and API calls. Find recommendations on bot and action package design and reusability.

## Package SDK

Package SDK enables you in creating and uploading action packages to your Control Room.

The Automation Anywhere Package Development Kit provides detailed instructions for users to independently develop custom actions and upload the packages in their Control Room. The custom action are build in an IDE and are compiled to generate Java Archive (JAR) files. The JAR files are then uploaded to the Control Room which becomes available as actions under the **Action Panel**.

The Package SDK section includes sample codes and supporting files for Java developers to create and validate custom actions.

## Set up the Java project

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

A working knowledge of Java and Gradle is required in order to successfully build an action package. You require the following software and file:

- Java Developer Kit (JDK) 11
- Java IDE
  - [Eclipse](#)
  - [Community edition of IntelliJ](#)
- Gradle plug-in v.7.\*.\* in the IDE
- Automation Anywhere Bot Agent installed and connected to your Control Room **Download and extract a zip file**

Download and extract the zip file for the release you want:

<a href="#">Package SDK v.32 release</a> on page 47	SDK: <a href="#">A360-package-sdk-2.10.0.zip</a> Docs: <a href="#">A360-package-sdk-2.10.0-javadoc.zip</a>
<a href="#">Package SDK v.30 release</a> on page 119	SDK: <a href="#">A360-package-sdk-2.9.0.zip</a> Docs: <a href="#">A360-package-sdk-2.9.0-javadoc.zip</a>
<a href="#">Package SDK v.29 release</a> on page 160	SDK: <a href="#">A360-package-sdk-2.8.0.zip</a>
<a href="#">April 2023, Release (Automation 360 v.28)</a>	SDK: <a href="#">A360-package-sdk-2.7.0.zip</a> Docs: <a href="#">A360-package-sdk-2.7.0-javadoc.zip</a>

November 2022, Release (Automation 360 v.27)

SDK: A360-package-sdk-2.6.1.zip

Configure the build files, compile the JAR file, add the package to your Control Room, and then build a bot to test your package. [Build and test a demo package and bot](#) on page 3812.

Develop your own package and upload it to an Control Room to provide custom actions for bots.

## Standard coding practices and guidelines for developing packages

This topic covers standard coding practices and guidelines that help to ensure the development of high quality packages.

Testing

Ensure high quality code. Write sufficient unit tests and integration tests for your package.

Icons

Set proper icon for your package.

Setting the version manually

The SDK package build version gets updated automatically every time a build happens. However, you can set it manually in the command project of a common **build.gradle** file.

- Update the **build.gradle** file before a build.
- Enter up to four digits numbers, separated by a period, as shown below:

```
. . .
ext {
 version '2.0.8'
}
dependencies {...}
```

Dependencies

Embed all the dependencies in your package JAR. Load the dependencies at run time by extracting them to a temporary location. Be

Dependent JAR files

sure to clean the temporary location after the dependencies are loaded.

Add dependent JAR files under dependencies in the **build.gradle** file as implementation so that the dependant JAR files are packaged.

```
. . .
dependencies {
 compileOnly name: 'command-
annotations'
 compileOnly name: 'bot-runtime'
 compileOnly name: 'bot-api'
 implementation name: 'il8n-api'
implementation
name: 'mydependentjavafile.jar'
 apt name: 'command-processor'
 compileOnly group:
'org.apache.logging.log4j',
name: 'log4j-core', version:
"$loggerVersion"
 testImplementation
"org.testng:testng:
$testNgVersion"
 testImplementation name: 'bot-
runtime'
 testImplementation name: 'bot-
api'
}
. . .
```

Add new actions to the exiting package

When adding new actions to an existing package, make sure to do clean before packaging. It is always a good practice to do clean build - gradlew.bat clean build shadowJar.

Error messages

Provide meaningful error messages.

- Do throw meaningful error messages. For example, in local language using i18n APIs with `BotCommandException`, throw a new exception  
`BotCommandException(MESSAGES.getString("Run.E`
- Do not throw generic error messages, such as `ex.message`.

Basic validation

Use the validation annotation rules, such as `@NotEmpty` included with this development kit. Do not add basic validations for your code. See [Validation annotations](#) on page 3810.

Loops

Avoid long running loops in your code. Long running loops can cause high CPU usage, leading to errors such as, "Bot is unresponsive."

### Add logging

Use the default **log4j** logger provided in the bot run time framework. Do not add your own logger. See the sample code for details.

### Logging levels

- **ERROR/FATAL**: Severe error event that the user is affected and there is no workaround.
- **WARN** : Unexpected error occurred but the system has recovered from it.
- **INFO**: Informational messages about state change, for example, an accepted request.
- **DEBUG**: Detailed diagnostic information that will be required to debug when something goes wrong.
- **TRACE**: All information is captured about an application behavior.

If you are not sure of the log level, set it to **TRACE**.

### Loading resources

All resources should be loaded using current thread context class loader, as shown in the following example:

```
Thread.currentThread().getContextClassLoader().getSystemClassLoader()
```

### Related concepts

### Related tasks

[Set up the Java project](#) on page 3754

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#) on page 3757

Develop your own package and upload it to an Control Room to provide custom actions for bots.

## Develop a sample package

Develop your own package and upload it to an Control Room to provide custom actions for bots.

Download and extract the contents from the latest Automation 360 Package SDK release. The newest package contains the necessary sample source code to build your package.

You need to have a project created in a Java IDE. For details about setting up a project, read [Set up the Java project](#) on page 3754.

The following high-level tasks provide the basic workflow for creating a package.

1. Create a java class.

This class is the action you plan to publish in your package.

---

**Important:** It is required that the class supports the default constructor.

---

2. Add required business logic to the class.  
The following are the supported return types:
  - **Void:** Use this return type if your action does not return any value.
  - **Value:** Use this return type if your action returns any type of value.
3. Annotate the class with **BotCommand** and **CommandPkg** Annotations to make the class eligible to be converted to an action.
4. Annotate the variable that accepts values with **Idx** and **Pkg**.
5. Annotate the entry method with the **Execute** annotation.
6. From the action prompt, run `gradlew.bat clean build shadowJar`.  
The JAR file created from the build is located in **build/lib**.

From the Control Room on the **Manage > Package** page, click the **Add package** icon to upload the JAR file.

---

**Tip:** To upload a package to a Control Room, you need **Upload package** permission. Review how to add a package to a Control Room: [Add packages to the Control Room](#) on page 2026.

---

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

## Using the package SDK

These example topics provide a basic understanding of how to use the Package SDK with Automation 360. Each SDK package includes a collection of configurable files that you can use to build a custom package, and then use the package to create Task Bots.

Use the following steps to create, configure, and build an IntelliJ project to compile a new package, and then create a bot to test the package you created.

1. Download, extract, and review the Package SDK files:
  - Download the latest Automation Anywhere A2019 Package SDK.  
For download links, see [Package SDK](#) on page 3753.

- Go to your Downloads folder, right-click your downloaded Package SDK, and select **Extract All**.
  - Review all the files included in the package. You can drop any java file in your IntelliJ project to view or edit the content.
2. Install the latest Automation 360 version:
    - a) After the installation, log in to the Control Room with an admin privilege and create a new user with permissions to upload a package and create bots.  
[Create a user](#) on page 1845
    - b) Connect your local device to the Control Room. If required, download and install the latest Bot Agent.  
[Install Bot Agent and register device](#) on page 1450
  3. Install Java SE Development Kit 11 or IntelliJ IDE Community Edition and Gradle plug-in.
    - Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
    - Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
  4. Configure the sample build files in the IntelliJ project.  
[Configuring build files](#) on page 3759
  5. Create a new directory, package, and class.  
[Creating new Java class](#) on page 3760
  6. Use the compiled JAR file as a package and upload it to your Control Room in Automation 360.  
[Upload custom package to your Control Room](#) on page 3762
  7. Create a Task Bot to test the new package.  
[Create a bot to test the new package](#) on page 3763
  8. Optional: Verify the results, and if required, add additional actions to your bot flow, and configure parameters and values.
  9. View additional resources.  
To learn more, search for the [Package SDK: How to examples](#).

[Configuring build files](#) on page 3759

## Configuring build files

Use IntelliJ to configure and compile a JAR file, and then upload it as a package to your Control Room in Automation 360.

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have the following software and files:

- Java SE Development Kit 11 (<https://www.oracle.com/java/technologies/javase/jdk11-archive-downloads.html>)
  - Java IDE (<https://www.jetbrains.com/idea/download/#section=windows>)
  - Automation Anywhere A2019 SDK. Download and extract the zip file for the release you require: [Enterprise A2019 Package Development Kit Release Notes](#)
1. Unzip the contents of the SDK package to your `IdeaProjects` directory and rename the folder from `<latest package sdk zip file>` to `A2019FileDetails`.

2. In IntelliJ IDEA, go to **File > Open** and open the project located at `C:\Users\.`
3. Open the `settings.gradle` file in the project root, and set the `rootProject.name = 'A2019FileDetails'`
4. Update the `package.template` file located at **src > main > resources > package.template**.
5. Change the package name from `A2019DemoPackage` to `A2019FileDetails`.
6. Update the package name in **locales json**: go to **src > main > resources > locales > en\_US.json**.
  - a) Open the `en_US.json` file and update the required `label` field. Update the optional description.
  - b) Delete all other remaining lines in the `en_US.json` file.
7. Open the `build.gradle` in the project root. After the dependencies section, remove other dependencies, if they are not required.
8. Save all files.

[Creating new Java class](#) on page 3760

## Creating new Java class

Use IntelliJ to create a new java class and a new directory, and configure other build files.

Complete the steps in the following task: [Configuring build files](#) on page 3759.

1. Create a new **Java Class**, right-click the `com.automationanywhere.botcommand` package, and select **New > Java Class**. Enter the name for the new class `GetFileDetails`.
  - a) Copy `@BotCommand` from the `Concatenate.java` and paste it into the new `GetFileDetails.java` file.

```
import static
 com.automationanywhere.commandsdk.model.DataType.STRING;
//BotCommand makes a class eligible for being considered as an
action.

@BotCommand
//CommandPks adds required information to be dispalable on GUI.
@CommandPkg(
 //Unique name inside a package and label to display.
 name = "concatenate", label = "[Concatenate.label]",
 node_label = "[Concatenate.node_label]", description =
 "[Concatenate.description]", icon = "pkg.svg",

 //Return type information. return_type ensures only the right
 kind of variable is provided on the UI.
 return_label = "[Concatenate.return_label]", return_type =
 STRING, return_required = true)
public class Concatenate {

 //Messages read from full qualified property file name and
 provide i18n capability.
 private static final Messages MESSAGES = MessagesFactory

 .getMessages("com.automationanywhere.botcommand.samples.messages");
```

```
//Identify the entry point for the action. Returns a
Value<String> because the return type is String.
@Execute
public Value<String> action(
 //Idx 1 would be displayed first, with a text box for entering
the value.
 @Idx(index = "1", type = TEXT)
 //UI labels.
 @Pkg(label = "[[Concatenate.firstString.label]]")
 //Ensure that a validation error is thrown when the value is
null.
 @NotEmpty
 String firstString,

 @Idx(index = "2", type = TEXT)
 @Pkg(label = "[[Concatenate.secondString.label]]")
 @NotEmpty
 String secondString) {

 //Internal validation, to disallow empty strings. No null check
needed as we have NotEmpty on firstString.
 if ("".equals(firstString.trim()))
 throw new
BotCommandException(MESSAGES.getString("emptyInputString",
"firstString"));

 if ("".equals(secondString.trim()))
 throw new
BotCommandException(MESSAGES.getString("emptyInputString",
"secondString"));

 //Business logic
 String result = firstString + secondString;

 //Return StringValue.
 return new StringValue(result);
}
```

- b) Update the @CommandPkg parameters such as: name, label, node\_label, description, and icon.
  - c) Update the return\_label and the return\_type.
  - d) Add the NumberValue action, internal validation, business logic, and the return value.
  - e) Delete the Concatenated. java file and samples.commands. basic directory, and the sample.commands directory.
2. Configure the en\_US.json file: go to **src > main > resources > locales > en\_US.json** and add the following fields after the label and description values, and delete other parameters from the file.

```
{
 "label": "File Details",
 "description": "Returns basic file details",
 "GetFileDetails.label": "File Size",
 "GetFileDetails.description": "Return the size of the selected file
in bytes",
 "GetFileDetails.node_label": "File Size in Bytes",
 "GetFileDetails.return_label": "File Size",
 "GetFileDetails.return_label_description": "Return in bytes",
}
```

```
"GetFileDetails.filePath.label": "Select a File for analysis"
}
```

3. Delete packages: go to **src > main > java > com.automationanywhere.botcommand**, and delete the `samples.commands` and delete the `samples` packages.
4. Import new icons from Github and update the `CommandPkg` annotation.
  - a) Download any icons you want to use in your bot flow and save them as `.svg` files.
  - b) Copy your image files into the **src > main > resources > icons** folder.
5. Create a new directory: go to **src**, right- click, and select **New > Directory**.
  - a) In the **Name** field, enter `test\java`. Alternatively, select the `test\java`, and enter the name `TestFileSize`.
  - b) Configure test annotations in the `TestFileSize` java class.
  - c) Create a `@test` public class, create a `GetFileDetails` object, and invoke the action.
  - d) Optional: Run the `TestGetFileDetails` in IntelliJ to test it.
6. Configure the `TestFileSize` file, and open `TestFileSize` and copy and paste the following code:

```
{
 @Test
 public void TestGetFileDetails() {
 String filePath = "src\\main\\resources\\icons\\sample.svg";
 //Create GetFileDetails Object
 GetFileDetails getFileDetails = new GetFileDetails();
 //invoke action
 NumberValue output = getFileDetails.action(filePath);
 Assert.assertEquals(output.getAsDouble(), 5027.0);
 }
}
```

7. Save the project: **File > Save All**.
8. Click **Reload All Gradle Projects**, and then click **Execute Gradle Task**, and verify that the **A2019FileDetails** project is selected.
9. In the **Run Anything** window, enter `gradle clean build shadowJar`. After it runs, the following message is displayed: `BUILD SUCCESSFUL in 8s <number of seconds>`

[Upload custom package to your Control Room](#) on page 3762

## Upload custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in the following task: [Creating new Java class](#) on page 3760.
- Ensure you have the following:
  - Access to the Control Room.
  - Credentials with **AAE\_Basic** permission or a custom role with the capability to upload packages to the Control Room.

1. From Windows Explorer, go to `C:\Users\<Username>\IdeaProjects\A2019-FileDetails\build\libs` and locate `A360-package-sdk-2.9.0.zip`.

2. Log in to your Control Room as a user with permissions to add a new package.
3. Click **Manage > Packages**.
4. In the **Packages** page, move your mouse over the plus sign and click **Add package**.
5. In the **Add package** page, click **Browse** and locate the Package SDK jar you want to upload. For example: A360-package-sdk-2.9.0.zip file.  
By default, the file is located at: C:\Users\\IdeaProjects\A2019-FileDetails\build\libs.
6. Select the A360-package-sdk-2.9.0.zip file and click **Open**.
7. Click **Upload Package**.  
When you upload a custom package to the Control Room, a notification is also sent to the Control Room users to notify about package updates. This notification is sent to the users who have the **View package** permission. For more information, see [Platform events](#) on page 2357 event notification.

[Create a bot to test the new package](#) on page 3763

## Create a bot to test the new package

Use the actions in Automation 360 to create a bot and test the new package you have added to your Control Room.

Ensure you have the following to build the bot:

- Access to the Control Room.
  - Credentials with **AAE\_Basic** permission or a custom role to create bots.
  - Your workstation is a registered device in the Control Room.
  - Your package A2019FileDetails-2.0.9.jar is available in the Control Room.
1. Log in to the Control Room.
  2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  3. Click the **Create a bot** icon.
  4. In the **Name** field, enter `TestingFileSize` or any other name you want.
  5. Click **Create & Edit**.
  6. In the Actions pane, find **File Details** and drag **File Size** into the bot flow.
    - a) In the **Select a File for analysis** field, select **Desktop file**, click **Browse**, and select any file from your desktop.
    - b) Click **Create variable** to create a new number variable.
    - c) In **Create Variable**, enter `nFileSize` and click **Create & Select**.
    - d) Click **Apply**.
  7. In the Actions pane, find the **Number** package and drag the **To String** command.
    - a) In the **Enter a number** field, enter `F2`, and select `nFileSize`.
    - b) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
    - c) Click **Apply**.
  8. From the Actions pane, drag **Message box**.

9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
10. Click **Apply** and **Save**.
11. Click **Run**.  
The bot displays the <The value of the file size>, which is a successful build.

If you were not able to run bot your bot, go back and modify your configuration steps in your Control Room.

## Package SDK examples

This section contains code examples and explanations about how to code some basic bot capabilities.

<a href="#">Return a value from an action</a> on page 3765	Set the following properties on <code>CommandPkg</code> to store the action output in a variable.
<a href="#">Expose property attributes of action</a> on page 3767	The property values of an action can be exposed by setting the following properties on <b>CommandPkg</b> .
<a href="#">Organize and group actions when developing packages</a> on page 3768	Review the provided examples on how to add and group actions during the package SDK development process.
<a href="#">Input types - UI elements</a> on page 3769	The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.
<a href="#">Create custom variables using Package SDK</a> on page 3771	When using Automation 360, you can create custom variables using the SDK package.
<a href="#">Create a condition using Package SDK</a> on page 3777	When using Automation 360, you can create a condition with the SDK package.
<a href="#">Add a condition in a custom package for If condition</a> on page 3779	Add conditions in a custom package.
<a href="#">Create an iterator using Package SDK</a> on page 3780	In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, <code>next</code> and <code>hasNext</code> , which return the actual object and a boolean value.
<a href="#">Create a custom trigger (Example 2)</a> on page 3788	The example shows how to create a trigger in Automation 360 that allows you to create tasks that will be executed at specified intervals.
<a href="#">Create a custom trigger (Example 3)</a> on page 3792	The example shows how to create an event-based trigger ( <code>SimpleMessageListenerContainer</code> ) using the Package SDK.
<a href="#">Add debug logs of custom packages to bot_launcher.log file</a> on page 3794	You can add logs using <code>log4j</code> . The dependency is already added in the package SDK sample <code>build.gradle</code> file.

[Handle sessions in a custom package](#) on page 3796

You can extract a session using a session name from the SessionsMap. In the same package, you can use sessions to pass information between actions, but not to other packages.

[Configure shared session using Package SDK](#) on page 3799

Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other Task Bots can read and update the session and vice versa.

[Create a bot to test the custom package](#) on page 3826

A shared session enables you to reuse actions between Task Bots that run concurrently, for example, using the same Excel file to pass values.

## Actions

Any action class supports only one method as an entry point. Annotate all parameters of the entry point method with `Idx`. There are three types of actions:

- `Command\Action` (default choice)
- `Iterator`
- `Condition`

---

**Important:** If you do not provide a public setter to member variables with `Inject`, compilation errors occur.

---

[Set up the Java project](#) on page 3754

Set up an integrated development environment (IDE) for Java, including Automation Anywhere custom annotations to develop an action package that you can upload to your Control Room.

[Develop a sample package](#) on page 3757

Develop your own package and upload it to an Control Room to provide custom actions for bots.

## Return a value from an action

Set the following properties on `CommandPkg` to store the action output in a variable.

### Action return values

- **return\_type**

Defines the return type of the action. It usually matches the entry method return type.

- **return\_required**

When the value is set to `true` the return value is required.

- **return\_label**

A description of the UI label for the variable value.

### Example: Convert a `sourceString` to uppercase and assign the result to `returnTo`

```
//BotCommand makes a class eligible for being considered as an action.
@BotCommand

//CommandPkg adds required information to be displayable on the UI.
@CommandPkg(
 //Unique name inside a package and label to display.
 name = "uppercase", label = "[[Uppercase.label]]",
 node_label = "[[Uppercase.node_label]]", description =
 "[[Uppercase.description]]", icon = "pkg.svg",

 //Return type information. return_type ensures only the right kind of
 variable is provided on the UI.
 return_label = "[[Uppercase.return_label]]", return_type =
 STRING, return_required = true)
public class Uppercase {

 //Messages read from a fully qualified property file name and provides
 i18n capability.
 private static final Messages MESSAGES = MessagesFactory
 .getMessages("com.automationanywhere.botcommand.samples.messages");

 //Identify the entry point for the action. Returns a Value <String>
 because the return type is String.
 @Execute
 public Value<String> action(
 //Idx 1 would be displayed first, with a text box for entering the
 value.
 @Idx(index = "1", type = TEXT)
 //UI labels.
 @Pkg(label = "[[Uppercase.sourceString.label]]")
 //Ensure that a validation error is thrown when the value is null.
 @NotEmpty
 String sourceString,
```

Related concepts

[Package SDK examples](#) on page 3764

This section contains code examples and explanations about how to code some basic bot capabilities.

## Expose property attributes of action

The property values of an action can be exposed by setting the following properties on **CommandPkg**.

### Action property values

	Property Attributes	Description
1	name	The name of the property, unique at action level, in auto-complete box this name would appear.
2	description	A description of the property.
3	type	The data type on which property operates, only if the type matches, the property will be appear in the auto-complete box.
4	return_type	The return data type of the property. If this type does not match the field type where it is used, there will be a validation error.

```
@BotCommand
@CommandPkg(label = "Uppercase", name = "uppercase",
 description="Converts the string to upper case",
 icon = "uppercase.svg", node_label="Convert {{sourceString}} to upper
 case| and assign the result to {{returnTo}}",
 return_type=DataType.STRING, return_required = true,
 return_label="Assign the output to variable") public class UpperCase {

 @Execute
 public Value<String> convert(
 @Idx(index = "1", type=TEXT)
 @Pkg(label="Source string")
 @NotEmpty
 String sourceString){
 return new StringValue(sourceString.toUpperCase());
 }
}
```

**Tip:** The character | acts as a separator node label. The content before and after the | character appears only when there is an input for the variables declared in each part. For example, in the above sample, when the {{sourceString}} variable has a value, the content before the | appears, and when {{returnTo}} has a value, the content after the | appears.

For example, the above class in the UI will look like:

**Message box**

Displays a message box

Required bot agent version: 20.11 or above

Enter the message box window title

Converts the string to upper case

String:uppercase - String

Enter the message to display

1 \$Test123{Body}.u| \$ (x)

Scrollbar after lines

# 30 (x)

Close message box after

Seconds

#

[Package SDK examples](#) on page 3764

This section contains code examples and explanations about how to code some basic bot capabilities.

## Organize and group actions when developing packages

Review the provided examples on how to add and group actions during the package SDK development process.

**Example: Add** actions

```
@BotCommand
//CommandPks adds required information to be dispalable on the UI.
@CommandPkg(
 //Unique name inside a package and a label to display.
 name = "concatenate", label = "[[Concatenate.label]]",
 node_label = "[[Concatenate.node_label]]", description =
 "[[Concatenate.description]]", icon = "pkg.svg",

 //Return type information. return_type ensures only the right kind of
 variable is provided on the UI.
 return_label = "[[Concatenate.return_label]]", return_type = STRING,
 return_required = true)
```

**Example: Group** actions

Use the `group_label` to `ConcatenateGroup` which it is displayed in the UI also as **ConcatenateGroup**. When the `group_label` is not used, you will get all the actions in the respective package.

```
@BotCommand

//CommandPks adds required information to be dispalable on the UI.
@CommandPkg(
 //Provide a unique name inside a package and a label to display.
 group_label = "ConcatenateGroup", name = "concatenateWithGroup",
 label = "concatenateWithGroup",
 node_label = "[[Concatenate.node_label]]", description =
 "[[Concatenate.description]]", icon = "pkg.svg",

 //Return type information. return_type ensures only the right kind of
 variable is provided on the UI.
 return_label = "[[Concatenate.return_label]]", return_type = STRING,
 return_required = true)
public class ConcatenateWithGroup {
```

## Input types - UI elements

The user interface (UI) elements are the input controls used to receive inputs in an action while building a bot.

The following examples show the supported input types. Use the UI elements to create user interface (UI) designs to build the Control Room interfaces. For instance, if you need an input as text then, use `TEXT`, if you need a radio button, select `RADIO`, and so on. This topic is based on the `SampleUI` sample available within the Package SDK in the following location: `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java`.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Pkg;
import com.automationanywhere.commandsdk.annotations.rules.CodeType;
import
 com.automationanywhere.commandsdk.annotations.rules.VariableType;
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3806.

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - labels, description, and name.

```
@CommandPkg(label = "UI Demo", description = "Demonstrates the
 provided UI elements", name = "uiDemo")
```

4. Create a class and define the fields as described below.
  - a) Annotate the method with `@Execute` to execute the method during compilation.
  - b) In this sample, `@Idx` and `@Pkg` are used as a member of the class, so you should use `set` and `get` methods to define them.

1. @Idx - Defines the index of an action.
2. @Pkg - Defines all the parameters and member variables shown in the interface. Must be accompanied by the @Idx, if not this annotation is ignored.
3. @Inject - To receive value from the UI using the member class, @Inject is required at field levels.

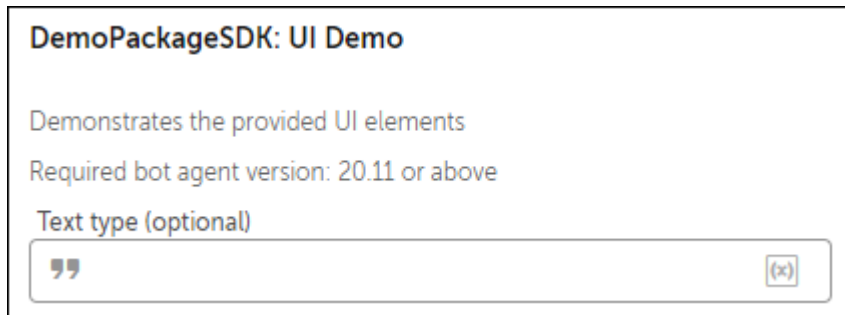

```

@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates
the provided UI elements", name = "uiDemo")
public class SampleUI {
 @Idx(index = "1", type = TEXT)
 @Pkg(label = "Text type")
 @Inject
 String text;

 @Execute
 public String getText() {
 return text;
 }
 public void setText(String text) {
 this.text = text;
 }
}

```

5. Drag the action into canvas and you will be able to input a string in the text field. You will see an input box similar to this image.

The screenshot shows a window titled "DemoPackageSDK: UI Demo". Inside the window, there is a description "Demonstrates the provided UI elements" and a requirement "Required bot agent version: 20.11 or above". Below this, there is a section labeled "Text type (optional)" which contains a text input field with a placeholder "''" and a clear button (X).

### UI element - Number field

Use the Number type to create an UI element that will accept a number. Using the below sample you will be able to create a field that will accept only numbers.

```

@BotCommand
@CommandPkg(label = "UI Demo", description = "Demonstrates the provided
UI elements", name = "uiDemo")
public class SampleUI {
 @Idx(index = "2", type = NUMBER)
 @Pkg(label = "Number type")
 @Inject
 String num;

 @Execute
 public String getNum() {

```

```

 return num;
 }
 public void setNum(String num) {
 this.num = num;
 }
}

```

### Other UI elements

It is possible to create other UI components like: Boolean, Radiobutton, Number, Variable, Code, Dictionary, List, Date/Time, and so on. To get a complete list of UI elements supported, see <PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\ui\SampleUI.java.

### UI validations supported

The following UI validations are also supported:

- @NotEmpty means that the UI field needs an input at the bot design time.
- @LocalFile refers to a local file from a user machine.
- @NumberIntegers refers to a number value that you can provide, such as, a float or a double input kind.

## Create custom variables using Package SDK

When using Automation 360, you can create custom variables using the SDK package.

### Using custom variables

Use Automation 360 to create a custom variable. This is a system variable and is used as other bot variables, except it is read-only and the value is calculated instead of being assigned.

### Required annotations

For creating a variable, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the <code>variable</code> as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for creating an Automation 360 variable.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
Idx	Annotate all the parameters and member variables that are required and help with the validation check. Alternatively they might be displayed in the interface for the input. Provide the index ( <code>Idx</code> ) and the type.

Annotation	Usage
Pkg	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the Idx.
VariableExecute	The method that has to be called for returning the variable value. This method does not accept any input parameters. Sessions and GlobalSessionContext are available through setter injection.

## Use case example

The following use case shows how to return the current time for the system default zone.

1. Create the POJO class with the business logic:

```
public class Now {
 public DateTimeValue now() {
 Instant instant = Instant.now();
 ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
 return new DateTimeValue(now);
 }
}
```

2. Annotate the POJO class to enable it for the Automation 360 variable and to create the package:

```
@BotCommand(commandType = BotCommand.CommandType.Variable)
@CommandPkg(description = "The current datetime at system
default zone.", name = "Now", label = "", variable_return_type =
DataType.DATETIME)
public class Now {
 public DateTimeValue now() {
 Instant instant = Instant.now();
 ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
 return new DateTimeValue(now);
 }
}
```

3. Annotate the now method to denote it to be the execute method.

```
@VariableExecute
public DateTimeValue now() {
 Instant instant = Instant.now();
 ZonedDateTime now = instant.atZone(ZoneId.systemDefault());
 return new DateTimeValue(now);
}
```

Every variable must have one test `VariableExecute` method.

This section contains code examples and explanations about how to code some basic bot capabilities.

## Using EntryList

EntryList enables you to accept any number of parameters through the bot designer. The parameter structure is defined in the Automation 360 actions.

### Example: EntryList

The following example shows how to create a parameter with the name of `village` pair.

```
@BotCommand
@CommandPkg(label = "EntryList example", description = "EntryList
example", icon = "sample.svg", name = "entryListExample")
public class EntryListExample {
// UI display for ENTRYLIST 1.1, the linking is done based on the
ENTRYLIST title.
// This should be added as a child of the ENTRYLIST, however it should
not be part of options.
// The EntryList does not need a setter or Inject as the value is
provided inside the ENTRYLIST.
@Idx(index = "1.3", type = TEXT, name = "NAME")
@Pkg(label = "Name", default_value_type = DataType.STRING)
@NotEmpty
private String name;
//Linked to 1.2 through title.
@Idx(index = "1.4", type = TEXT, name = "VILLAGE")
@Pkg(label = "village", default_value_type = STRING)
private String city;
@Execute
public void setParameter(
// Add the entryList, the values are accepted as a list of values.
// Provide the column header for the tabular display of accepted
entries.
// In Pkg, provide a unique title.
// Provide Idx for each option separately, this is needed to
// have the correct UI type when the entry form is presented.
// Add only columns to options, you cannot add their definitions.
@Idx(index = "1", type = ENTRYLIST, options = {
@Idx.Option(index = "1.1", pkg = @Pkg(title = "NAME", label =
"Name")),
@Idx.Option(index = "1.2", pkg = @Pkg(title = "VILLAGE", label =
"village")),
})
//Label that is displayed in the UI
@Pkg(label = "Provide name value entries")
//Header of the entry form
@EntryListLabel(value = "Provide entry")
//Button label which displays the entry form
@EntryListAddButtonLabel(value = "Add entry")
//Unique rule for the column, this value is the column TITLE.
```

```

@EntryListEntryUnique(value = "NAME")
//Message to dispaly in the table when no entries are present.
@EntryListEmptyLabel(value = "No parameters added")
 List<Value> entryList) {

}

```

Here is another example of the EntryList, define the values of the EntryList usage.

```

//Entry list//
@Idx(index = "1", type = ENTRYLIST, options = {
 @Idx.Option(index = "1.1", pkg = @Pkg(title = HEADER_ENABLED,
 label = "[[HEADER1]]")),
 @Idx.Option(index = "1.2", pkg = @Pkg(title = HEADER_NAME, label
 = "[[HEADER1]]")),
 @Idx.Option(index = "1.3", pkg = @Pkg(title = HEADER_VALUE, label
 = "[[HEARER3]]"))
})
@Pkg(label = "customHeaderslabel")
@EntryListLabel(value = "customHeaderlabel")
@EntryListAddButtonLabel(value = "add.header")
@EntryListEmptyLabel(value = "no.header")
@Inject
List<Value> customHeaders;

```

## Using regular expression

Use regular expressions (regex) to create string patterns that help match, locate, or manage text in Java. Together, the literals and special characters define a logical pattern. Use the pattern to compare strings of text to check if the strings match the defined pattern.

---

**Note:** Regular expression (regex) does not recognize `\b` as a Backspace command. Use `\\b` to use Backspace instead.

---

### Example: MatchesRegex

Use `MatchesRegex` to test the string pattern.

In the following example, the input pattern starts from the English alphabet, uppercase and lowercase, (A-Z/a-z) and ends with a numeric value.

```

@Idx(index = "1", type = TEXT)
@Pkg(label = "Field label", description = "Field description")
@MatchesRegex("[A-Za-z]\w*")
@NotEmpty
String cell

```

If the pattern does not match, the following message is displayed: `Must match pattern.`

Related concepts

[Package SDK examples](#) on page 3764

This section contains code examples and explanations about how to code some basic bot capabilities.

## FILE2 (Regex) attribute

A regular expressions (RegEx) are patterns of string defined to search for a file in a specified path. Use the FILE2 attribute when using regular expressions (regex) to create string patterns.

For instance: If you want to search a folder path for a file (For example `Hello.txt`) which contains a certain string. . You will use `File2` attribute type to enter the following regex pattern: `He11` or `e11` which will find the file that matches the search criteria. This topic is based on the `File2TypeDemo` sample available within the Package SDK in the following location `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types\File2TypeDemo.java`.

## Using the FILE2

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.model.AttributeType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3806.

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - labels, description, icon, return type, and name.

```
@CommandPkg(label = "[File2TypeDemo.label]", description =
 "[File2TypeDemo.description]", icon = "sample.svg", name =
 "file2TypeDemo")
```

4. Create a method (For example: `regexFile`) within your class and define the fields as described below.

- a) Annotate the method with `@Execute` to execute the method during compilation.
- b) In the below sample, `@Idx`, `@Pkg`, and `@NotEmpty` are defined as a parameters of the method. If they are used as a member of the class, then you should use `set` and `get` methods to define them.

1. `@Idx` - Defines the index of an action. (`@Idx(index = "1", type = AttributeType.FILE2)`)
2. `@Pkg` - Defines all the parameters and member variables shown in the interface (`@Pkg(label = "[File2TypeDemo.localFile.label]")` ). Must be accompanied by the `@Idx`, if not this annotation is ignored.

3. `@NotEmpty` - Defines that this parameter cannot be empty (`@NotEmpty @LocalFile FileValue fileValue`).

```
@BotCommand
@CommandPkg(label = "[[File2TypeDemo.label]]",
description = "[[File2TypeDemo.description]]", icon =
"sample.svg", name = "file2TypeDemo")
public class File2TypeDemo {
private static Logger logger =
LogManager.getLogger(File2TypeDemo.class);

@Execute
public void regexFile(
@Idx(index = "1", type = AttributeType.FILE2)
@Pkg(label = "[[File2TypeDemo.localFile.label]]")
@NotEmpty @LocalFile FileValue fileValue)
```

5. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#) on page 3758.
6. Create a bot.
7. Drag the action into canvas and you will be able to input the regex to find a file. You will see an input box similar to this image.

### DemoPackageSDK: File2 Demo

(x)
⚙️

Type	Value
Pattern ▾	C:\log\ ell (x)

Add regex

**Print the Regex - Folder name and the File location**

Use the [Logger](#) interface obtained from Log4j package to provide information of the objects being manipulated. In the below sample you will be able to log the folder name and the local file location by using the debug method.

```
@BotCommand
@CommandPkg(label = "[[File2TypeDemo.label]]",
 description = "[[File2TypeDemo.description]]", icon = "sample.svg",
 name = "file2TypeDemo")
public class File2TypeDemo {
 private static Logger logger =
 LogManager.getLogger(File2TypeDemo.class);

 @Execute
 public void regexFile(
 @Idx(index = "1", type = AttributeType.FILE2) @Pkg(label =
 "[[File2TypeDemo.localFile.label]]") @NotEmpty @LocalFile FileValue
 fileValue) {
 if (fileValue.isRegex()) {

 RegexFile regexFile = fileValue.getRegex();
 logger.debug("folder name {}", regexFile.getFolder());
 logger.debug("local file location {}",
 regexFile.getFileNamePattern().toString());
 } else {
 logger.debug("Regex option is not selected");
 }
 }
}
```

## Create a condition using Package SDK

When using Automation 360, you can create a condition with the SDK package.

## Using a condition

If and Loop are branching constructs in Automation 360. They are used to run a sequence of actions when a condition is set to `true`. A condition is used along with the If and Loop packages. A condition takes a set of inputs and returns a Boolean value.

## Required annotations

For creating a condition, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the condition as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for the creation of an Automation 360 condition.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.

Annotation	Usage
<code>Idx</code>	Annotate all the parameters and member variables that are required and help with the validation check, or they might be displayed in the interface for the input. Provide the index ( <code>Idx</code> ) and the type.
<code>Pkg</code>	Annotate all the parameters and member variables that will be shown in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .
<code>ConditionTest</code>	The method that has to be called for testing the condition. It must return a Boolean value. If the method accepts parameters, then annotate them with <code>Idx</code> .

### Use case example

The following use case verifies whether the given number is greater than the other number.

1. Create the POJO class with the business logic:

```
public class IsGreater {
 public Boolean checkGreater(Double first, Double checkAgainst) {
 return first > checkAgainst;
 }
}
```

2. Annotate the POJO class to enable it for the Automation 360 condition and to create the package:

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "Is greater condition", name = "IsGreater",
 description = "Checks if the given number is greater than the
 other.", node_label = "{{first}} > {{checkAgainst}} ")
public class IsGreater {
 public Boolean checkGreater(Double first, Double checkAgainst) {
 return first > checkAgainst;
 }
}
```

3. Annotate the `checkGreater` method to indicate that this method should be used as a comparison method.

```
@ConditionTest
public Boolean checkGreater(Double first, Double checkAgainst) {
 return first > checkAgainst;
}
```

Every condition must have exactly one test condition method.

4. Annotate the parameters of the `checkGreater` method with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null.

```
@ConditionTest
public Boolean checkGreater(
 @Idx(index = "1", type = AttributeType.NUMBER) @Pkg(label = "Number
to check") @NotEmpty Double first,

 @Idx(index = "2", type = AttributeType.NUMBER) @Pkg(label = "Number
to compare against") @NotEmpty Double checkAgainst) {

 return first > checkAgainst;
}
```

The attribute type number returns a Double.

## Add a condition in a custom package for `If` condition

Add conditions in a custom package.

### Create condition values in an Action

- To create a condition, set `commandType` property of `BotCommand` annotation with value as `Condition`.
- To define the entry method of the condition, use the annotation `ConditionTest`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "File exists", name = "fileExists",
 description = "Checks if the file exists.",
 node_label = "file exists at {{sourceFilePath}}", icon = "")
public class Exist extends AbstractCondition {
 @ConditionTest
 public boolean test(@Idx(index = "1", type = FILE) @LocalFile
@Pkg(label = "File path") @NotEmpty String sourceFilePath,
 @Idx(index = "2", type = NUMBER) @Pkg(label =
"How long you would like to wait for this condition
to be true?(Seconds)",
 default_value = "0", default_value_type
= DataType.NUMBER)
 @GreaterThanOrEqualTo("0")
@LessThanOrEqualTo("99999") @NotEmpty @NumberInteger Double waitTimeout)
 {
 // Add the logic to check for the condition
 }
}
```

The following example verifies if the provided boolean value is false.

Set `commandType` to `Condition`.

```
@BotCommand(commandType = Condition)
@CommandPkg(label = "False condition example", name =
 "conditionalTypeExample",
 description = "Checks if the boolean value is false.")
public class ConditionalTypeExample {

 @ConditionTest
 public Boolean validate(
 @Idx(index = "1", type = AttributeType.BOOLEAN)
 @VariableType(BOOLEAN)
 @Pkg(label = "Boolean variable", default_value_type =
 BOOLEAN) @NotEmpty Boolean variable
) {
 return variable == null ? false : !variable ;
 }
}
```

This section contains code examples and explanations about how to code some basic bot capabilities.

## Create an iterator using Package SDK

In Automation 360, you can create an iterator with the SDK package. An iterator is used to loop through multiple objects of similar type and is used with the Loop package. It consists of two methods, `next` and `hasNext`, which return the actual object and a boolean value.

### Required annotations

When iterator is used, the `next` method returns the next available value. If no more values are available, an exception is shown. The `hasNext` method checks for other values and returns `false` if no more values are available. In Automation 360, when the loop is executed, `hasNext ()` is called first, and `next ()` is called only if `hasNext ()` returned a `true` value.

For creating an iterator, the following annotations are required.

Annotation	Usage
<code>BotCommand</code>	Use the <code>BotCommand</code> annotation with an <code>iterator</code> as the <code>commandType</code> . This ensures that the plain old Java object (POJO) is eligible for creating an Automation 360 iterator.
<code>CommandPkg</code>	When creating a package, provide a name, label, and description to the annotation.
<code>Idx</code>	Annotate all parameters and member variables that are required and help with the validation check, or they can be displayed in the interface for the input. Provide the <code>Idx</code> and the type.
<code>Pkg</code>	Annotate all parameters and member variables that will be displayed in the interface. This annotation will be ignored if it is not accompanied by the <code>Idx</code> .

Annotation	Usage
HasNext	<p>The method that has to be called for testing if the iteration has more elements (returns <code>true</code> if <code>next ()</code> returns an element rather than throwing an exception). It must return a Boolean value.</p> <p>If the method accepts parameters, then they must be annotated with the <code>Idx</code>. The <code>hasNext</code> method verifies it and returns <code>false</code> if no more values are available. In Automation 360, when Loop is executed, <code>hasNext ()</code> is called first. <code>next ()</code> is called only if <code>hasNext ()</code> returns a <code>true</code> value.</p>
Next	The method returns the next available value in the iteration. The return type is a value. If no more value is available, an exception is shown.

### Use case example

The example use case loops through number of times, for example, `for (int i=0; I<n; i++)` Java construct. It accepts the value of `n` from the Bot Creator when the bot is created.

1. Make sure you have imported the following packages to ensure all the functionalities works as described in the sample.

```
import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.NumberValue;
import com.automationanywhere.commandsdk.annotations.BotCommand;
import com.automationanywhere.commandsdk.annotations.CommandPkg;
import com.automationanywhere.commandsdk.annotations.HasNext;
import com.automationanywhere.commandsdk.annotations.Idx;
import com.automationanywhere.commandsdk.annotations.Inject;
import com.automationanywhere.commandsdk.annotations.Next;
import com.automationanywhere.commandsdk.annotations.Pkg;
import
 com.automationanywhere.commandsdk.annotations.BotCommand.CommandType;
import
 com.automationanywhere.commandsdk.annotations.rules.GreaterThanEqualTo;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import
 com.automationanywhere.commandsdk.annotations.rules.NumberInteger;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.commandsdk.model.DataType;
```

2. Create the POJO class with the business logic.

Ensure that the POJO has a method and returns a boolean value. This will act as the comparison method.

```
@BotCommand(commandType=CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable",
 node_label = ": {{times}} times",
 label = "Iterator demo", description = "Iterate number of times",
 name = "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {
 @Idx(index = "1", type = AttributeType.NUMBER)
 @Pkg(label = "times", default_value = "10", default_value_type =
 DataType.NUMBER)
 @GreaterThanEqualTo("0")
 @NumberInteger
 @NotEmpty
```

```

 @Inject
 private Double times = 10d;

 private Double counter = 0d;

 @HasNext
 public boolean hasNext() {
 return counter < times;
 }

 @Next
 public Value<Double> next() throws Exception{
 if (counter >= times)
 throw new Exception("Counter '" + counter + "' is exceed the times
 limit '" + times + "'");

 counter++;
 NumberValue result = new NumberValue();
 result.set(counter);
 return result;
 }

 public void setTimes(Double times) {
 this.times = times;
 }
}

```

3. Annotate the POJO class to enable it for the Automation 360 iterator and to create a package.

```

@BotCommand(commandType = CommandType.Iterator)
@CommandPkg(return_label = "Return the value in variable",
node_label = ": {{times}} times",
label = "Iterator demo", description = "Iterate number of times",
name = "iteratorTypeDemo", return_type = DataType.NUMBER)
public class IteratorTypeDemo {

 private Double times = 10 d;
 private Double counter = 0 d;

 public boolean hasNext() {
 return counter < times;
 }
}

```

4. Annotate the hasNext () and next () method appropriately.

```

@HasNext
public boolean hasNext() {
 return counter < times;
}

@Next
public Value < Double > next() throws Exception {
 if (counter >= times)
 throw new Exception("Counter '" + counter + "' is exceed the times
 limit '" + times + "'");

 counter++;
 NumberValue result = new NumberValue();
 result.set(counter);
 return result;
}

```

```
}

```

The methods are named in easy-to-use way and are in parallel with the Java iterator interface. There is no restriction from the SDK side when naming methods.

In an iterator, do not use parameter methods, but use `setter injection`.

##### 5. Annotate the variables with `Idx` and `Pkg`.

Add `@NotEmpty` to ensure the value is not null, and add `@GreaterThanEqualTo` to ensure the value is always greater than 0.

```
@Idx(index = "1", type = AttributeType.NUMBER)
@Pkg(label = "times", default_value = "10", default_value_type =
 DataType.NUMBER)
@GreaterThanEqualTo("0")
@NotEmpty
@Inject
private Double times = 10 d;
```

The attribute type number returns a `Double`.

This section contains code examples and explanations about how to code some basic bot capabilities.

## Create a custom trigger (Example 1)

Package SDK provides tools to build your custom trigger that automate actions based on predefined conditions.

In this section, you will learn how to create an interval trigger using Automation Anywhere's Package SDK. A sample class called `TriggerDemo` is used to explain its functionality step by step. By the end, you will have a solid understanding of how to build your own custom triggers using Package SDK:

1. Dependencies and Package: The code sample utilizes various imports and is organized within the package `com.automationanywhere.botcommand.samples.trigger`.
2. Annotations: The code utilizes several annotations provided by Package SDK to define and configure the trigger. These annotations include:
  - a) `@BotCommand`: Specifies that this class represents a trigger. You specify this using the line `@BotCommand(commandType = BotCommand.CommandType.Trigger)`. When you specify that it is a command type `Trigger`, then it will be visible in the Trigger section within the Bot editor.
  - b) `@CommandPkg`: Provides metadata about the trigger, such as label, description, icon, and return type. The return type is always set to `RECORD` as shown in the following sample.
  - c) `@TriggerId`: Indicates the unique identifier assigned to each trigger instance.
  - d) `@TriggerConsumer`: Specifies the consumer function to be invoked when the trigger condition is met.
  - e) `@StartListen`: Marks the method responsible for starting the trigger.

---

**Tip:** `@StartListen` is used to execute a trigger and is analogous to `@Execute` in the case of a bot.

---

- f) `@StopAllTriggers`: Identifies the method used to cancel all triggers.
  - g) `@StopListen`: Identifies the method responsible for canceling a specific trigger.
3. **Trigger Execution**: The trigger execution logic is implemented in the `startTrigger` method using the `@StartListen` annotation. In this example, a `TimerTask` is scheduled to run at regular intervals defined by the user. When the scheduled time is reached, the `run` method of the `TimerTask` is executed, triggering the `consumer.accept`. The consumer accepts the `RecordValue` returned by the `getRecordValue` method.
- 
- Tip:** `RecordValue` is also available to use within your bot logic.
- 
4. **`getRecordValue` Method**: The `getRecordValue` method creates a `RecordValue` object and populates it with a list of schemas and values. In this example, the schema `triggerType` is added with the corresponding value `Interval Trigger`.
5. **`StopListen` and `StopAllTriggers` Methods**: These methods are annotated with `@StopListen` and `@StopAllTriggers`, respectively. They are responsible for canceling the trigger task(s) and removing them from the task map.
6. **Additional Helper Methods**: The code also includes getter and setter methods for the `triggerUid` and `consumer` variables.

logger.debug("checking DB");
try {
if (checkRecordsExist(dataSource.getConnection(), sqlQuery)) {
consumer.accept(getRecordValue());
return;
}
} catch (SQLException e) {
logger.warn(e.getMessage(), e);
logger.warn("Trigger is still running.");
}
logger.debug("no records found");

}
};

taskMap.put(this.triggerUid, timerTask);
TIMER.schedule(timerTask, interval.longValue(),
interval.longValue());
}

private RecordValue getRecordValue() {
List<Schema> schemas = new LinkedList<>();
List<Value> values = new LinkedList<>();
schemas.add(new Schema("triggerType"));
values.add(new StringValue("DBStatus"));

RecordValue recordValue = new RecordValue();
recordValue.set(new Record(schemas, values));
return recordValue;
}
/*
 * Cancel all the task and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
taskMap.forEach((k, v) -> {
if (v.cancel()) {
taskMap.remove(k);
}
});
}
}
/*

```

```
* Cancel the task and remove from map
*
* @param triggerUid
*/
@StopListen
public void stopListen(String triggerUid) {
 if (taskMap.get(triggerUid).cancel()) {
 taskMap.remove(triggerUid);
 }
}

 public static DataSource getDataSource(String driverClassName,
String url, String userName, SecureString password) {
 BasicDataSource ds = new BasicDataSource();
 ds.setDriverClassName(driverClassName);
 ds.setUrl(url);
 ds.setUsername(userName);
 ds.setPassword(password.getInsecureString());
 return ds;
}

 public static boolean checkRecordsExist(Connection con, String
query)
 throws SQLException {
 Statement stmt = null;
 try {
 stmt = con.createStatement();

 return triggerUid;
}

public void setTriggerUid(String triggerUid) {
 this.triggerUid = triggerUid;
}

public Consumer getConsumer() {
 return consumer;
}

public void setConsumer(Consumer consumer) {
 this.consumer = consumer;
}
}
```

In the above code sample describes the various methods and annotations used to create and manage the trigger. By understanding the code and its functionality, you are now equipped to create your own interval triggers using Package SDK. Experiment with different intervals and trigger actions to automate your business processes effectively.

The above article is a just a sample, and you need to refine and customize it further based on your specific requirements and target audience.

## Create a custom trigger (Example 2)

The example shows how to create a trigger in Automation 360 that allows you to create tasks that will be executed at specified intervals.

A trigger launches a bot when certain conditions are met and waits until conditions have changed or stopped. When the conditions of the trigger are matched, the run method is called to signal the trigger.

## Required annotations

For creating a trigger, the following annotations are required:

Annotation	Usage
BotCommand	Use the BotCommand annotation with the trigger as <code>commandType</code> . This ensures that the plain old Java object (POJO) is suitable for creating the trigger with Automation 360.
CommandPkg	These values are used when creating a package. Provide a name, label, and description to the annotation.
TriggerId	A trigger ID, which is required for stopping the trigger.
TriggerConsumer	Specifies the consumer function to be invoked when the trigger condition is met.
StartListen	Starts the trigger listener.
StopAllTriggers	Identifies the method used to cancel all triggers.
StopListen	Identifies the method responsible for canceling a specific trigger..

## Use case - Timer Trigger

The following use case shows how to create a timer trigger that triggers a bot at regular intervals. The `Demo Trigger` command sample explained here is a trigger command that allows you to create and manage triggers based on user-specified intervals. This trigger can be used to execute tasks at regular intervals.

## Command Information

```
@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "Demo Trigger", description = "Demo Trigger", icon
 = "email.svg", name = "demoTrigger",
 return_type = RECORD, return_name = "TriggerData",
 return_description = "Available keys: triggerType")
```

- Command Type: Trigger
- Label: Demo Trigger
- Description: Demo Trigger
- Icon: email.svg
- Name: demoTrigger
- Return Type: RECORD
- Return Name: TriggerData
- Return Description: Available keys: triggerType

## Class Structure

The `TriggerDemo` class is a singleton class that manages the trigger tasks. It stores the tasks in a map using the `triggerId` as the key. Once the trigger condition is met, the `run` method of the associated `Runnable` is called to signal the trigger.

## Class Variables

- `taskMap`: A static `ConcurrentHashMap` that stores multiple trigger tasks.
- `TIMER`: A static `Timer` used for scheduling the trigger tasks.
- `triggerUid`: Annotated with `@TriggerId`, it represents the unique identifier for the trigger.
- `consumer`: Annotated with `@TriggerConsumer`, it is the consumer that will accept the trigger data.

## Methods

- `startTrigger`: Annotated with `@StartListen`, this method starts the trigger. It takes an interval parameter (in seconds) to specify the trigger activation interval. It creates a new `TimerTask` that calls the `run` method of the associated `Runnable` when executed. The `TimerTask` is added to the `taskMap` with the `triggerUid` as the key, and it is scheduled to run at the specified interval.
- `getRecordValue`: A private method that creates and returns a `RecordValue` containing the trigger data. The trigger data includes a schema with a single key "triggerType" and its corresponding value "Interval Trigger".
- `stopAllTriggers`: Annotated with `@StopAllTriggers`, this method cancels all trigger tasks and clears the `taskMap`.
- `stopListen`: Annotated with `@StopListen`, this method cancels a specific trigger task identified by the `triggerUid` parameter and removes it from the `taskMap`.
- Setter methods: `setTriggerUid` and `setConsumer` are setter methods for the `triggerUid` and `consumer` variables, respectively.

 ConcurrentHashMap<>();
 private static final Timer TIMER = new Timer(true);

 @TriggerId
 private String triggerUid;
 @TriggerConsumer
 private Consumer consumer;
```

```

/*
 * Starts the trigger.
 */
@StartListen
public void startTrigger(@Idx(index = "1", type =
AttributeType.NUMBER)
@Pkg(label = "Please provide the interval to trigger in seconds",
default_value = "120", default_value_type = DataType.NUMBER)
@GreaterThan("0")
@NumberInteger
@NotEmpty
Double interval) {
 TimerTask timerTask = new TimerTask() {

 @Override
 public void run() {
 consumer.accept(getRecordValue());
 }
 };

 taskMap.put(this.triggerUid, timerTask);
 TIMER.schedule(timerTask, interval.longValue());
}

private RecordValue getRecordValue() {
 List<Schema> schemas = new LinkedList<>();
 List<Value> values = new LinkedList<>();
 schemas.add(new Schema("triggerType"));
 values.add(new StringValue("Interval Trigger"));

 RecordValue recordValue = new RecordValue();
 recordValue.set(new Record(schemas, values));
 return recordValue;
}

/*
 * Cancel all the task and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
 taskMap.forEach((k, v) -> {
 if (v.cancel()) {
 taskMap.remove(k);
 }
 });
}

/*
 * Cancel the task and remove from map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
 if (taskMap.get(triggerUid).cancel()) {
 taskMap.remove(triggerUid);
 }
}

public void setTriggerUid(String triggerUid) {
 this.triggerUid = triggerUid;
}

```

```

}

public void setConsumer(Consumer consumer) {
 this.consumer = consumer;
}

}

```

### Example

Here's an example of using the Demo Trigger

```
demoTrigger.startTrigger(60.0);
```

This will start a trigger that runs every 60 seconds and calls the associated consumer with the trigger data.

To stop the trigger, you can use the following methods:

- `demoTrigger.stopAllTriggers()`: This method will stop all active triggers.
- `demoTrigger.stopListen(triggerUid)`: This method will stop a specific trigger identified by the `triggerUid`.

---

**Note:** The `triggerUid` is a unique identifier for each trigger and is assigned automatically when a trigger is created.

## Create a custom trigger (Example 3)

The example shows how to create an event-based trigger (`SimpleMessageListenerContainer`) using the Package SDK.

### Event-based triggers - Push mechanism

The trigger waits for an event to occur, for example, a message listener to start listening.

- An event details are stored in the memory and a message listener waits for a message.
- When the event occurs, it runs the `consumer.accept(<RecordValue Instance>)` method and triggers an associated bot..

The following example shows how to create a simple `ActiveMQ` message listener (`SimpleMessageListenerContainer`) to demonstrate the trigger push mechanism.

```

@BotCommand(commandType = BotCommand.CommandType.Trigger)
@CommandPkg(label = "JMS Trigger", description = "JMS Trigger", icon =
 "jms.svg", name = "jmsTrigger",
 return_type = RECORD, return_name = "TriggerData", return_description
 = "Available keys: triggerType")
public class JMSQueue implements SessionAwareMessageListener {

 // Map storing multiple MessageListenerContainer

```

```
private static final Map<String, MessageListenerContainer> taskMap =
new ConcurrentHashMap<>();

@TriggerId
private String triggerUid;
@TriggerConsumer
private Consumer consumer;

//This method is called by MessageListenerContainer when a message
arrives.
// At this point, the trigger get enabled
@Override
public void onMessage(javax.jms.Message message, Session session)
throws JMSEException {
 consumer.accept(getRecordValue());
}

private RecordValue getRecordValue() {
 List<Schema> schemas = new LinkedList<>();
 List<Value> values = new LinkedList<>();
 schemas.add(new Schema("triggerType"));
 values.add(new StringValue("JMSQueue"));

 RecordValue recordValue = new RecordValue();
 recordValue.set(new Record(schemas, values));
 return recordValue;
}
/*
 * Starts the trigger.
 *
 * Use this method to setup the trigger, such as, setup the
MessageListenerContainer and start it.
 */
@StartListen
public void startTrigger(@Idx(index = "1", type = AttributeType.TEXT)
@Pkg(label = "Provide the broker URL")
@NotEmpty
String brokerURL, @Idx(index = "2", type = AttributeType.TEXT)
@Pkg(label = "Provide the queue name")
@NotEmpty
String queueName) {

 if (taskMap.get(triggerUid) == null) {
 synchronized (this) {
 if (taskMap.get(triggerUid) == null) {
 SimpleMessageListenerContainer messageListenerContainer = new
SimpleMessageListenerContainer();
 messageListenerContainer.setConnectionFactory(new
PooledConnectionFactory(brokerURL));
 messageListenerContainer.setDestinationName(queueName);
 messageListenerContainer.setMessageListener(this);
 messageListenerContainer.start();
 taskMap.put(triggerUid, messageListenerContainer);
 }
 }
 }
}
}
```

```

/*
 * Cancel all the tasks and clear the map.
 */
@stopAllTriggers
public void stopAllTriggers() {
 taskMap.forEach((k, v) -> {
 v.stop();
 taskMap.remove(k);
 });
}

/*
 * Cancel the tasks and remove from the map
 *
 * @param triggerUid
 */
@stopListen
public void stopListen(String triggerUid) {
 taskMap.get(triggerUid).stop();
 taskMap.remove(triggerUid);
}

public String getTriggerUid() {
 return triggerUid;
}

public void setTriggerUid(String triggerUid) {
 this.triggerUid = triggerUid;
}

public Consumer getConsumer() {
 return consumer;
}

public void setConsumer(Consumer consumer) {
 this.consumer = consumer;
}
}

```

[Package SDK examples](#) on page 3764

This section contains code examples and explanations about how to code some basic bot capabilities.

## Add debug logs of custom packages to bot\_launcher.log file

You can add logs using `log4j`. The dependency is already added in the package SDK sample `build.gradle` file. Review the logging info using `RadioTypeDemo.java` file.

### Example 1: Logger info - Get region value using `RadioTypeDemo` class

1. Review the code example where the logger is added in the code, open the `RadioTypeDemo.java` file located at `<your latest package-sdk-2.0.9>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types`

```

@BotCommand
@CommandPkg(label = "[[RadioTypeDemo.label]]",

```

```

description = "[[RadioTypeDemo.description]]", icon = "sample.svg",
name = "radioTypeDemo")
public class RadioTypeDemo {

 private static Logger logger =
 LogManager.getLogger(RadioTypeDemo.class);

 @Execute
 public void getRegionValue(@Idx(index = "1", type =
 AttributeType.RADIO, options = {
 @Idx.Option(index = "1.1", pkg = @Pkg(label =
 "[[RadioTypeDemo.region.1.1.label]]", value = "us_east")),
 @Idx.Option(index = "1.2", pkg = @Pkg(label =
 "[[RadioTypeDemo.region.1.2.label]]", value = "us_west")),
 @Idx.Option(index = "1.3", pkg = @Pkg(label =
 "[[RadioTypeDemo.region.1.3.label]]", value = "us_central"))
 })
 @Pkg(label = "[[RadioTypeDemo.region.label]]")
 @NotEmpty
 String region) {
 logger.info("Selected region is {}", region);
 }
}

```

- Build a simple bot from the Automation 360 Demo package and select a radio group: **Radio Demo**.
- Select an appropriate region, such as, US East.
- Save and run the bot.
- Access the folder where the logs were generated, the default log location: C:\ProgramData\AutomationAnywhere\BotRunner\Logs\Bot\_Launcher.log.  
If the logs get roll back from the Bot\_Launcher.log file, then logs will create a folder based on the month when they were created, for example, 2021-May. Inside this folder, the logs will continue to generate.
- Open the Bot\_Launcher.log file and review the log info for the **RadioTypeDemo** and **selected region is us\_east**.

### Example 2: Assigning a value to clipboard

The following example accepts a user input or a variable and assigns it to clipboard.

```

@BotCommand
@CommandPkg(label = "Copy to", icon="assigntoclipboard.svg" ,name =
"assignToClipboard", description
= "Accepts user input or a variable and assigns it to Clipboard",
node_label="{{value}}")
public class AssignToClipboard {

 private static Logger logger =
 LogManager.getLogger(AssignToClipboard.class);

 @Execute
 public static void assign(@Idx(index = "1", type = TEXT) @Pkg(label =
 "Value") @NotEmpty String
 value) {

 logger.trace("Assigning '{}' value to clipboard.", value);
 }
}

```

```
}

```

This section contains code examples and explanations about how to code some basic bot capabilities.

## Handle sessions in a custom package

You can extract a session using a session name from the SessionsMap. In the same package, you can use sessions to pass information between actions, but not to other packages.

## Configure the following attributes

- Apply an annotation to the class field and add a corresponding public setter.
- Retrieve the SessionsMap using the Sessions attribute.
- Set the variable type as Map<String, Object>.
- Set the attributeType: TEXT or SESSION. If type = TEXT, it is a regular session; if type = SESSION, it is a sharedSession.

Start a new session

```
@BotCommand
@CommandPkg(label = "Start session", name = "startSession", description
= "Start new session",
icon = "pkg.svg", node_label = "start session {{sessionName}}|") public
class Start {

 @Sessions
 private Map<String, Object> sessions;

 @Execute
 public void start(@Idx(index = "1", type = TEXT) @Pkg(label =
"Session name",
 default_value_type = STRING, default_value = "Default") @NotEmpty
String sessionName) {

 // Check for existing session
 if (sessions.containsKey(sessionName))
 throw new
BotCommandException(MESSAGES.getString("xml.SessionNameInUse",
sessionName));

 // Do some operation

 // Create new session
 sessions.put(sessionName, new Session(operation));
 }
 public void setSessions(Map<String, Object> sessions) {
 this.sessions = sessions;
 }
}
```

```
}

```

End a session

```
@BotCommand
@CommandPkg(label = "End session", name = "endSession", description =
 "End session", icon =
 "pkg.svg", node_label = "End session {{sessionName}}|")
public class EndSession {
 @Sessions
 private Map<String, Object> sessions;
 @Execute
 public void end(
 @Idx(index = "1", type = TEXT) @Pkg(label = "Session name",
 default_value_type = STRING,
 default_value = "Default") @NotEmpty String sessionName) {

 sessions.remove(sessionName);
 }
 public void setSessions(Map<String, Object> sessions) {
 this.sessions = sessions;
 }
}

```

Add a session

In the below example, string objects are used (although in real actions, you can use complex objects).

```
@BotCommand
@CommandPkg(label = "[[SessionDemo.label]]", description =
 "[[SessionDemo.description]]", icon = "sample.svg", name =
 "sessionDemo")
public class SessionDemo {

 // Sessions are provided as a Map. Actions can add or remove entries
 // in this
 // Map.
 // The choice to reuse/overwrite/delete/add any Object in this Map
 // belongs to
 // the actions, and the framework makes no assumption regarding it.
 @Sessions
 private Map<String, Object> sessionMap;

 @Execute
 public void execute(@Idx(index = "1", type = TEXT)
 @Pkg(label = "[[SessionDemo.name.label]]")
 @NotEmpty
 String name) {
 if (!sessionMap.containsKey(name))
 sessionMap.put(name, "Some Value");
 }
}

```

```

}

// Ensure that a public setter exists.
public void setSessionMap(Map<String, Object> sessionMap) {
 this.sessionMap = sessionMap;
}
}

```

Set a session variable

The below example shows how to develop an action (for example, Set session variable). In the action, the session details are retrieved and stored as a session variable so that the information can be used within a specific package.

```

@BotCommand
@CommandPkg(label = "[[SessionDemo2.label]]", description =
 "[[SessionDemo2.description]]", icon = "sample.svg", name =
 "SessionDemo2",
return_type = DataType.STRING)
public class SessionDemo2 {

 // Sessions are provided as a Map. Actions can add or remove entries
 in this
 // Map.
 // The choice to reuse/overwrite/delete/add any Object in this Map
 belongs to
 // the actions, and the framework makes no assumption regarding it.
 @Sessions
 private Map<String, Object> sessionMap;

 @Execute
 public Value<?> execute(@Idx(index = "1", type = TEXT)
 @Pkg(label = "[[SessionDemo2.name.label]]")
 @NotEmpty
 String name) {
 if (sessionMap.containsKey(name)) {
 return new StringValue(sessionMap.get(name));
 }
 return new StringValue("session does not exist");
 }
 // Ensure that a public setter exists.
 public void setSessionMap(Map<String, Object> sessionMap) {
 this.sessionMap = sessionMap;
 }
}

```

Related concepts

[Package SDK examples](#) on page 3764

This section contains code examples and explanations about how to code some basic bot capabilities.

## Configure shared session using Package SDK

Package SDK provides configuration for the SDK users to create and use shared sessions. Sessions are seamlessly shared between different bots to share resources between them. This means that if a session has been created, the other Task Bots can read and update the session and vice versa.

## Share session between parent and child

The following section describes creating a shared session. The parent `GlobalSessionDemoUpperCaseParent` returns a `Session` value to the global session and is used by the child bot `GlobalSessionDemoUpperCaseChild`.

---

**Note:** Place the three classes below in the following location: `<PackageSDK>\src\main\java\com\automationanywhere\botcommand\samples\commands\basic`

---

1. Create the following POJO class `DemoForSession` that implements `CloseableSessionObject`.

```
package
 com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProj

import
 com.automationanywhere.toolchain.runtime.session.CloseableSessionObject;

import java.io.IOException;

public class DemoForSession implements CloseableSessionObject
{
 public void setClose(boolean close) {
 this.close = close;
 }

 boolean close=false;
 public String getDemo() {
 return demo;
 }

 public void setDemo(String demo) {
 this.demo = demo;
 }
 public DemoForSession(String demo){
 this.demo=demo;
 }
 String demo;

 @Override
 public boolean isClosed() {
 return close;
 }

 @Override
 public void close() throws IOException {

 }
}
```

2. Add the `@BotCommand` annotation to make a class as an Action in the Control Room. For more information on annotations, see [Annotations](#) on page 3806.

```
@BotCommand
```

3. Add the `@CommandPkg` annotation to define all the UI related components - labels, description, icon, return\_type, and name. The elements return\_label, return\_settings, return\_type, and return\_required belonging to the `@CommandPkg` ensures that the SESSION is returned by the parent bot.

```
@CommandPkg (
 //Unique name inside a package and label to display.
 name = "GlobalSession", label = "Global session uppercase parent",
 node_label = "Shared session parent node label", description =
 "Shared session parent description", icon = "pkg.svg",

 //Return type information. return_type ensures only the right kind
 of variable is provided on the UI.
 return_label = "Return the parent session",
 return_settings = {ReturnSettingsType.SESSION_TARGET},
 return_type = SESSION,
 return_required = true)
```

4. Create the `GlobalSessionDemoUpperCaseParent` object. The `GlobalSessionDemoUpperCaseParent` gets a lower case string input from the action's input, converts it to an upper case string and store the result in the `SessionValue`.
  - Annotate the method with `@Execute` to execute the method during compilation.

```
package
 com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSamplePr

import com.automationanywhere.botcommand.data.impl.SessionValue;
import com.automationanywhere.commandsdk.annotations.*;
import
 com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.model.ReturnSettingsType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;

import java.util.Map;

import static
 com.automationanywhere.commandsdk.model.AttributeType.TEXT;
import static
 com.automationanywhere.commandsdk.model.DataType.SESSION;

//BotCommand makes a class eligible for being considered as an
action.
@BotCommand

//CommandPks adds required information to be disalable on GUI.
@CommandPkg (
 //Unique name inside a package and label to display.
 name = "GlobalSession", label = "Global session uppercase
parent",
 node_label = "Shared session parent node label", description =
 "Shared session parent description", icon = "pkg.svg",
```

```

//Return type information. return_type ensures only the right
kind of variable is provided on the UI.
return_label = "Return the parent session",
return_settings = {ReturnSettingsType.SESSION_TARGET},
return_type = SESSION,
return_required = true)
public class GlobalSessionDemoForStringUpperCaseParent {
private static Logger logger =
LogManager.getLogger(GlobalSessionDemoForStringUpperCaseParent.class);

//Identify the entry point for the action. Returns a SessionValue
because the return_type is SESSION.
@Execute
public SessionValue action(
//Idx 1 would be displayed first, with a text box for entering
the value.
@Idx(index = "1", type = TEXT)
//UI labels.
@Pkg(label = "Enter string in lower case")
//Ensure that a validation error is thrown when the value is
null.
@NotEmpty
String firstString) {
String result = firstString.toUpperCase();
DemoForSession demoForSession= new DemoForSession(result);
return SessionValue
.builder()
.withSessionObject(demoForSession)
.build();
}
}

```

5. Create the GlobalSessionDemoUpperCaseChild object. The GlobalSessionDemoUpperCaseChild gets a lower case string input from the action's input, converts it to upper case and concatenates it with the SessionValue received from the parent bot.

```

package
com.automationanywhere.botcommand.samples.commands.basic.GlobalSessionSampleProje

import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.data.impl.StringValue;
import
com.automationanywhere.botcommand.samples.commands.basic.Uppercase;
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import
com.automationanywhere.commandsdk.annotations.rules.SessionObject;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.commandsdk.model.DataType;
import org.apache.logging.log4j.LogManager;
import org.apache.logging.log4j.Logger;

import static
com.automationanywhere.commandsdk.model.AttributeType.TEXT;
import static
com.automationanywhere.commandsdk.model.DataType.STRING;

```

```

//BotCommand makes a class eligible for being considered as an
action.
@BotCommand

//CommandPks adds required information to be dispalable on GUI.
@CommandPkg(
 //Unique name inside a package and label to display.
 name = "GlobalSessionChild", label = "Global session upper case
child",
 node_label = "Global session child node label",
 description = "Global session child description", icon =
"pkg.svg",

 //Return type information. return_type ensures only the right kind
of variable is provided on the UI.
 return_label = "Return the concatenated string to", return_type =
STRING, return_required = true)
public class GlobalSessionDemoUpperCaseChild {
 private static Logger logger =
 LogManager.getLogger(Uppercase.class);

 @Execute
 public Value<String> action(
 //Idx 1 would be displayed first, with a text box for entering
the value.
 @Idx(index = "1", type = TEXT)
 //UI labels.
 @Pkg(label = "Enter a sting in lower case to concatenate")
 //Ensure that a validation error is thrown when the value is
null.
 @NotEmpty
 String sourceString,
 @Idx(index = "2", type = AttributeType.SESSION)
 @Pkg(label = "sharedSession", description = "sharedSession",
 default_value = "Default", default_value_type =
DataType.SESSION)
 //Using the sessionObject annotation here as its a consumer class
 @SessionObject
 DemoForSession session) {

 //Business logic
 String result = sourceString.toUpperCase();
 logger.info("session: {}", session);
 return new StringValue(result+session.getDemo().toUpperCase());
 }
}

```

6. Build and upload the custom package to the Control Room. For more information on uploading the package, see [Using the package SDK](#) on page 3758.
7. Create a bot by using the Global session uppercase parent action.
  - a) Enter a lower case string (For example: parentbot string)
  - b) Enter a name for the session. The parent bot returns the value to the Global session (For example: Global)

8. Create a Task Bots by using the **Global session upper case child** action. You will be able to input a lower case string and also get the string from the shared parent session. Concatenate the parent and child strings.
9. Use a **Message box** to show the output.

10. Now call the **Global session upper case child** into the parent.

11. Run the parent bot and you will see the message box showing the value from the Child bot which it derived using the Shared global session.

## Build bots to share session details using Package SDK

A shared session enables you to reuse actions between Task Bots that run concurrently, for example, using the same Excel file to pass values.

Ensure you have the following to build a Task Bot:

- Access to the Control Room
- Credentials with **AAE\_Basic** permissions
- A development license, which enables you to create and run Task Bots
- Your workstation is a registered device in the Control Room
- An Excel file that you want to use in the shared session actions

1. Log in to the Control Room.
2. Create three Task Bots that will share the shared session actions.

3. Create a new childSession2 variable of **Type > Session** and **Session type > MS Excel session**, select **Use as input**, and then click **Apply**.
4. On the left pane, click **Automation**.  
A list of available and forms is displayed.
5. Click the **Create a bot** icon.
6. Create a new bot called childBot2.
  - a) In the **Name** field, enter childBot2.
  - b) In the Actions pane, find **Excel Advanced**, and drag **Get current worksheet name** to the Bot editor.
  - c) In **Session name > Shared session**, enter **F2 > childSession2**, and in **Assign the output to variable**, select **prompt-assignment**.
  
7. Create a new parentSession variable of **Type > Session** and **Session type > MS Excel session**, and then click **Apply**.
8. Create a new bot called parentSession, and click **Create & Edit**.
9. In the Actions pane, find **Excel Advanced**, and drag **Open** to the Bot editor.
  - a) In **File path**, select **Desktop file**, click **Browse**, and navigate to the Excel file that you want to use.
  - b) In **Session name**, retain **Default**.
  - c) Click **Save**.
  
10. Create a new childSession1 variable of **Type > Session** and **Session type > MS Excel session**, select **Use as input**, and then click **Apply**.
11. Create a new bot called childBot1.
  - a) In the **Name** field, enter childBot1.
  - b) In the Actions pane, find **Excel Advanced**, and drag **Get single cell** to the Bot editor.
  - c) Select **Active cell** in **Session name**, and select **Local name**, enter **F2**, and then in **Store cell content to**, select **prompt-assignment**.
  
12. In the Actions pane, find **Excel Advanced**, and drag **Set session variable** to the Bot editor.
  - a) In **Session name**, retain **Default**.
  - b) In **Save session to a variable**, select **parentSession**.
  
13. From the Actions pane, find **Task Bot**, and drag **Run** to the Bot editor.
  - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and select **childBot1**.
  - b) In **Input values**, select **Set childSession1**, enter **F2**, and select **parentSession**.
  
14. In the Actions pane, find **Excel Advanced**, and drag **Close**, select **Session name** as **Local name**, and retain **Default**.
15. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and then select **prompt-assignment**.
16. From the Actions pane, select **Task Bot**, and drag **Run** to the Bot editor.
  - a) In **Task Bot to run**, select **Control Room file**, click **Choose**, and then **Browse**, and then select **childBot2**.

b) In **Input values**, select **Set childSession2**, enter **F2**, and select **childSession1**.

17. In the Actions pane, find **Message box**. In **Enter the message to display**, enter **F2**, and select **prompt-assignment**.

18. Save all three bots and run the **parentSession** Task Bot.

The following three messages are displayed:

Single cell value from parent bot:1

Current worksheet name of excel opened in parent bot: Sheet1 <name of the sheet>

Your bot has run successfully!

This section contains code examples and explanations about how to code some basic bot capabilities.

## Create a custom bot command exceptions

You can use the `BotCommandException` class to create a custom Bot Command Exceptions for error reporting. You can throw and catch them in your methods. With custom exceptions, you can specify detailed error messages and have more custom error handling in your catch blocks.

### Example: Define a custom `BotCommandException`

This example defines a custom exception called `DemoException`. This class extends `BotCommandException` and implements several constructors by invoking the equivalent amount of constructors in the super-class. You only need to implement the constructors that you want to use, and you can ignore the rest of the constructors in the super-class (Java classes do not inherit constructors, so you must re-implement them).

```
package com.automationanywhere.botcommand.samples.exceptions;

import com.automationanywhere.botcommand.data.Value;
import com.automationanywhere.botcommand.exception.BotCommandException;

import java.util.Optional;

public class DemoException extends BotCommandException {
 public DemoException(String message, Throwable cause) {
 super(message, cause);
 }

 public DemoException(String message) {
 super(message);
 }

 public DemoException(Throwable cause) {
 super(cause);
 }

 public DemoException(String message, Throwable cause,
 Optional<Value> outputVariables) {
```

```

 super(message, cause, outputVariables);
 }
}

```

Many constructors of the `BotCommandException` class accept a `java.lang.Throwable` object as an argument. You can implement similar constructors and pass `Throwable` objects (usually other exception objects) to your custom exceptions when you want your custom exception to include the exception that caused it.

The following example shows how to use the exception that you defined in the previous example.

```

public static boolean checkRecordsExist(Connection con, String
query)
 throws SQLException {

 Statement stmt = null;
 try {
 stmt = con.createStatement();
 ResultSet rs = stmt.executeQuery(query);
 rs.last();
 if(rs.getRow() > 0)
 return true;
 } catch (SQLException e) {
 throw new DemoException("Problem running statement", e);
 } finally {
 if (stmt != null) { stmt.close(); }
 }

 return false;
}

```

If an exception is found, then this would catch the exception and through an error statement as defined in the example.

## Annotations

This section provides reference information about the annotations used to create Automation Anywhere packages.

Develop your own package and upload it to an Control Room to provide custom actions for bots.

## Creation and function annotations

List of the available creation and function annotations.

### Annotation: BotCommand

Makes the type eligible to be treated as an action. You can define three types of actions **commandType** property.

- CommandAction
- Condition
- Iterator

#### Examples:

- `@BotCommand(commandType = BotCommand.CommandType.Iterator)`
- `@BotCommand(commandType = Condition)`
- `@BotCommand(commandType = Variable)`
- `@BotCommand(commandType = Trigger)`

### Annotation: CommandPkg

Makes the type eligible for creation of action **package.json**. This annotation must be used with **BotCommand** to take effect. **Pkg** participates in the activity only when this annotation is present.

#### Example:

```
@CommandPkg(label = "Create", name = "createFile",
description = "Creates a file", node_label = "{{filePath}}",
icon = "file.svg")
```

### Annotation: ConditionTest

Participates in the **Condition** execution. This annotation can only be used when the **BotCommand** has **commandType** set as **Condition**. Only one method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

## Annotation: Execute

Participates in the execution of **BotCommand**. Exactly one method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

### Example:

```
@Execute public void create(@Idx(index = "1", type = FILE) @LocalFile
 @Pkg(label =
 "File", description = "e.g. C:\\MyDoc\\MyFile.doc") @NotEmpty String
 filePath,
 @Idx(index = "2", type = CHECKBOX) @Pkg(label = "Overwrite an existing
 file")
 @NotEmpty Boolean isOverwrite) { createFile(filePath, isOverwrite); }
```

## Annotation: GlobalSessionContext

Can only be applied to member variables and fetches the GlobalSessionContext through a setter.

### Example:

```
@com.automationanywhere.commandsdk.annotations.GlobalSessionContext
private GlobalSessionContext globalSessionContext;

public void setSessionMap(Map < String, Object > sessionMap) {
 this.sessionMap = sessionMap;
}
public void
setGlobalSessionContext (com.automationanywhere.bot.service.GlobalSessionContext
globalSessionContext) {
 this.globalSessionContext = globalSessionContext;
}
```

## Annotation: HasNext

Participates in the execution of **Iterator**. This annotation can only be used when the **BotCommand** has commandType set as **Iterator**. Requires the **Next** annotation to be present. One method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in the compilation error.

## Annotation: Index

Makes the annotated element part of hierarchy utilized for the code and resource generation. Without this annotation no **BotCommand** related element annotations would be processed.

## Annotation: Idx.Option

An option represents the elements that would play in the hierarchy, but lend the values to the parents.

### Examples:

- RADIO

```
@Idx(index = "1", type = RADIO, options = {
 @Idx.Option(index = "1.1", pkg = @Pkg(node_label
 = "[[Delay.delayType.1.1.node_label]]", label =
 "[[Delay.delayType.1.1.label]]", value = REGULAR)),
 @Idx.Option(index = "1.2", pkg = @Pkg(node_label
 = "[[Delay.delayType.1.2.node_label]]", label =
 "[[Delay.delayType.1.2.label]]", value = RANDOM))
})
@Pkg(label = "[[Delay.delayType.label]]", default_value = "REGULAR",
 default_value_type = DataType.STRING)
@Inject
private String delayType;
```

- SELECT

```
@Idx(index = "2", type = SELECT, options = {
 @Idx.Option(index = "2.1", pkg = @Pkg(label =
 "[[LaunchWebsite.browser.2.1.label]]", value = "DEFAULT")),
 @Idx.Option(index = "2.2", pkg = @Pkg(label =
 "[[LaunchWebsite.browser.2.2.label]]", value =
 "INTERNET_EXPLORER")),
 @Idx.Option(index = "2.3", pkg = @Pkg(label =
 "[[LaunchWebsite.browser.2.3.label]]", value = "FIREFOX")),
 @Idx.Option(index = "2.4", pkg = @Pkg(label =
 "[[LaunchWebsite.browser.2.4.label]]", value = "CHROME"))
}) @Pkg(label = "[[LaunchWebsite.browser.label]]", default_value
 = "DEFAULT", default_value_type = DataType.STRING)
@NotEmptyString(browser)
```

## Annotation: Inject

Makes an element eligible for injection into the annotated type object. The injection is setter-based so a corresponding setter in the type is **mandatory**. The injected values would form the **BotCommand** parameter map using the name provided in **Idx**.

## Annotation: Next

Participates in the **Iterator** execution. This annotation can only be used when the **BotCommand** has commandType set as **Iterator**. Requires the **HasNext** annotation to be present. One method needs to be annotated when **BotCommand** annotation is present on the type. Failure to do so will result in compilation error.

## Annotation: Pkg

Makes an element to participate in the `package.json` creation. This annotation is ignored when **Idx** is not present.

Related concepts

[Annotations](#) on page 3806

This section provides reference information about the annotations used to create Automation Anywhere packages.

## Validation annotations

Validates annotated strings and values used in the Java code.

Annotation	Description
<b>CodeType</b>	The MIME-type of the code to format.
<b>CredentialOnly</b>	Can only accept a credential value, no string allowed.
<b>Equals</b>	Validates that the given string is equal to the annotated string variable.
<b>FileExtension</b>	Validates the annotated string value that ends with the supported extension type.
<b>GreaterThan</b>	Validates that the annotated number variable value is always greater than the given numeric value.
<b>GreaterThanEqualTo</b>	Validates that the annotated number variable value is always greater than or equal to the given numeric value.
<b>LessThan</b>	Validates that the annotated number variable value is always less than the given numeric value.
<b>LessThanEqualTo</b>	Validates that the annotated number variable value is always less than or equal to the given numeric value.
<b>LocalFile</b>	Can only accept local paths and no file expression.
<b>MatchesRegex</b>	Validates that the annotated string value matches the given regular expression.

Annotation	Description
<b>NotEmpty</b>	Validates and throws an exception when the annotated variable value is null.  <pre>@Execute public Value&lt;Double&gt;length (@Idx (index="1", type=TEXT) @Pkg (label="Source string") @NotEmpty String sourceString) {}</pre>
<b>NotEquals</b>	Validates that the given string is not be equal to the annotated string variable.
<b>NotMatchesRegex</b>	Validates that the annotated string value does not match the given regular expression.
<b>NumberInteger</b>	Ensures the UI accepts only integers and not double for the annotated variable value.
<b>RepositoryFile</b>	Can only accept repository paths and no file expression.
<b>VariableNotPackage</b>	Cannot choose a variable from this package.
<b>VariablePackage</b>	Can only choose a variable from this package.
<b>VariableSubType</b>	The variable subtype must match.
<b>VariableType</b>	The variable type must match.
<b>VariableUserDefined</b>	Can only choose a user-defined variable.

[Annotations](#) on page 3806

This section provides reference information about the annotations used to create Automation Anywhere packages.

## Configure and use credential allow password annotation

Use the provided **CredentialTypeDemo.java** package SDK file and configure the **CredentialAllowPassword** annotation for the password field in Automation 360 locker actions.

### Example: Review the CredentialTypeDemo.java

Use the following **CredentialTypeDemo.java** file located at: <latest package-sdk>2.0.9\src\main\java\com\automationanywhere\botcommand\samples\commands\basic\types as an example on how to configure the credential attribute.

```
@BotCommand
@CommandPkg (label = "[[CredentialTypeDemo.label]]",
description = "[[CredentialTypeDemo.description]]", icon =
"sample.svg", name = "credentialTypeDemo")
public class CredentialTypeDemo {
```

```

private static Logger logger =
LogManager.getLogger(CredentialTypeDemo.class);

/**
 * To accept credentials the {@link AttributeType} in index should be
 * {@link AttributeType.CREDENTIAL CREDENTIAL}. A {@link SecureString}
is
 * provided for any credentials type.
 */
@Execute
public void printCredentials(@Idx(index = "1", type =
AttributeType.CREDENTIAL)
@Pkg(label = "[[CredentialTypeDemo.credentials.label]]")
SecureString credentials) {
// SecureString provides multiple way to access the data inside.
// Let's try to get the user name and print it in logs.

// To get the username as String
String userName = credentials.getInsecureString();
logger.trace("User name from getInsecureString : {}", userName);
}

```

### Example: Configure the credential attributes @Execute

Configure the index, type, label, optional description, and the credentialAllowPasswordAttribute. When creating a new or updating an existing package, use the **CredentialAllowPassword** annotation to allow the credential picker to pick a credential attribute marked as a password field.

```

@Execute
public void printCredentials(@Idx(index = "2", type =
AttributeType.CREDENTIAL)
@Pkg(label =
"[[CredentialTypeDemo.credentialsAllowPasswordAttribute.label]]")
@CredentialAllowPassword
SecureString credentialAllowPasswordAttribute) {
}

```

### Configure the attributes in the Control Room

In the **Attribute name** field, enter **password** and an optional **description**, in **Input** field, select **Standard**, and enter the **value**. In the **Security** field, select **Use attribute only on Password or Masked fields**.

### Use the credential attribute in Control Room

- In the **Pick a credential** field, select **credential**. In the **Attribute** field, select **username**. In the **Provide the credential for the user (optional)** field, select **Credential**, and then **Pick**.
- In the **Attribute** field, select **password**. In the **Provide the credential for the password (optional)** field, select **Credential**, and then **Pick**.

## Build and test a demo package and bot

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

Here is a list of all the necessary tasks to create a package, add the package to your Control Room, and verify your work in a bot. Complete the listed tasks in order.

**Tip:** Click the title of each step to go the detailed task.

Step 1 <a href="#">Update related workflow and build files on page 3813</a>	Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).
Step 2 Choose your favorite IDE	You can compile a package from the IDE of your choice. Here are two possible ways you can compile a package:
<a href="#">Compile a demo JAR file from the Eclipse UI on page 3814</a>	Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.
<a href="#">Compile a demo JAR file from the command line on page 3814</a>	Compile the demo Java code provided with this software development kit.
Step 3 <a href="#">Add your demo package to the Control Room on page 3815</a>	Users with <b>Upload package</b> permission can add packages to the Control Room for use by all Bot Creators.
Step 4 <a href="#">Create a demo bot with the demo package on page 3816</a>	Create a bot using the demo package to verify the actions that were created.
Step 5 <a href="#">Change the Java file used to create the package JAR file on page 3817</a>	Modify and compile the Java code used to create a package to fix issues and create new functionality.
Step 6 <a href="#">Upload new demo package on page 3818</a>	Package management allows you to upload package updates. The new package has the same name, but a different version number.
Step 7 <a href="#">Update the demo bot with the updated package on page 3818</a>	Update bots to use specific package versions.

## Update related workflow and build files

Follow the detailed steps for updating workflow and build files for this project using your integrated development environment (IDE).

Complete all the steps for project setup detailed in [Set up the Java project on page 3754](#).

This task shows you how to update the appropriate build and workflow files.

1. Open the project "A2019DemoPackage" that you created in [Set up the Java project on page 3754](#).  
You can find the project file in the directory where you extract the zip files to, for example `c:\A2019DemoPackage`.
2. From inside the project, Open the **settings.gradle** file.
3. Replace the project name with `A2019DemoPackageFirstnameLastname`.  
If your name is John Developer it would look like this, `A2019DemoPackageJohnDeveloper`.
4. Open **src > main > resources > package.template**.

5. Update the **name**, **label**, and **description** values.

Original package.template	Updated package.template
<pre>{   "name":   "A2019DemoPackage",   "label":   "A2019DemoPackage",   "description":   "Provides actions for A2019DemoPackage operations.",   "group": "",   "artifactName": "",   "packageVersion": "",   "codeVersion": "",   "commands": [] }</pre>	<pre>{   "name":   "A2019DemoPackageFirstnameLastname",   "label":   "A2019DemoPackageFirstnameLastname",   "description":   "A2019DemoPackageFirstnameLastname",   "group": "",   "artifactName": "",   "packageVersion": "",   "codeVersion": "",   "commands": [] }</pre>

6. Save the changes.

After you have setup the build files, you need to compile the demo Java code, [Compile a demo JAR file from the command line](#) on page 3814.

## Compile a demo JAR file from the Eclipse UI

Use Eclipse to compile a demo JAR file that you can add as a package to your Control Room.

Before starting this task complete the steps in [Update related workflow and build files](#) on page 3813.

Build a package file using a Gradle project in the Eclipse IDE.

1. Import the A2019DemoPackage as a Gradle project, **File > Import > Gradle > Existing Gradle Project** and click **Finish**.
2. From the **Gradle Tasks** tab, go to **<your project> > build** and run the following tasks in order.
  - a) **<your project> > build > clean**
  - b) **<your project> > build > build**
3. From the **Gradle Tasks** tab, go to **<your project.> shadow** and run the **shadowJar** task.

Your compiled package file is located in file:\ \A2019DemoPackage\build\libs\. The package file has named after your project name (<your project>-1.0.0.jar).

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#) on page 2026.

Related concepts

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

## Compile a demo JAR file from the command line

Compile the demo Java code provided with this software development kit.

Before starting this task complete the steps in [Update related workflow and build files](#) on page 3813.

1. Open a terminal window and go to where the **gradlew.bat** file is located.  
**...\A2019DemoPackage > gradlew.bat**
2. In the terminal window, type `gradlew.bat clean build shadowJar`, and press Enter. Here is an example of what you see:

```
> . . .\A2019DemoPackage>gradlew.bat clean build shadowJar

> Task :compileJava
Note: Starting hierarchy discovery for
'com.automationanywhere.botcommand.demo.Concatenate'
Note: Starting non-hierarchical element discovery for
'com.automationanywhere.botcommand.demo.Concatenate'
Note: Starting hierarchy discovery for
'com.automationanywhere.botcommand.demo.Uppercase'
Note: Starting non-hierarchical element discovery for
'com.automationanywhere.botcommand.demo.Uppercase'
Note: Starting Command Java generator...
Note: Starting Json generator...
Note: Generating command json for Concatenate
Note: Generating command json for Uppercase

> Task :commandCodeGen
mergeJsonFiles: updatePackage: group com.automationanywhere ,
artifactName A2019DemoPackageFirstnameLastname ,
packageVersion 1.0.0-20190816-101906
```

The compiled file is located in `file:\ \A2019DemoPackage\build\libs\`.

To add your custom package to your Control Room follow the instructions in [Add packages to the Control Room](#) on page 2026.

Related concepts

[Build and test a demo package and bot](#) on page 3812

This practical how to section demonstrates that creating, changing, and managing packages allow you to customize actions and efficiently manage packages for all Control Room users.

## Add your demo package to the Control Room

Users with **Upload package** permission can add packages to the Control Room for use by all Bot Creators.

Before you can upload a package, you need valid user login credentials with **Upload package** permission for the Control Room you are adding the package to.

To add a package manually from a site or URL, follow these steps:

1. Download the .jar file:
  - For updated packages made available periodically, go to A-People and download the file from this location: [Automation 360 package releases \(A-People login required\)](#).
  - To download an individual package (updated in an Automation 360 release where you want only the package), use this URL:

```
https://aai-artifacts.my.automationanywhere.digital/packages/
<package-file-name>-<version.number>.jar
```

For example, if you want to download Browser package 3.10.2, then use this URL:  
`https://aai-artifacts.my.automationanywhere.digital/packages/bot-command-browser-3.10.2.jar`

2. Log in to the Control Room as an administrator.
3. Navigate to **Manage > Packages**.
4. Click **Add package**.
5. Click **Browse**.
6. Locate and select the package to add to the Control Room.
7. Click **Upload package**.
8. On the **Packages > Confirm package** page, choose any of the following options:
  - **Accept, enable and set as default:** Uploads and enables the selected package, and sets it to the default package for the Control Room.
  - **Accept and enable:** Uploads and enables the package, but the package is not set as the default package. Bot Creators have to specifically select non-default packages to use them for creating bots.
  - **Accept but disable:** Uploads and disables the new package.

Choosing **Reject** stops the upload process.

To add a package from Bot Store, see the following video:

9. After installation, click **Administration > Packages** to verify that the package is added. When you add or update a package in the Control Room, a notification is also sent through the **Notifications** icon. This notification is sent to the Control Room users who have the **View package** permission. For more information, see [Capabilities supporting notifications](#) on page 2357.

---

**Note:** API Task supported packages cannot be uploaded to the Control Room unless they are signed by Automation Anywhere. This includes all custom packages that support API Tasks. For more information on API Task supported packages, see [API Task FAQs](#) on page 3748.

---

After successfully uploading your demo package, create a bot to test the actions you just created. For detailed step about how to create a bot, read [Create a demo bot with the demo package](#) on page 3816

## Create a demo bot with the demo package

Create a bot using the demo package to verify the actions that were created.

Here are the minimum prerequisites for building this demo bot:

- Access to a Control Room
- User credentials with **AAE\_Basic** permission
- Your local host (workstation) is a registered device in the Control Room
- Ensure that the demo package A2019DemoPackageFirstnameLastname is available in the Control Room

This task uses the following actions and components:

- Uppercase (demo package)
- [Message box](#)

- [Variables overview](#) on page 2478
1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  2. Click the **My Task Bot** icon.
  3. Type MyDemoBot1 in the **Name** field.
  4. Click **Create & Edit**.
  5. Expand **A2019DemoPackageFirstnameLastname** and double **Uppercase**.
  6. Type hello world, go be great! in all lower case letters.
  7. Create the variable vMyDemoVar1.
  8. Click **Apply**.
  9. Add a **Message box** and insert the variable **vMyDemoVar1** in the **Enter the message to display** field.
  10. Click **Apply** and **Save**.
  11. Click the **Run** icon.  
A message box with "HELLO WORLD, GO BE GREAT!" in all upper case letters is displayed.  
The custom action **Uppercase** converted all the letters from lower case letters to upper case letters.

The task, [Change the Java file used to create the package JAR file](#) on page 3817, gives instruction on how to modify the **Uppercase** action to convert all upper case letters to lower case letters.

## Change the Java file used to create the package JAR file

Modify and compile the Java code used to create a package to fix issues and create new functionality.

1. Open the project "A2019DemoPakcage."
2. From inside the project, open **src/main/java/com.automationanywhere.botcommand.samples.commands/basic/Uppercase** .
3. Change the function from upper case to lower case.

Original function	Updated function
<pre>String result = "ALL".equals(caseType) ?  sourceString.toUpperCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>	<pre>String result = "ALL".equals(caseType) ?  sourceString.toLowerCase() : (sourceString .substring(0, 1).toUpperCase() + sourceString .substring(1));</pre>

4. Save the changes and re-compile the package.

You can now upload the changed package to the Control Room. [Upload new demo package](#) on page 3818

Related tasks

[Upload new demo package](#) on page 3818

Package management allows you to upload package updates. The new package has the same name, but a different version number.

## Upload new demo package

Package management allows you to upload package updates. The new package has the same name, but a different version number.

You need **AAE\_Basic** permissions to create and edit bots.

1. From the **Manage > Packages** page, click the **Add package** icon.
2. **Browse** to the location of the package to add.  
Packages are Java Archive (JAR) files that contain actions used to create bots.
3. Select the package to add, and click **Upload package**.
4. On the **Packages > Confirm package** page, click **Accept, enable and set as default**.

You can select specific packages to be used from within a bot. Read detailed steps about managing packages for specific bots in [Update the demo bot with the updated package](#) on page 3818 task.

## Update the demo bot with the updated package

Update bots to use specific package versions.

- Access to the bot created in the task [Create a demo bot with the demo package](#) on page 3816.
  - **AAE\_Basic** permission.
1. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  2. Double-click **MyDemoBot1**, the demo bot you created in an earlier task.
  3. Click the **vertical eclipses** in the upper right corner and click **Packages**.
  4. Expand the row for the package **A2019DemoPackageFirstnameLastname**.
  5. From the drop-down list of package versions, select the **Default** version.  
Because you added the updated package as the default version, you are selecting the new version of the package you created.
  6. Click **Change Version** and **Save**.
  7. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  8. Double-click **MyDemoBot1**.
  9. Click **A2019DemoPackageFirstnameLastname** and type HELLO WORLD, GO BE GREAT! in the **Source string** field.
  10. Click **Apply** and **Save**.
  11. Click the **Run** icon.  
The message box displayed by the bot displays "hello world, go be great!" This verifies that the action from the updated package is being used.

## Build and test a custom package

Use IntelliJ to build a custom package and use Automation 360 actions to test the package.

Complete the following tasks to create a custom package, upload the package to your Control Room, and build a bot to test it. After you update the IntelliJ files, create directories, and create and update java classes, you can build the custom package.

1. [Build a custom package in IntelliJ](#) on page 3819

Use IntelliJ to import the Automation Anywhere SDK, create a new package, and compile a JAR file that you can upload to your Control Room.

2. [Add custom package to your Control Room](#) on page 3826

Use the compiled JAR file and upload it to the Control Room.

3. [Create a bot to test the custom package](#) on page 3826

Use Automation 360 actions to create a bot to test the custom package.

---

**Note:** The customer support team does not provide guidance for the code written by customers.

---

**Note:** [Create custom packages](#)

---

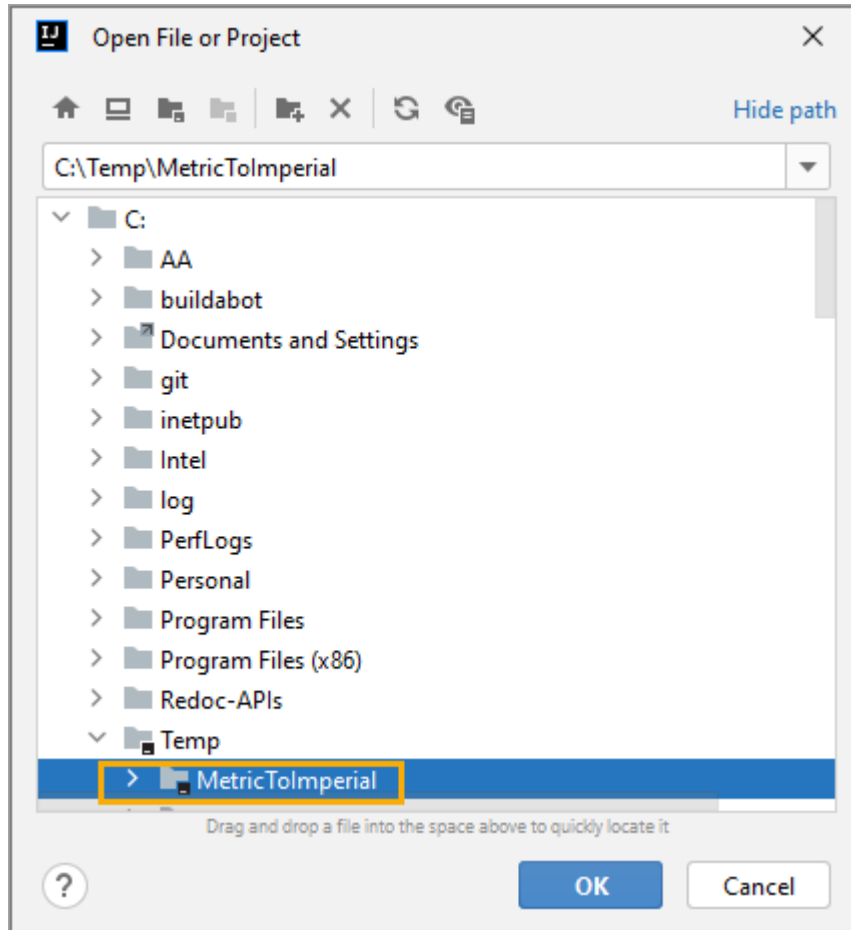

## Build a custom package in IntelliJ

Use Java IntelliJ to create and compile a JAR file that you can upload as a package to your Control Room in Automation 360.

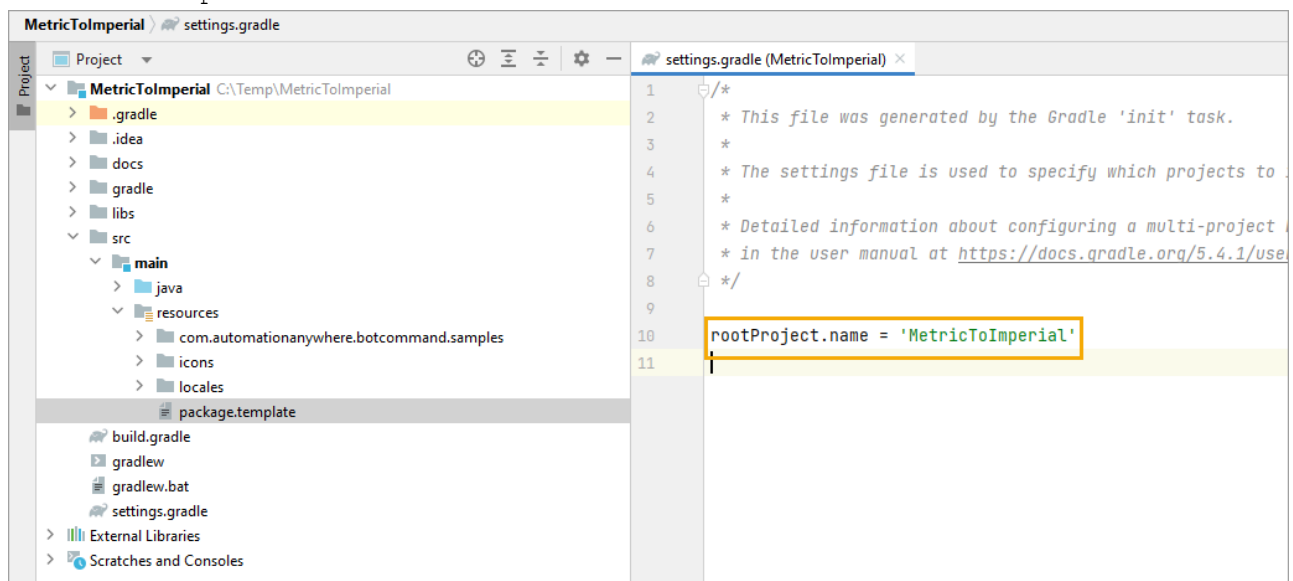

A basic understanding of JDK and Java IntelliJ is required in order to build an action package. Ensure you have installed the following software and files:

- [Java SE Development Kit 11 Downloads](#)
- [Java IDE Community edition of IntelliJ](#)

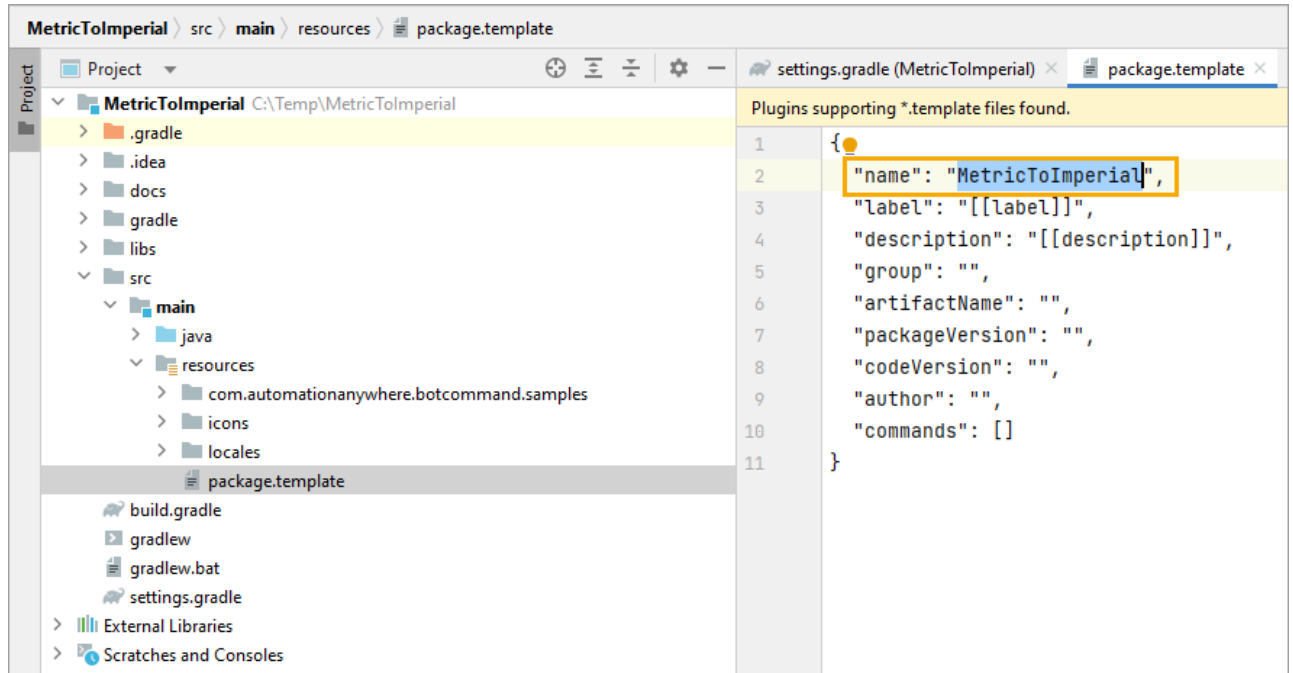

1. Download the latest release of the Automation Anywhere Package SDK. For the latest release of the Package SDK, see - [Previous Package SDK Release Notes](#) on page 1071.
2. Unzip the contents of the SDK package to any of your local directory.
3. Rename the folder from `A360-package-sdk-<version number>` to `MetricToImperial`.
4. In IntelliJ IDEA, go to **File > Open** and open the project at `C:\<SavedLocation>\MetricToImperial`.

5. Open the `settings.gradle` file in the project root. Set the `rootProject.name = 'MetricToImperial'`

6. Open the `package.template` file located at `src > main > resources > package.template`.
7. Change the package name from `A360DemoPackage` to `MetricToImperial`.

Click the **Sync** button in IntelliJ to update the project.

8. Update the package name in **locales json**: go to **src > main > resources > locales > en\_US.json**.
  - a) Open the **en\_US.json** file and update the **required** label field from A360DemoPackage to MetricToImperial. Update the optional description.
  - b) Delete all other remaining lines in the **en\_US.json** file.
9. Delete the sample packages, go to **src > main > java > com.automationanywhere.botcommand**, and delete the **samples.commands** and delete the **samples** packages.
10. Create a new package, right-click on **java** folder and select **New > Package**. Enter the new package name as **metrictoimperial.commands**.
11. Create a new **Java Class**, right-click on the **metrictoimperial.commands** package, and select **New > Java Class**. Enter the name for the new class **CMtoINCH**:
  - a) Open the **CMtoINCH** class. Copy and paste the following code above the class definition statement:

```
import static
 com.automationanywhere.commandsdk.model.DataType.NUMBER;
//BotCommand makes a class eligible for being considered as an
 action.
@BotCommand
//CommandPks adds required information to be dispalable on GUI.
@CommandPkg (
 //Unique name inside a package and label to display.
 name = "CMtoInch", label = "[[CMtoINCH.label]]",
 node_label = "[[CMtoINCH.node_label]]", description =
 "[[CMtoINCH.description]]", icon = "ruler_icon.svg",
 //Return type information. return_type ensures only the
 right kind of variable is provided on the UI.
```

```
return_label = "[[CMtoINCH.return_label]]", return_type =
NUMBER, return_required = true)
```

b) Inside the **CMtoINCH** class, copy and paste the following code:

```
//Identify the entry point for the action. Returns a Value<String>
because the return type is String.
@Execute
public NumberValue action(
 //Idx 1 would be displayed first, with a text box for
 entering the value.
 @Idx(index = "1", type = AttributeType.NUMBER)
 //UI labels.
 @Pkg(label = "[[CMtoINCH.CMInput.label]]")
 //Ensure that a validation error is thrown when the value is
 null.
 @NotEmpty
 Double CMInput) {
 //Internal validation, to disallow empty inputs. No null check
 needed as we have NotEmpty on CMInput.
 if ("".equals(CMInput.toString().trim()))
 throw new BotCommandException("Input of CM is required");
 Number result;
 try {
 //Conversion logic
 result = CMInput * 0.393701;
 } catch (Exception e) {
 //Throw custom error message
 throw new BotCommandException("Unable to convert " +
CMInput.toString() + "cm to inches");
 }
 //Return NumberValue.
 return new NumberValue(result);
}
```

To import the namespaces, click the highlighted red notations and press ALT+ENTER key and select **Import** which automatically imports namespaces based on the annotations and datatypes.

```

4 import com.automationanywhere.commandsdk.annotations.*;
5 import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
6 import com.automationanywhere.commandsdk.model.AttributeType;
7
8 import static com.automationanywhere.commandsdk.model.DataType.NUMBER;
9 //BotCommand makes a class eligible for being considered as an action.
10 3 usages
11
12 @BotCommand
13 //CommandPkg adds required information to be dispalable on GUI.
14 @CommandPkg(
15 //Unique name inside a package and label to display.
16 name = "CMtoInch", label = "[[CMtoINCH.label]]",
17 node_label = "[[CMtoINCH.node_label]]", description = "[[CMtoINCH.description]]", icon = "ruler_icon.svg",
18 //Return type information. return_type ensures only the right kind of variable is provided on the UI.
19 return_label = "[[CMtoINCH.return_label]]", return_type = NUMBER, return_required = true)
20
21 public class CMtoINCH {
22 //Identify the entry point for the action. Returns a Value<String> because the return type is String.
23 1 usage
24 @Execute
25 public NumberValue action(
26 //Idx 1 would be displayed first, with a text box for entering the value.
27 @Idx(index = "1", type = AttributeType.NUMBER)
28 //UI Labels.
29 @Pkg(label = "[[CMtoINCH.CMInput.label]]")
30 //Ensure that a validation error is thrown when the value is null.
31 @NotEmpty
32 Double CMInput) {
33 //Internal validation, to disallow empty inputs. No null check needed as we have NotEmpty on CMInput.
34 if (!"".equals(CMInput.toString().trim()))
35 throw new BotCommandException("Input of CH is required");
36 Number result;
37 try {
38 //Conversion logic
39 result = CMInput * 0.393701;
40 } catch (Exception e) {
41 //Throw custom error message
42 throw new BotCommandException("Unable to convert " + CMInput.toString() + " cm to inches");
43 }
44 //Return NumberValue.
45 return new NumberValue(result);
46 }
47
48 }
49
50 }

```

12. Configure **en\_US.json** file, go to **src > main > resources > locales > en\_US.json** and add the following fields after the label and description values:

```

"CMtoINCH.label" : "cm to inches",
"CMtoINCH.node_label": "cm to inches",
"CMtoINCH.description" : "Convert centimeters to inches",
"CMtoINCH.return_label" : "Assign the Output in Inches to a Number Variable",
"CMtoINCH.CMInput.label" : "Centimeters to Convert to Inches"

```

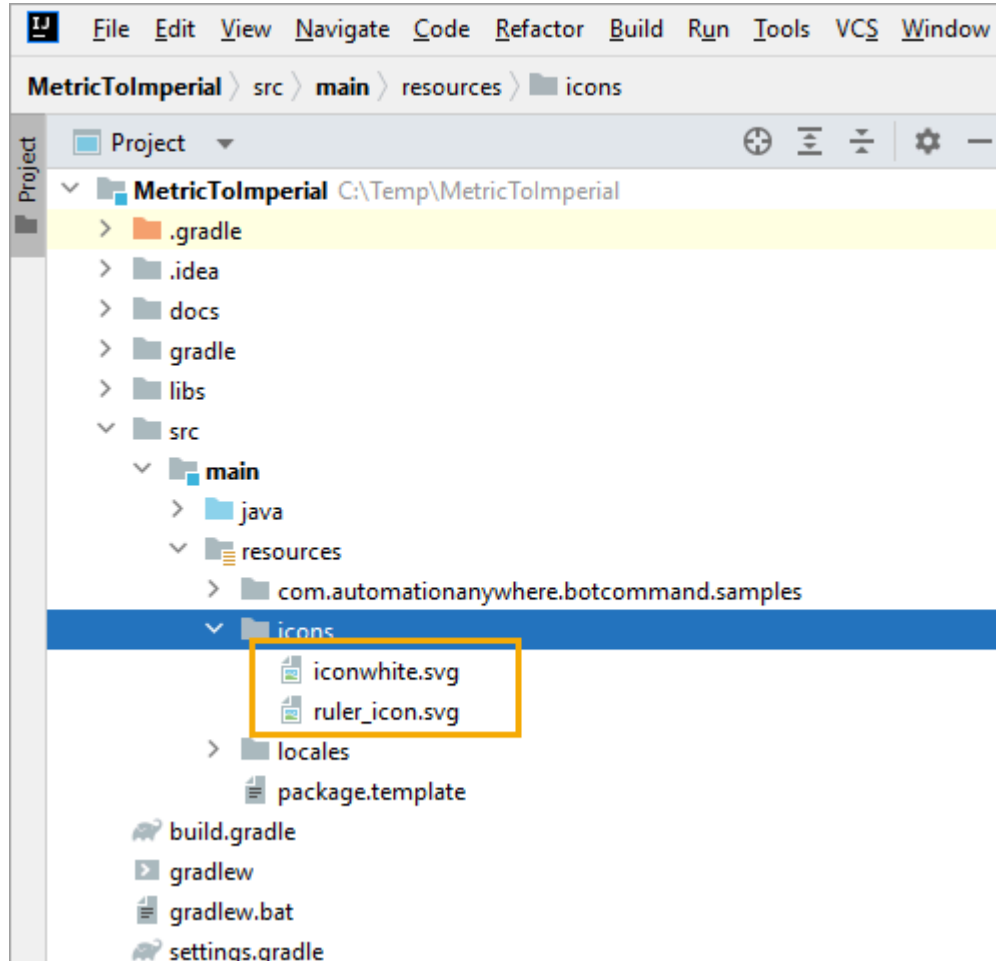

```

1 {
2 "label": "MetricToImperial",
3 "CMtoINCH.label": "cm to inches",
4 "CMtoINCH.node_label": "cm to inches",
5 "CMtoINCH.description": "Convert centimeters to inches",
6 "CMtoINCH.return_label": "Assign the Output in Inches to a Number Variable",
7 "CMtoINCH.CMInput.label": "Centimeters to Convert to Inches"
8 }

```

13. Update the CommandPkg annotation. Download icons from Github.

- a) Download `ruler_icon.svg` from [github](#) and right-click the image and save the image as `ruler_icon.svg`.
- b) Download `iconwhite.svg` from [github](#), right-click the image and save the image `iconwhite.svg`.
- c) Copy both files into the `src > main > resources > icons` folder.

14. Open the `build.gradle` in the project root. After the dependencies section, but before the last closing tag, copy and paste the following code:

```
test {
 testLogging {
 exceptionFormat = 'full'
 }
 useTestNG() {}

 afterSuite { desc, result ->
 if (!desc.parent)
 println("${result.resultType} " +
 "${result.testCount} tests, " +
 "${result.successfulTestCount} successes, " +
 "${result.failedTestCount} failures, " +
 "${result.skippedTestCount} skipped")
 }
}
```

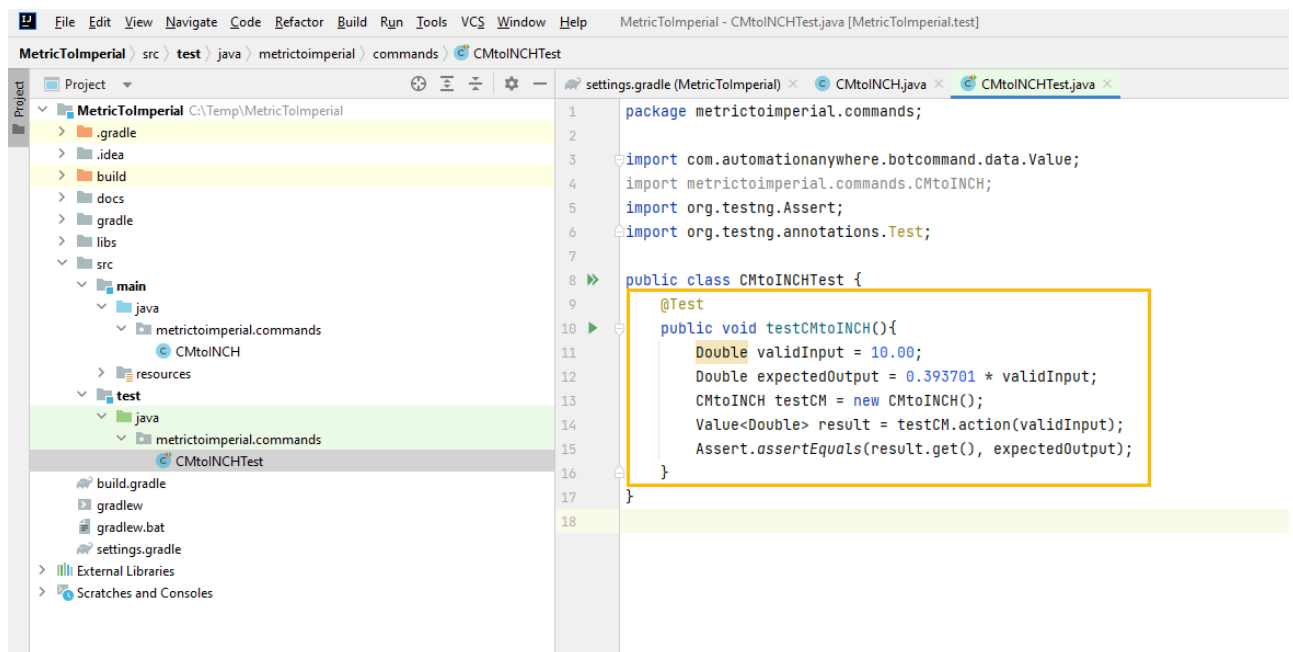

```
 maxHeapSize "3g"
}
```

15. Update the version number and remove dependencies that is not required for your project from `build.gradle`.
16. Create a new directory, right-click **src** and select **New > Directory**.
  - a) In the **Name** field, enter `test\java`, or select the **test\java** suggestion from the **Gradle Source Sets**.
  - b) Create a new package, right-click the `java` directory and select **New > Package**.
  - c) Enter the name for the newly created package: `metrictoimperial.commands`.
17. Create new Java class, right-click and select **New > Java Class**. Enter the name for the new class `CMtoINCHTest`.

Inside the `CMtoINCHTest` class, copy and paste the following code:

```
@Test
public void testCMtoINCH(){
 Double validInput = 10.00;
 Double expectedOutput = 0.393701 * validInput;
 CMtoINCH testCM = new CMtoINCH();
 Value<Double> result = testCM.action(validInput);
 Assert.assertEquals(result.get(), expectedOutput);
}
```

18. Save the project **File > Save All**.
19. Build the package.
 

You can use the IntelliJ UI or the command line. If you are using the command line:

  - a) Open a terminal window and navigate to the `MetricToImperial` directory.

- b) To build the project, enter the following command: `gradlew.bat clean build shadowJar`

A `BUILD SUCCESSFUL` message appears.

Sometimes a build might fail because existing files could not be automatically deleted and a system message appears indicating the execution failed for the task: `clean`. If this occurs, close the explorer windows and run the build again.

[Add custom package to your Control Room](#) on page 3826

## Add custom package to your Control Room

Use the compiled JAR file and upload it as a package to your Control Room in Automation 360.

- Complete the steps in [Build a custom package in IntelliJ](#) on page 3819.
  - Ensure you have the following:
    - Access to the Control Room.
    - Credentials with **AAE\_Basic** permission or a custom role with permissions to add packages to the Control Room.
1. From Windows Explorer, go to `C:\Users\<Username>\IdeaProjects\MetricToImperial\build\libs` and locate `MetricToImperial-1.0.0.jar`.
  2. Log in to your Control Room as a user with permissions to add a new package.
  3. Click **Manage > Packages**.
  4. In the **Packages** page, move your mouse over the plus sign and click **Add package**.
  5. In the **Add package** page, click **Browse** and locate the `MetricToImperial-1.0.0.jar` file. By default, the file is located at: `C:\Users\<Username>\IdeaProjects\MetricToImperial\build\libs`.
  6. Select the `MetricToImperial-1.0.0.jar` file and click **Open**.
  7. Click **Upload Package**.

When you add a custom package to the Control Room, a notification is also sent to the Control Room users to notify about package updates. This notification is sent to the users who have the **View package** permission. For more information, see [#unique\\_358/unique\\_358\\_Connect\\_42\\_package-event](#) event notification.

## Create a bot to test the custom package

Use the actions in Automation 360 to create a bot and test the custom package.

Ensure you have the following to build the bot:

- Access to the Control Room.
  - Credentials with **AAE\_Basic** permission or with a custom role to build a bot.
  - Your workstation is a registered device in the Control Room.
  - Your package **MetricToImperial-1.0.0.jar** is available in the Control Room.
1. Log in to the Control Room.
  2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  3. Click the **Create a bot** icon.
  4. In the **Name** field, enter `MetricToImperialTest`.
  5. Click **Create & Edit**.
  6. In the Actions pane, find **Metric to Imperial** and drag **Convert centimeters to inches** into the bot flow.
    - a) In the **CM to Convert** field, enter 1.
    - b) Click **Create variable** (next to the **Output** field) to create a new number variable.
    - c) In **Create Variable**, enter `nInchesOutput` and click **Create & Select**.
    - d) Click **Apply**.
  7. In the Actions pane, find the **Number** package and drag the **To String** command below **Convert centimeters to inches**.
    - a) In the **Enter a number** field, enter **F2** and select **nInchesOutput**.
    - b) In the **Enter number of digits after decimal** field, enter 5.
    - c) In the **Assign the output to variable** field, select **prompt-assignment - String** from the drop-down list.
    - d) Click **Apply**.
  8. From the Actions pane, drag **Message box**, click **F2** and insert the **prompt-assignment variable**.
  9. In the **Enter the message to display** field, click **F2** and select the **prompt-assignment variable**.
  10. Click **Apply** and **Save**.
  11. Click **Run**.  
The bot displays the 0.39370 message, which is a successful build.

## Using Python to parse JSON response

Use the Automation 360 Python script to execute Python functions to build a bot. Use the Python functions to parse the JSON response from a REST Web Services GET request.

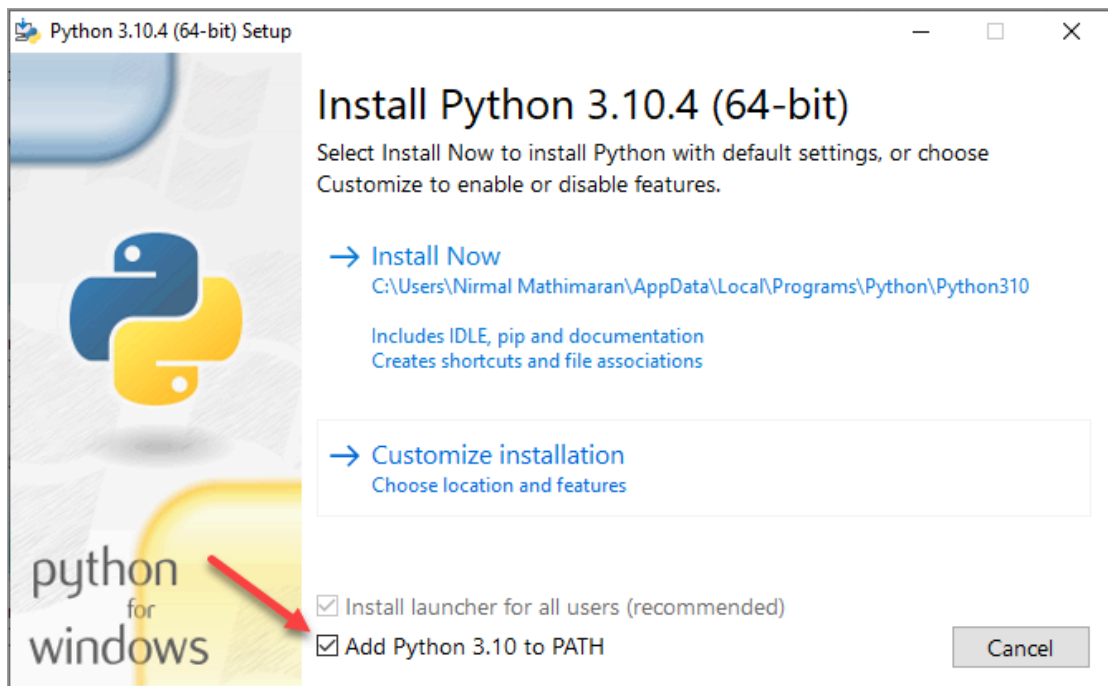

Ensure you have the following to build the bot:

- Basic understanding of Python programming language.
- Basic experience with creating Automation Anywhere bots.
- Download and install Python 3.

[download Python](#)

Do one of the following:

- While installing the Python, make sure to select **Add Python x.xx to PATH** during the Python installation.

- Add a path to the Environment variable.

1. Log in to the Control Room.
2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
3. Click **Create a bot** icon.

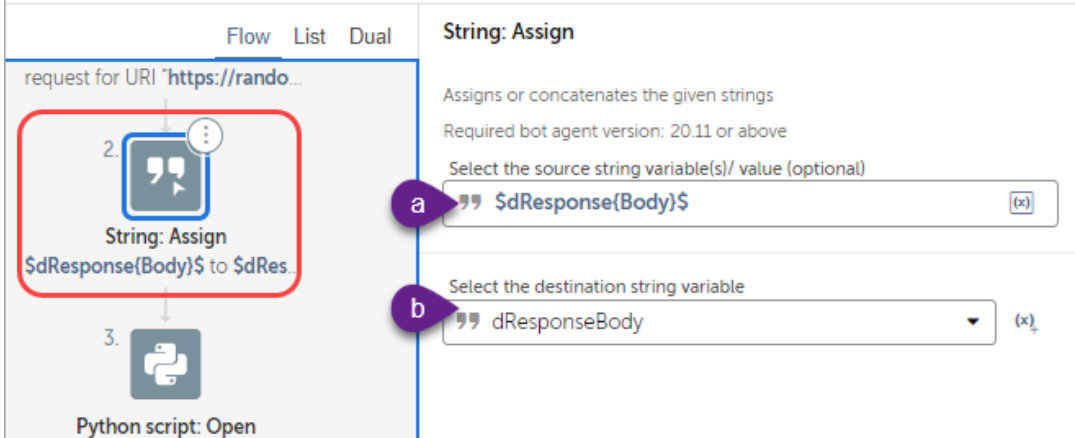

4. In the **Name** field, enter PythonTutorial.

5. Click **Create & Edit**.
6. In the Actions pane, click **Variables** to create the following new variables:
  - a) Name dResponse, **Type > Dictionary** and **Subtype > String**.
  - b) Name dRetrieveValue, **Type > Dictionary** and **Subtype > Any**.
  - c) Name dResponseBody, **Type > String**.
  - d) Name sFullName, **Type > String**.
  - e) Name sLocation, **Type > String**.
  - f) Name sTotalUserCount, **Type > String**.
  - g) Name nTotalUserCount, **Type > Number**.
  - h) Name nCurrentUser, **Type > Number**.
  - i) Name sCurrentUser, **Type > String**.
  - j) Name prompt-assignment, **Type > String**.
7. From the Actions pane, select **REST Web Services > Get method** and place it under the **Start** of the bot flow.
  - a) In the **URI** field, enter <https://randomuser.me/api/?results=5&inc=name,email,location&nat=us>.  
This is a sample API that returns random user details to the calling application.
  - b) In the **Authentication Mode** drop-down list, select **No Authentication**.

The screenshot displays the configuration for a REST Web Services: Get method action. The left pane shows a flowchart with six steps: 1. REST Web Services: Get method (highlighted with a red box), 2. String: Assign, 3. Python script: Open, 4. Python script: Execute function, 5. Dictionary: Put, and 6. String: To number. The right pane shows the configuration for the REST Web Services: Get method action, including the URI field (containing 'https://randomuser.me/api/?results=5&inc=na'), Authentication Mode (set to 'No Authentication'), and the 'Assign the output to a variable' dropdown (set to 'dResponse').

- c) In the **Assign the output to a variable** drop-down list, select **dResponse -Dictionary of Strings**.
8. From the Actions pane, click **String > Assign** action and drag it into the canvas below the **REST Web Services** action.
- a) In the **Select the source string variable value** field, enter `$dResponse{Body}$`.

The image shows a screenshot of the Automation Anywhere interface. On the left, a flow canvas is visible with three steps: 1. A request for URI 'https://rando...'. 2. A 'String: Assign' action, which is highlighted with a red box and labeled with a purple callout 'a'. The text below the action reads 'String: Assign \$dResponse(Body)\$ to \$dRes...'. 3. A 'Python script: Open' action. On the right, the configuration pane for the 'String: Assign' action is shown. It includes the title 'String: Assign', a description 'Assigns or concatenates the given strings', and a required bot agent version of '20.11 or above'. The configuration is divided into two sections: 'Select the source string variable(s)/ value (optional)' with a callout 'a' and a dropdown menu containing '\$dResponse(Body)\$', and 'Select the destination string variable' with a callout 'b' and a dropdown menu containing 'dResponseBody'.

- b) In the **Select the destination string variable** drop-down list, select **dResponseBody - String**.
9. From the Actions pane, click **Python script** > **Open** and drag it into the canvas below the **String** > **Assign** action.

  - a) In the **Python** field, select **Manual input**.

The screenshot displays the Automation Anywhere interface. On the left, a workflow is visible with steps: 1. request for URI "https://rando...", 2. String: Assign, 3. Python script: Open (highlighted with a red box and callout 'a'), 4. Python script: Execute function "get\_node\_count" with param..., 5. Dictionary: Put, 6. String: To number, and 7. Loop. On the right, the "Python script: Open" configuration panel is shown. It includes a "New Python session" dropdown set to "Default", a "Python" section with "Manual input" selected, and a "Enter script here" text area containing Python code. Callout 'b' points to the code area, and callout 'c' points to the "Python runtime version" dropdown set to "3".

itemCount = int(dictRequest['count'])
#parse response as json
response_dict=json.loads(dictRequest['response'])
Create list from JSON body
response_body = response_dict['results']
#Extract values to return
return response_body[itemCount]['name']['first'] + " " +
response_body[itemCount]['name']['last']

def get_location(dictRequest):
itemCount = int(dictRequest['count'])
#parse response as json
response_dict=json.loads(dictRequest['response'])
Create list from JSON body
response_body = response_dict['results']
#Extract values to return
return response_body[itemCount]['location']['city'] + ", " +
response_body[itemCount]['location']['state']

```

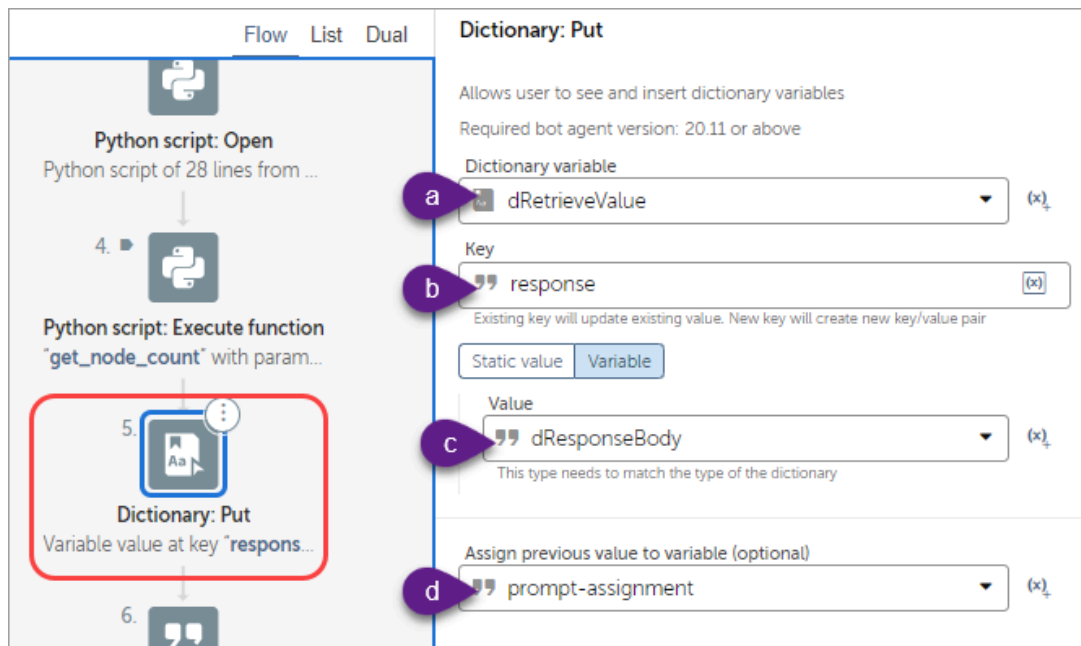

- c) In the **Python runtime version** field, retain the default value as **3**.
10. From the Actions pane, click **Python script > Execute function** and drag it into the canvas below the **Python script > Open** action.
- a) In the **Python session** field, retain **Default**.
- b) In the **Enter the name of function to be executed** field, enter `get_node_count`.
- c) In the **Arguments to the function** drop-down list, select **dResponseBody - String**.

The screenshot displays the Automation Anywhere interface. On the left, a workflow canvas shows a sequence of actions: 'Python script: Open', 'Python script: Execute function' (highlighted with a red box and labeled '4'), and 'Dictionary: Put' (labeled '5'). On the right, the configuration panel for the 'Python script: Execute function' action is shown. It includes the following fields:

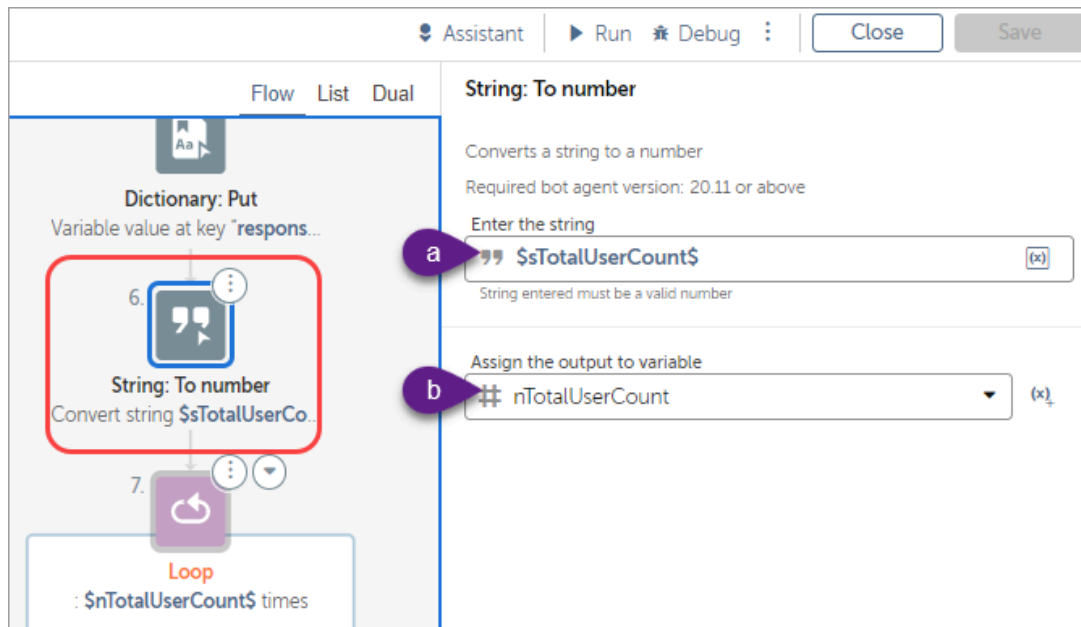

- Python session:** Set to 'Default' (labeled 'a').
- Enter name of function to be executed:** Set to 'get\_node\_count' (labeled 'b').
- Arguments to the function (optional):** Set to 'dResponseBody' (labeled 'c').
- Assign the output to variable (optional):** Set to 'sTotalUserCount' (labeled 'd').

- d) In the **Assign the output to a variable** drop-down list, select **sTotalUserCount - String**.
11. From the Actions pane, click **Dictionary > Put** and drag it into the canvas below the **Python script > Open** action.
- a) In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.
- b) In the **Associate to this key** field, enter `response`.

- c) In the **New value** drop-down list, select **dResponseBody - String**.
- d) In the **Assign previous value to a variable** drop-down list, select **prompt-assignment - String**.

12. From the Actions pane, click **String** > **To number** and drag it into the canvas below the **Dictionary** > **Put** action.
- a) In the **Enter the string** field, enter `$$TotalUserCount$`.
  - b) In the **Assign the output to a variable** drop-down list, select **nTotalUserCount - Number**.

13. From the Actions pane, click **Loop** > **Loop**.

- a) In the **Loop Type > Iterator**, select **For n times** from the drop-down list.
- b) In the **times** field, enter `$nTotalUserCount$`.
- c) In the **Assign the current value to a variable** drop-down list, select **nCurrentUser - Number**.

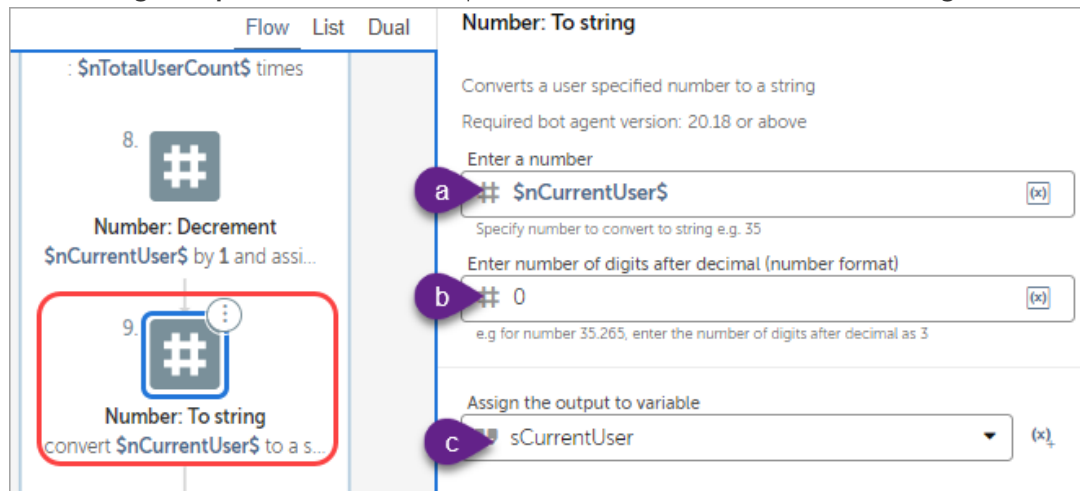

14. From the Actions pane, click **Number**, select **Decrement** and place it inside the **Loop** action.
  - a) In the **Enter number** field, enter `$nCurrentUser$`.
  - b) In the **Enter decrement value** field, enter 1.
  - c) In the **Assign output to a variable** drop-down list, select **nCurrentUser - Number**.

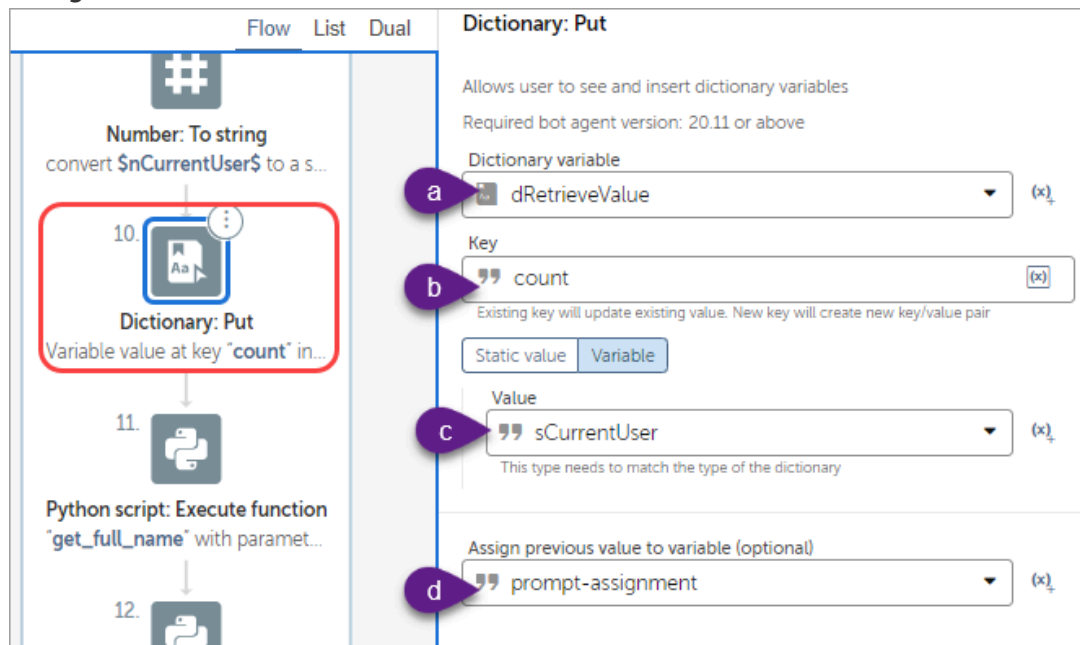

15. From the Actions pane, click **Number**, select **To string** and place it inside of the **Loop** action, below **Number > Decrement**.
  - a) In the **Enter a number** field, enter `$nCurrentUser$`.
  - b) In the **Enter number of digits after decimal** field, enter 0.

- c) In the **Assign output to a variable** drop-down list, select **sCurrentUser - String**.

16. From the Action pane, click **Dictionary > Put** and place it inside of the **Loop** action.

- In the **Dictionary variable** field, select **dRetrieveValue -Dictionary**.
- In the **Associate to this key** field, enter **count**.
- In the **New value** drop-down list, select **sCurrentUser - String**.
- In the **Assign previous value to a variable** drop-down list, select **prompt-assignment - String**.

17. From the Actions pane, click **Python script > Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter **get\_full\_name**.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.

- d) In the **Assign the output to a variable** drop-down list, select **sFullName - String**.

The screenshot shows the configuration for a Python script action. The left pane displays a flow with three actions: 'Dictionary: Put', 'Python script: Execute function' (highlighted with a red box and labeled '11'), and another 'Python script: Execute function'. The right pane shows the configuration for the selected action, with callouts 'a' through 'd' pointing to specific fields:

- a**: Python session (Default)
- b**: Enter name of function to be executed (get\_full\_name)
- c**: Arguments to the function (optional) (dRetrieveValue)
- d**: Assign the output to variable (optional) (sFullName)

18. From the Actions pane, click **Python script > Execute function** and place it inside of the **Loop** action.

- In the **Python session** field, retain **Default**.
- In the **Enter the name of function to be executed** field, enter `get_location`.
- In the **Arguments to the function** drop-down list, select **dRetrieveValue - Dictionary**.
- In the **Assign the output to a variable** drop-down list, select **sLocation - String**.

The screenshot shows the configuration for a Python script action. The left pane displays a flow with three actions: 'Python script: Execute function' (highlighted with a red box and labeled '12'), another 'Python script: Execute function', and 'Message box'. The right pane shows the configuration for the selected action, with callouts 'a' through 'd' pointing to specific fields:

- a**: Python session (Default)
- b**: Enter name of function to be executed (get\_location)
- c**: Arguments to the function (optional) (dRetrieveValue)
- d**: Assign the output to variable (optional) (sLocation)

19. From the Actions pane, click **Message box** and place it inside of the **Loop** action.

- a) In the **Enter the message to display** field, enter the following:

```
Full Name: $sFullName$ Location: $sLocation$
```

- b) Select **Close message box after** > **Seconds**, enter 5.

The screenshot shows the configuration for a 'Message box' action. The left pane displays a flow with a Python script action followed by a 'Message box' action (step 13). The right pane shows the configuration for the 'Message box' action, including the window title, the message to display, and the scrollbar settings.

- Message box**
  - Displays a message box
  - Required bot agent version: 20.11 or above
  - Enter the message box window title: Automation Anywhere Enterprise Client
  - Enter the message to display: Full Name: \$sFullName\$ Location: \$sLocation\$
  - Scrollbar after lines: 5
  - Close message box after

20. From the Actions pane, click **Python script** > **Close** and place it outside of the **Loop** action.

- a) In the **Python session** field, retain **Default**.

The screenshot shows the configuration for a 'Python script: Close' action. The left pane displays a flow with a 'Python script: Close' action (step 14) and an 'End' action. The right pane shows the configuration for the 'Python script: Close' action, including the Python session name.

- Python script: Close**
  - Closes Python script execution session
  - Required bot agent version: 20.11 or above
  - Python session: Default
  - The name you gave the Python session when you opened it.

21. Click **Save** to save your bot, and then click **Run**.

The bot runs, displaying five full user names with locations for approximately 5 seconds each before completing its successful execution.

If you get a Bot **Error** message, see the following sections for a solution: [Getting Bot Error while executing Python Script/Function \(A-People login required\)](#), [Getting Bot Error or True value in message box while executing Python Script \(A-People login required\)](#), or [An unexpected error occurred while executing Python Script command; Error code: bot.execution.error \(A-People login required\)](#).

## Use JavaScript to build a bot to take user input

Use the JavaScript actions Automation 360 to execute JavaScript functions to build a bot. Use the actions to create a bot that takes user input and provides the appropriate output.

Ensure you have the following to build the bot:

- Basic understanding of JavaScript programming language.
  - Basic experience with creating Automation Anywhere bots.
1. Log in to the Control Room.
  2. On the left pane, click **Automation**.  
A list of available and forms is displayed.
  3. Click **Create a bot** icon.
  4. In the **Name** field, enter `Hello User`.
  5. Click **Create & Edit**.
  6. In the Actions pane, click **Variables** to create the following new variables:
    - a) Name `lInputList`, **Type** > **List** and **Subtype** > **String**.
    - b) Name `sInputName`, **Type** > **String**.
    - c) Name `sOutput`, **Type** > **String**.
  7. From the Actions pane, click **Prompt** > **For value**:
    - a) In the **Prompt window capture** field, enter `Enter your name here`.
    - b) In the **Prompt message** field, enter `Please enter your name here`.
    - c) In the **Assign the output to a variable** drop-down list, select **sInputName - String**.
  8. From the Actions pane, click **List** > **Add item**:
    - a) In the **List variable** drop-down list, select **lInputList - List**.
    - b) In the **Item to be added** drop-down list, select **sInputName - String**.
    - c) In the **Add item** field, select **To end of list**.
  9. Create a new JavaScript file.
    - a) Open a notepad, and copy and paste the following code:

```
function response(str) {
 return "Hello "+ str
}
```
    - b) Save the file in your desktop as `Salutation.js`, and select **Save as type:** as **All Files**.
  10. From the Actions pane, click **JavaScript** > **Open**:
    - a) In the **JavaScript session** field, leave as **Default**.
    - b) In **JavaScript** > **Import existing file**, for the **JavaScript file** field, select **Desktop file**.
    - c) Click **Browse** and select the `Salutation.js` file from your desktop or where you saved the file.

- d) In the **Assign the output to a variable** drop-down list, select **sOutput - String**.
11. From the Actions pane, click **JavaScript > Run JavaScript**:
  - a) In the **Enter name of the function to be executed** field, enter `response`.
  - b) In the **Parameters** drop-down list, select **InputList - List**.
12. From the Actions pane, click **Message box**:
  - a) In the **Enter the message to display** field, enter `$sOutput$`.
13. Click **Save** to save your bot, and then click **Run**.
14. When the bot prompts to enter a name, enter the name and click **OK**.  
A message from the bot appears: `Hello <User>`.

## Bot developer recommendations

Automation Anywhere provides a flexible platform for bot and package development. The information in this topic provide guidelines and recommendations on how to structure and develop robust and reusable bots and packages.

### Bot Store submissions checklist

Use the checklist to ensure that your Automation 360 Bot Store submission is correctly created, processed, and accepted. If you do not follow requirements listed in the checklist, your submission will be rejected and will not be published on the Bot Store page.

Use this checklist from Pathfinder Community: [Automation 360 bot submission checklist](#).

### Building reusable bots

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

Define prerequisites, input, output, and variables

When you build bots for reusability, define the following:

- Document all necessary prerequisites on how to use your bot either on its own or as a subtask.
- When creating your bots, define values as input, output, or local. Input and output variables are used when your bot is designed to be used as a subtask, allowing it to receive and pass back values to or from another calling bot.
- Provide meaningful variable descriptions when defining input and output variables so that other developers know how to interact with your subtask.

- Adhere to an established standard for variable naming guidelines. Review the Automation Anywhere user-defined variables for variable naming guidelines. [Your variables \(user-defined\)](#) on page 2483

#### Follow single-responsibility principle

Bots developed for reusability should follow the single - responsibility principle which states that each subtask or component should have responsibility over a single part of the functionality of the overall bot and that responsibility should be entirely encapsulated by that subtask or component.

Other examples of single-responsibility:

- A subtask that processes a single transaction, but can be called multiple times for each transaction on a list.
- A subtask that collects screen display data on a single page of a website, but can be called multiple times as a bot goes through pagination.

#### Bot design considerations

Consider the following patterns based on which templates must be developed for use:

##### 1. Primary, Main, and Sub bots

- Primary bot: This bot is called directly to begin the process, through mechanisms including scheduling through the Control Room or API call. Include the following major process steps in the **TRY** section:
  - a) Initial setup for the process.
  - b) Validation that the setup was successful. For example, check whether all required files and folders exist or initial variable values are populated as required.
  - c) Run the desktop **PRE-PROCESS CLEANUP**.
  - d) Call the main bot to run the business logic of the process.

In the **FINALLY** section, run the desktop **POST-PROCESS CLEANUP**.

- Main bot: This bot calls the sub bots as required to run the business logic of the process. Include the following major process steps in the **TRY** section:

- a) Validation of any input. For example, input variable values from the primary bot.
- b) Execution of sub bots.
- c) Validation of any output.
- d) Ensure population of any output variable values based on the execution of main bot, to return to the primary bot.

In the **CATCH** section, log the error, and ensure population of any output variable values, for example, **oStrResult** to pass back to the primary bot.

- Sub bots
  - A sub bot is called by the primary bot or main bot to run the actual business logic required for the automation. They are also referred to as helper tasks or utility tasks because their only purpose is to assist the calling task.
  - Use output variables to return a result indicator to the calling bot either main, or another sub bot. For example, **outStrResult**. The value contains an error message if the processing was not successful due to an error or exception that had occurred.

2. Main and Sub bots: This pattern includes the primary and the main bot in a single main bot. The design pattern of the Sub bot is similar to the design pattern explained above.

## Opening and closing applications

Any applications, files, or windows that a bot or subtask opens must be closed by the same bot or subtask.

- For example, when a bot opens Microsoft Excel to perform a spreadsheet operation, verify that the spreadsheet and Excel are closed when the bot finishes processing.
- Close applications when the bot execution is successful or unsuccessful.
- Use the **Finally** block of the **Try/Catch/Finally** operation to ensure applications

are closed regardless of success of the task processing.

- In the case that applications do not respond during testing, consider using the command prompt to forcefully close (kill) the applications. For example, to forcefully close power point, the command-line operation would be:

```
Taskkill /IM powerpnt.exe /F
```

## Error handling

After completing the task, verify that the bot successfully handles any failure or exceptions.

- Each task or subtask must handle its own errors.
- An unhandled exception in a subtask can cause issues in a parent task.
- Use **Try/Catch/Finally** blocks at the root level of every bot.
- Use **Try/Catch** blocks inside of a loop if you want to try an operation multiple times before reporting a failure.

## Event or exception handling

Other than action errors that are captured by **Try/Catch**, you must perform code checks for other processes such as events or exceptions. If a certain process condition occurs, notify or log these conditions for additional analysis.

- Develop a configurable event handler Task Bot that minimizes the requirement for code changes if the actions change. For example, maintain an XML file that contains a definition of all the possible events or exceptions and any notification requirements when those events or exceptions occur.
- In the code, when such events or exceptions occur, write the information to an event log. You can also add memory usages and capture a screenshot.
- Run the event handler Task Bot to process the event or exception. For example, issue a notification using parameters such as email recipient, CC recipient, or subject from the XML file.
- If the notification requirements vary for each environment, or change over time, the configuration file can be updated without having to change the code.

### Running bots on other computers

When designing a bot, enable it so it runs on computers other than the computer on which a bot was created.

- Use variables for local file paths, network shares, or window titles so that your bot can successfully run from other machines.
- Consider using global values for environment markers or network shares that multiple bots need access to.
- Use wildcard characters for window titles where appropriate to enable bots to run regardless of specific environment or version of the target application. For example, instead of using

```
Salesforce - Professional
Edition - Internet Explorer
```

use the following:

```
Salesforce - * - Internet
Explorer
```

### Using prompts, message boxes, and infinite loops

Prompts and message box actions stop the bots from running when waiting for a user input. Unless a user input is required, design the bots without using prompt statements.

- When using loops, ensure all loops have a definite end by clearly defining their number of iterations or specifying where break loop actions need to exist.
- If your bot is intended to run as an unattended bot, remove or disable any prompts or message box actions.
- If you are building bots for an attended automation scenario, message boxes and prompts are often reasonable or required for bots to run as expected. Use message boxes to display different variables, such as, responses, outputs, or values.

### Storing sensitive data in the Credential Vault

The Control Room includes the Credential Vault that can be used to store sensitive information, such as user names, passwords, API keys, and tokens.

- When building a bot, create a locker in the Control Room using the Credential Vault to store credentials and retrieve them as required by referencing the credential and the attribute. This allows users to create

bots that consume APIs or perform logins without the need for bot builders to directly hard-code the required credentials within a bot.

- Do not hard-code sensitive credentials into a bot, or a subtask, because hard-coded storage in a bot introduces a security risk.
- When Credential Vault values are required to be used in a bot, verify that all locker names and credentials are clearly defined in the bot documentation. If required, include details on how to obtain credentials, for example, an API key or a token.

#### Testing independent tasks

When creating bots for reusability, design them in a way that they can be tested independently of other subtasks.

- Practice the test-driven development (TDD) approach: When adding a new bot, or a new feature in an application, write a test case for it.
- In a test case, define the specific function that validates that feature or functionality.
- For single-responsibility principle and reusability, create many smaller tasks that can be tested independently.

#### Using comments and steps

Comments enable developers to provide descriptions within their bots so that other bot developers can better understand what each section, block of code, or subtask is designed for. Include clear comments to allow developers to understand the purpose of the function of a given code block.

- When bots are submitted to the Bot Store, commenting demonstrates how to customize the bot.
- Using comments makes code maintenance easier because section descriptions help identify where changes might be required to enable developers to work towards quicker issue resolution
- Comments on bots that are a work in progress can be helpful when creating placeholders for future work. Consider using a TODO command as a reminder to add logic to the bot, but update the comments when the work is completed.
- Automation 360 includes the Step action, which provides the capability to organize

the code into logical groupings to improve readability and the flow.

- Create an outline of the major objectives of your bot by using empty, labeled step actions. When that is completed, go back to each step and complete the logic for the step.

## Creating logging files

Identifying problems without logs can be difficult when bots are running unattended on any number of Bot Runners. Software developers, support teams, and bot owners rely on logs to understand where their automations have issues and how to diagnose problems. Bots must log errors to get error details.

- Use error handling and screen captures to better understand when a bot or subtask encounters an error.
- Use the A2019 Bot Store template that contains basic error handling, logging, and snapshot capabilities with the customizable root logging location for maintaining older log files.

### [Bot Store bot template](#)

- If required, create additional logging files and include a full audit history of everything a bot or subtask has done. The additional log files can include audit, debug, and performance information about the bot, as well as the following:
  - Main bot start and end time.
  - Subtask start and end time.
  - The completion time of specific milestones defined within the bot.
  - Number of transactions received in an input file.
  - Number of successfully processed or failed transactions.

---

**See also:** [Best practices: Building reusable and secure Automation 360 bots and packages](#)

---

### Related tasks

[Using Loop action](#) on page 2986

Use the Loop action to repeatedly run a sequence of actions for a specific number of times or until a condition is met.

### Related reference

[Your variables \(user-defined\)](#) on page 2483

Users and some actions create user-defined variables to temporarily hold values. Use this kind of variable to input values into an action (window title, login credential, or file path) or to accept the output of an action (values read from a file or a Boolean return).

[Application package](#) on page 2583

Use the `Open Program/File` action in the `Application` package to launch an application or a file. This action supports `.exe`, `.bat`, script files, or shortcut paths.

[Error handler package](#) on page 2709

If a bot encounters an error due to an abnormal condition or exceptions during execution, the normal execution of the bot is hindered, and the bot fails to complete the task. The Error handler package contains actions that enable you to easily handle exceptions a bot encounters and transfers control to the other actions within that bot.

[Step package](#) on page 3278

The `Step` package groups various actions together and runs them in a specific order. You can provide a relevant name for a step to identify the operation performed by the actions included in that step.

[Prompt package](#) on page 3097

Use the `Prompt` package to accept an input value, a yes/no response, or to open a file or folder.

[Message box package](#) on page 2988

Use the **Message box** action from the **Message box** package to insert a message box that shows a message when the task runs. For example, you can insert a **Message Box** action to follow a web form so that the action displays the message: `Web Form Filled and Complete`.

## Building reusable packages

Review the guidelines to understand how to build packages for reusability.

Know your incoming data

When setting fields that your action package requires from the user, provide specifics in setting the attribute type to limit the kinds of data that your package receives.

- Limit the input to reduce the burden of checks that have to be done when the package is received.
- Javadoc includes 34 defined attribute types, so review those when you build your package to select the appropriate field types.
- Set your package so that it takes a stored value. For example, on behalf of the bot, your package is making API calls, verify that the `AttributeType` of the action input field for the API key or a token is set to `credential`. This way users are encouraged to use a value stored in the Credential Vault for sensitive input data that the package requires.

Use labels appropriately

In the `CommandPkg` annotation, use different labels, `node_labels`, and descriptions appropriately.

- Use these labels as short descriptions of your action and use only a few words to describe an action.
- Replicate the same naming style as it is presented in the default Action packages.
- Each action is a child element of a package, and the action label is displayed along with the package icon in the Actions pane. Use short names to describe each action.
- Document an expected input format for certain fields. Use the parameter description for the @Pkg annotation. This allows package developers to review the format, requirement, or data that must be used for a specific input field. For example:

```
@Pkg(label = "Start Date",
 description="Date Format as
 MM/DD/YYYY")
```

#### Unit test your components

During the package development, create unit tests to validate that each component and the action of the package is working as expected.

- Validate the behavior of the individual test unit, a single class, or a single action, to ensure that it is functioning as expected.
- Review and document any feature or functionality defects at early stages of the development process.

#### Handling errors

Include the error handling in the bot logic to ensure that all errors are handled gracefully. If an error is not handled, it could prevent a bot runner from executing other tasks.

- Create meaningful error messages that can help bot consumers with error resolutions.
- As a package developer, keep in mind these recommendations:
  - Use **Try/Catch** block to accommodate for an error.
  - Use a multi-catch block to find specific errors, and use the **BotCommandException** to return customized error messages. For example:

```
//create array of 3 items
int[] myIntArray = new int[]
{1, 0, 7};
try {
 //print 4th item in array
```

```
System.out.println(myIntArray[3]);
//Perform operation on
first and second items in
array
 int result =
myIntArray[0] /
myIntArray[1];
} catch
(ArrayIndexOutOfBoundsException) {
 //Throw custom message
for IndexOutOfBounds
 throw new
BotCommandException("The
array does have the number
of expected items.");
} catch (ArithmeticException
e) {
 //Throw custom message on
Arithmetic Exception
 throw new
BotCommandException("Math
Operation Error with " +
Integer.toString(myIntArray[0])
+ " and " +
Integer.toString(myIntArray[1]));
}
```

Follow single-responsibility principle

A package is a collection of actions. Each action within a package must have a single responsibility and that responsibility must be encapsulated by that action.

- Following the single-responsibility principle helps your package consumers to implement it easily, simplifies testing, and avoids unnecessary modifications.
- The actions that you offer allow package consumers to customize the way they use your package within their bots, and can help their bots be as efficient as possible.

Provide examples

When submitting packages to the Bot Store include a demo bot that demonstrates the use of the package.

- Use the Automation 360 actions and allow package consumers to use these actions to expend their bot capabilities.
- Always provide sample bots with descriptions to help your package consumers with the knowledge they require to understand its proper use.

Review the guidelines to gain a better understanding of how to develop bots or subtasks for reusability, from designing and creating through reusing.

## Troubleshooting and debugging

Troubleshooting and debugging information.

### Troubleshoot bot run issue

Issue: I'm unable to deploy a bot because I get the following – Unexpected error setting up a new user session.

Cause:

Most often, this error is caused by invalid device credentials.

Solution:

Confirm the device is registered and connected.

1. Select **Manage > Devices** from the Control Room.
2. Confirm that the Status column shows **Connected** for the relevant device.

Confirm that the device username and password are correct.

1. Select your profile on the left pane and select **My Settings > My profile**.
2. Verify the device username.

Depending on how the device is configured within the network, you might need to prepend it with the domain name. For example, domainname \firstname.lastname.

3. Verify the device password.

### Other resources

- [Could not deploy due to one of the following issues-User is already running a bot on device \(A-People login required\)](#)
- [A360| Run bot pre processing failed \(A-People login required\)](#)
- [Automation 360 Device error while running a bot \(A-People login required\)](#)

## Bot Agent log files

Various types of information about the Bot Agent are captured in different log files. You can analyze these log files when the Bot Agent or a bot encounters an error and identify the root cause for that error.

### Overview

The Bot Agent log files enable you to perform these actions:

- Determine whether a bot ran successfully
- Identify issues that resulted in a bot failure
- Determine if the device is properly connected with the Control Room

### Log file locations

The Bot Agent log files are available at `C:\ProgramData\AutomationAnywhere\BotRunner\Logs` on your device. The following files are available at this location:

Bot_Launcher	Captures information about the execution of a bot such as the operations performed, events triggered, and errors encountered by the bot. The filename now includes the name of the user running the bot on the Bot Runner. For a multi-user session machine, there will be a bot launcher log per user.
Node_Manager	Captures information about when a bot is run from the Control Room and communication details between a Bot Runner and the Control Room.

### Log file configuration

To configure the different types of log files that can be collected from the devices connected to the Control Room, see [Configure log collection](#) on page 1915.

## Bot Store

You can access Bot Store from the Control Room. From Bot Store, you can download bots or packages to your Control Room repository.

There are two ways for you to get bots and packages from Bot Store into your Control Room:

- You can load items directly from Bot Store to your Control Room, without needing to download the items locally. For details, see [Directly import bots and packages from Bot Store to Control Room](#) on page 3854.

- You can download items from Bot Store locally, then import them to your Control Room, even if your Control Room is not connected to the internet. For details, see [Download locally and import bots and packages from Bot Store to Control Room](#) on page 3855.

## Access Bot Store from the Control Room

As a Bot Store registered user, you can log in to Bot Store from the Control Room.

You must have valid Bot Store credentials to access Bot Store from the Control Room. If you do not have valid Bot Store credentials, you must register with Bot Store.

1. Log in to the Control Room.
2. Click the **Bot Store** tab.  
Bot Store opens in a separate window (<https://botstore.automationanywhere.com>).
3. Log in using your Bot Store credentials.

In the Control Room, you can see **My downloads** under the **Bot Store** tab.

Watch the following video on how to find bots on Bot Store.

Related concepts

[Bot Store](#) on page 3851

You can access Bot Store from the Control Room. From Bot Store, you can download bots or packages to your Control Room repository.

Related tasks

[Submit bots or packages to Bot Store](#) on page 3852

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

[Directly import bots and packages from Bot Store to Control Room](#) on page 3854

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

## Submit bots or packages to Bot Store

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

You must have a system-created **AAE\_Bot Store Publisher** role in order to submit bots or packages to Bot Store. See [System roles](#) on page 1882.

1. Download the A2019 Bot Store Bot template from GitHub: [A2019 Bot Store Bot Template](#).
2. Log in to the Control Room.

3. Log in to Bot Store using the Bot Store credentials.
4. On the left pane, click **Automation**.  
A list of available and forms is displayed.
5. Click **Public** workspace and select the **Bot Store** folder.
6. In the **Automation** page, move your mouse over the **Action** toolbar and click **Submit to Bot Store**.
  - a) In the **Submit to Bot Store** page, review the dependencies that will be bundled with your bot (including a parent bot) and make changes as required. In addition, ensure that the bot and all dependent bots and files are in the same folder to submit to Bot Store.
  - b) Click **Next** to review the **Bundled packages** to ensure all packages are included with your submission.
  - c) If the bot you want to submit and the bundled package look complete, click **Submit**.  
When choosing a name for your bot or package, ensure it is unique and descriptive so it is easily searchable on Bot Store.  
Alternatively, click **Back** to go back.  
When you submit your files, the system displays the following message: <bot/package name> submission is in progress. Go to Bot Store > My Submissions to complete your submission form. You will receive a confirmation email when the submission is completed.
  - d) Click **Take me to Bot Store** to complete your submission form in Bot Store.

When you resubmit files to Bot Store, the system overwrites the previously submitted files, which are in a **Draft** status.

- It can take 3 to 5 business days for the review and approval of your bot or package.
- For any questions on bot or package submissions, review the [Bot Store FAQ](#), or select the **Have questions about submitting a bot** option on Bot Store pages.

Related concepts

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

## Directly import bots and packages from Bot Store to Control Room

You can load items directly from Bot Store to your Control Room without the need to download the items locally.

You must have a system-created **AAE\_Bot Developer** role in order to download bots or packages to your Control Room repository. See [System roles](#) on page 1882.

1. Navigate to Bot Store site.
2. Log in with your A-People credentials to download from Bot Store.
3. Select a bot or package.  
Once you have selected your bot, you are redirected to a detailed bot page.
4. Click the **Get Bot** button.  
A confirmation window prompts you to confirm the request.
5. Click **Ok, Get Bot** to confirm the request.  
You can choose from the **Add to Control Room** or **Download as a zip file** options.
  - The **Add to Control Room** option requires you to specify your Control Room URL.
  - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Add to Control Room** option to load the bot directly to your Control Room.
7. Enter your Control Room URL.
8. Log in to the Control Room.
9. Navigate to the **Automation** page.
10. Open your **Bot Store** tab.
11. Click **Add to RPA Workspace** in the **Action** toolbar.  
The following message appears: `If you have any files already installed in private workspace, they will be overwritten.`
12. Select **Yes, continue** to overwrite an existing file and continue with the installation, or select **No, cancel** to cancel your download.  
The installation status of the selected file changes to `Installed`.
13. Verify the downloaded bots in your Bot Store folder of the private workspace.  
The custom packages downloaded from Bot Store are available in the **Packages** repository. You can navigate **Bot Editor > Action Palette**.
14. Verify that the downloaded packages have been enabled in the **Packages** repository. If the packages are not enabled, then go to individual packages and enable them.

Related concepts

[Bot Store](#) on page 3851

You can access Bot Store from the Control Room. From Bot Store, you can download bots or packages to your Control Room repository.

You can submit bots or packages from the Control Room to Bot Store. If your bot includes dependencies, submit all dependencies. Submit a demo bot that demonstrates the use of the package.

## Download locally and import bots and packages from Bot Store to Control Room

You can download items from Bot Store locally then import them to your Control Room, even if your Control Room is not connected to the internet.

You must have a system-created **AAE\_Bot Developer** role in order to download bots or packages to your Control Room repository. See [System roles](#) on page 1882.

1. Navigate to Bot Store site.
2. Log in with your A-People credentials to download from Bot Store.
3. Select a bot or package.  
Once you have selected your bot, you are redirected to a detailed bot page.
4. Click the **Get Bot** button.  
A confirmation window prompts you to confirm the request.
5. Click **Ok, Get Bot** to confirm the request.  
You can choose from the **Add to Control Room** or **Download as a zip file** options.
  - The **Add to Control Room** option requires you to specify your Control Room URL.
  - The **Download as a zip file** option requires you to save the bot locally on your device and confirm the location path for your download to begin.
6. Select the **Download as a zip file** option  
You can save the bot locally on your device and when you confirmed the location path, your download begins.
7. Log in to the Control Room.
8. Navigate to the **Automation** page.
9. Click **Import bots**.
10. Click **Browse**.
11. Select your downloaded zip file at the location path you saved.
12. Specify the option to have your bot in the **Public** or **Private** tab.
13. Click **Import** to import the downloaded bot.
14. Navigate to the **Public** or **Private** tab that you specified.
15. Open your **Bot Store** folder.
16. Access the bot.  
You can now use the bot from Bot Store to start your automation experience.  
To use a Bot Store package, open the bot you want to edit and access package from the Actions panel.

---

**Note:** For users who want proxy access to Bot Store, you can reference this knowledge base [article](#) for a workaround.

### Scenario: Generating insurance quote with Automation Co-Pilot and Process Composer

This scenario details how Zoe (as an insurance agent) generates an insurance quote for a customer using Automation Co-Pilot for Business Users and Process Composer.

#### About this scenario

The scenario describes the actions and data flow for the following four people:

- Zoe is an insurance agent at BBB Insurance Co. where she serves as the primary contact for customers. She is responsible for supporting new and existing customers as she creates insurance quotes based on customer data she's gathered.
- Natalia is a potential customer who has contacted Zoe requesting an insurance quote for a new home purchase.
- Tomas is Zoe's Manager at BBB Insurance Co. He is responsible for drafting budgets, managing resources, and for reviewing and approving any insurance quotes Zoe or any other agent on his team generates.
- Marcus is a software engineer working at BBB Insurance Co. He is responsible for designing, developing, and implementing automations that increase process efficiencies for the insurance company. He is familiar with development tools, processes, and best practices.

## Architecture and tasks flow

The following architecture overview shows the front-end and back-end components, and their related human-initiated tasks and automated tasks for the BBB Insurance Co:

### Front-end components

- [Automation Co-Pilot for Business Users](#) on page 3495 is a user-interface that enables real-time communication between users and bots. Using Automation Co-Pilot for Business Users, you can automate repetitive and time-consuming tasks, navigate controls, and input data when interacting with a customer.
- [Salesforce](#)
- [SAP](#)

**Note:** The Salesforce mark and logo and the SAP mark and logo are trademarks or registered trademarks of Salesforce, Inc., and SAP, respectively, and are used for identification purposes only.

### Back-end components

- [Process Composer](#) is an environment that leverages multiple products across the Automation 360 platform to deliver an Intelligent Automation experience. It provides a drag-and-drop interface that Professional developers can use to create process flows and configure when to execute a bot. Additionally, it displays correct data to users and exchanges data across multiple teams.
- [Realtor.com](#)
- [API Task](#) on page 3721 builder and [RPA workspace](#)
- [Guidewire.com](#) (a property and casualty insurance data platform) through an [Apigee connector](#)
- Bot builder

- [Document Automation](#) on page 3864

## Scenario walkthrough

The BBB Insurance Co. needed a system that could handle complex workflows that met and delivered on high service level agreements (SLAs).

1. Marcus used Process Composer to create this business process automation and automate the task of generating customer quotes for the BBB Insurance Co.
2. Natalia is in the middle of purchasing a new home and has been shopping online to compare policy quotes provided by several home insurance companies. As a result of her research, she accessed the BBB Insurance Co's website and dialed their toll-free number to speak with an agent about getting a homeowner's policy quote. Natalia contacts Zoe.
3. As part of her job responsibilities, Zoe is first line support for customers looking for insurance policy quotes. She has just engaged with a potential new customer, Natalia. Zoe accesses Automation Co-Pilot for Business Users through an [embedded widget](#) in her Salesforce instance. The widget automates tasks that embed automations built on the Automation 360 platform and connects and authorizes the flow of data between applications and Automation Co-Pilot for Business Users.
4. Zoe explains the process to Natalia as she asks her questions and collects data to generate a new homeowner policy quote. A bot runs in the background gathering property value data based on Natalia's location from Realtor.com.
5. Working in Salesforce (with Automation Co-Pilot for Business Users embedded through the widget), Zoe enters data. API Tasks and the automated process run in the background gathering industry-wide data from Guidewire.com to add to the quote.
6. In the background, Process Composer uses an RPA bot to generate a PDF file for the quote.
7. Zoe sends the generated quote (formatted as a PDF file) electronically to her manager Tomas to review and hopefully approve.
8. Tomas is manager of a team of customer agents and is responsible for drafting budgets, managing resources, and for reviewing and approving any insurance quotes generated by his team. Working in SAP (with Automation Co-Pilot for Business Users embedded in the application), Tomas was just notified of a new policy quote that was submitted by Zoe for review.
9. Tomas carefully reviews Zoe's quote and agrees that it would be a good risk for his company to accept. He approves the policy quote. Zoe receives an immediate notification that the policy quote for Natalia has been approved. Simultaneously in the background:
  - a) An API Task is used to attach the policy quote to a record in Salesforce.
  - b) Document Automation extracts data from the quote for an email.
  - c) Generative AI generates a customer-specific email that contains the policy quote information.
10. After receiving Tomas' approval for the policy quote, Zoe reviews and edits the generative AI email in Salesforce.
11. Zoe attaches the policy quote PDF file to the email and sends it to Natalia.
12. During the phone call with Zoe (within five to six minutes), Natalia receives the completed policy quote as an attachment to an email. She considers using the BBB Insurance Co. to insure her new home.

## Scenario summary and benefits

The BBB Insurance Co. will be looking to automate future business processes.

### Summary

With access to the Automation Co-Pilot embedded widget, employees (Zoe and Tomas) can run remote or local automations on-demand from any web application. With in-app (Automation Co-Pilot for Business Users) notifications, Zoe and Tomas are alerted to tasks requiring their immediate attention. As a result, the BBB Insurance Co. can automatically generate and deliver on-demand insurance quotes to their customers (Natalia) with real-time and embedded approvals.

### Benefits

By implementing Automation Co-Pilot for Business Users and Process Composer on the Automation 360 platform, the BBB Insurance Co. realized the following benefits:

Time to generate each policy quote decreased by 90% (from 60 mins to 6 mins).

Zoe can spend her valuable time and effort processing the quote request (including approval) instead of spending a lot of time logging in and out of various applications, trying to contact her manager, writing emails, looking up various industry data points, and so on. By having prompt results and actionable deliverables, Zoe felt empowered with her interaction with Natalia and derived immediate job satisfaction.

Whether it's Salesforce, SAP, or other applications, BBB employees never need to leave their home application of choice for their daily activities or for when an immediate action is required leading to greater employee productivity and efficiencies.

---

Customer satisfaction has increased for both new and existing customers. Natalia ended her call with Zoe satisfied and confident with the service the BBB Insurance Co. can provide having experienced their competency and customer care first-hand.

---

## Scenario: Developing and using templates in an automation

Use this scenario to understand how to create a template for automations, and how to use these templates to simplify the process of creating automations.

### About this scenario

This scenario details the actions and workflow of the following users:

Marcus is a Professional Developer who works in the Acme healthcare company. He works in the Human Resources department and is responsible for designing, developing, and implementing automations to improve process efficiency and has created many such automations to automate business processes in his organization.

In this scenario, Marcus creates a template to automate the performance metric process. Performance metrics workflow consists of a series of repetitive steps that is widely used across multiple departments. Creating a template for this workflow will benefit all departments by saving the time and effort for each department to build its own automation from the start. Instead, they can use the template Marcus creates and customize it based on their specific requirements. After he creates the template, Marcus checks in his template to the public repository and makes it available for other users in different departments.

Sue is a Citizen Developer who works in the same organization as Marcus but in the Finance department. She is responsible for calculating annual employee appraisals and decides to automate this process. While working on the automation workflow, Sue uses the template created by Marcus for performance metrics to help save time.

The following workflow illustrates how Marcus (Professional Developer) develops a template for performance metrics, and then how Sue (Citizen Developer) uses that template in the appraisal calculation automation.

## Developing performance metrics template

## Using performance metrics template in building automation

## Marcus creates a template

The following procedure summarizes how Marcus creates a template for the performance metric process and checks in the template to the public repository.

1. Marcus log in to the Control Room as a Bot Creator.
2. He navigates to the **Automation** tab, and creates an automation.
3. After entering the required details for the automation, he opens the automation on the Bot editor to build the performance metric automation.
4. He uses the **Workday > Get report** action to get the performance metrics report and save the outcome to a list variable.
5. He uses **Loop > For each item in the list** to read and iterate each item in the list.
6. He uses **Database > Insert/Update/Delete** to update the performance metrics component for each employee in the database.
7. He saves this automation as a template.
8. On the **Automation** page, he selects the Performance metrics template and check in the template to the public workspace from his private workspace to make it available for all users.

## Sue builds automation using the template

Sue uses Marcus's template and creates an annual appraisal automation.

1. Sue log in to the Control Room as a Citizen Developer.
2. She navigates to the **Automation** page and selects the **Create new > Task Bot from Template** option to create an automation using a template.
3. In the template picker window, Sue sees all the template available in the public repository.
4. She searches for Marcus's template and opens the template in preview mode to review if that one suits her requirements.
5. After ensuring it does, she selects the template to start creating an automation.

6. She enters the required details and navigates to the Bot editor.  
The structure from the template is added to the Bot editor.
7. She modifies the existing code flow and adds the following new actions to build the Annual appraisal automation:
  - a) **Database > Run stored procedure** action to retrieve the employees' salary details.
  - b) **Number > Assign** action to apply the formula and calculate the appraisal amount.
  - c) **Database > Insert/Update/Delete** action to insert the data and update the database.
  - d) **Send** email action to send emails to employees and managers.
8. She then saves and runs the automation.

Appraisal details are retrieved and shared with managers through email.

## Summary and benefits

Using templates benefited Sue and Marcus to achieve their automation goals in specific ways.

	Marcus creates templates for use cases that are common across different departments.
	Using a predefined template enables Sue to quickly build automation without recreating the same automation, thus saving time.
	Overall benefits include cost reduction, enhancement in productivity, and accelerated automation development.

# Document Processing

Automation Anywhere offers several web-based intelligent document processing solutions that extract semi-structured data from documents and convert it into structured data, which can be used by Robotic Process Automation (RPA) bots for automation of business processes.

## Overview

Typically, RPA bots can automate only those tasks that involve processing structured data. As a result, about 80% of a business's data remains inaccessible to RPA bots as "dark data." This dark data is made accessible to RPA bots by cognitive automation, which combines the technologies of intelligent document processing and RPA. With cognitive automation, semi-structured data is extracted from documents such as invoices, and converted into structured data, so RPA bots can subsequently use this structured data for automating business processes.

Learn more about the Automation Anywhere intelligent document processing solutions:

Document Automation

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pre-trained models and validation feedback.

[Document Automation](#) on page 3864

Automation 360 IQ Bot

In Automation 360 IQ Bot, users configure templates and train bots to extract data from a variety of documents. Automation 360 IQ Bot is available for on-premises and cloud installations, and offers users a wide range of tools to customize and optimize document processing, including the following:

- Packages to create models for classifying documents by category and to enhance the quality of documents or images for better extraction

- Standard form models for extracting data from documents that have minimal or no variation in their layout
- Support for Optical Character Recognition (OCR) engines to improve the accuracy of the extracted data

[Automation 360 IQ Bot](#) on page 3977

IQ Bot 11.3.x

This early version of IQ Bot supports Enterprise 11 customers. It is available for on-premise installations only.

[IQ Bot 11.3.x](#)

Community Edition

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

[Document Automation Community Edition](#) on page 3973

## Document Automation

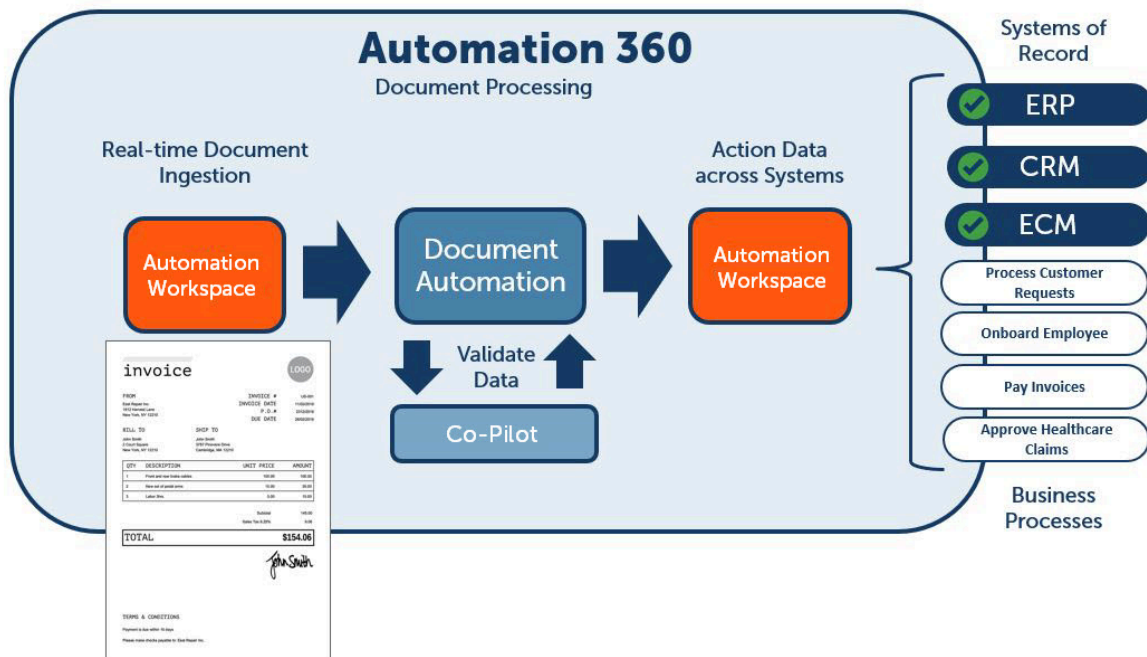

Document Automation is the new Cloud-native intelligent document processing solution that business users can set up to automatically read and process documents quickly using pre-trained models and validation feedback.

Document Automation is fully integrated into Automation 360: Document Automation is installed as part of the Control Room. RPA bots are used to extract semi-structured or unstructured data to automate document-centric business processes, and Automation Co-Pilot for Business Users manages the end-to-end extraction process and validation tasks.

With Document Automation you can:

- Process more document types: Configure and process structured and semi-structured documents within a single, intuitive interface that is integrated with the Automation Success Platform with no additional software to install.
- Leverage a seamless user experience: Enjoy a unified experience for all document validations using Automation Co-Pilot for Business Users. The default document processing flow can be changed as needed enabling users to streamline their document workflows with ease.

The Document Automation workflow enables users to scale their document processing operation. Users create learning instances that use Automation Anywhere or Google Document AI pre-trained models to process invoices, utility bills, and receipts. Once a learning instance is running in production, it automatically improves extraction accuracy based on feedback from manual validation.

Watch this video to understand how you can use Document Automation to extract and embed data quickly and easily with an automated work-flow.

To compare Document Automation features side by side with Automation 360 IQ Bot, see [Intelligent Document Processing solutions feature comparison matrix](#) on page 3873.

## Set up the Document Automation environment

Document Automation is installed simultaneously with the Control Room and shares the Control Room database. There are no additional installation tasks for Control Room Cloud customers.

To get started using Document Automation, you must first configure users, roles, and devices, and connect the Control Room with Automation Co-Pilot for Business Users:

[Set up your Document Automation environment](#) on page 3875

**Note:** To install Document Automation in an On-Premises server, note the following:

- The Control Room stores Document Automation output data.
- You must install the Control Room in a configuration that points to the location where Document Automation data is stored. Ensure there is sufficient storage space.
- The minimum necessary storage space depends on the processing volume, document size, and use case. As a guide: an environment that processes 100,000 pages per month, with a 30-day data lifespan, requires 500 GB of storage space.

## Using Document Automation

Workflow map: Click the following schematic image to view the workflow in an interactive visual

format:

1.

The following is an overview of the end-to-end process to create, configure, and publish a learning instance in Document Automation:

Step 1: [Create a learning instance](#)

Log in to the Control Room as the learning instance creator user, and create a learning instance to extract values from documents.

Step 2: [Process documents](#)

Upload documents to the learning instance to test the model, fix validation errors, and verify the extracted data.

Step 3: [Build a bot to upload documents to Document Automation](#) on page 3927

Build a bot that uploads documents from a source folder to Document Automation.

Step 4: [Publish the learning instance to production](#) on page 3925

Check-in the learning instance assets (process, form, and bots) to the public repository. Then, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

After the process is deployed, incoming documents are processed, and Document Automation either extracts data from the documents or sends the documents for validation.

Step 5: [Validate the uploaded documents](#)

Log in as the Validator user, open the validation queue, and use the Validator to fix errors.

## Document Automation architecture

Document Automation uses features from the Control Room and Automation Co-Pilot for Business Users, as well as some third-party products.

The following architecture graphic demonstrates the flow of data in the intelligent document processing workflow for the two possible deployment scenarios:

- The Learning instance creator uploads documents to the Document Automation interface, for example to test the extraction capabilities of the learning instance.
- An Unattended Bot Runner deploys the Scheduler Bot to upload and process the documents.

The graphic also shows the scenarios where data is sent to third-party products, such as for Google Document AI or Standard Forms extraction.

### Control Room to regions mapping

Document Automation is supported on AWS and Google Cloud Platform.

For customers who configured Document Automation with Google Document AI licenses purchased from Google: Documents uploaded to Document Automation for processing in Google Document AI are sent to the Apigee gateway that you configured when you created the processor in Google Document AI.

For customers who purchased Google Document AI product licenses from Automation Anywhere: Google Document AI uses the Apigee API gateway to manage the document processing APIs. When a document uploaded to Document Automation is sent to Google Document AI, data is sent to the Apigee gateway that corresponds with your AWS or Google Cloud Platform region.

Apigee gateway	AWS/Google Cloud Platform regions
US	<ul style="list-style-type: none"> <li>• US-East</li> <li>• US-Central</li> <li>• US-West</li> <li>• CAN</li> <li>• LATAM</li> </ul>
Europe	<ul style="list-style-type: none"> <li>• EU-West1</li> <li>• EU-West4</li> <li>• ME</li> <li>• S-Africa</li> <li>• AP-Aus</li> <li>• AP-Singapore</li> <li>• AP-JP</li> <li>• India</li> </ul>

## File storage

The document that you upload in Document Automation is first stored in the Automation Anywhere Control Room Storage Service in an encrypted form. During the extraction phase, documents are pulled from the storage service and then uploaded to external providers for extraction.

After extraction, the files are stored as follows:

- For **AA Pre-trained** models: File is deleted immediately post extraction.
- For **Connected Learning Instances**: File is deleted immediately post extraction.
- For Microsoft Azure Form Recognizer and Google Document AI: Since these are third party managed extraction services, the privacy policies vary for each providers and it needs to be checked with the service provider. For more details about privacy policy for these external services, see [Document AI Security & Compliance](#) and [Microsoft Azure AI Security Policies](#).

When you have the extraction results from the provider, the results are validated. Based on the validation results,

- If the document goes to validator, it is available for 90 days and you can perform validations within the 90 days.
- If the document goes to STP or validated by users, then by default the document gets deleted when the downloaded bot runs.

## Document Automation FAQ

Answers to frequently asked questions (FAQs) on the latest Automation Anywhere intelligent document processing solution, Document Automation.

### Product FAQ

What pre-trained models are included?

Automation Anywhere offers invoices and Google Document AI offers invoices, utility bills, and receipts.

Does Document Automation have feature parity with Automation 360 IQ Bot?

Document Automation supports the following features from Automation 360 IQ Bot:

- Data extraction from text, number, date time, and check box fields
- Validation rules based on patterns, formulas, lists, and statements

---

**Note:** Document Automation does not support check box fields. The check box fields are available only for Automation 360 IQ Bot.

---

Which browsers are supported?

Document Automation is supported on the same browsers as the Automation Anywhere Control Room: Google Chrome, and Microsoft Edge.

---

**Note:** If you use Document Automation in Firefox, the user interface might not behave as expected.

---

What languages are supported?

The languages supported Document Automation vary based on the providers, document types, OCR engines, and third-party parsers. For more details, see [Languages supported in Document Automation](#) on page 3965 and [Language support matrix and OCR engines](#) on page 3970.

You can process documents in other languages by creating and training a learning instance in

What file formats are supported?	<p>Automation 360 IQ Bot and connecting it with Document Automation to process documents using Document Automation technology and workflow. For more information, see <a href="#">Connect learning instance</a> on page 3914.</p> <p>Document Automation can process documents in the following file types:</p> <ul style="list-style-type: none"><li>• PDF</li><li>• JPG</li><li>• JPEG</li><li>• PNG</li><li>• TIF</li><li>• TIFF</li></ul>
What are the hardware requirements for Document Automation?	<p>The hardware requirements for Document Automation are the same as the Bot Agent. For detailed information such as hardware components, compatible devices, supported operating systems and browser extensions, see <a href="#">Bot Agent device requirements</a> on page 1442.</p>
Which licenses are necessary?	<p>For the license details, see <a href="#">Understanding licenses in Document Automation</a> on page 1516.</p>
Can learning instances be migrated from Automation 360 IQ Bot to Document Automation?	<p>Users can connect their learning instances from Automation 360 IQ Bot to their Document Automation environment, which allows them to process documents using the Document Automation technology without having to rebuild the learning instances. For more information, see <a href="#">Connect learning instance</a> on page 3914.</p>
Are customers required to maintain their Automation 360 IQ Bot environments?	<p>If you have connected a learning instance from Automation 360 IQ Bot to Document Automation, do not delete the learning instance from Automation 360 IQ Bot since it stores the training data.</p> <p>We recommend you maintain Automation 360 IQ Bot in a version compatible with the associated Control Room.</p>
What learning instance fields are supported out of the box?	<p>Document Automation offers over 35 of the most common invoice fields, with the option to configure custom fields. To see all the possible fields when you are creating a learning instance, click <b>Show unused fields</b>.</p>
What are the available deployment models for Document Automation?	<p>Document Automation solutions can be deployed in On-premise edition as well as Cloud.</p>

## Processing and extraction FAQ

Which OCRs are supported?	The Automation Anywhere pre-trained model uses the ABBYY FineReader Engine or the Google Vision OCR .
I uploaded documents for processing, but nothing is happening.	The first time you process documents, the Document Extraction package downloads to the local device. This might cause a delay in document processing.
What should I do if a folder contains documents in multiple languages?	Use the Document Classifier package to sort the documents by language, then create a learning instance for each language.
What should I do if a language is not supported for the provided document?	If a document language is not currently supported, a recommended solution is to extract documents using languages available by other Providers such as, Standard Forms and Google Custom Data Extraction (CDE).
Is it possible to define custom document types such as bank statements or commerce registrations?	You can use the user-defined document type to process documents that are visually similar to invoices. Additionally, you can also use Standard Forms and Google Custom Document Extractor.
How do I process documents using Google Document AI?	Document Extraction enables users to send their documents to Google Document AI for processing. To use this feature, users must have Document AI licenses that they either purchased from Automation Anywhere or provided their Google Document AI account credentials to the Control Room.  The process of creating, testing, and publishing is the same for learning instances using a Google Document AI model as for learning instances using a pre-trained model from Automation Anywhere.
Are multi-page tables supported?	Yes, Document Extraction supports extracting tables that span across multiple pages.
Is it possible to extract multiple tables from a document?	At this time, Document Automation can extract one table per document.
Where can I see the reason why data was not extracted from an uploaded document?	The Automation Co-Pilot <b>Requests</b> tab holds the history for each uploaded document. Here, you can see the step at which extraction failed or if a Validator user marked the document as invalid.
Is currency extraction supported?	Yes, except for the rupee (#).

## Intelligent Document Processing solutions feature comparison matrix

Review the differences between Automation 360 IQ Bot and Document Automation by comparing the features in them.

	Automation 360 IQ Bot	Document Automation
Administration and setup		
Installation	Separate installer	Installed as part of the Control Room
Database administration	Separate database; requires additional effort for backups and maintenance	Uses the Control Room database; no additional backup or maintenance needed
Server configuration	Requires additional SSL configuration, RabbitMQ administration, HA and DR	Works out of the box
Learning instance configuration		
Alias management (keywords)	Yes, parity	Users can view, add, or remove field aliases for the learning instance
Confidence threshold	Does not work out of the box; server-level configuration	Helps to catch false positive outcomes; field-level configuration
Field order and field name customization	Not supported	Helps to improve validation efficiency
Field configuration	Must be done for every group	Needs to be done only one time for a learning instance
Ability to add and remove fields from the learning instance	No	Yes
Search for form or table fields	No	In create/edit learning instance search by field name, label, or data type.
Extraction capabilities		
Pre-trained models	Pre-configured domains that require additional training	Yes, out-of-the-box
Handling document variations	Classifier relies on document layout and training. Documents uploaded with a new layout are sent to a new document group, which requires training. Some docs could not be classified.	Layouts are identified using an object detection model to find key-value pairs. It is not necessary to configure all the fields in a learning instance before uploading documents.

	Automation 360 IQ Bot	Document Automation
Training process	Each group needs to be manually trained before it can process documents	Learning instance extraction improves based on changes users make in the Validator
Output format	CSV only	CSV or JSON
Process invoice-like documents with user-defined document type	Custom domains can be created exclusively through APIs for processing custom document types	Supported out-of-the-box
Regular expression-based extraction	Not supported	Use regex pattern extraction for values that follow a specific pattern, such as a VAT number or a PO number
Standardize the format of extracted numbers and dates	No	Configure your learning instances to convert extracted dates and numbers to standard formats
Unstructured document support	No	Yes, available with GenAI integration
Extraction from Fixed Forms	No	Yes, supported via Microsoft Standard Forms
Google Document AI		
Google Document AI support	No	<ul style="list-style-type: none"> <li>• Pre-trained models for invoices, Utility bills, Receipts</li> <li>• Google CDE support</li> <li>• Available through BYOL and OEM licenses</li> </ul>
Human review and Validation		
Validation queue management	No	Use filters and search to find specific learning instances or documents
Auto-fill for tables	No	Use the <b>Auto fill</b> button in the validation interface to expedite the extraction of values from tables
Document-level Validation rules	No	Document Automation lets you create complex validation rules with different fields, multiple conditions and actions
End-to-end automation		

	Automation 360 IQ Bot	Document Automation
Task bots	Must be manually created	Document Automation automatically creates task bots for a learning instance
See status and history of uploaded documents	No	Yes
Customizable document processing workflow	No	Yes
Ability to split documents	No	Supported by the Advanced Classifier package
Monitoring and reporting		
Custom dashboards	No	Available with Bot Insight integration
Licensing	No	License consumption is tracked properly
Security		
Retention policy	No	Supported for 90 days by default
Secret management	No	Can use credential vault
Audit log	No.	Yes

## Set up your Document Automation environment

Document Automation is installed simultaneously with the Control Room. Configure the users, roles, and devices, and connect the Control Room with Automation Co-Pilot for Business Users.

1. Log in to Document Automation through the Control Room.  
You will receive an email from Automation Anywhere with your URL and credentials. Open the Control Room URL in your browser, enter your credentials in the login screen, and click **Log in**.
2. Upload the Document Extraction package to the Control Room: [Upload the IQ Bot packages to the Control Room](#)
3. Create a custom role that allows users to check in and check out bots, manage packages, and validate documents.: [Create a custom role for Document Automation](#) on page 3877
4. Create the users necessary to complete the end-to-end process of creating and publishing a learning instance: [Document Automation users](#) on page 3877

---

**Note:** When creating the Unattended Bot Runner user, provide the device credentials. You will connect the Unattended Bot Runner to the device in the next step.

---

5. Configure the unattended Bot Runner user device and device pool to allow the learning instance to function in public mode:
  - a) Using Remote Desktop Protocol (RDP), open the virtual machine where the unattended Bot Runner will run.

- b) Log in to the Control Room as the `Document Automation Admin` user you created previously.
- c) Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
- d) Click **Refresh** to verify that your device is connected.
- e) Click **Create device pool** and perform the following steps:
  - 1. Enter a name for the device pool.
  - 2. Click **Devices** and then the arrow to move the device to the **Selected** column.
  - 3. Click **Consumers** and then the arrow to move `aari-document-processor` to the **Selected** column.
  - 4. Click **Create device pool**.

You can perform the following steps in the virtual machine or you can return to your device. If you perform the following steps on your device, ensure that you log in to the Control Room as the `Document Automation Admin` user.

- 6. Open Automation Co-Pilot for Business Users to connect it with the Control Room.
  - a) Navigate to the Automation Co-Pilot interface by adding `/aari` after your assigned Control Room URL.
  - b) Navigate to **Manage > Process > Global scheduler** and click **Edit**.
  - c) Select the Scheduler user that you created previously and click **Save**.  
The following message is displayed: `Secure connection between AARI Web and Enterprise Control Room established successfully`
- 7. Create a team in Automation Co-Pilot to grant the `validator` user access to the documents awaiting validation.
  - a) Navigate to **Manage > Team > Create new team**.
  - b) Enter a team name.
  - c) Select the **Shared** request visibility.
  - d) In the **Users** field, add the `validator` user that you created previously and click **Save**.

If users will create learning instances that use the Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere, follow the steps to [Configure key for Google Document AI](#) on page 3880.

Log in to the Control Room as the `Learning instance creator` user and begin creating learning instances: [Using Document Automation](#) on page 3866

Related tasks

[Installing additional licenses](#) on page 1900

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

Related reference

[Automation 360 licenses](#) on page 1511

The **All Licenses** page displays detailed information about current product and device licenses.

## Create a custom role for Document Automation

With a custom role, Document Automation users can check in and check out bots, manage packages, and validate documents.

You can select the below permissions for document processing in Co-Pilot and managing (create, publish, and migrate) the learning instances.

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `aari-document-processor`.
3. In the Feature permissions page, select the following permissions:
  - Set automation priority to high
  - View my bots
  - Run my bots
  - Export bots
  - Import bots
  - Create folders
  - Rename folders
  - Cancel checkout

### Package Manager

- View packages
- Manage packages

### Automation Co-Pilot for Business Users

- Cross Team Read
- AARI Scheduler

4. In the Bots permissions page, select all the check boxes in the **Bots** row.
5. Click **Save** to create the role.

Create users and assign this custom role to them. For more information about the required users, refer to [Document Automation users](#) on page 3877.

## Document Automation users

With the required roles, permissions, and licenses, Document Automation users can perform various tasks. Users and roles are defined in the **Administration** tab.

The following table contains information about each type of user that interacts with Document Automation. It includes a description of the tasks that each user performs, the required roles, permissions, and licenses, and links to the pages most relevant to that user. Use this page to guide you in creating the users in the table below: [Create a user](#) on page 1845

---

**Note:** Some users require a custom role in Document Automation. This role grants users permissions to check in and check out bots, manage packages, and validate documents. For

instructions on how to create a custom role, see [Create a custom role for Document Automation](#) on page 3877.

User	Description	Roles	License	Related links
Learning instance creator	Can create, edit, and delete learning instances, upload documents for processing, and check in or check out learning instances.	<b>AAE_IQ Bot Services</b> , <b>AAE_Basic</b> , and <b>aari-document-processor</b> custom role	Bot Creator	<a href="#">Create a learning instance in Document Automation</a> on page 3881  <a href="#">Process documents in Document Automation</a> on page 3891  <a href="#">Publish the learning instance to production</a> on page 3925

Document Automation Admin	Deploys the Automation Co-Pilot process and RPA bots to the unattended Bot Runner, manages Automation Co-Pilot teams, and assigns validation tasks to a team	<b>AAE_Admin</b> , <b>AAE_Pool Admin</b> , <b>AAE_Locker Admin</b> , <b>AAE_Robotic Interface Manager</b> , and <b>AAE_Robotic Interface Admin</b>	--	<a href="#">Set up your Document Automation environment</a> on page 3875  <a href="#">Create a team and assign roles to team members</a> on page 3612  <a href="#">Publish the learning instance to production</a> on page 3925
Scheduler	Enables the Control Room and Automation Co-Pilot to connect learning instances in public mode to Automation Co-Pilot processes.  <b>Note:</b> This user is not associated with a real person.	<b>AAE_IQ Bot Services</b> , <b>AAE_Basic</b> , and <b>aari-document-processor</b> custom role	--	--

User	Description	Roles	License	Related links
Unattended Bot Runner	Runs the RPA bots for learning instances in public mode to upload, process, and download documents.  <b>Note:</b> This user is not associated with a real person.	<b>AAE_IQ Bot Services</b> , <b>AAE_Basic</b> , and <b>aari-document-processor</b> custom role  <b>Note:</b> Provide the device credentials when you configure this user. You will connect the Unattended Bot Runner user to the device in one of the steps in <a href="#">Set up your Document Automation environment</a> on page 3875.	Unattended Bot Runner, Automation Co-Pilot for Business Users, and the product licenses necessary to upload documents to learning instances in production: IQ Bot pages, standard forms, or Document AI  <a href="#">Document processing product licenses</a>	--
Validator	Validates documents that were processed by a learning instance in public mode.	<b>AAE_IQ Bot Validator</b> and <b>AAE_Robotic Interface User</b> and <b>aari-document-processor</b> custom role	Automation Co-Pilot for Business Users	<a href="#">Validate documents in Document Automation</a> on page 3935

## Related tasks

[Create a user](#) on page 1845

Create a user and assign their specific license based role.

[Create a role](#) on page 1855

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

## Related reference

[Automation 360 licenses](#) on page 1511

The **All Licenses** page displays detailed information about current product and device licenses.

## Configure key for Google Document AI

If the learning instance uses a Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere, follow these configuration steps.

- If you have not done so already, complete the steps to [Set up your Document Automation environment](#) on page 3875.
- Log in as the **Admin** user type. For more information about the user types, refer to [Document Automation users](#) on page 3877.

For detailed information, see [BYOK | Google Doc AI Integration](#).

You will assign this role to a Credential Vault locker, which will allow the **Learning instance creator** user to securely provide the Google Document AI key to the **Extraction bot**, allowing the learning instance to send documents to Google Document AI for extraction.

Create a custom role to access the Credential Vault locker that holds the Google Document AI key:

1. Navigate to **Administration > Roles > Create role**.
2. Provide a name for the role, such as `doc-ai-credential-role`.  
The `Manage my credentials and lockers` permission is automatically selected.
3. Click **Create role**.

Assign the role to the **Learning instance creator** and **Unattended Bot Runner** user types.

4. Navigate to **Administration > Users** and locate the users.
5. For each user, click **Edit user** and add the `doc-ai-credential-role`.

Create a credential to store the Google Document AI key:

6. Navigate to **Manage > Credentials > Create credential**.
7. Provide a name for the credential, such as `doc-ai-credential`.
8. Provide a name for the attribute, such as `ServiceAccount`.
9. Select the **Standard** input option and enter the Google Document AI API key in the **Value** field.
10. Click **Create credential**.

Create a locker to store the key and provide access to other users.

11. Navigate to the **Lockers** tab and click **Create locker**.
12. Provide a name for the locker, such as `doc-ai-locker`.
13. Select the `doc-ai-credential` and click the right arrow to move the credential to the **Selected column**.
14. In the **Consumers** tab and select the `doc-ai-credential-role` and click the right arrow to move the credential to the **Selected column**.
15. Click **Create locker**.

Log in as the **Learning instance creator** user type to do the following:

- Create a learning instance: [Create a learning instance in Document Automation](#) on page 3881
- Provide the credential to the **Extraction bot**: [Configure Extract action to process documents in Google Document AI](#) on page 2672

#### Related tasks

[Installing additional licenses](#) on page 1900

Upload new licenses to the Automation Anywhere Control Room to be distributed to users as required.

#### Related reference

[Automation 360 licenses](#) on page 1511

The **All Licenses** page displays detailed information about current product and device licenses.

## Create a learning instance in Document Automation

Begin processing documents by creating a learning instance to extract data from invoices, utility bills, or receipts. A learning instance is a structure that holds information such as document type, language, and the fields to be extracted.

- To create a learning instance, you must be a `Learning instance creator` user. See [Document Automation users](#) on page 3877.
- The default OCR is ABBYY FineReader Engine. Alternatively, Cloud Control Room users can create a learning instance to process documents in Google Vision OCR.

Watch this video for the complete end-to-end process of creating a learning instance:

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.  
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Select the document type: **Invoice**, **User-defined**, **Utility Bill**, or **Receipt**  
Use the user-defined document type to process documents that are visually similar to invoices, such as purchase orders and sales orders, which contain key-value pairs and a table structure. In this document type, you create and configure all of the form and table fields.
4. Select the language.  
Document Automation supports English, Dutch, French, German, Italian, Portuguese (Brazilian), and Spanish. For more details, see [Languages supported in Document Automation](#) on page 3965.

---

**Note:** Extraction for German language documents is currently in preview. Extraction results will improve in future releases.

---

If you select a document type that is used while configuring the parser in step 3, the language selected during parser configuration is auto-selected. In addition, the locale list displays language options based on the auto-selected language.

5. If you selected Invoice: Select the provider.  
If you selected the English language in step 4, Automation Anywhere (Pre-trained) is auto-selected.  
If you select a document type that is used while configuring the parser in step 3, the configured (third-party) parser is auto-selected as the provider.
6. Optional: Select the OCR provider. By default, Document Automation processes documents in ABBYY FineReader Engine.  
Users with a Cloud Control Room can select to process documents in Google Vision OCR.

7. Optional: You can use the **Improve accuracy using validation** option to send feedback to the system to improve extraction results. For more information, see [Improving extraction accuracy through validation](#).

---

**Note:** The **Improve accuracy using validation** option is not available for **Utility bills** and **Receipts** document types.

---

8. Optional: Select the **Generative AI-driven data extraction** option to use the generative AI capabilities for extraction. For more information, see [Document Automation data extraction using generative AI](#) on page 3954.

The screenshot shows a 'Create Learning Instance' form with the following fields and values:

- Name:** test-docs
- Description (optional):** test environment
- Document Type:** Invoices
- Language:** English
- Locale:** English (United States)
- Provider:** Automation Anywhere (Pre-trained)
- OCR Provider:** ABBYY
- Improve accuracy using validation**  
The system learns from user-provided changes in the Validator.
- Generative AI-driven data extraction**  
Your document data will be processed by an AI language model. [learn more...](#)

9. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

---

**Note:**

- A form field is a type of field that occurs only one time in a document.
- A table field is a type of field that reoccurs throughout a document, typically in the form of a table.

- 
10. Configure the form and table fields for extraction. For more details, see [View and search fields](#) on page 3884.

- Click a field to open the fields editor. For more details, see [Guidelines to edit the fields and create custom aliases](#) on page 3885
- Hover over the menu icon to the right of a field to access the up/down arrows.
- Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.

To learn more about the other field attributes, see [Considerations for form and table fields](#) on page 3885.

11. Click **Add a field** and specify the fields details such as field name, fields label, confidence, data type, format date/number, and so on. For more details, see [Considerations for form and table fields](#) on page 3885.

The following image shows form and table fields configured in a learning instance:

The screenshot shows the 'docs-test' configuration interface. It has tabs for 'Form fields' and 'Table fields'. The 'Form fields' tab is active. Below the tabs, there is a search bar for 'Field name'. A table lists the following fields:

Field name	Field label	Data type	Aliases
invoice_number	Invoice Number	Text	69
invoice_date	Invoice Date	Date	38
po_number	PO Number	Text	42
receiver_address	Receiver Address	Address	81
ship_to_address	Ship To Address	Address	57
total_amount	Total Amount	Number	50

Buttons at the bottom include 'Show unused fields' and 'Add a field'.

The screenshot shows the 'docs-test-19379' configuration interface. It has tabs for 'Form fields' and 'Table fields'. The 'Table fields' tab is active and highlighted with an orange box. Below the tabs, there is a search bar for 'Field name'. A table lists the following fields:

Field name	Field label	Data type	Aliases
description	Description	Text	1
quantity	Quantity	Number	5
unit_price	Unit Price	Number	1
total_price	Total Price	Number	1

Buttons at the bottom include 'Show unused fields' and 'Add a field'. A '+ Add a table' button is also visible, highlighted with an orange box.

12. Optional: On the **Table fields** tab, click **+** icon to add a custom table at learning instance level.
- Enter a name for the table and click **Add**.
  - Click **Add a field** and specify the fields details such as field name, fields label, confidence, data type, format date/number, and so on. For more details, see [Considerations for form and table fields](#) on page 3885.

**Note:** You can also add and delete the custom table while editing a learning instance.

The custom table is displayed in the **table** drop-down list.

docs-test-19379

Form fields **Table fields**

table

docs-test-language

<input checked="" type="checkbox"/>	Field name	Field label	Data type	docs-test-language	
<input checked="" type="checkbox"/>	description	Description	Text	1	⋮
<input checked="" type="checkbox"/>	quantity	Quantity	Number	5	⋮
<input checked="" type="checkbox"/>	unit_price	Unit Price	Number	1	⋮
<input checked="" type="checkbox"/>	total_price	Total Price	Number	1	⋮

Show unused fields Add a field

You can also view the fields from custom and default tables on the **Document Rules** tab but cannot select fields across all different tables. For more details about multi-table support, see [Guidelines to create or edit the custom multi-table in a learning instance](#) on page 3887.

### 13. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder. The folder contains two bots (extraction and download), a process, and a form. For more details, see [Bots output file and folder structure](#) on page 3888.

Upload documents to the learning instance, fix validation errors, and verify the extracted data: [Process documents in Document Automation](#) on page 3891

Related reference

[References for creating a learning instance in Document Automation](#) on page 3884

This topic provides additional references that you can use while creating a learning instance such as considerations for form and table fields, search fields, additional information about output folder after creating a learning instance, and so on.

## References for creating a learning instance in Document Automation

This topic provides additional references that you can use while creating a learning instance such as considerations for form and table fields, search fields, additional information about output folder after creating a learning instance, and so on.

### View and search fields

Document Automation offers a standard set of form and table fields, many of which are not initially visible. You can search for a field by field name, field label, or data type.

To see the full list of fields, click **Show unused fields**. See the following video for a demonstration:

## Guidelines to edit the fields and create custom aliases

- You can edit most attributes of a field.
- You cannot edit the name and default aliases. Document Automation assigns default aliases, which are hard coded keywords, to standard fields to help with extraction.
- You cannot modify or delete default aliases, but you can add aliases in the **Custom aliases** field.

See the following video for a demonstration of creating a custom alias:

## Considerations for form and table fields

The following table lists all the fields names and required values to specify in the description.

Table 16:

Option	Description
Field name	<p>Enter a field name that begins with an alphabetical character (A-Z or a-z).</p> <p>In standard fields, the field name is hardcoded and cannot be changed.</p>
Field label	<p>Enter a user-friendly name to help validators.</p> <p>For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code>.</p> <p>The field label does not affect extraction.</p>
Confidence	<p>Set a threshold to reduce potential false positives.</p> <p>At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue.</p> <p>If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue.</p> <p>Supports values from zero to 100.</p>

Option	Description
Data type	<p>Choose from <b>Address*</b>, <b>Text</b>, <b>Number</b>, and <b>Date</b>.</p> <p>If the data in the field does not match the data type, the document is sent to the validation queue.</p> <p>Document Automation supports date and number format variations.</p> <p>* If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.</p>
Format Date/Number	<p>Set a standard appearance to convert extracted dates and numbers to a specific format. This ensures consistency and accuracy in your databases and other systems of record.</p> <p>For example, if you select to standardize dates to MM/DD/YYYY and a processed document contains a date that appears as 12 Feb 2023, the learning instance will reformat the date to 02/12/2023.</p> <p>If you select to standardize numbers to the English (United States) locale and a processed document contains a number that appears as 100,00, the learning instance will reformat the number to 100.00.</p>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Required:</b> Field cannot be empty.</li> <li>• <b>Optional:</b> Field can be empty or not exist in the document.</li> </ul>
Default aliases	<p>No action is necessary for this field. Document Automation assigns default aliases, which are hardcoded keywords, to standard fields to help with extraction.</p>

Option	Description
Custom aliases	<p>Additional keywords to help Document Automation locate the field. For example, add country or region-specific names for fields such as VAT number as an alias to an Organization tax number custom field.</p> <hr/> <p><b>Note:</b> Custom aliases must be unique. They cannot duplicate the default alias of another field. Exception: Form fields can have duplicate custom aliases as the table fields and vice versa.</p> <hr/>
Validation rules	<p>Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with.</p> <p><a href="#">Formula validation</a> on page 3901   <a href="#">Pattern validation</a> on page 3905</p>

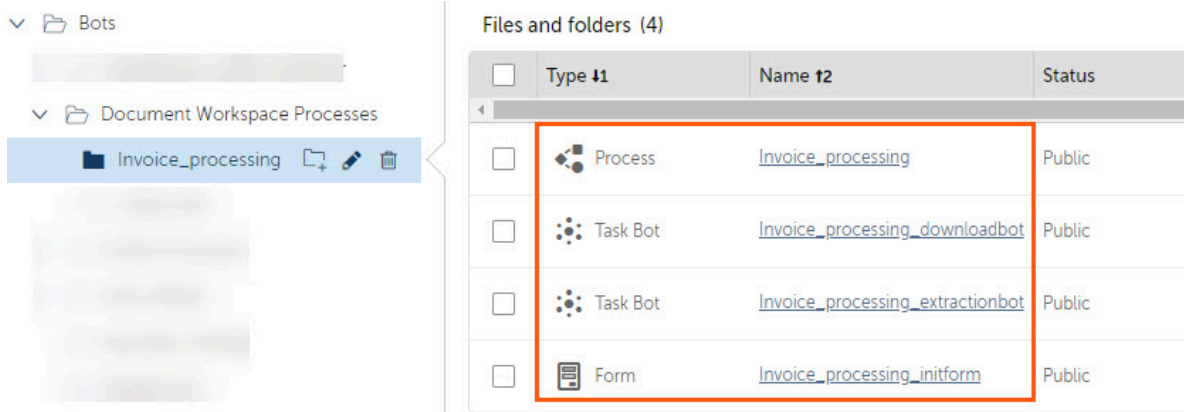

## Guidelines to create or edit the custom multi-table in a learning instance

When creating or editing multi-table at learning instance level, consider the following points:

- This feature is applicable to the document types such as Automation Anywhere (Pre-trained), Automation Anywhere (User-defined), IQ Bot to Document Automation Bridge package, and unstructured (generative AI).
- You can set up the rules with only one table field at a time and it cannot be setup across fields that belongs to different tables.
- All fields names must be unique.
- **Advanced training settings** is applicable to multi-tables. It will work on a per table basis and not across the tables.
- You can import, export, and copy learning instances that contain multi-tables.
- You can delete the custom table created in learning instance but the default **table** cannot be deleted.
- The maximum number of characters for custom multi-table name are 50 characters and 200 characters for column name.
- Only alpha numeric, underscore, spaces, and hyphen characters are allowed in for the **table name** field.
- You cannot rename the table name while creating or editing a learning instance.
- Multi-table support is not applicable for Standard Forms, Google Document AI, bill of lading, waybill, arrival notice, and packing list document types.
- The output (CSV) file will indicate all the table references (default and custom multi-table) in the `table_name: field name` format.

## Bots output file and folder structure

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder. The folder contains two bots (extraction and download), a process, and a form.

- **Process:** Manages the process using if/else scenarios through which Document Automation extracts data from uploaded documents, assigns documents to users for validation, and downloads the extracted data. To learn more, see [About the Automation Co-Pilot process in Document Automation](#) on page 3889
- **Extraction bot:** Extracts data from defined fields in the uploaded documents.
- **Download bot:** Downloads the extracted data to a specific folder on the device or shared network.
- **Form:** Defines the input parameters that are sent to the process. Input parameters include the learning instance name, uploaded file, and output file path.

## Copy a learning instance in Document Automation

You can copy an existing learning instance (Public and Private) to reuse the learning instance fields, parser, document type, language, and local associations in the learning instance copy.

When you copy a public learning instance, the copied learning instance remains in the private mode. After copying a learning instance, you can edit the existing parameter (except parser and heuristic feedback) as required.

1. Go to **Manage > Learning Instances**.  
A list of all the learning instances display.
2. Click the three dots icon next to the learning instance that you want to copy and click the **Copy** option.
3. In the **Copy Learning Instance** window, enter the name for the instance.

---

**Note:** When you copy a learning instance, the default name starts with the prefix **Copy of <<instance name>>**. You can change the name, if required.

---

4. Select the required copy options and click **Copy**.

Following are the available copy options:

- a) **Form and table field attributes**

- Copies only form and table fields.
- Enables you to add the custom fields.
- Does not copy form or document rules.

**b) Form and table fields validation rules**

- Copies form and table fields along with form and document rules.
- Enables you to add the custom fields.
- Does not copy the feedback provided to original instance.

**c) Heuristic feedback for learning instance**

Copies a learning instance along with the feedback provided to original learning instance

A success message indicates that the copy process is started and a Control Room notification is triggered to indicate success or failure of the copy process.

## Limitations

Consider the following points when you copy a learning instance:

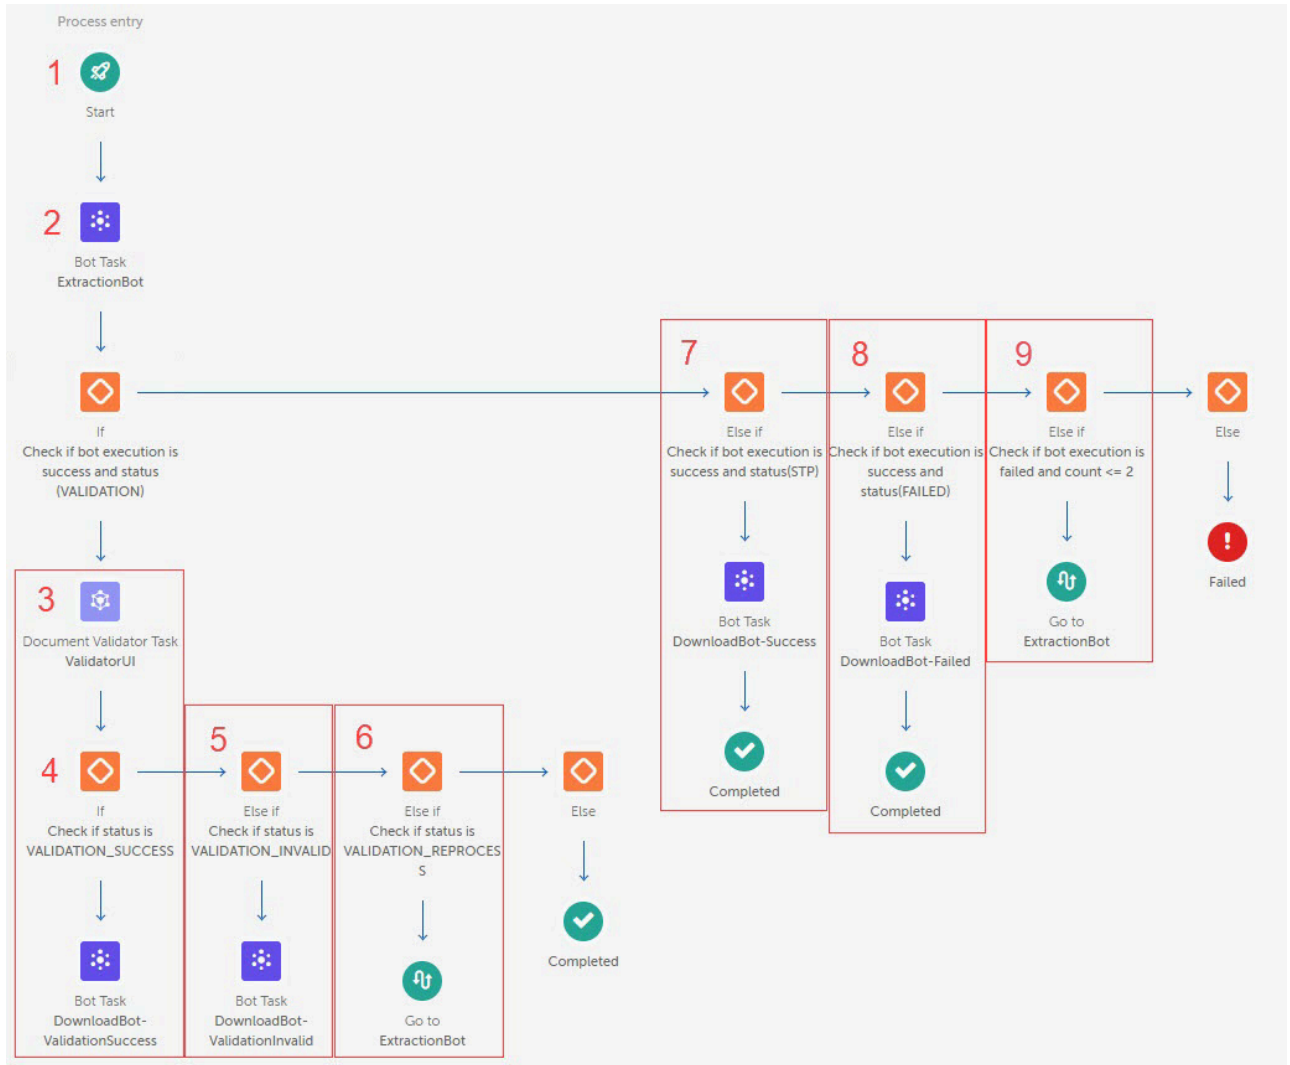

- You cannot copy the dashboard metrics for the learning instance.
- You cannot copy the connected learning instance.
- You cannot copy the Doc AI learning instance credentials.
- If the underlying package of the learning instance is deleted before copying an instance, an error might occur during the copy process.
- Each copied learning instance is separate one.
- You can delete the original or copied learning instance when required.
- An audit entry is logged.

## About the Automation Co-Pilot process in Document Automation

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. When you create a learning instance in Document Automation, the system also creates an Automation Co-Pilot process. Review the following guide to understand the logic.

When a learning instance is in production, each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, Automation Co-Pilot creates a validation task and assigns it to a validation team.

After the documents are processed, the Download bot downloads the extracted data to a file in the Success folder.

1. Start: The Automation Co-Pilot form that defines the inputs, such as the learning instance name, uploaded documents, and output folder.
2. Bot Task ExtractionBot: Executes the RPA bot that processes incoming documents to extract data from them.
3. Document Validator Task: Opens the Validation user interface where the user can manually validate the fields in the document.
4. Documents require validation: The ExtractionBot tried to process the documents then sent the documents for validation, the documents were successfully validated, and the DownloadBot downloaded the extracted data to the Success subfolder.

Request status = VALIDATION\_SUCCESS

5. Invalid documents: The previous process was interrupted at validation, where a user marked certain documents as **invalid**. These documents were downloaded to the Invalid subfolder.

Request status = VALIDATION\_INVALID

6. Reprocessed documents: The previous process was interrupted at validation because the user clicked **Reprocess**. Documents were sent back to the ExtractionBot for reprocessing.

Request status = `VALIDATION_REPROCESSING`

7. Documents are successfully processed: The ExtractionBot successfully processed the documents, no documents required validation, and the DownloadBot downloaded the exacted data.

Request status = `success` and `STP`

8. Processing failed: The ExtractionBot failed to process the documents (for example: invalid format or could not read the file) and the file is saved to the `Failed` subfolder

Request status = `FAILED`

9. Deployment failed: The Control Room failed to deploy the ExtractionBot (for example: lost server connection). The Control Room makes three attempts.

---

**Important:** We do not recommend deleting the process. If you unintentionally delete a process associated with a learning instance, do the following steps to recover the process:

1. Navigate to **Manage > Learning Instances** and mouse over the actions menu to the right of the learning instance.
2. Click **Export**.
3. Mouse over the actions menu to the right of the learning instance and click **Delete**.
4. Click **Import** at the top of the page.
5. Click **Browse** and select the `.dw` file you exported.
6. When prompted, click **Overwrite** to generate a new process for the learning instance.

---

## Process documents in Document Automation

Upload sample invoices to test the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Document Automation](#) on page 3881.
- Verify that your device is connected to the Control Room: [Install Bot Agent and register device](#) on page 1450
- If the learning instance uses a Google Document AI model and you did not purchase Google Document AI licenses through Automation Anywhere , you must provide your Google Document AI credentials to the Extraction bot. See [Configure key for Google Document AI](#) on page 3880
- If the learning instance uses an Automation Anywhere model, ensure that each file is 50 MB or less.

If the learning instance uses a Google Document AI model, ensure that each file is 20 MB or less, with a maximum of 5 pages.

- Ensure that the sample documents are in one of the following supported document types:
  - PDF
  - JPG
  - JPEG
  - PNG

- TIF
  - TIFF
- The default output format for the extracted data is CSV file. To change the output to JSON, see [Change output format from CSV to JSON](#) on page 3894.

Perform the following steps to upload sample invoices to the learning instance to test the data extraction capabilities of the learning instance.

**1.** Upload documents to test the learning instance:

See these steps in a video:

**a)** Click **Process documents**.

**b)** In the **Process Documents** window, click **Browse** to select the files to upload.

**c)** In the **Download data to** field, enter the file path that will hold extracted data.

When the process runs, it creates the following three folders in the provided file path:

- **Success:** Contains the extracted data in the specified format (CSV or JSON).
- **Invalid:** Holds documents marked invalid.
- **Failed:** Holds documents that could not be processed.

You can provide an output folder path based on one of the following options:

- **Option 1:** The local device path if you have set up document processing and validation on the same device.

This option is typically used when you are testing the learning instance.

- **Option 2:** The shared folder path if you have set up distributed validation on separate devices.

This option is typically used for published learning instances. For example, `\10.239.192.60\Sharepath\Output`.

**d)** Click **Process documents**.

The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the document fields. Otherwise, proceed to step 3.

**2.** Fix the validation errors

**a)** Click **Validate documents**.

The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3933.

- b)** Review each field to verify the data type and extracted value.  
Document Automation supports the following data types: text, number, date, address, and check box  
Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

---

**Note:** When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

---

- c)** Update the fields with errors.  
Click the field or draw a box around the values that you want to extract.  
For Automation Anywhere pre-trained models, you can configure the learning instance to extract specific values in a field and ignore others. For more information, see [Use validation feedback to extract specific values in a table](#) on page 3908.
- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
  - To remove a document that cannot be processed, click **Mark as Invalid**.
- d)** After you make the necessary corrections, click **Submit** so that the document can finish processing.  
The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.
- e)** Close the tab to return to the **Learning Instances** page.

**3.** Verify the output results:

- a)** Open the file in the **Success** folder that contains the extracted data and review the results to ensure that it matches your use case.

The Microsoft forms return extracted values (OCR data) in the JSON format, such as `GUID_0-MSFormTableResult.json`. Along with the extracted document data in `<<GUID>>_FileName` CSV file, the **Success** folder also shows the extracted table data separately in another CSV files. Based on the number of tables in the document, you can find different CSV files for each table. For example, `<<GUID_PAGE_NUMBER-Table_FILENAME_PAGENUMBER_TABLENUMBER`.

With separate table data, you can compare extracted data with Microsoft engine data in the `GUID_0-MSFormTableResult.json` file.

- b)** Optional: Review the **Learning Instance** dashboard.  
The dashboard displays the total number of uploaded documents and the number of documents pending validation.

If the learning instance repeatedly cannot find a field or if characters are not correctly recognized (such as the letter "l" extracted as the number "1"), you can try changing the OCR to Google Vision OCR.

Build a bot that uploads documents from a source folder to the learning instance. Then, publish the learning instance assets (process, form, and bots) to the public repository so that the learning

instance can be used in public mode to extract data from real documents, and validators can manually validate documents: [Publish the learning instance to production](#) on page 3925

Related concepts

[Extracting data from check boxes](#) on page 3915

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

## Change output format from CSV to JSON

Data from successfully processed documents is available as a CSV file, by default. Change the output format by editing the download data action before you begin uploading documents.

If you have not done so already, [Create a learning instance in Document Automation](#) on page 3881.

To change the output format to JSON, perform the following steps:

1. Navigate to **Automation > Private tab > Document Workspace** and click the folder with the same name as the learning instance to configure the assets.
2. Open the process.

You must update the output format for `DownloadBot-ValidationSuccess` and `DownloadBot-Success`:

3. Click `DownloadBot-ValidationSuccess` and locate the **DocumentType** field.
4. Change `OUTPUT_CSV` to `OUTPUT_JSON`.
5. Repeat steps 3 and 4 to change the output format for `DownloadBot-Success`.
6. Click **Save**.

Upload documents to the learning instance: [Process documents in Document Automation](#) on page 3891

## Validation rules in Document Automation

With validation rules, you can ensure the accuracy of extracted data across multiple fields in your documents.

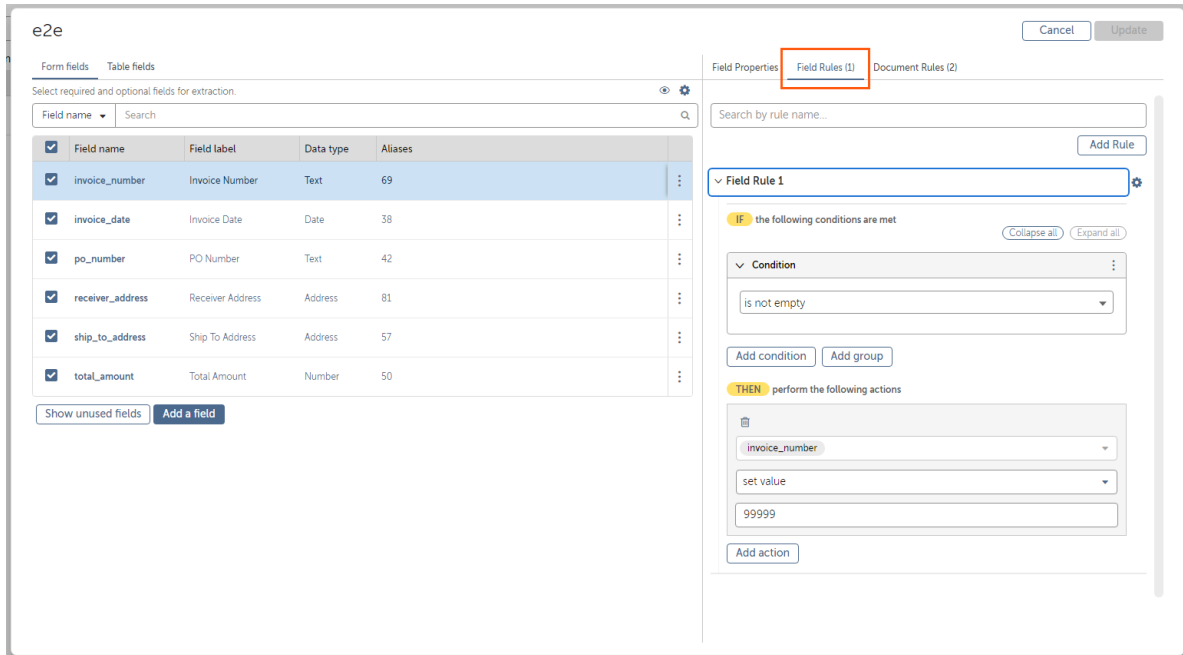

You can define various conditions, such as pattern matching or equality checks. When those conditions are met, you can effortlessly take action to flag errors or warnings, clean up or replace values, or set new values.

Enhanced validation rules can be applied on two levels:

- Field Rules
- Document Rules

### Field rules

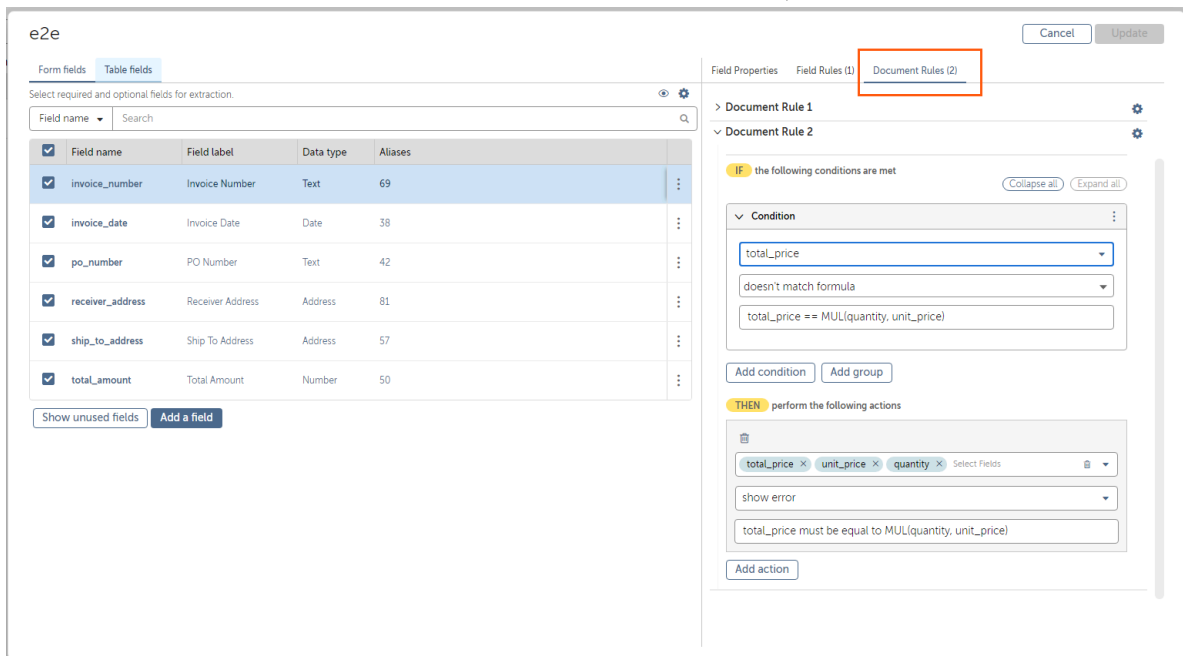

Field-level rules are designed to create rules specifically for individual fields. These rules contain a condition that is followed by a set of actions to be performed if the condition is met and is implicitly associated with the highlighted field.

These rules are processed before document-level validation rules.

## Document Rules

A document level rule is associated with a field but can have conditions and actions that are dependent on values of other fields. With these rules, you can build complex structure of conditions that can include several fields and encompass extensive actions.

### Note:

- You can select one or more fields where these actions can be applied.

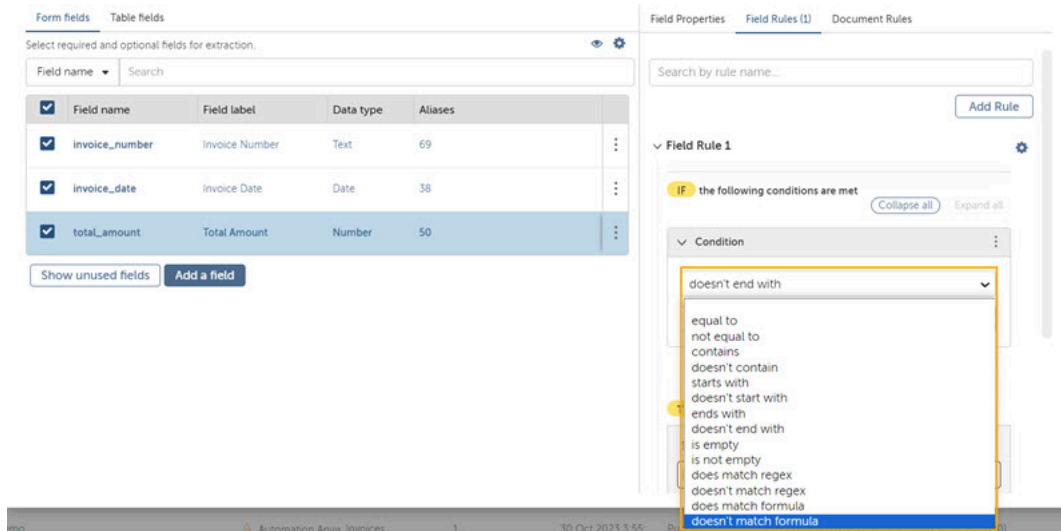

- The document rules can be structured with dependencies between fields, and their execution order is crucial. It is important to maintain the sequence.
- When there are multiple conditions in the document rule and if the user corrects a value for validation, the conditions with **AND** and **OR** operators does not function in expected manner.
- You must enter all the populated fields while adding a field or document rule to get the **Update** option enabled.

For example, you must add an **Action value** for selected **Action type** and then update the learning instance.

In the following video, you can observe how validation rules are utilized within documents to enhance the process of data extraction.

## Available conditions

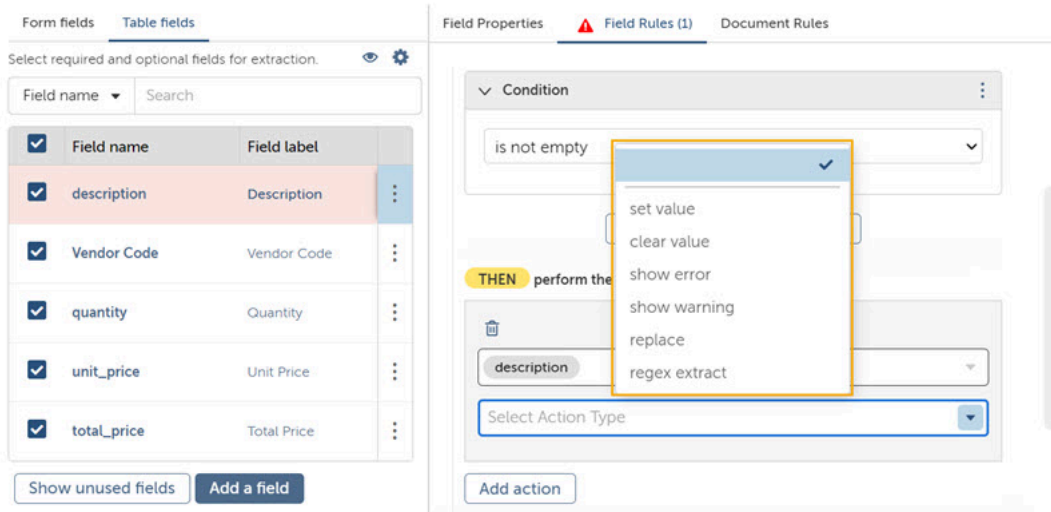

A condition is expressed as a logical rule that evaluates the state or values of certain fields that must be met for an action to occur. Below is the list of all the available conditions:

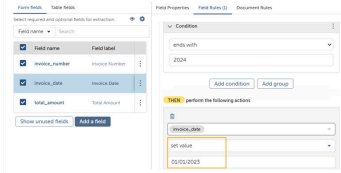

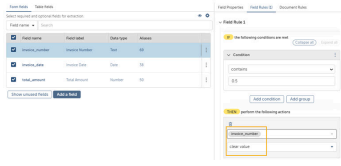

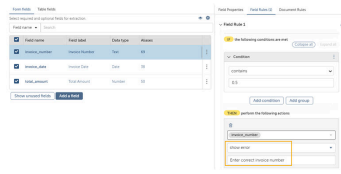

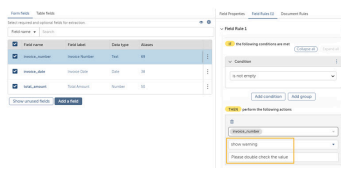

## Available actions

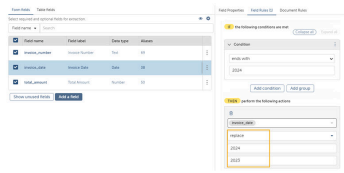

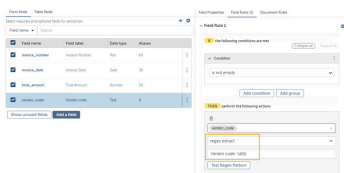

An action is associated with an operation that is performed when certain conditions are met. Below is the list of all the available actions:

When the specified conditions are met, these actions filter the generated output and provide more accurate document data.

Action type	Description	Example
<b>set value</b>	If the specified condition meets, the <b>set value</b> action sets the specified value for the selected fields.	
<b>clear value</b>	If the specified condition meets, the <b>clear value</b> action clears the values of the selected fields.	
<b>show error</b>	If the specified condition meets, the <b>show error</b> action shows the error message for the selected fields.	
<b>show warning</b>	If the specified condition meets, the <b>show warning</b> action shows the warning message for the selected fields.	

Action type	Description	Example
<b>replace</b>	If the specified condition meets, the <b>replace</b> action replaces the values of the selected fields.	
<b>regex extract</b>	<p>If the specified condition meets, the <b>regex extract</b> action applies a regular expression to the extracted value to retrieve a specific sub-string.</p> <hr/> <p><b>Note:</b> The <b>regex extract</b> action extracts only the first match found in the value based on the specified regex pattern.</p> <hr/>	

Related reference

[Formula validation](#) on page 3901

Use basic arithmetic, comparative, logical, and functional operations.

[Pattern validation](#) on page 3905

A pattern defines an acceptable format for date, number, or text fields. Reference the tables below for common examples:

## Use regex extract action in validation rule

The **regex extract** action allows users to apply a custom regular expression (regex) to the values extracted from documents. With this action, users can manipulate the extracted data by extracting specific sub-strings based on the specified regex pattern.

When a document is processed and a value is extracted, you can apply the **regex extract** action to this value. You can define a regex pattern which will be used to identify and extract a specific part of the extracted value.

---

**Note:** It extracts only the first match found in the value based on the specified regex pattern.

---

- When you apply the regex extract action, the system sets a field value with the first regex match during extraction.
- If the specified regex does not have a match for the field, it returns an empty field value.
- If you do not have an updated (v.31) package connected to a learning instance, you will encounter a warning message to indicate that this rule might not work as expected.

## Example

This feature is particularly useful in scenarios where only a portion of the extracted data is needed. For example, extracting a specific set of numbers from a larger string, isolating a part of an address, or retrieving a specific fragment from a table description.

In the below example, if you want to extract the **Vendor Code** from the **Description** column of the document, it retrieves all the description text from the **Description** column.

The following image shows **Vendor Code** values with regular extraction process.

Item No.	Description	Qty	Unit of Measure	GST	Amount	GST	
102021	Cannula IV Retractable Autoguard 22G Black 1 in 0.9mm x 25mm Vendor Code: 381823	2	Box of 50		85.50	171.00	
102670	Set Extension 3-way Stopcock 10cm Connecta Plus3 White Vendor Code: 394995	10	Box of 50		45.50	455.00

Syringe Luer Lock Plastipak 50ml Vendor Code: 300845	Syringe Luer Lock Plastipak 50ml Vendor Code: 300845	2

In this example, we will see how to extract only **Vendor Code** from the **Description** column of document.

1. On the **Field Rules** tab, click **Add Rule**.
2. Specify the **is not empty** condition for the **Vendor Code** field.
3. Select the **regex extract** action type.
4. Specify the regex pattern. For example, `Vendor Code: \d{6}`
5. Test the regex pattern by providing appropriate value for the specified pattern and click **Update**. For example, `Vendor Code: 381823`.

6. Click **Process** to process the document.  
Based on the specified regex pattern, only **Vendor Code** value is extracted from the **Description** column.

The following image shows **Vendor Code** values after applying the **regex extract** action.

Item No.	Description	Qty	Unit of Measure	Unit Cost Ex GST	GST Amount	Line Total Ex GST
102021	Cannula IV Retractable Autoguard 22G Black 1 in 0.9mm x 25mm Vendor Code: 381823	2	Box of 50	85.90		171.80
102670	Set Extension 3-way Stopcock 10cm Connecta Plus3 White Vendor Code: 394995	10	Box of 50	48.50		485.00
103270	Needle Blunt 18G 1.5in Vendor Code: 302032	1	Ctn of 1000	20.00		20.00
103273	Needle Hypodermic 18G 1.5in Vendor Code: 302032	5	Ctn of 1000	20.00		100.00
103404	Syringe Luer Lock Plastpak 30ml Vendor Code: 301229	3	Ctn of 240	67.20		201.60
103409	Syringe Luer Lock Plastpak 30ml Vendor Code: 300965	2	Ctn of 240	76.80		153.60
122629	Syringe Oral Amber 10ml Clear Oral Dispensers with Amber Plunger Vendor Code: 305857	4	Box of 100	24.00	9.60	96.00
245696	Needle AutoShield Duo Safety Pen 30G 5 Retractable Vendor Code: 329505	1	Box of 100	70.00		70.00
288766	Syringe 30ml Slip Precise Vendor Code: 300142	4	Ctn of 200	52.00		208.00
103031	Container Syringe 75 Yellow Au Vendor Code: 302404	2	Ctn of 5	217.60	43.52	435.20
	Resign	1	Each	50.00		50.00
	<b>Total All Excl. GST</b>					<b>1,190.40</b>
	<b>Total All incl. GST</b>					<b>2,048.52</b>

Following are some sample regex patterns that you can use for extraction:

Date type	Regex pattern	Examples
Text or address	\b[A-Za-z0-9._%+-]+@[A-Za-z0-9.-]+\.[A-Z a-z]{2,}\b	test@gmail.com
	\b\d{3}[-.]?\d{3}[-.]?\d{4}\b	123.456.7890 or 123-456-7890
Number	^\d{2}\$	12, 23, or 99
	^[0-9]+\$	123 or 12434

Date type	Regex pattern	Examples
Date	<code>\b\d{1,2}[/-]\d{1,2}[/-]\d{4}\b</code>	12/31/2022 or 02/07/2012
	<code>^\d{2}/\d{2}/\d{4}\$</code>	28/02/2222

**Note:** These regex patterns are not fixed and might vary based on your use case requirement.

## Formula validation

Use basic arithmetic, comparative, logical, and functional operations.

**Tip:** We recommended using functional operators instead of mathematical operators when validating fields and tables for better accuracy.

When formulating an expression remember the following:

- All function names must be in capital letters.
- All formulas must result in either a true or false validation.
- Field and column names are case sensitive when used within formulas. If field is defined as Qty in design, using qty or QTY in formula results in an invalid formula.
- For variable declaration or manipulation, ensure not to use certain keywords that are reserved for formulating an expression, including SUM, SUB, DIV, MUL, COLSUM, IF.

## Mathematical operators

Operations	Description	Syntax
+	Addition	Field/Column_Name1 + Field/Column_Name2
-	Subtraction	Field/Column_Name1 - Field/Column_Name2
*	Multiplication	Field/Column_Name1 * Field/Column_Name2
/	Division	Field/Column_Name1 / Field/Column_Name2

## Comparative operators

Operations	Description	Syntax
==	Equal To	[Current Field/Column Name] == [expression comprised of one or more field/column name or fixed numeric values]  For example, AMOUNT == MUL(QUANTITY, UNIT_PRICE)
>=	Greater than or Equal To	[Current Field/Column Name] >= [expression comprised of one or more field/column name or fixed numeric values]  For example, TOTAL_BILL_AMOUNT >= AMOUNT_PAID
<=	Less than or Equal To	[Current Field/Column Name] <= [expression comprised of one or more field/column name or fixed numeric values]  For example, AMOUNT_PAID <= TOTAL_BILL_AMOUNT
>	Greater Than	[Current Field/Column Name] > [expression comprised of one or more field/column name or fixed numeric values]  For example, BILL_AMOUNT > 0
<	Less Than	[Current Field/Column Name] < [expression comprised of one or more field/column name or fixed numeric values]  For example, DISCOUNT_PERCENTAGE < 100

Operations	Description	Syntax
!=	Not Equal To	[Current Field/Column Name] != [expression comprised of one or more field/column name or fixed numeric values]  For example, DEBIT_AMOUNT != 0

## Logical operators

Operations	Description	Syntax
&&	And: Field/Column is valid if all conditions are true	<Current Field/Column Name> <operator 1> <expression 1> && <Current Field/Column Name> <operator 2> <expression 2>  For example, DISCOUNT_PERCENTAGE >= 0 && DISCOUNT_PERCENTAGE <=100
	Or: Field/Column is valid if any one of the given conditions is true	<Current Field/Column Name> <operator 1> <expression 1>    <Current Field/Column Name> <operator 2> <expression 2>  For example, DISCOUNT_PERCENTAGE >= 0    DISCOUNT_PERCENTAGE == 'Net'
!	Not: Converts a true expression to false and also the other way round	!<expression>  For example, !(AGE < 18) ==> valid when AGE is not less than 18

## Functional operators

Operations	Description	Syntax
SUM	Summation: gives result of addition of one or more field/column/fixe-number values	SUM(n1,n2,...,nN)  For example, SUM(SUB_TOTAL, SERVICE_TAX, EDUCATION_CESS) ==> equivalent to SUB_TOTAL plus SERVICE_TAX plus EDUCATION_CESS
SUB	Subtraction: gives result of subtraction of one or more field/column/fixe-number values from the first specified value	SUB(n1,n2,...,nN)  For example, SUB(SUB_TOTAL, TOTAL_DISCOUNT, ADJUSTMENTS) ==> equivalent to SUB_TOTAL minus TOTAL_DISCOUNT minus ADJUSTMENTS
MUL	Multiplication: gives result of multiplication of one or more field/column/fixe-number values	MUL(n1,n2,...,nN)  For example, MUL(QTY_IN_BOX, UNIT_PRICE, SHIPPED_BOXES) ==> equivalent to QTY_IN_BOX multiply-with UNIT_PRICE multiply-with SHIPPED_BOXES
DIV	Division: gives result of division of one or more field/column/fixe-number values from the first specified value	DIV(n1,n2,...,nN)  For example, DIV(AMOUNT, SHIPPED_BOXES, UNIT_PRICE) ==> equivalent to AMOUNT divide-by SHIPPED_BOXES divide-by UNIT_PRICE

Operations	Description	Syntax
COLSUM	Sum of a given Column in a table: gives result after evaluating given expression for each row of specified table and adding them all together	<p>COLSUM("&lt;table-name&gt;", "&lt;expression to evaluate for each row of specified table-name&gt;")</p> <p>For example, FINAL_TOTAL == COLSUM("LINE_ITEMS", "MUL(QTY, UNIT_PRICE)")</p> <p>Say there are 3 rows for table LINE_ITEMS, then FINAL_TOTAL should be equal to MUL(QTY1, UNIT_PRICE1) + MUL(QTY2, UNIT_PRICE2) + MUL(QTY3, UNIT_PRICE3)</p> <p>where, QTY1 is QTY value in row 1, similarly UNIT_PRICE1 is UNIT_PRICE value in row 2, and so on for other rows as well.</p>

[Validation rules in Document Automation](#) on page 3894

With validation rules, you can ensure the accuracy of extracted data across multiple fields in your documents.

## Pattern validation

A pattern defines an acceptable format for date, number, or text fields. Reference the tables below for common examples:

### Text

Field	Pattern	Notes	Description
Email	^ ([a-z0-9_ \.-]+)@([\da-z \.-]+)\.([a-z\.-]{2,6})\$	This regular expression validates emails like john@ado.com.	The Email field supports regular expressions.
Phone Number	^( \(?\)+?[0-9]* \)? ?[0-9_ \- \(\)]*\$	This regular expression validates phone numbers like (+64) 38 3235393.	The Phone Number field supports regular expressions.
Website	^ ([a-zA-Z0-9]+)(\.[a-zA-Z0-9]+)+.*\$	This regular expression validates websites like www.domain.com.	The Website field supports regular expressions.

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.
Alpha-numeric	<code>^[A-Za-z0-9_@./#&amp;+]*\$</code>	This regular expression validates a string containing alphanumeric values like INV-001.	The Alpha-numeric field supports regular expressions.

## Number

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.

[Validation rules in Document Automation](#) on page 3894

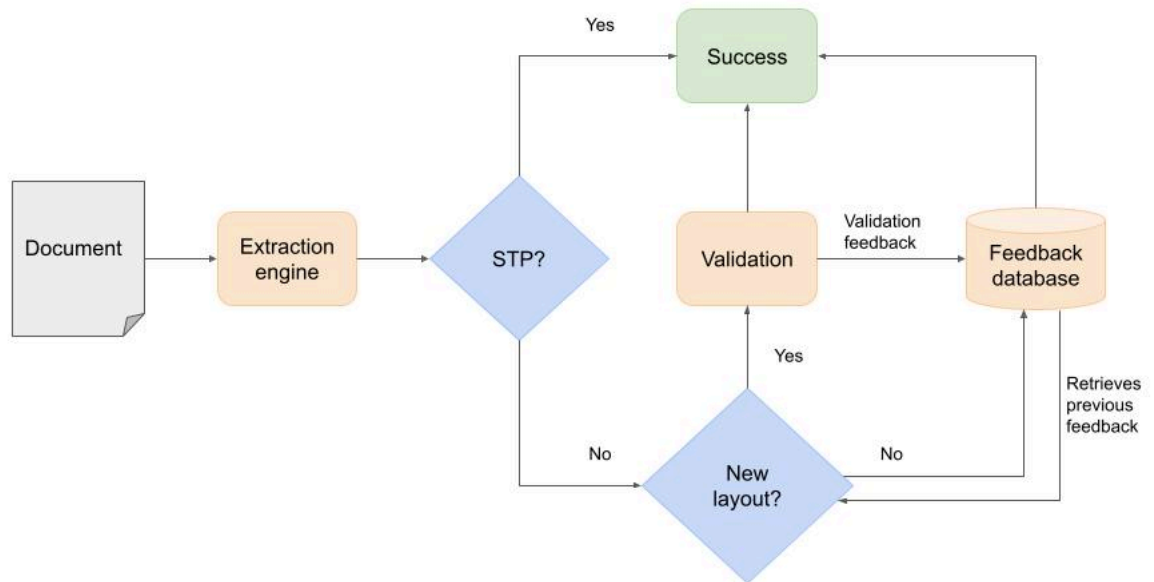

With validation rules, you can ensure the accuracy of extracted data across multiple fields in your documents.

## Improve extraction accuracy through validation

Understand how the system improves extraction accuracy through user-provided changes in the Validator.

When a learning instance is created, the user has the option to enable this feature to send feedback to the learning instance based on user-provided changes in the Validator. In Document Automation, learning instances running in production mode can continuously "learn" whenever a user resizes or relocates the extraction region in the Validator.

The following graphic provides a visual overview of the process by which learning instances continuously receive feedback from validation:

1. An uploaded document passes through the extraction engine.
2. If the learning instance successfully extracts the data, the document is added to the straight-through processing (STP) count and the extracted values are downloaded to a file in the *Success* folder.  
If the learning instance can not extract the data, the system evaluates whether the document contains an unfamiliar layout.
3. If the learning instance does not recognize the document layout (new layout), the document is sent for manual validation where the user "teaches" the learning instance how to extract the data by setting the extraction region.
4. The extracted values are downloaded to a file in the *Success* folder and the changes are collected in a feedback file, which is sent to the feedback database.

---

**Note:**

- Feedback is only collected when the user changes the extraction region. If the user manually inputs text, the system does not collect feedback.
- The feedback file only contains data on the field location to improve extraction accuracy for subsequent documents.

---

If the learning instance recognizes the cluster, it retrieves previous feedback from the feedback database and uses it to extract data.

## Use validation feedback to extract specific values in a table

As of Automation 360v.27, you can train a learning instance to extract data from a cell that contains more than one field.

For example, if a product description column also includes item number, you can outline the item number in the Validation interface. When the learning instance processes subsequent documents, it will extract the item number and ignore the product description.

Follow this procedure to configure a learning instance to extract specific values from a cell:

1. Create a learning instance using an Automation Anywhere pretrained model and select the option to send validation feedback: [Create a learning instance in Document Automation](#) on page 3881
2. Upload a sample document: [Process documents in Document Automation](#) on page 3891
3. In the Validator, locate the field and redraw the box to only surround the values that you want to extract.
4. After you click **Submit**, the information on the new extraction region is sent to the feedback database.
5. Upload more documents to test the accuracy of extraction. When you are satisfied with the results, proceed to preparing the learning instance to run in production: [Publish the learning instance to production](#) on page 3925

---

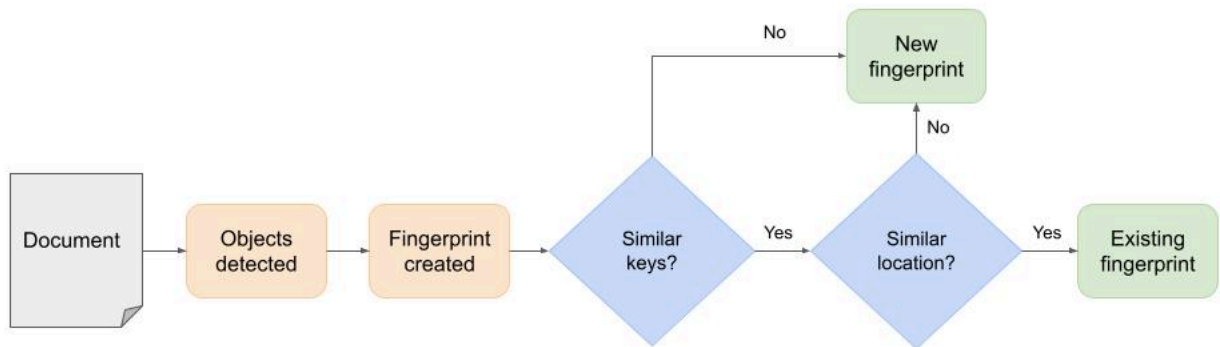

**Note:** You can also use this procedure to leverage validation based improvements for learning instances imported in Document Automation from IQ Bot using IQ Bot to Document Automation Bridge package. For more information, see [IQ Bot - DA Bridge package](#) on page 2924.

---

## How Document Automation identifies new layouts

Document Automation extraction is based on object detection. During document processing, the extraction engine identifies objects, or key-value pairs of the field and associated value. The engine creates a "fingerprint" of the document, which stores the sequence of the objects and each object's location in the document.

When a document is processed, if the engine recognizes the keys and their locations, the document is classified and extracted based on that existing fingerprint. Otherwise, the engine saves a new fingerprint of the keys and their locations.

## Use advanced training settings

Use the advanced training settings to train your documents and provide additional inputs to Document Automation extraction engine to improve the table data extraction.

After extracting the document, you can use the **Advanced training setting** option on the validation page to set the following values:

- **Primary column:** Set the primary column for row identification based on your requirements.
- **End of table indicator:** Add an end of table indicator value for the system to extract data till the value reaches to the specified value, excluding the end of table indicator value.
- **Header labels:** Adjust or re-map the table fields as required.

---

**Note:** This feature is only applicable to providers only if the **Improve accuracy using validation** option is available.

---

- The **Advanced training setting** option is available only if the **Improve accuracy using validation** option is enabled.
- Ensure that you have the **Train groups** permission to provide information about header labels, end of table indicator, and a primary column used for row detection.
- There can be only one primary column.
- The end of table indicator is a text system-identified region (SIR).

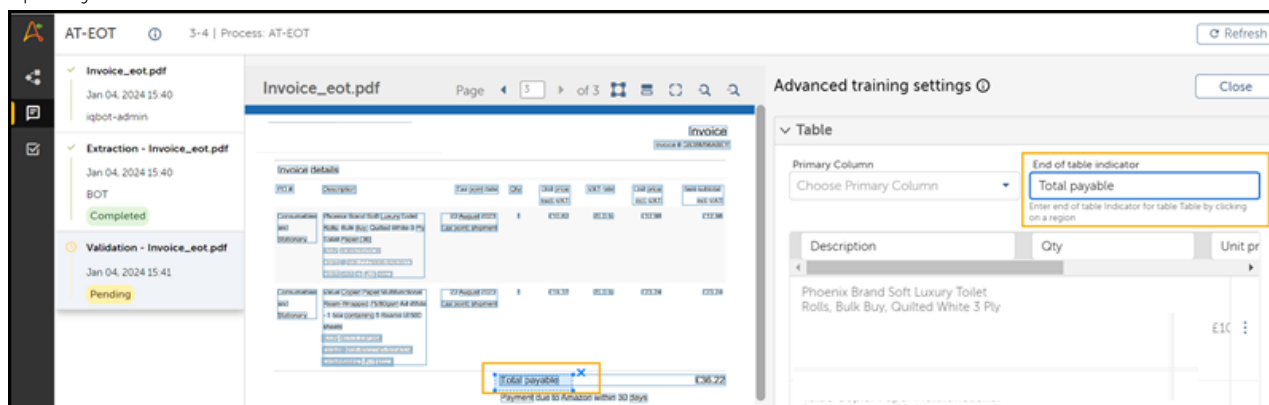

1. Process a document and navigate to the validation page.
2. Click **Advanced training settings**.

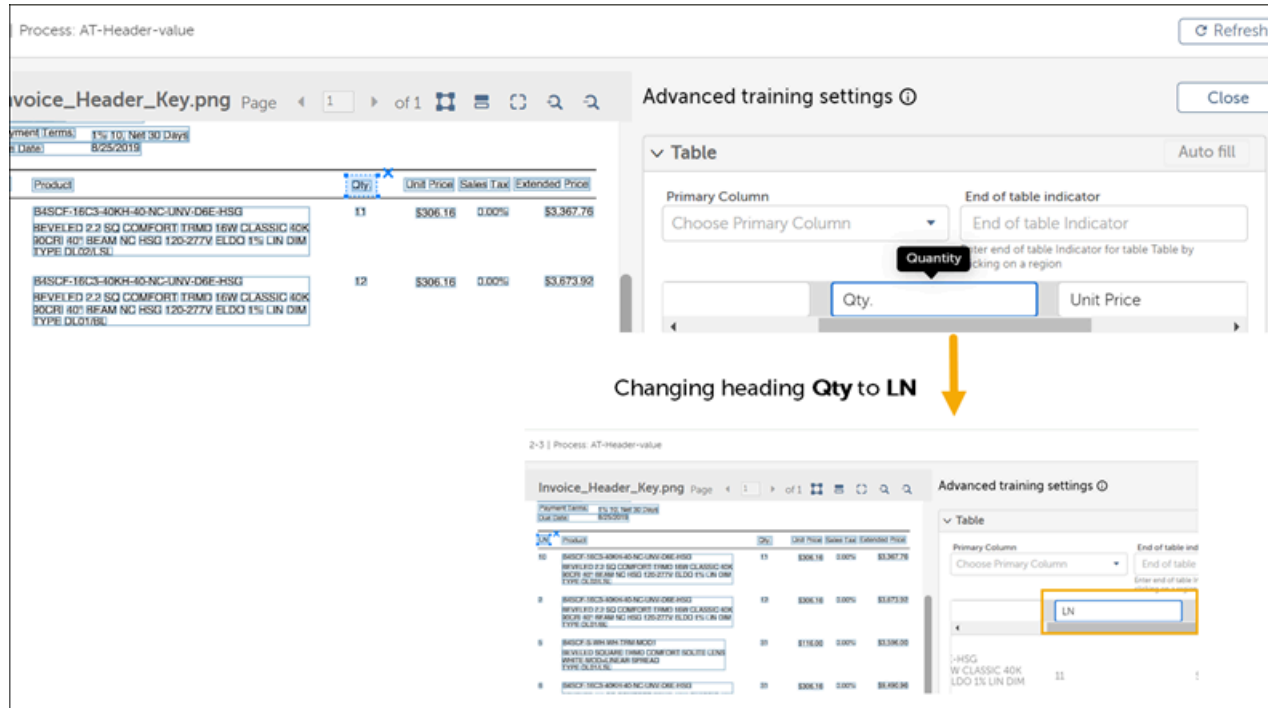

3. Train your document to set the following values:
  - a) Set the user-defined primary column for row identification.

- b) Specify the end of table indicator value.

- c) Click the required column and specify the required header name.

4. Click **Submit** and re-process the document.

**Note:** You must click **Submit** to save and take these settings into effect while reprocessing the document.

Based on the specified advanced training settings, the document is reprocessed and either sent to validator again to validate fields, if any or the data is extracted in the Success folder as CSV file.

#### Primary column

For example, after extracting the document, the multi-line table data from **Item number** column is extracted in a single row but you want to extract it in separate rows. In such cases, you can set the **Item number** as primary column to improve table extraction. For more details, see [Example of setting primary column using advanced training settings](#).

#### End of table indicator

For example, when you process a document, it extracts entire table data where as you want to extract row data till **Total payable**. In such cases, you can specify the **End of table indicator** value so that table data till that value (excluding the **End of table indicator** value) will be extracted and no further row data will be extracted.

#### Header label

When there is a label mismatch in table data, for example the extracted header label is **Unit Price** but you want the header label as **Price**. In such cases, you can change the header label.

Another use case is you can re-map or change the header label along with the column data. For example, after extraction, the **Price** column from learning instance is extracted as **Extended Price** but you want the header label as **Unit Price** along with it's column data. In such cases, you can change the **Extended Price** header label to **Unit Price** and you must select and re-map at least two cells from the **Unit Price** column.

Qty.	Unit Price	Sales Tax	Extended Price
11	\$306.16	0.00%	\$3,367.76
12	\$306.16	0.00%	\$3,673.92

Change the header label to "Unit Price"

Replace these values with at least two cells values from Unit Price column that is \$306.16

The following micro-animation demonstrates an example of setting the **Item number** as primary column and extracting the data in separate row instead of single cell.

## Lock the validation feedback

Use the lock feedback feature to freeze the validation feedback applied to learning instance and restrict other users from making any changes to the validation feedback.

You can enable the **Lock feedback** option to freeze the validation feedback at any point of time to ensure that no future validation will impact the extraction.

- Ensure that you have the **Create Learning Instance** and **Edit Learning Instance** permissions to select the **Lock feedback** in private mode.
- Ensure that the **Improve accuracy using validation** option is selected.

1. Go to **Manage > Learning Instances**.
2. Edit the required learning instance using the **Edit** option from three dots icon.
3. On the **Form fields** or **Table fields** tab, click **More options > Edit**.
4. Select the **Lock feedback** option to lock the feedback for the learning instance and click **Update**.

## Connect learning instance

Connect to a learning instance in Automation 360 IQ Bot to process documents in that learning instance using the Document Automation workflow.

To perform this task, you must have one of the following roles:

- **AAE\_IQ Bot Admin**
- **AAE\_IQ Bot Services**
- A custom role with the **Connect learning instance** permission

Open the Document Automation and Automation 360 IQ Bot environments on the same device.

When you connect a learning instance that was created in Automation 360 IQ Bot, the system creates learning instance assets (RPA bots, Automation Co-Pilot process, and form) to enable the learning instance to start processing documents in Document Automation.

---

### Note:

- You must have the **AAE\_Basic** and **AAE\_Bot Developer** role with the **Bot Creator** license.
- This feature is accessible only within Document Automation (not available in Community Edition). If you are an IQ Bot customer, you can use this feature within Document Automation.
- The Automation 360 IQ Bot environment must be associated with the Control Room where Document Automation is installed. In addition, Automation 360 IQ Bot must be in a version that is compatible with the Control Room.
- You can connect one learning instance at a time.

---

A connected learning instance can extract data from check boxes if your device is configured with the Microsoft Visual C++ 2019 Redistributable package: [Extracting data from check boxes](#) on page 3915

1. Login to the Control Room as the Admin user. Navigate to **Manage > Learning Instances**. Click **Connect learning instance**. This takes you to **Connect Learning Instances from IQ Bot classic page** which contains a list of Automation 360 IQ Bot learning instances.

- Select the learning instance from version Automation 360 IQ Bot to connect with. Move it from left to right. Click **Connect**.

**Connect Learning Instances from IQ Bot classic** Cancel Connect

You can edit the Learning Instance only in IQ Bot

Name

**Learning Instances (4)** (1 selected)

Name	Document type
<input checked="" type="radio"/> multilar_extractionbot	Invoices
<input type="radio"/> S_MS	Purchase Orders
<input type="radio"/> Z_T1	Purchase Orders
<input type="radio"/> INT1	Invoices

**Selected (0)**

Name	Document type
No learning instances	

→ Click here and Move learning instance(s) from left to right ←

The newly-connected learning instance appears in the Learning instances table in private mode.

**Note:** The value in the Provider column indicates whether a learning instance was connected from Automation 360 IQ Bot or created in Document Automation.

- For a connected learning instance, the Provider column value is User-trained.
- For a learning instance created in Document Automation, the Provider column value is Automation Anywhere (Pre-trained).

**Note:** You must maintain the Automation 360 IQ Bot server because it stores the configuration and training data for the connected learning instance.

- A connected leaning instance can only be edited in Automation 360 IQ Bot. To edit the leaning instance after connecting it, click the name in the Learning instances table and you will be redirected to open the learning instance in Automation 360 IQ Bot in a new window.
- To upload documents for processing, click **Process Documents**. [Process documents in Document Automation](#) on page 3891

## Extracting data from check boxes

Document Automation supports check box extraction for connected learning instances. The output varies depending on the selected data format.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. Document Automation supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, Document Automation supports triangle and rhombus outlines.

Document Automation supports the extraction of group check boxes from connected learning instances. For more information on group check boxes, see [Extract data from check box groups in Automation 360 IQ Bot](#).

---

**Note:** To enable check box detection, you must install the Microsoft Visual C++ 2019 Redistributable package on the Bot Runner device where the documents are processed. [Download Microsoft Visual C++ Redistributable](#)

---

## How the data is output

The possible output values are Yes, No, or No Checkbox Found. The output format depends on the format you selected [Change output format from CSV to JSON](#) on page 3894.

---

**Note:** Regardless of the document language, the output values are always in English.

---

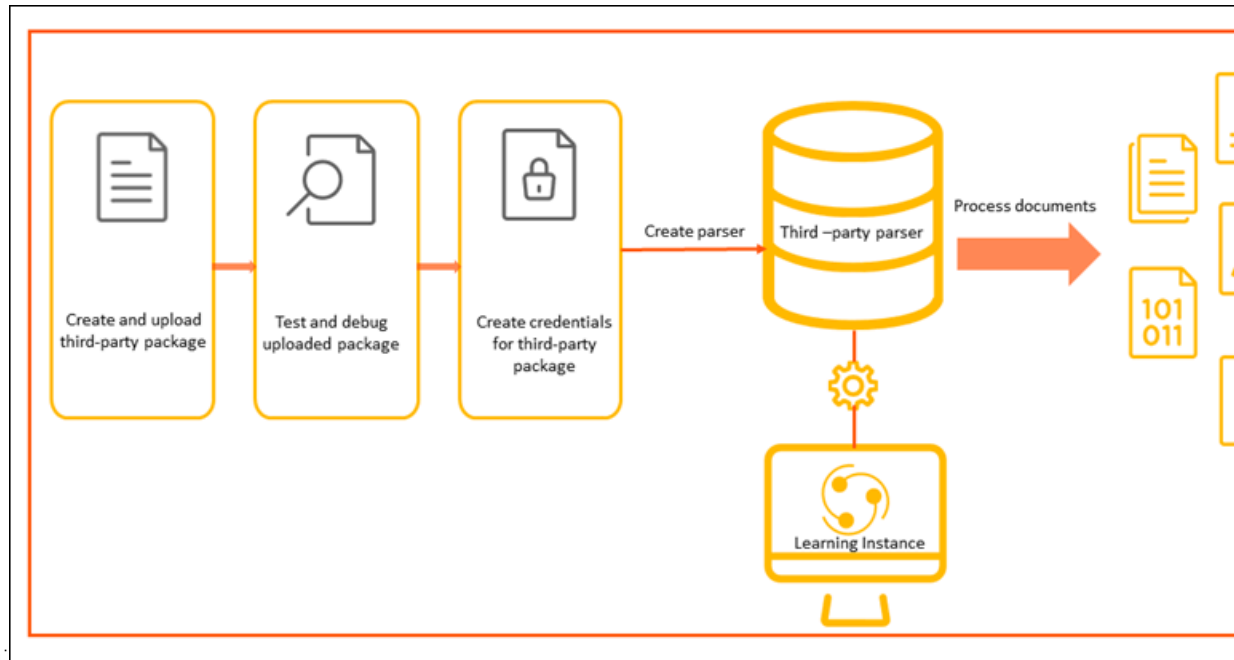

## Integrate third-party parser in learning instance

Document Automation enables you to connect to an external extraction engine using a custom Automation 360 package. You can create, customize, and connect this custom package as a parser and use it to extract documents.

The custom package leverages local engines and external services, like OpenAI, Amazon, or Google using API.

Using the third-party parser integration feature in Document Automation, you can create a custom Automation 360 package, connect it to Document Automation, and use it as a parser to process your documents. Create your own parser based on your specific use case and integrate it with the learning instance to process the documents. With the third-party parser integration in the learning instance, the associated package converts the document data into an authorized engine data format, which is sent to Document Automation for processing the documents. You can customize the fields when creating or updating the parser, viewing the added fields in the learning instance, and selecting or clearing the fields while the creating learning instance.

The following image illustrates the flow of third-party parser integration in Document

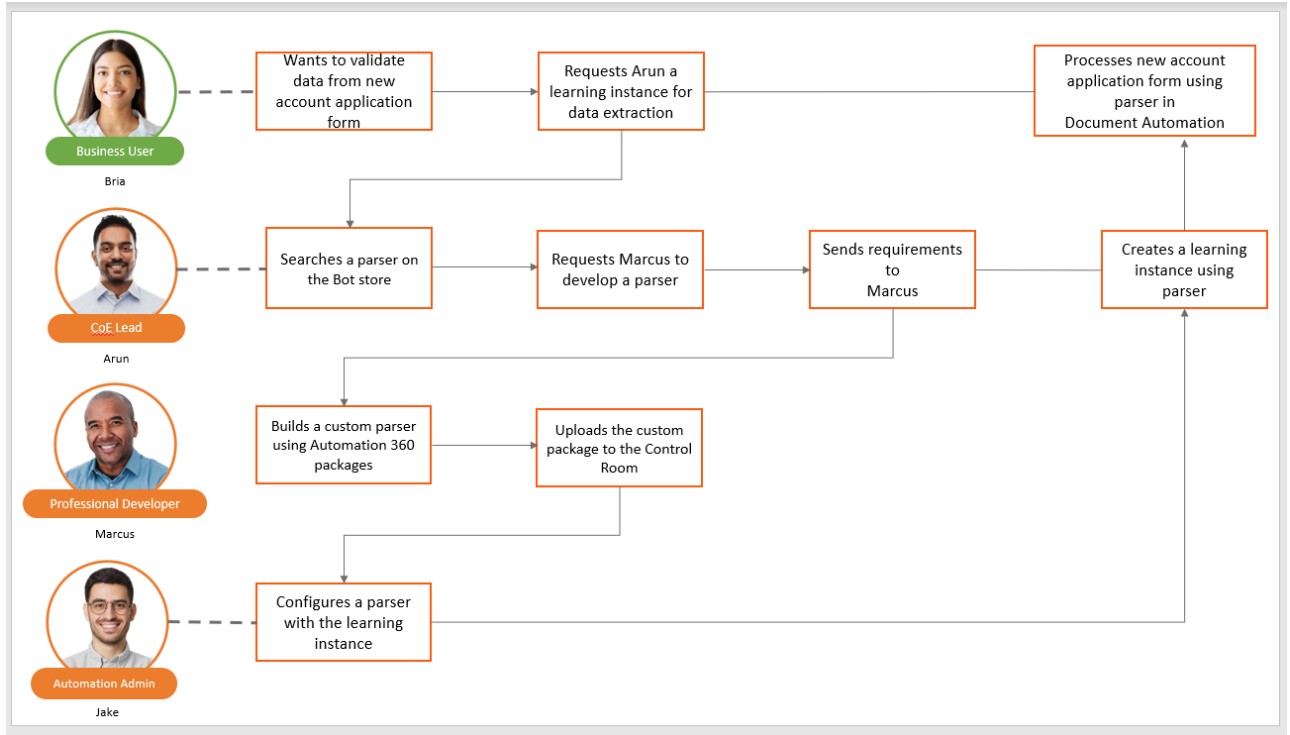

Automation:

With a third-party parser integration in Document Automation, you can:

- Leverage Automation 360 packages for enhanced document extraction
- Speed up your processing time with custom and package-driven document extraction
- Improve document parsing quality and reliability
- Improve learning instance efficiency to process more unstructured documents
- Extract documents more efficiently in less time and cost

For example, a bank employee wants to validate data in an application form for opening a new account. The existing system parser does not support a new application document type. As a result, an automation developer (Pro developer or CoE Lead) needs a third-party parser to extract document data from the new account application form. By integrating this third-party parser with the learning instance, the bank employee can use Document Automation SDK (software development kit) to extract data from the new account application form.

The following graphic illustrates the parser integration workflow) for a Business User, Pro Developer, CoE Lead, and the Control Room administrators.

Follow these steps to integrate a third-party parser:

1. Create a custom package, upload it to the Control Room, and test the uploaded package.  
See [Build and test a custom package](#) on page 3819.

---

**Note:** When working with API URL trusted list for custom parsers, you must add all API end points used in the parser to the trusted list at the Bot Runner end only.

---

2. Create credential and locker in the Credential Vault. See
  - [Create credential](#) on page 1980
  - [Create locker](#) on page 1982
3. Create a parser and configure it with a learning instance in Document Automation.  
[Create a parser and configure with learning instance](#) on page 3918
4. Process documents with the third-party parser.  
[Process documents in Document Automation](#) on page 3891

## Create a parser and configure with learning instance

After creating a credential and locker for the custom package and uploading it to the Control Room, create a parser using the custom SDK and configure it with a learning instance in Document Automation.

Ensure that your custom Package you want to integrate with in Document Automation, fulfills these requirements:

- The Automation Anywhere IQ Bot Administrator role to configure the parser in Document Automation.
- A Document Workspace license to configure the parser and integrate with a learning instance.
- When you create a Package, a defined command variable with `inputFilePath` must contain the input file path.
- If the package requires credentials to connect to the external service, the variable name must be same as the attribute defined in the Credential Vault.

For example, if there is a credential in the Credential Vault with the `serviceAccount` attribute, then the variable name defined in the command must be `serviceAccount` to capture the Credential Vault key value .

Configure a third-party parser with a learning instance and use it to process documents in Document Automation.

**1.** Create a parser.

To create a parser, provide an input and output contract for the parser package that you want to integrate with Document Automation. For more details, see [Sample codes for parser contracts](#) on page 3920.

**2.** Configure a parser with a learning instance.

After creating a parser, configure it with a learning instance in Document Automation. To configure a parser,

**a)** Navigate to **Manage > Learning Instances** and click **Configure Parser**.

**b)** On the **Parser Configuration** page, click **Create Parser Configuration**.

**c)** Enter the following details for parser configuration and click **Next**.

- **Name:** Provide a parser name. The allowed limit of characters for a parser name is 50.

---

**Note:** The special characters such as " , [ \ , ? , < , > , : , \$ , | , \* , / , ] are not supported for a parser name.

---

- **Description:** This is an optional field. Enter a description.
- **Package and Version:** Select the relevant package and version from the list.
- **Provider:** Select the provider you want to use with the learning instance for document extraction.
- **Document type:** Select the document type.
- **Language:** Select language and click **Add**.
- **Credentials:** This is an optional field. For the **Credentials** field, select the **Pick a credential** option and select the locker, credential, and attribute.

**d)** Click **Browse** to upload a JSON file that contains form and table fields for the parser and click **Create**.

Following is the sample schema for a JSON file which contains fields for a parser:

```
{
 "parserFields": [
 {
 "fieldName": "invoice_number",
 "dataType": "TEXT",
 "fieldType": "KEY_VALUE"
 },
 {
```

```
"fieldName": "invoice_date",
"dataType": "DATE",
"fieldType": "KEY_VALUE"
},
{
"fieldName": "total_amount",
"dataType": "NUMBER",
"fieldType": "KEY_VALUE"
},
{
"fieldName": "total_price",
"dataType": "TEXT",
"fieldType": "TABLE_HEADER"
}
]
}
```

The required parser with the associated package SDK is created and displays in the **Parser Configuration** list.

3. Create a learning instance and integrate the configured parser with the learning instance. See [Create a learning instance in Document Automation](#) on page 3881.

The following micro-animation demonstrates how to configure a parser and integrate it with a learning instance:

Consider the following points when working with a parser (such as: create, edit, or delete a parser):

- You can edit the parser details such as parser name, parser description, and version.
- You can change the parser details such as document type, language, package name, and field names only when the parser is not used in a learning instance. However, you can add new languages and field names.
- While editing a parser, when you change the package version in the parser, it might impact the existing document extraction capability of the associated learning instance.
- If a parser is used in a learning instance, you cannot delete it until the associated learning instance is deleted.
- While integrating a parser with a learning instance, you are required to create form and table fields that map to the parser fields.
- When you migrate the learning instances, you also need to migrate the associated third-party parser configuration. If multiple learning instances with the same parser configuration are migrated, then the corresponding parser configuration is migrated only once. If a target configuration exists for the parser, the same is updated with that of the source parser configuration.

## Sample codes for parser contracts

As a CoE Lead, you must provide input and output contract for the parser package to integrate it with Document Automation.

Following are the sample codes for input and output contracts:

## Input contract

```

package aws;

import com.automationanywhere.botcommand.data.impl.StringValue;
import com.automationanywhere.commandsdk.annotations.*;
import com.automationanywhere.commandsdk.annotations.rules.LocalFile;
import com.automationanywhere.commandsdk.annotations.rules.NotEmpty;
import com.automationanywhere.commandsdk.model.AttributeType;
import com.automationanywhere.core.security.SecureString;
import static com.automationanywhere.commandsdk.model.DataType.STRING;

@BotCommand
@CommandPkg(
 name = "ExtractionCommand",
 label = "Extraction Command",
 description = "Extraction Command",
 node_label = "Extraction Command",
 return_type = STRING,
 return_label = "Extraction Command Response",
 minimum_botagent_version = "21.98",
 minimum_controlroom_version = "10520")
public class ExtractionCommand {

 @Execute
 public StringValue compute(

## Output contract

The response from the command must be in JSON format with appropriate schema with which Document Automation can work. Following is the schema for JSON output generated out of the command:

```

{
 "metadata": {

```

```
"documentId": "unique Id used to Indentify document in DA",
"filepath": "Input File Path that refers to the Path used by Bot runner
during execution",
"executionStatus": {
"statusCode": "Status code which indicates the response post
extraction",
"statusMessage": "status message which indicates the response post
extraction ",
"message": "Message that details the result"
},
"timeInMs": "Time taken in ms to process the entire document",
"clusterId": "unique Id used to capture Heuristic feedback",
"numberOfPages": "Number pages in the document"
},
"imagePreprocessingResult": {
"metadata": {
"documentId": "unique Id used to Indentify document in DA",
"filepath": "Input File Path that refers to the Path used by Bot runner
during execution",

```

## Publish the learning instance to production

Check-in the process associated with the learning instance. Then, build a bot that uploads documents from a source folder to the learning instance and check it in to the public repository. Finally, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.

For Bot Runner devices with a Windows 2012 server-based operating system:

1. Download and install the Windows Essential Media Pack from Microsoft.

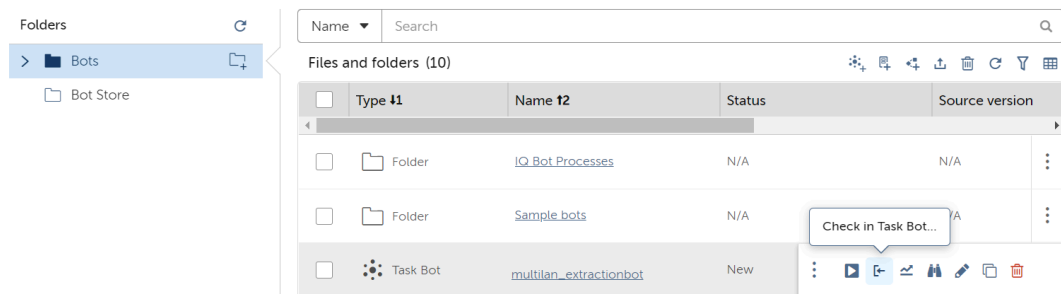

2. Install the Media Foundation feature from the Windows Server Manager.
1. Publish the process.
    - a) Navigate to **Automation > Private tab > Bots > Document Workspace processes** and select the folder with the same name as the learning instance.
    - b) Mouse over the vertical ellipses to the right of the process to open the actions menu and click **Check in process**.  
The **Check in Process** window opens with the bots and form auto-selected to also be checked in.
    - c) In the **Check in Process** window, add your comment and click **Check in**.  
The process appears in the same folder structure in the public workspace.

See these steps in a video:

**Note:** The **Private** mode is used for testing in a controlled environment and cannot be viewed by other users. The **Public** mode is used when the bot is production-ready, allowing it to be viewed and accessed by others based on permissions set by the administrator.

2. Build the **Extraction-Scheduler** bot to automate uploading documents to the learning instance: [Build a bot to upload documents to Document Automation](#) on page 3927
3. Publish the **Extraction-Scheduler** bot.
  - a) Locate the **Extraction-Scheduler** bot in the private tab.
  - b) Mouse over the triple ellipses to the right of the bot to open the menu and click **Check in Task**

Private bots and files cannot be viewed by other people. If a bot or file has been checked out from the Public tab, it can be viewed and run by other people, but cannot be edited.

**bot.**

The **Check in Task bot** page opens with the bot auto-selected.

- c) Add a comment and click **Check in**.
4. Login as the **Document Automation Admin** user to deploy the process and bots to unattended Bot Runner devices: [Deploy the learning instance assets](#) on page 3932

Once the process and **Extraction-Scheduler** bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity > In progress** to see the status of the running bots.

## Build a bot to upload documents to Document Automation

Build a bot to upload documents to a specific learning instance for processing and extraction.

- Ensure you have the name of the destination learning instance.
- If you have an adequate amount of Bot Runners connected. For instructions on connecting a Bot Runner, see step 5 of [Set up your Document Automation environment](#) on page 3875.

---

**Note:** You need a dedicated Bot Runner for this bot and additional Bot Runners for the extraction and download bots, depending on the average number of pages in the documents. Review the explanation below for more guidance on how many Bot Runners are needed.

- 
- Decide on the scheduling interval for deploying this bot with a maximum interval of every thirty minutes.
  - Determine the average number of pages in the documents awaiting upload.

This bot is necessary for end-to-end automation of the document extraction process. When deployed, the bot checks if there are enough Bot Runners to handle the documents, by comparing the number of files already uploaded against a calculated value. The calculation considers the number of Bot Runners, scheduling interval, and average number of pages in the documents.

---

**Note:** This step is important as it controls the number of documents being uploaded to ensure smooth processing and avoid overloading the Bot Runners, which might cause a time-out error.

---

To determine the number of Bot Runners needed, consider the following:

- One Bot Runner can process a single-page document in one minute.
- One Bot Runner can process a two-page documents in two minutes.
- One Bot Runner can process 1440 single-page documents in one day.
- Two Bot Runners can process two single-page documents in one minute.

---

**Note:** The current Bot Runner driven architecture of Document Automation is a constraint to facilitate the real-time or near-real-time processing.

---

Use this equation to determine how many Bot Runners are needed:

$$\text{Number of Documents to Process per day} * \text{Average Number of Pages per document} / 1440 = \text{Number of Bot Runners}$$

---

**Note:** If the equation result is not an integer, you must round up to the next whole number to obtain an adequate number of Bot Runners. For example, if the equation result is 4.2, you will need 5 Bot Runners.

---

To learn more, search for the Document Automation Developer course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

As an example, if you want to process 10,000 documents each day with an average of one page per document, you need seven Bot Runners:

$$10,000 \text{ documents} * 1 \text{ page per document} / 1440 = 7 \text{ Bot Runners}$$

To build the bot, follow these steps:

1. Navigate to **Automation > Private tab** and click **Create a bot**.  
Ensure you do not place the bot in the **Document Workspace** folder.
2. Provide a name for the bot, such as **Extraction-Scheduler**.
3. Create the following variables: [Create a variable](#) on page 2488

Variable name	Description	Data type	Value
File_Count	Increments with each loop iteration to count the number of files uploaded for processing.	Number	0
Extraction_Devices	Number of Bot Runner devices connected to the Control Room	Number	Enter the number of connected Bot Runner devices
Scheduler_Interval	Scheduling interval in minutes	Number	Enter the interval for which you will schedule this bot to run when you deploy it (minimum 2 min, maximum 30 min)
Average_Pages	Average number of pages per document		Enter the approximate average number of pages in the documents
FilesInFolder	Holds file name and extension	Dictionary	--
SourcePath	File path to the folder containing documents awaiting upload to Document Automation	String	Enter the file path
OutputPath	File path to the folder containing the extracted data and invalid or failed documents	String	Enter the file path where you want the extraction output

4. Insert a **Loop** action to iterate through all the documents in a specific file path.

- a) Double-click or drag the **Loop** action.
  - b) Select the **For each file in folder** iterator.
  - c) Insert the `SourcePath` variable into the **Folder path** field.
  - d) Insert the `FilesInFolder` variable into the **Assign file name and extension to this variable** field.
5. Insert an **If** action to compare the number of documents uploaded for processing to the number of Bot Runner devices multiplied by a scheduling interval and divided by the average number of pages.

---

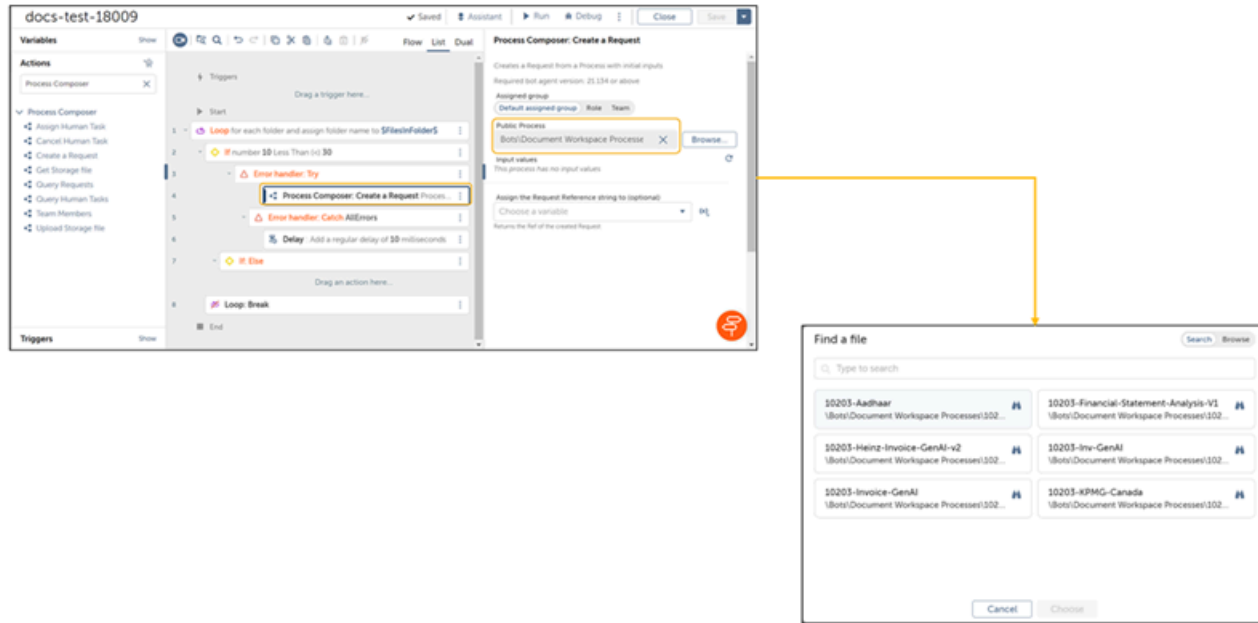

**Note:** You must include this equation to limit the number of files uploaded for processing at one time to ensure that the Bot Runners are able to process the documents.

---

- a) Drag the **If** action into the **Loop** container.
  - b) Select the **Number** condition.
  - c) Insert the `File_Count` variable into the **Source value** field.
  - d) Select the **Less than** operator.
  - e) Enter the following into the **Target value** field:  $\$Extraction\_DeviceCount\$ * \$Scheduler\_Interval\$ / \$Average\_Pages\$$
6. Insert **If: Else** and **Loop: Break** actions to end the loop if the condition is not met:
- a) Drag the **If: Else** action beside the **If** action in the **Loop** container.
  - b) Drag the **Loop: Break** action into the **If: Else** container.
7. Insert an error handling mechanism to log any possible errors:
- a) Drag the **Error handler: Try** action into the **If** container.
  - b) Drag the **Error handler: Catch** action beside the **Error handler: Try** action.
  - c) Drag a **Delay** action below the **Error handler: Catch** action.
  - d) Set a delay of 10 seconds.
8. Configure actions to upload documents to the process associated with a specific learning instance.
- a) Drag the **Process Composer: Create a request** action below the **Error handler: Try** action.

---

**Note:** You are pointing to a public process path that Document Automation creates automatically. For example, see the following image:

- b) Mark the **Set LearningInstanceName** option and provide the name of the learning instance where to send the documents.
  - c) Mark the **Set InputFile** option and enter `$SourcePath/$FilesInFolder{name}$. $FilesInFolder{extension}$.`
  - d) Mark the **Set InputFileName** option and enter `$FilesInFolder{name}$. $FilesInFolder{extension}$.`
  - e) Mark the **Set OutputFolder** option and enter `$OutputPath$.`
  - f) Drag the **Number: Increment** action below the **Process Composer: Create a request** action.
  - g) Insert the `File_Count` variable into the **Number** and **Assign output to variable** fields. The **Number** action increases the value of `File_Count` by one each time a file is uploaded to the learning instance. As long as the value in `File_Count` is less than the total in the equation you entered in step 5, the bot can run another loop iteration to upload another document to the learning instance.
9. Make a copy of the uploaded file to a different location on your desktop to keep track of which documents were successfully uploaded:
    - a) Drag the **File: Copy Desktop file** action below the **Number: Increment** action.
    - b) Enter `$SourcePath/$FilesInFolder{name}$. $FilesInFolder{extension}$.` in the **Source file** field.
    - c) Provide the folder path where to copy the files.
  10. Remove documents after they are uploaded to Document Automation so they do not get re-uploaded in the next iteration:
    - a) Drag the **File: Delete** action.
    - b) Enter `$SourcePath/$FilesInFolder{name}$. $FilesInFolder{extension}$.` in the **File** field.

11. Click **Save**.

The completed bot should resemble the one in the image below:

Publish the process and bot. See step 3 of [Publish the learning instance to production](#) on page 3925

## Deploy the learning instance assets

Deploy the process and RPA bots to the unattended Bot Runner devices, and assign the learning instance to a validation team. Here, you configure the learning instance assets to process documents in real time.

- The user who created the learning instance assets must check-in the process, form, and bots to the public repository. If you have not done so already, complete steps 1 and 2 of [Publish the learning instance to production](#) on page 3925.
- To deploy the learning instance assets, you must be an Admin user. See [Document Automation users](#) on page 3877.

### 1. Assign the a team of Validators to the process:.

- a) Open Automation Co-Pilot by appending `/aari` to the Control Room URL.
- b) Navigate to **Manage > Process** and locate the process with the same name as the learning instance.
- c) Click the process to assign it to a team.
- d) Navigate to the **Request Creation** section and select the **by Bot** option.
- e) Navigate to the **Teams** tab and click the **Add** icon on the left side.
- f) Select the team and click **Add and save**.

### 2. Deploy the `Extraction-Scheduler` bot

See these steps in a video:

- a) Return to the Control Room by removing `/aari` from the Control Room URL.
- b) Navigate to **Automation > Public tab** and locate the `Extraction-Scheduler` bot.
- c) Follow the steps to [Schedule a bot](#) on page 2276.
  - At the scheduling details section, select **Run repeatedly**.
  - Select the **Repeat every** option to schedule the bot on a recurring basis.

When you provide the desired interval and frequency, ensure that the interval matches the value in the `Scheduler_Interval` variable in the `Extraction-Scheduler` bot.

---

**Note:** If you are scheduling the bot to run starting today, you must repeat the steps two times to schedule the bot as follows:

- Schedule the bot with the desired start time for today, with an end time of 11:59pm on the same day.
- Schedule the bot to start tomorrow at 12:00am, with an end time of 11:59 on a future date.

---

**Important:** If you do not follow this guidance, the bot will start running each day at the time you provided in the **Start time** field, instead of being scheduled to run for 24 hours of each day.

---

- When selecting a Bot Runner, deploy the `Extraction-Scheduler` bot to a different Bot Runner than the one running the process.

**Note:** A Bot Runner can run only one bot at a time. Ensure that you use separate Bot Runners for the process and the `Extraction-Scheduler` bot, so that the `Extraction-Scheduler` bot does not interfere with the `Extraction` and `Download` bots.

---

Once the process and `Extraction-Scheduler` bot are deployed, documents in the specified folder are uploaded to Document Automation, and Document Automation either extracts data from the documents or sends the documents for validation.

Navigate to **Activity > In progress** to see the status of the running bots.

## Using the Automation Co-Pilot Task Manager Validator for Document Automation

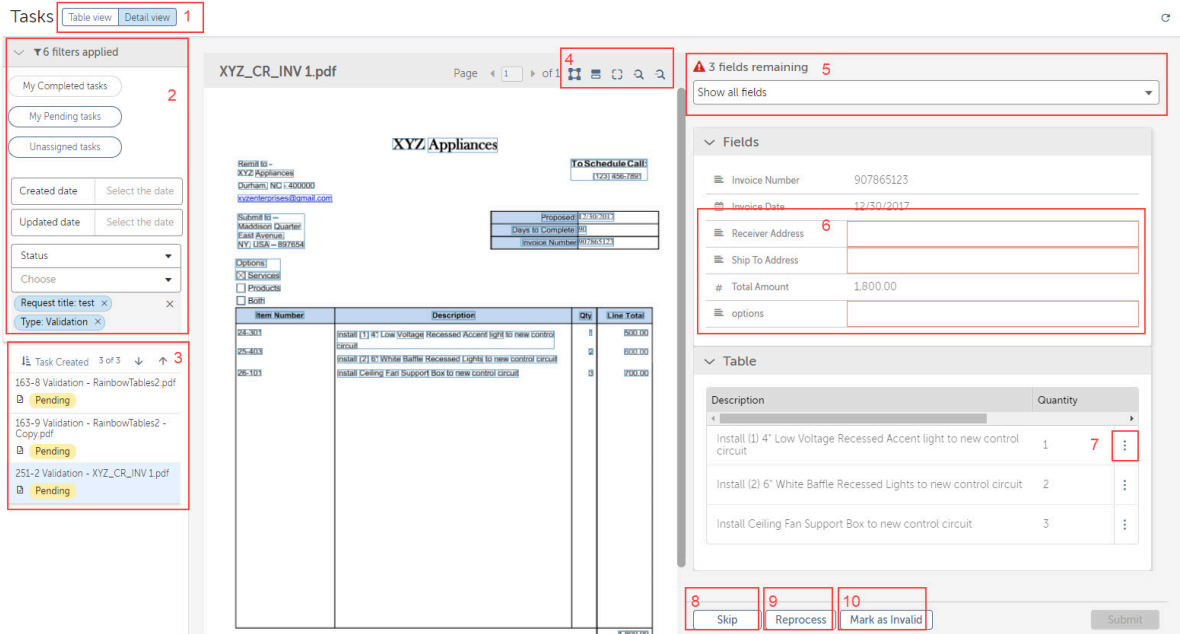

Document Automation uses Automation Co-Pilot for Business Users technology to manage the end-to-end document extraction process. Each incoming document creates a new request, which triggers the extraction process. If a document requires manual validation, Automation Co-Pilot creates a validation task and assigns it to a validation team.

When you click the **Validate documents** link in the Learning instances page, the Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue.

---

**Note:** An empty page with a notification message appears in the following scenarios:

- If you are not assigned to any validation teams, and thus do not have access to learning instances.
  - If there are no files that require validation in the learning instances to which you have access.
  - If another user is working on the remaining file in the validation queue.
-

1. You can toggle between the Table and Detail views

Detail view: We recommend that you perform validation tasks in the **Detail** view because this view shows all the documents in the validation queue side by side with the document that you are currently validating. Additionally, when you finish validating a document, the next document in the queue automatically opens.

**Note:** You can search for specific documents (tasks) in **Detail** view only.

2. Filter the documents in your queue

Table view: Use the **Table** view see learning instance history. When you open a document from this view, the history for the learning instance that is processing this document appears in a pane on the left. Click the empty text field, then select the blue-bounded box in the document that contains the data to extract. After you select a box, the data is highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

3. Your documents queue

The Validator opens with certain filters enabled by default to show only the documents from a specific learning instance that need validation.

The documents that match the parameters you specified in the filters pane appear here.

You can switch between documents in the queue without completing validation for the current document.

- |                                                   |                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4. Customize your view                            | Use the icons in the taskbar to hide the blue-bounded system identified regions, stack the document pane above the fields pane, or change the zoom levels.                                                                                                                                                                |
| 5. Toggle between the fields views                | Use the drop-down list to select between <b>Show all fields</b> to see all the document fields or <b>Show fields that need validation</b> to only show the fields that need your manual validation.                                                                                                                       |
| 6. Fields awaiting validation are outlined in red | In the example above, the table fields <b>Item total</b> and <b>Quantity</b> require manual entry.                                                                                                                                                                                                                        |
| 7. Add or delete a row                            | To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows.                                                                                                                                                                                                                   |
| 8. Skip to next file                              | Skip a file without correcting the errors in the current document.                                                                                                                                                                                                                                                        |
| 9. Reprocess                                      | If the learning instance is edited while documents are awaiting validation, you must Reprocess the documents.                                                                                                                                                                                                             |
| 10. Mark document as invalid                      | Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click <a href="#">here</a> to mark a document as invalid, then select from the following reasons: <ul style="list-style-type: none"><li>• Fields missing</li><li>• Tables missing</li><li>• Wrong values</li></ul> |

For documents processed in a connected learning instance:

The Validator shows the group number for the document. If you are unsatisfied with the extraction results, you can retrain the learning instance in Automation 360 IQ Bot.

## Validate documents in Document Automation

If a learning instance cannot extract data from a document (for example, blurry text, data does not match data type, or data is missing for a required field), it sends that document to the validation queue, where the `validator` user manually provides the data.

The learning instance assets must be checked-in to the public repository.

The Validator is comprised of two panels with the document on the left side and the fields with extracted data on the right side.

In a window that is 1280 pixels or more, the panels are positioned side-by-side. Otherwise, the panel containing the fields and extracted data shifts below the panel containing the document, as demonstrated in this video:

**Note:** If a document contains tables with large number of rows or data fields (>1000), there might be a delay in the initial validation and the corresponding response time.

---

1. Log in as the `Validator` user.
2. From the Control Room home page, navigate to **Manage > Learning Instances**.  
The Learning instances table displays details for each instance. The value in the **Validate documents** link indicates the number of documents awaiting manual validation.
3. Click **Validate documents**.  
The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3933.
4. Provide correct values to the fields that need validation.  
See these steps in a video:
  - a) Select **Show fields that need validation** from the drop-down list in the right panel.
  - b) Click the field to extract.
  - c) In the document image, click the blue-bounded box containing the correct data or draw a box around the data you want to extract.
    - To skip a document without correcting its errors, click **Skip** to proceed to the next document in the validation queue.
    - To remove a document that cannot be processed, click **Mark as Invalid**.
5. After you make the necessary corrections, click **Submit** so the document can be processed and the extracted data downloaded.  
The extracted values are saved to a file in the Success folder. The Validator shows the next document in queue. When all documents are corrected, the system displays a message stating that there are no more tasks available.

## Export or Import learning instances

A user with the `IQ Bot Admin` role or with the `View and manage migration` permission can use the **Export** and **Import** buttons to move learning instances between Document Automation environments.

### Export a learning instance

When you export a learning instance, a `.dw` file, a Control Room notification (link) is displayed which contains the learning instance configurations, including the language, provider, and fields.

1. Navigate to **Manage > Learning Instances**
2. Hover over the vertical ellipses to the right of the learning instance you want to export.
3. Click **Export**.

A Control Room notification (link) displays to indicate that the learning instance is exported successfully.

4. Click the Control Room notification link and download the .dw file to your local desktop.

---

**Note:** The process and bots associated with the learning instance are exported separately: [Export a process automation](#) on page 3719 | [Export bots](#) on page 2174

---

## Import a learning instance

First, import the process and bots associated with the learning instance: [Import a process automation](#) on page 3716. If you do not import the process, Document Automation will create a new process when you import the learning instance.

---

### Note:

- Verify that the destination environment has the necessary licenses. See [Automation 360 licenses](#) on page 1511
- If a previous version of the learning instance already exists in the Control Room, only the user who imported that learning instance can import a new version.

- 
1. Navigate to **Manage > Learning Instances** and click **Import** at the top of the page.
  2. Click **Browse** to select the learning instance.

---

**Note:** If there is already a learning instance in this environment with the same ID number, the imported learning instance overwrites the existing one.

---

3. Select whether to pair the learning instance with an existing process or to create a new process.

## Incorporating validation feedback in export/import of learning instances

You can use Export and Import with enhanced feature that enables you to export and import learning instances while retaining the pre-training information. This enhancement empowers users to leverage pre-trained learning instances across different environments

### Validation feedback during export

To export a learning instance, navigate to **Manage > Learning Instances** and mouse over the vertical ellipses to the right of the learning instance you want to export. Then, click **Export**

1. When you **Export** the learning instance, a pop-up window appears **Do you want to include validation feedback**).

2. If you select **Yes**, the validation feedback will be saved as part of the learning instance with a notification displaying **Export process successfully started**.

---

**Note:** Once the export process is initiated, you can track the progress in the **Notifications** window. Notifications are available to keep you informed about the successful export.

---

3. If the learning instance `test` file is exported successfully, click the file to download it in `.dw` format .

The information saved in these learning instances can contain various training sessions along with their corresponding feedback files. This enables you to transfer it to another instance and perform an **Import**.

## Validation feedback during import

When you **Import** the file, a pop-up window appears **How do you want to update this learning instance?** which has three options to select from:

- **Merge validation feedback**
- **Replace validation feedback**
- **Update learning instance without validation feedback data**

Once the import process is initiated, you can track the progress in the **Notifications** window.

## Create custom models in Document Automation using Standard Forms

Standard Forms are fixed format document types that have a defined template, with little or no variation in the overall layout, and are typically official or legal forms, such as a W-4 (Employee Withholding Certificate) form, income tax form, or a sale deed.

See the following video on how Microsoft Standard Forms integrates with Document Automation and its enhanced processing capabilities.

With enhanced accuracy, this feature enables you to extract data from densely structured forms including those with handwritten input in the following languages: English, Dutch, French, German, Italian, Portuguese, and Spanish.

The following overview provides an end-to-end process you can use to create the Standard Forms data model, configure the learning instance, and publish the learning instance to process documents autonomously, all within the Document Automation interface.

---

**Note:** Set up your Document Automation environment, which includes configuring users, roles, and devices, and connecting the Control Room with the Automation Co-Pilot for Business Users: [Set up your Document Automation environment](#) on page 3875.

---

1. Evaluate your use case for Standard Forms.  
[Evaluate your use case](#) on page 3939
2. Review extraction service.  
[Review extraction service](#)
3. Set up and configure an extraction service.  
[Set up extraction service](#) on page 3942
4. Configure Document Automation for the selected extraction service.  
[Configure Document Automation with Microsoft Azure Form Recognizer](#) on page 3942
5. Build a data extraction model.  
[Create a custom extraction model using Standard Forms](#)
6. Create a learning instance with the Standard Forms data model.  
[Create a learning instance for standard forms](#) on page 3946
7. Upload documents to the learning instance to test the model, fix validation errors, and verify the extracted data.  
[Process documents](#)
8. Build a bot that uploads documents from a source folder to Document Automation.  
[Build a bot to upload documents to Document Automation](#) on page 3927
9. Transfer the Standard Forms learning instance across different Document Automation environments.  
[Transfer standard forms learning instance](#) on page 3948
10. Check the learning instance assets (process, form, and bots) into the public repository. Then, deploy the process and bots to unattended Bot Runner devices to begin processing documents in real time.  
[Publish the learning instance to production](#) on page 3925
11. Validate the processed documents for the Standard Forms learning instance.  
[Validate the uploaded documents](#)

## Evaluate your use case

Before processing documents in Document Automation, you must ensure that your documents are Standard Forms. After you confirm that your document meets the prescribed Standard Forms criteria, you can proceed with the type of extraction service required.

To determine if your use case meets the Standard Forms criteria, review the following parameters:

- The layout of your document remains the same across vendors.
- The positions of various data elements such as checkboxes, tables, and so on, is fixed in your documents.
- You have documents where the values are independent of other data elements.
- Your document is available in a supported language. For more information, see [Azure Form Recognizer Supported Languages](#).
- Your documents contain tables that have the same number of rows and columns.
- The document layout remains the same within the same year, across different organizations.

## Review extraction service

After you have confirmed that the documents are Standard Forms, you can then plan the type of standard forms extraction service that fits your requirement. You can use the Microsoft Form Recognizer service to process Standard Forms in Document Automation. Before processing, ensure the following:

- Input documents can contain:
  - Information with many details and have a reasonable quality resolution (>200 dpi)
  - Check-boxes and radio buttons
  - Handwritten content
  - Signatures
  - Tables

---

**Note:** Input documents can also contain tables that span over a single page. However, if the Standard Forms contain table that spans across multiple pages, the content extraction can fail.

---

- No section of the input document is repeated.
- Documents that contain transpose tables.

## Benefits of Microsoft Azure Forms Recognizer service

- Ability to process diverse standard form type documents.
- Auto detection feature can identify different types of tables, such as header-less tables, inverted tables, and so on.
- Provides good support for handwritten forms.

## Data Flow for Standard Forms in Document Automation

The following data flow diagram shows how to configure Standard Forms in Document Automation using various components that facilitate the flow of data between Document Automation and the third-party extraction service.

- Labeling and model creation tool

You use the model creation tool to label and create models. In this diagram, the training documents are uploaded in the tool and stored in the blob storage of the third-party service. To obtain the best results, we recommend that you upload and label a minimum of five training documents to create a model.

- Blob storage

Blob storage is a storage unit that contains training documents and its related information.

- Extraction model

The trained models stored in the blob storage of the third-party service are fetched through APIs. The Model ID, which can be a GUI ID or a standard name, is used to create the learning instance.

- Learning instance creation

You can browse and select the model to create a Learning instance. After you select the model, you can upload a document for extraction to this Learning instance. The Learning instance accesses the third-party extraction service to retrieve extraction results. The results either move to the output folder, or the document moves to the validator.

- Extraction engine

The extraction engine performs extraction based on the model ID and returns the results to the Learning instance.

- Output results

Once the extraction is completed, the output results will include three components:

- `extraction .csv`
- `auto detected table .csv`

- `response.json`

## Set up extraction service

To extract content from Standard Forms, you must setup and configure Microsoft Azure Form Recognizer service.

Document Automation provides you with the option to get your own license key or purchase license from Automation Anywhere. For more information on licenses, see [Automation 360 licenses](#) on page 1511.

### 1. Subscribe to Microsoft Azure service

Microsoft provides the Azure Form Recognizer service. This service enables you to build automated data processing software that can identify and extract specific content from documents. You must have Microsoft Azure subscription in order to access Azure resources (OCR, Form Recognizer), Automation Anywhere provides access to these resources through its subscription. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) who will help you setup the services.

[Request access for Microsoft Azure resources \(OCR and Form Recognizer\) \(A-People login required\)](#)

### 2. Setup Microsoft Azure Form Recognizer service

For Cloud deployment

- If you purchase the license from Automation Anywhere, no additional configurations or changes are required.
- If you purchase the license from Microsoft Azure, review the following article to setup and configure your Microsoft Azure Form Recognizer for extracting content from standard forms.

[Setup Azure Form Recognizer and Storage \(Cloud\) \(A-People login required\)](#)

## Next steps

Connect Document Automation with the extraction service. See, [Configure Document Automation with Microsoft Azure Form Recognizer](#) on page 3942.

## Configure Document Automation with Microsoft Azure Form Recognizer

Send an API request to connect Document Automation with the extraction service.

---

**Note:** You will need the following information:

- Authorization token. See [Authentication API](#)
  - Microsoft Azure Form Recognizer endpoint
  - Microsoft Azure Form Recognizer API key
  - Microsoft Azure Blob storage URI
-

When working with API URL trusted list for Standard Forms:

- Add only form recognizer services API URL to the trusted list at Bot Runner end.
- Add the following URLs to the trusted list at the Control Room end:
  - SAS (blob) URL
  - Form recognizer services API URL
  - <https://fotts.azureedge.net/> (Required for specific document type rendering)

---

**Note:** To obtain a Microsoft Azure API Key, reach out to your CSM. Raise a support case with the account name or tenant name, validity period (usually till expiry of license), and region (refer to Azure Products By Region) for standard forms in description through [Apeople](#) page. For any issue, reach out to CSM or AE.

For supported regions, see Microsoft Azure AI Document Intelligence product at [Azure Products by Region](#).

---

## For Document Automation Cloud

Request

```
PUT <Cloud Host Url>/cognitive/v3/formrecognizer/config
```

```
Headers: X-Authorization - <IQBot Admin User Auth token >
```

Request body:

```
{
 "formRecognizerApi": "https://<Cognitive Service Endpoint>",
 "formRecognizerKey": "<Cognitive Service apiKey>",
 "blobStorageSas": "https://<storage URL>"
}
```

## For Document Automation On-Premises

Request

```
PUT <On-Premises Machine ip_address or localhost:port>/cognitive/v3/
formrecognizer/config
```

```
Headers: X-Authorization - <IQBot Admin User Auth token >
```

Request body:

```
{
 "formRecognizerApi": "https://<Cognitive Service Endpoint>",
 "formRecognizerKey": "<Cognitive Service apiKey>",
 "blobStorageSas": "https://<storage URL>"
}
```

}

## Next steps

Log in as the `Learning instance creator` user to [Create a custom extraction model using Standard Forms](#) on page 3944.

## Create a custom extraction model using Standard Forms

Create a Standard Forms extraction model in the Control Room.

- Ensure your Control Room has the Document Automation (Number of pages) product license. For more details on licenses, see [Understanding licenses in Document Automation](#) on page 1516.
  - You must have the **AAE\_IQ Bot Admin** or **AAE\_IQ Bot Services** roles to complete this task
  - Identify between five and fifteen training documents
  - For template-based training, the maximum limit of Standard Forms document type is 157286400 bytes.
1. In the Control Room, navigate to **Manage > Learning Instances** and click **Create model**. The **Projects** window opens in a new tab.
  2. Click **Create project**.
  3. Enter a name for the project, click **Browse** to upload documents to train the extraction model, and click **Create**.
  4. Define the field tags:
    - a) Click **Add new tag**.
    - b) Enter a name for the tag. For example, `Invoice no.` or `Invoice Date`.
  5. Define the table tags:
    - a) Click **Configure table tag**.
    - b) Enter a name for the table.
    - c) For each column in the table, enter the name of the column under the **Column fields** section.

## Column fields

Name	Type	Format
<input type="radio"/> Quantity	string	not-sp...
<input checked="" type="radio"/> Description	string	not-sp...

+ Add column

- d) When you are done entering the columns names, click **Save**.
6. Define the location of the data for each field:
  - a) For the form fields, highlight the location of the data to extract, then click the respective field in the right panel.
  - b) For each row in the table, highlight the location of the data to extract, then click the respective table field on the right.
  - c) Click **Done**, then open the next document and repeat the steps to define the locations of the form and table fields.
7. Click the **Train model** icon, enter a name for the model, and click **Train**.

8. Click the **Analyze** icon, click **Browse for file**, and select a document to test the extraction model.

---

**Note:** As of Automation 360 v.29, you can create and train new models in Microsoft Form Recognizer v.3.0 only. If you are in Microsoft Form Recognizer v.2.1, then you must update to Microsoft Form Recognizer v.3.0 by following the below steps:

- a) Open **Project**.
  - b) Go to **Train** tab.
  - c) Click **Train**. The model is created in the Microsoft Form Recognizer v.3.0.
- 

Next, [Create a learning instance for standard forms](#) on page 3946

---

**Note:** You cannot edit an extraction model after associating it with a learning instance.

---

## Create a learning instance for standard forms

A learning instance is a structure that holds information such as document type, language, and the fields to be extracted. After creating Standard Forms, you must create learning instance to extract data from the documents.

- Ensure your Standard Forms configuration is complete.
- Ensure your Control Room has the Document Automation Standard Forms (Number of pages) product license

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.

The **Create Learning Instance** window opens in a new tab.  Connect learning instance  Create model 

2. Add a name for the new learning instance to be created.
3. From the **Document Type** drop-down menu, select **Standard Forms**.

Document Type

Standard Forms

---

**Note:** The provider name is selected as **Microsoft Form Recognizer** by default.

---

4. For model selection, click **Browse** and search for a model using name or description filter.
5. Select your model and click **Next**.
6. To proceed further, you must select atleast one field:
  - Table
  - Forms

Select required and optional fields for extraction.

**Note:** Standard forms support multiple tables. However, Document Automation does not allow displaying multiple tables. Hence, the tables are displayed as **tablename:field name** under **Tables** tab.

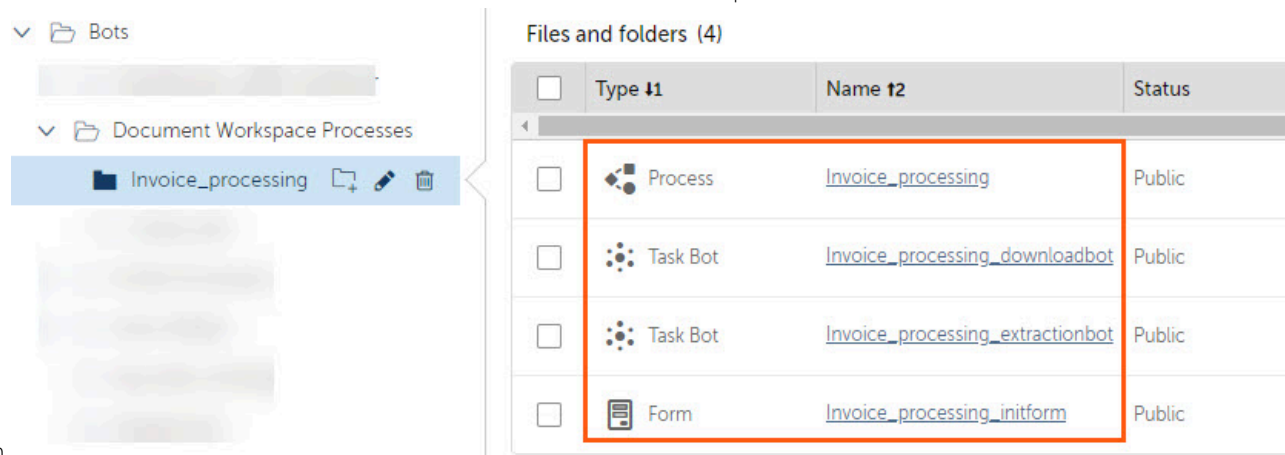

7. Some other field attributes are as follows:

Option	Description
Field name	<p>Enter a field name that begins with an alphabetical character (A-Z or a-z).</p> <p>In standard fields, the field name is hardcoded and cannot be changed.</p>
Field label	<p>Enter a user-friendly name to help validators.</p> <p>For example, you can rename <code>Organization tax number</code> to a localized name, such as <code>VAT number</code>.</p> <p>The field label does not affect extraction.</p>
Confidence	<p>Set a threshold to reduce potential false positives.</p> <p>At the time of processing, the Document Automation engine assigns a score to each field in a document to indicate the certainty that the data was correctly extracted. If the document contains fields with a score that is lower than the confidence threshold, the document is sent to the validation queue.</p> <p>If you enter a high confidence threshold, more documents will be sent to the validation queue. If you enter a low confidence threshold, fewer documents will be sent to the validation queue.</p> <p>Supports values from zero to 100.</p>
Data type	<p>Choose from <b>Address*</b>, <b>Text</b>, <b>Number</b>, and <b>Date</b>.</p> <p>If the data in the field does not match the data type, the document is sent to the validation queue.</p> <p>Document Automation supports variations of the date format.</p> <hr/> <p><b>Note:</b> If you are configuring a learning instance with a user-defined document type, the form fields include the address data type, which extracts the entire structure of an address.</p> <hr/>
Required	<p>Select one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Required:</b> Field cannot be empty.</li> <li>• <b>Optional:</b> Field can be empty or not exist in the document.</li> </ul>

Option	Description
Validation rules	Depending on data type, create rules using patterns, formulas, lists, and statements such as starts or ends with. <a href="#">Starts With and Ends With</a> on page 4019   <a href="#">Pattern</a> on page 4019   <a href="#">Lists</a> on page 4024   <a href="#">Formulas</a> on page 4025

8. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder. The folder contains two bots (extraction and download), a process, and a

form.

- Process: Manages the process using if/else scenarios through which Document Automation extracts data from uploaded documents, assigns documents to users for validation, and downloads the extracted data. To learn more, see [About the Automation Co-Pilot process in Document Automation](#) on page 3889
- Extraction bot: Extracts data from defined fields in the uploaded documents.
- Download bot: Downloads the extracted data to a specific folder on the device or shared network.
- Form: Defines the input parameters that are sent to the process. Input parameters include the learning instance name, uploaded file, and output file path.

Upload documents to the learning instance, fix validation errors, and verify the extracted data:  
[Process documents in Document Automation](#)

## Transfer standard forms learning instance

Standard forms learning instance can be used across similar Document Automation environments. Export/Import an existing learning instance to avoid creating another one with the same configurations.

- Ensure that the source and destination systems are running the same Document Automation version. Learning instances from different Document Automation versions cannot be imported because their database schema will not match.
- Back up your database before importing learning instances.
- Export the .dw file from the source Document Automation environment.
- Import the .dw file into the destination Document Automation environment.

- 

---

**Note:** The incoming model of the source system must be available in the configuration of the target system.

---

For detailed information on exporting/importing learning instances, see [Export or Import learning instances](#) on page 3936.

## Document Automation support for Google Custom Document Extractor (CDE)

In Document Automation, you can create a user-trained learning instance and extract using a Google Custom Document Extractor (CDE) processor.

The new capability can be used to train a model using Google Custom Document Extractor (CDE) for any document type covering 50 languages. Once a model is deployed, the processor URL can be embedded within Document Automation extraction process.

To use Google CDE, you must have a:

- Google subscription to Google Document AI workbench.
- License for **Document Automation Platform** > **Document Workspace pages**.

---

**Note:** When working with API URL trusted list for Google CDE, you must add all APIs to the trusted list on the Bot Agent machine. The list of allowed APIs for Google CDE is as follows:

- Google accounts
- Google OAuth
- Google APIS
- Processor end point (only the host to be added to the trusted list)

For example,

```
https://eu-documentai.googleapis.com/v1/projects/⟨⟨Project ID⟩⟩/
locations/eu/processors/⟨⟨Processor ID⟩⟩:process
```

---

## Usage of Google CDE

The effort involved in creating and maintaining models with Google CDE is justified by various scenarios, including:

- Extended language support: When working with documents that require support for additional languages, and existing pre-trained models do not offer that capability, Google CDE becomes essential.

For supported languages, see [Language support for Google CDE](#).

- Unsupported document formats: Google CDE is beneficial when dealing with document types that lack compatible parsers.

- Addressing accuracy and performance challenges: In specific document formats, even with the use of pre-trained models, achieving the desired accuracy can be difficult. Google CDE with specific training on documents can provide better accuracy.
- Custom or non-standard field extraction: Google CDE can be used in scenarios where specific fields need to be extracted from documents that have custom or non-standard formats.
- Extraction based on specific training when labels do not exist: Google CDE is beneficial when there is a need to extract information from fields where pre-defined labels do not exist.

## Create a Custom Document Extractor (CDE)

The Google Custom Document Extractor (CDE) enables you to extract structured data and specific information from unstructured documents, such as invoices, receipts, and contracts.

With CDEs, you can train and evaluate processors using your own data, enabling accurate identification and extraction of entities from your documents. By applying these trained processors to additional documents, you can streamline the extraction of information from similar document types.

For detailed instructions on setting up Document AI Workbench and accessing the dataset, see [Build Custom Processor](#).

### Train multi-row tables

This quick feature allows the model to accurately extract information from tables spanning across multiple rows.

1. Train the first row of the table.

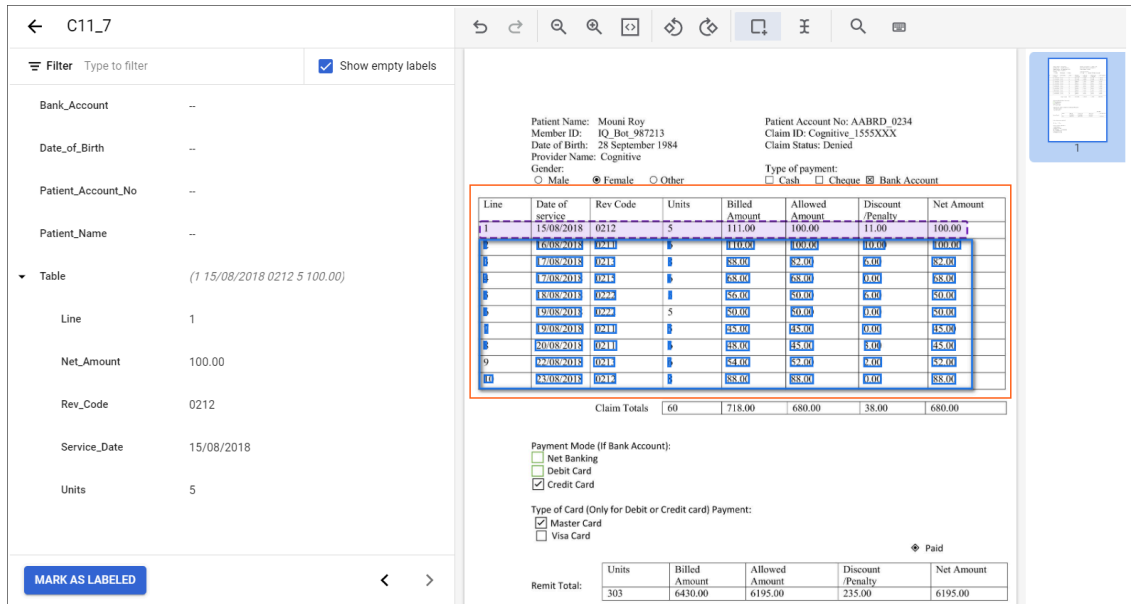

The screenshot shows the CDE interface for document 'C11\_7'. On the left, there is a filter panel with fields like Bank\_Account, Date\_of\_Birth, Patient\_Account\_No, and Patient\_Name. Below the filter is a table preview for 'Table' with columns: Line, Net\_Amount, Rev\_Code, Service\_Date, and Units. The main area displays patient information (Mouni Roy, IQ\_Bot\_987213, 28 September 1984, Female) and a table of services. The first row of the table is highlighted in blue, and an 'Add more rows' icon is visible on the right side of this row. Below the table are checkboxes for Payment Mode (Net Banking, Debit Card, Credit Card) and Type of Card (Master Card, Visa Card).

Line	Date of service	Rev Code	Units	Billed Amount	Allowed Amount	Discount /Penalty	Net Amount	
2	16/08/2018	0211	6	100.00	100.00	10.00	100.00	
3	17/08/2018	0213	8	82.00	82.00	6.00	82.00	
4	17/08/2018	0215	6	100.00	68.00	0.00	68.00	
5	18/08/2018	0222	5	50.00	50.00	6.00	50.00	
6	19/08/2018	0222	5	50.00	50.00	0.00	50.00	
7	19/08/2018	0211	5	45.00	45.00	0.00	45.00	
8	20/08/2018	0211	6	48.00	45.00	3.00	45.00	
9	22/08/2018	0213	6	54.00	52.00	2.00	52.00	
10	23/08/2018	0212	8	88.00	88.00	0.00	88.00	
Claim Totals				60	718.00	680.00	38.00	680.00

2. Click **Add more rows** icon on the first row.

3. Draw a bounding box on subsequent rows or columns within the table. By doing so, the subsequent nested entities will be automatically detected and identified under each parent.

4. Review the identified text values to verify that they accurately represent the content of the document.  
For detailed information, see the **Label a document** section in [Create a Custom Document Extractor](#).

- You can manually correct any discrepancies in the table fields after the training on multiple rows.
- [Create a learning instance using Google CDE](#) on page 3951.

## Create a learning instance using Google CDE

A learning instance is a structure that holds information such as document type, language, and the fields to be extracted. After creating a custom extraction processor, you must create learning instance to extract data from the documents.

- Ensure you have successfully created and trained a Google Custom Document Extractor (CDE) processor.
- Ensure your Control Room has the Document Workspace (Number of pages) product license.
- Ensure you configured the BYOK. For more information, see [Configure bring your own key BYOK for Google CDE](#) on page 3953.

To integrate a new processor with Google Document AI, the crucial step is the creation of a learning instance. This involves utilizing the provider as **Google Document AI (User-defined)** option. By creating a learning instance using this option, users can define form and table fields with matching names as present in the processor.

**Note:**

- Currently, Google Document AI supports single table extraction.
- The check box feature (in preview mode) might result in inconsistent extraction for the check boxes fields, which could lead to inconsistent results. In such cases, if the system is unable to accurately extract the check box field value, it will be labeled as **Not Found**.

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.

The **Create Learning Instance** window opens in a new tab.

2. Add a name for the new learning instance to be created.
3. From the **Document Type** drop-down menu, select **User-defined**.
4. From the **Provider** menu, select **Google Document AI (User-defined)**.
5. Select **Table** or **Forms** field.
6. Create new fields with identical names as those utilized in the Google CDE processor.

**Note:** When creating new fields, ensure that their names match the schema labels used in the Google processor. This applies to both form fields and table fields.

7. Click **Create**.

When a new learning instance is created, the Control Room creates a folder with the same name as the learning instance in the **Automation > Document Workspace** folder.

8. Update the extraction bot of learning instance with Service Account and Processor Endpoint URL.
  - a) Open the bot for the learning instance from **Bots > IQ Bot Processes > {LI name} > {LI name}\_extractionbot**.
  - b) Pick a credential vault locker and key. For more information, see [Configure bring your own key BYOK for Google CDE](#) on page 3953.
  - c) Copy the prediction endpoint URL from Google CDE processor.

The screenshot shows the 'FreeDomALL' processor details in the Document AI interface. The 'Prediction' section is highlighted with a red box, showing the 'Prediction endpoint' URL: `https://eu-documentai.googleapis.com/v1/projects/1018049478570/locations/eu/processors/c6384ae2227adb95/process`.

FreeDomALL	
Name	FreeDomALL
ID	c6384ae2227adb95
Status	Disabled
Processor Type	Custom Document Extractor
Encryption Type	Google-managed
<b>Prediction</b>	
Prediction endpoint	<code>https://eu-documentai.googleapis.com/v1/projects/1018049478570/locations/eu/processors/c6384ae2227adb95/process</code>

- d) Paste the copied URL in the **Document AI endpoint URL for document processor**.

Unsaved Assistant Run Debug Cancel Save

### Document Extraction: Extract data

Processes uploaded documents to extract data  
Required bot agent version: 21.98 or above

**Document to extract**

 Uploaded to server  
 Saved to a local folder  
 Output folder path  
 Variable Desktop folder  
 Path to local file system  Browse...

**Additional settings**  
None Google DocAI MS OpenAI IQ Bot

**Service account**  
Credential Variable Insecure string

cde-locker, cde-cred, ServiceAccountCDE X Pick...

Pick a credential with your AI service's security token; using your own credentials is optional.

**Endpoint URL for document processor**  
`https://eu-documentai.googleapis.com/v1/projects/1018049478570/locations/eu/prc` (x)

URL to Document AI endpoint. Format should be "https://[host]/[apiVersion]/projects/[projectId]/locations/[location]/processors/[processorId].process". Optional parameter for using your own Google service account to access Doc AI.

**Cloud Storage bucket name (optional)**  
 (x)

For Documents more than 10 pages, input file and extraction results will be stored temporarily in this bucket

Upload documents to the learning instance, fix validation errors, and verify the extracted data. For more information, see [Process documents in Document Automation](#) on page 3891.

## Configure bring your own key BYOK for Google CDE

To leverage BYOK (bring your own key) license for Google Custom Document Extractor (CDE) processor, follow these configuration steps.

Log in as the `AAE_Locker_Admin` user type.

1. Create a custom role for Credential Vault locker.
  - a) Provide a name for the role, such as `google-cde-credential-role`. The `Manage my credentials` and `lockers` permission is automatically selected.
  - b) Click **Create** role.

Assign the role to the Bot creator and Unattended Bot Runner user types.

2. Create a credential in Credential Vault for Google service account.
  - a) Navigate to **Manage > Credentials > Create credential**.
  - b) Provide a name for the credential, such as `google-cde-credential`.
  - c) Provide a name for the attribute, such as `ServiceAccount`.
  - d) Select the **Standard** input option and enter the Google Document AI API key in the **Value** field.
  - e) Click **Create credential**.
  
3. Create a locker to store the key.
  - a) Navigate to the **Lockers** tab and click **Create locker**.
  - b) Provide a name for the locker, such as `google-cde-locker`.
  - c) Select the `google-cde-credential` and click the right arrow to move the credential to the **Selected** column.
  - d) In the **Consumers** tab, select the `google-cde-credential-role` and click the right arrow to move the credential to the **Selected** column.
  - e) Click **Create locker**.

## Document Automation data extraction using generative AI

Document Automation for Automation 360 Cloud and On-Premises provides generative AI (GenAI) capability to extract data seamlessly from unstructured and semi-structured documents without prior training. Create learning instance with GenAI capability to process documents in English, using a large language model (LLM).

---

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

---

### Benefits

Enhance extraction accuracy in a learning instance by using the **Search query for generative AI model** feature when defining form and table fields. Document Automation offers a default customizable query based on your selected field. Transmitting your query to GenAI enhances and enables data extraction from different document types without prior training. Leverage this innovation to enhance your document processing capability.

### How generative AI improves extraction

When you create a learning instance for unstructured documents (such as: Contracts, Agreements, Reports, Letters, and Emails), the GenAI-driven data extraction capability is

automatically selected. While defining the **Form fields** and **Table fields** for your learning instance, you can leverage the **Search query for generative AI model** option to customize your data extraction request.

For an address field, the GenAI query provides a default query such as: 'What is the Property Address?'. You can customize this query for more focused extraction to say: 'What is the full Property Address with city, state and zip code?'

On processing a document, using this learning instance, the GenAI capability will extract the complete address, instead of just the street name and number. All you need to do is define the search query in the model just once, and then for every document processed using this model, the data gets extracted with no additional configuration.

When creating a learning instance for semi-structured documents such as Invoices, User-defined and Purchase orders or supply-chain documents such as: Waybill, Bill of Lading, Arrival Notice, and Packing Lists, you can leverage the GenAI-driven data extraction capability in addition to the native extraction capability based on user-provided updates in the Validator.

**Important:** Privacy Notice: When the generative AI capability is selected, the query is sent to a third-party service. Currently, the data is sent to Microsoft Azure OpenAI service, which is located in the US and EU regions. If you do not want your data sent to a third-party service, we recommend not using the unstructured and semi-structured document types that uses the generative AI feature out-of-the-box.

Related concepts

[Data security for generative AI - FAQ](#) on page 1178

We have introduced generative AI (GenAI) infused features to help our customers realize productivity gains by building better and smarter automations. Our customers can realize the power of GenAI with features such as Automation Co-Pilot for Business Users and Document Automation.

## Enable generative AI and other external connections to Document Automation

From Automation 360 v31, we have introduced a new section in the Control Room settings for enabling the generative AI and other external third-party connections to Document Automation.

The Document Automation Admin can enable or disable the connection settings to external services.

- With this setting you can connect to generative AI LLMs, Google Document AI, Google Vision OCR, and Microsoft Azure OpenAI.
- This setting is supported on Cloud and On-Premises. Support for On-Premises is available from Automation 360 v32 onward.

**Note:** You must upload a valid Cloud license to your tenant to use the GenAI feature in Document Automation.

---

Ensure you have necessary permissions for a Document Automation Admin. See [Document Automation users](#) on page 3877

## Enabling external connection for Cloud

The external connection setting is preconfigured for a Cloud environment as these settings are taken care of by the Document Automation Admin.

As soon as the Admin installs the Document Automation Cloud license, the external connection is enabled. This will enable users to connect to and use learning instances from external connections. If the setting does not get enabled, then the Admin would have to enable the toggle and select the region of service manually.

Follow these steps to manually enable the external connection settings:

1. As the Document Automation Admin, log-in to your Cloud Control Room tenant and navigate to **Administration > Settings > Document Automation Settings**.
2. Under **External Connections**, turn on the toggle to **Enable connections with external Google DocumentAI, Google OCR, and Microsoft OpenAI services** option.
3. Next, from the **Third-party service server locations** drop down, select a preferred region for your external services. Currently, US and EU are the only options available, and US is the default selection.

## Enabling external connection for On-Premises

Follow these steps to enable the external connection settings for On-Premises

1. Install On-Premises Control Room.
2. Next, log-in to the Control Room as the Document Automation Admin and navigate to **Administration > Settings > OAuth** tab.
3. See [Access the AuthConfig App](#) on page 1964 to generate the OAuth token.
4. Next, paste the token details from your clipboard, click **Validate** and **Save changes**.
5. This ensures the registration is successful.
6. Now navigate to **Administration > Settings > Document Automation Settings**, and click the **Edit** button.
7. Click **External Connections** to enable it, and select the relevant service location from the **Third-party service server locations** list and save your changes.
8. This completes enabling your third-party connection to a selected region.
9. Now you would be able to create learning instances using Google Document AI, Google OCR, or Microsoft OpenAI services.

After performing these one-time setup steps, a user would be able to process documents which uses the external services with a valid Cloud license.

## What happens if the third-party connection is disabled in your tenant?

The connection could be disabled if you do not have a valid Cloud license uploaded to your Control Room tenant, or you could have missed enabling the connection. When this feature is disabled, you will not be able to do the following:

- create learning instances using any of these services: Google Document AI, Google Vision OCR, and Microsoft Azure OpenAI services
- create learning instances with GenAI-driven data extraction for unstructured and semi-structured documents

---

**Note:** This configuration setting is not required for Document Automation users using BYOL (bring your own license) connection services, as they will use their own service accounts.

---

## Create learning instance with generative AI for unstructured documents

Use this topic as a guide to create a learning instance leveraging the generative AI (GenAI) capability to extract data from unstructured documents such as Contracts, Agreements, Reports, Letters, and Emails.

With generative AI, you can create a learning instance to extract data from unstructured documents without training the learning instance. This is critical for fast and accurate document processing. Let's walk you through the steps of creating a learning instance with the generative AI capability that will enable accurate data extraction from unstructured documents.

A Professional Developer of a company would perform the following tasks:

- Create, edit, and delete learning instances
- Upload documents for processing and testing
- Check-in and check-out learning instances from private to public folders

License requirement: Bot Creator license to perform the above tasks.

Assigned roles and permission:

- **AAE\_IQBot Services** or **AAE\_IQBot Admin**
- **AAE\_Basic**

1. Log in to the Control Room and navigate to **Manage > Learning Instances** and click the **Create Learning Instance** button to start creating a new learning instance.
2. Next, enter a unique learning instance name to identify it easily in the **Learning Instances** list, and proceed to select the other options as follows:

- a) **Description (optional):** This is an optional field that can be used to add a meaningful description and summarize the use of the learning instance.
  - b) **Document Type:** Unstructured document  
On selecting this option, the generative AI driven data extraction feature is enabled. This is enabled by default for unstructured document types.
  - c) **Language:** English  
Currently, we support English language only.
  - d) **Locale:** as per locale of the documents.  
The locale is selected based on your language and the country where the document originates from.
  - e) **Provider:** Automation Anywhere (User-defined)  
This value is selected by default as we currently offer this option only.
  - f) **OCR Provider:** Google Vision OCR or ABBYY OCR  
Support for ABBYY OCR is new from release v32.
3. Click **Next** to begin creating form and table fields for the learning instance.  
For details on creating form and table fields, see: [Create a learning instance in Document Automation](#) on page 3881, steps 10-12.
  4. Click **Add a field** to begin adding fields for each data point or entity for which you want to extract data, from your documents.
  5. Next, add a **Field name** which must be specific to the data point you want to extract, a **Field label** which is used to create a default search query, and select **Data type** to define the field value data structure.  
You can select from Text, Number, Date, or Address Data type value options from the drop-down.
  6. When leveraging the generative AI capability, the **Confidence** field is grayed out. The field can be set to **Required** or **Optional**.
  7. For the **Search query for generative AI model** section, you have the option to go with the system-generated query or add a custom query.

For example, for a total cost field, the default generative AI query would say 'What is the total cost?'. You can customize the query to 'What is the total cost? Extract the number without the currency'. This extracts the total cost without the currency information.

The screenshot shows the 'Grant agreement' learning instance configuration. The 'Table fields' tab is selected, displaying a table of fields for extraction. The 'total cost' field is highlighted. The 'Field Properties' panel on the right shows the field name 'total cost', field label 'total cost', and data type 'Number'. A search query for the generative AI model is defined as 'What is the total cost? Extract the number without the currency.'

Field name	Field label	Data type
<input checked="" type="checkbox"/>	Item of expenditure	Text
<input checked="" type="checkbox"/>	account	Number
<input checked="" type="checkbox"/>	total cost	Number

8. In the next step, define the **Field Rules** and **Document Rules** for the form and table fields. See [Create a learning instance in Document Automation](#) on page 3881 and [References for creating a learning instance in Document Automation](#) on page 3884 for details on creating table fields, adding **Field Rules** and **Document Rules**.
9. From v32, you can define multiple tables during the process of defining **Table fields**. Based on your use case, you can define additional tables by clicking the **Add a table** icon next to the **table** field drop-down. See [Create a learning instance in Document Automation](#) on page 3881, step 12.
10. Click **Create** to complete creating the learning instance.
  1. Publish the learning instance to the public repository so that the learning instance can be used in public mode to extract data from real documents, and validators can manually validate documents. See [Publish the learning instance to production](#) on page 3925.
  2. In the **Manage > Learning Instances** list page, identify the learning instance you just created and published and click **Process** to begin uploading documents for processing and data extraction. See [Process documents in Document Automation](#) on page 3891.
  3. Open the CSV document with the extracted data to compare with the processed document to validate and confirm that the Generative AI enabled search query fields has extracted data with high accuracy.

## Create learning instance with generative AI for semi-structured documents

Use this topic as a guide to create a learning instance leveraging the Generative AI (GenAI) capability to extract data from semi-structured documents such as Invoices, User-defined and Purchase orders or supply-chain documents such as: Arrival Notice, Bill of Lading, Packing Lists, and Waybill .

For data extraction from semi-structured documents users have the option to use the generative AI capability in addition to the out-of-the-box user-validation feedback feature by checking the **Improve accuracy using validation** option while creating a learning instance. This ensures

consistent and improved data extraction with out-of-the-box accuracy. Let's walk you through the steps of creating a learning instance with the generative AI capability that will enable accurate data extraction from semi-structured documents.

A Professional Developer of a company would perform the following tasks:

- Create, edit, and delete learning instances
- Upload documents for processing and testing
- Check-in and check-out learning instances from private to public folders

License requirement: Bot Creator license to perform the above tasks.

Assigned roles and permission:

- **AAE\_IQBot Services** or **AAE\_IQBot Admin**
- **AAE\_Basic**

1. Log in to the Control Room and navigate to **Manage > Learning Instances** and click the **Create Learning Instance** button to start creating a new learning instance.
2. Next, enter a unique learning instance name to identify it easily in the **Learning Instances** list, and proceed to select the other options as follows:

The screenshot shows the 'Create Learning Instance' dialog box with the following fields and options:

- Name:** Learning Instance with generative AI
- Description (optional):** Learning instance for semi structured documents with generative AI capability
- Document Type:** Invoices
- Language:** English
- Locale:** English (United States)
- Provider:** Automation Anywhere (Pre-trained)
- OCR Provider:** ABBYY
- Improve accuracy using validation  
The system learns from user-provided changes in the Validator.
- Generative AI-driven data extraction  
Your document data will be processed by an AI language model. Learn more...

- a) Description (optional):** This is an optional field that can be used to add a meaningful description and summarize the use of the learning instance.
- b) Document Type:** Select from a list of semi-structured documents available such as: Invoices, User-defined, Arrival Notice, Bill of Lading, Packing Lists, and Waybill.  
On selecting this option, the **generative AI** driven data extraction feature is enabled in addition to the **Improve accuracy using validation** capability that is offered out-of-the box and is based on feedback sent to the system from the user-provided changes made in the Validator during the validation process. This is a critical capability for semi-structured documents as it ensures better data extraction result with a combination of user-validation feedback and GenAI capability.
- c) Language:** English  
Currently, we support English language only.
- d) Locale:** as per locale of the documents.

The locale is selected based on your language and the country where the document originates from.

e) **Provider:** Automation Anywhere (User-defined)

f) **OCR Provider:** Google Vision OCR or ABBYY OCR

You have the option to choose from the two supported OCR options.

3. Click **Next** to begin creating form and table fields for the learning instance. From v32, generative AI capability is available for both, form and table fields. You can use GenAI capability in addition to the default custom alias support. See [Create a learning instance in Document Automation](#) on page 3881, step 9 for details on adding aliases for a field.

Document Automation uses custom aliases and the feedback capability by default for semi-structured documents. The queries for fields with lower confidence and missing field-data are passed to generative AI for extraction.

The screenshot displays the 'Learning Instance with generative AI' configuration window. On the left, a table lists selected fields for extraction:

Field name	Field label	Data type	Aliases
invoice_number	Invoice Number	Text	69
invoice_date	Invoice Date	Date	38
po_number	PO Number	Text	42
receiver_address	Receiver Address	Address	81
ship_to_address	Ship To Address	Address	57
total_amount	Total Amount	Number	50

On the right, the 'Field Properties' panel is configured for the 'invoice\_number' field:

- Field name:** invoice\_number
- Field label:** Invoice Number
- Confidence (0-100):** 0
- Data type:** Text
- Required:**  Required
- Search query for Generative AI model:**  Language model will extract data using the provided search query. The search query is: "What is the Invoice Number?"
- Default aliases (read-only):** invoice number, invoice number, inv #, inv #, inv no, inv no, inv no, inv no, inv no, inv no

4. The generative AI capability for table fields can be used for column identification, which enhances data extraction with focus on table columns. This feature is a great value-add for table extraction. GenAI can identify a specific table column based on the defined search query without the need to train documents and works as an out-of-box feature in Document Automation. So you can use the GenAI-enabled search query to identify the column and then extract specific data for a field from that column using the Document Automation extraction model.

5. Next, add a **Field name** which must be specific to the data point you want to extract, a **Field label** which is used to create a default search query, and select **Data type** to define the field value data structure.

You can select from Text, Number, Date, or Address Data type value options from the drop-down. For details on creating form fields, see: [Create a learning instance in Document Automation](#) on page 3881, step 10.

6. The form and table fields can be set to **Required** or **Optional**. When leveraging the generative AI capability, the **Confidence** field is grayed out.
7. You have the additional option to use the **Extract field using pattern** capability for extraction.

8. For the **Search query for generative AI model** section, you have the option to go with the system-generated query or add a custom query.  
For example, for an address field the default Generative AI query would say 'What is the Home address?'. You can customize the query to 'What is the Home address with city and state?'.
9. In the next step, define the **Field Rules** and **Document Rules** for the form and table fields and click **Create** to complete creating the learning instance. For details on defining the form and document rules see: [Validation rules in Document Automation](#) on page 3894.
1. Publish the learning instance to the public repository so that the learning instance can be used in public mode to extract data from real documents, and validators can manually validate documents. See [Publish the learning instance to production](#) on page 3925.
2. In the **Manage > Learning Instances** list page, identify the learning instance you just created and published and click **Process** to begin uploading documents for processing and data extraction. See [Process documents in Document Automation](#) on page 3891.
3. Open the CSV document with the extracted data to compare with the processed document to validate and confirm that the GenAI enabled search query fields has extracted data with high accuracy.

## Architecture and security guidelines for Document Automation with Generative AI capability

Here's a list of privacy, security, and typical use cases for your consideration for using Document Automation with Generative AI capability.

### Functionality

**Note:** Generative AI models can produce errors and/or misrepresent the information they generate. It is advisable to verify the accuracy, reliability, and completeness of the content generated by the AI model.

What is different about the manner in which Document Automation processes unstructured documents and shipment documents compared to invoices?	Automation Anywhere incorporates (individually modeled) large language models (LLM) in the Document Automation product to assist with processing unstructured documents and shipment documents.
What document types can be processed using Generative AI?	Any unstructured and semi-structured documents, including pre-trained document types such as: invoices, bill of lading, waybill, arrival notice, or packing list.
Are there any limitations on the field types supported by Document Automation?	No, we support form and table fields with GenAI capability.
What are the supported languages?	Officially English is supported, but other languages would also work.
What is the pricing structure for Document Automation with Generative AI capabilities?	Automation Anywhere charges per page for Document Automation, and the OpenAI cost is included in the price.

Could a customer call their own Azure endpoint for Microsoft Azure OpenAI LLM?	Yes, we support bring your own license (BYOL) for Microsoft Azure OpenAI and a customer-defined LLM endpoint use case is supported.
Is the Generative AI with Document Automation feature available On-Premises in a customer's private cloud?	Yes, integrated generative AI is now available for use for the On-Premises and Cloud versions of Document Automation.
What OCR engine can be used for unstructured document types?	Currently we support Google Vision OCR and ABBYY OCR.
What OCR engine can be used for shipment documents?	We recommend using ABBYY OCR and Google Vision OCR for shipment documents.

## Security

Which LLM does Document Automation send the queries to?	Document Automation currently uses Microsoft Azure OpenAI services for LLM use. We currently use GPT3.5-Turbo and ADA models.
In which countries are the Document Automation documents submitted for processing?	Automation Anywhere has selected the EU and US regions for processing the documents.
Does Automation Anywhere permit vendors to train their LLMs on data from documents submitted to Document Automation?	No, Automation Anywhere does not use or allow any third-party vendors to use documents or data submitted by customers or users for training purposes.
Does Automation Anywhere train its own instance of any LLMs on data from documents submitted to Document Automation?	No, Automation Anywhere does not use or allow any third-party vendors to use documents or data submitted by customers or users for training purposes.
Do any additional vendors have access to prompts or documents which customers submit to Document Automation?	Yes, please see Exhibit C of our DPA (link at the end of this paragraph) for a list of vendors who have access to data submitted by customers to Document Automation. The applicable vendors will say "Document Automation" in the second column labeled Applicable Services. Link to <a href="#">DPA</a> .
Does Automation Anywhere store documents submitted to Document Automation or data extracted from the documents?	Beside Automation Anywhere Cloud hosting providers, the Automation Anywhere vendors do not store any documents, as documents exist in a transitory state only. However, to enable customers validate the documents, Automation Anywhere stores the document images and the OCR output of the document text in the Cloud instance.
What kind of data is shared with the LLM services?	Documents, content from documents, and prompt or search queries.
Will Automation Anywhere enter into a Business Associate Agreement ("BAA") for the processing of Protected Health Information (as defined	Yes. Typically, our BAA is automatically incorporated into our <a href="#">Cloud Automation Agreement</a> . Please reach out to your Customer

by C.F.R. § 160.103) ("PHI") with respect to PHI, which a customer submits to Document Automation?

Success Manager (CSM) or Sales Executive (SE) to check whether you have a BAA in place, and if not, they will get you a copy of our BAA.

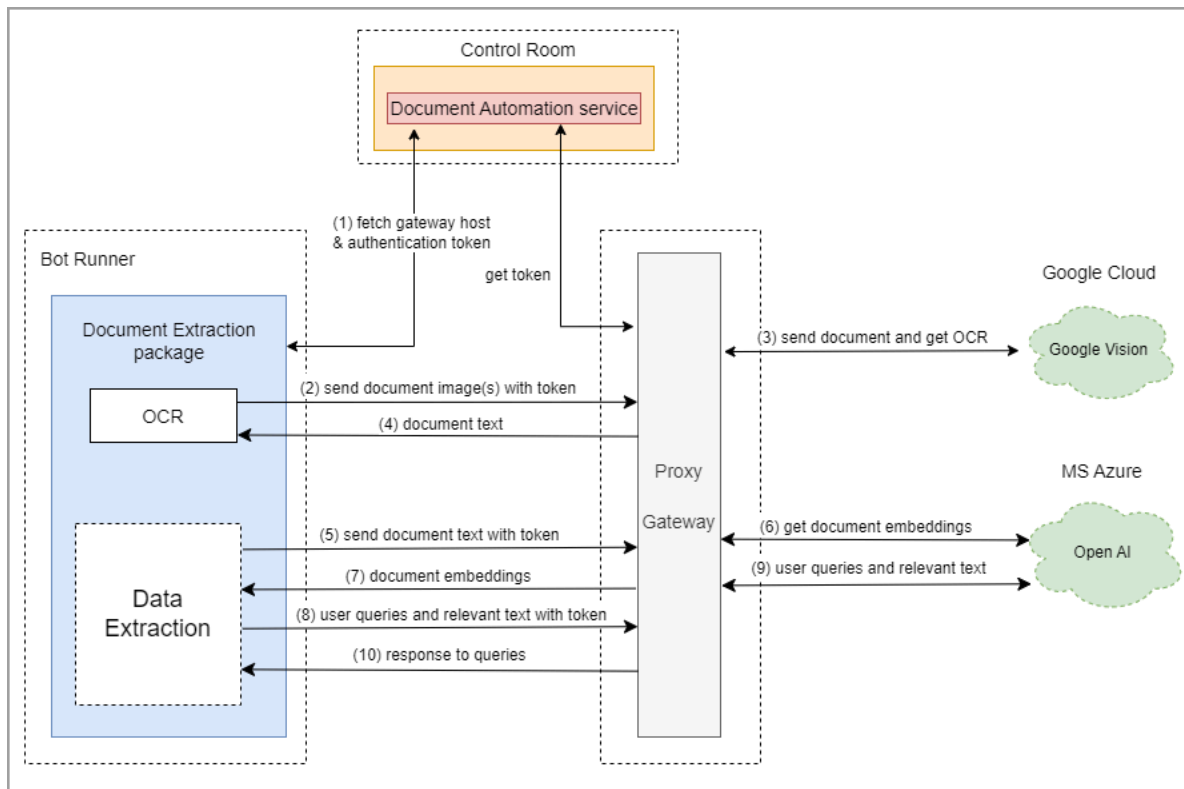

Will Automation Anywhere enter into a Data Processing Agreement ("DPA") for the processing of Personal Data which a customer submits to Document Automation?

Yes. Typically, our DPA is automatically incorporated into our [Cloud Automation Agreement](#). Please reach out to your Customer Success Manager (CSM) or Sales Executive (SE) to check whether you have a DPA in place, and if not, they will get you a signed copy of our DPA. If you would like to see the terms in our DPA, it can be found here: [Automation Anywhere DPA Agreement](#)

Important data usage details from Google Vision OCR Service (Source: Google).

[Google Vision OCR Service Data Usage](#)

### Architecture diagram

The extraction process consists of several steps:

#### 1. Authentication:

- Extraction process starts by running the Document Extraction package on a bot runner device
- (1) Configuration of the extraction process is defined in a learning instance. If the learning instance uses Generative AI-driven extraction, the package connects to Control Room to fetch information about the Proxy Gateway host location and authentication token.

**2. OCR:**

- The next step is to retrieve a text layer from the document. The system uses OCR engines for the task
- (2) If Google Vision OCR is selected in the learning instance, the package sends a document to Proxy Gateway
- (3) Proxy Gateway forwards this request to the Google Vision API endpoint for OCR, and (4) sends the results back to the package

**3. Data Extraction:**

- (5), (6), (7) To process large documents, the package creates embeddings for different chunks of the document using the ADA model
- (8), (9) Next, the package identifies the most relevant chunk of the document for the provided search query(s) using embedding and sends that chunk along with a prompt to the GPT model through the Proxy Gateway
- (10) Finally, the package receives responses from GPT and converts them into document extraction results

For Automation Anywhere Cloud Generative AI data security information, see: [Data security for generative AI - FAQ](#) on page 1178

## Languages supported in Document Automation

This topic provides lists of supported languages in Document Automation based on various providers and third-party parsers.

The following tables provide a list of supported languages in Document Automation for various providers:

### Automation Anywhere (Pre-trained)

Domains (Document Types)	Language
<b>Invoices</b>	English
	French
	German
	Spanish
<b>Arrival Notice</b>	English
<b>Bill of Lading</b>	English
<b>Packing List</b>	English
<b>Waybill</b>	English

## Automation Anywhere (User-defined)

## Language support matrix and OCR engines

Document Automation supports various languages for document extraction. This topic provides lists of supported languages in Document Automation based on various document types and OCR engines.

### Document type

The following table provides a list of supported languages in Document Automation for various document types:

Language	Document type				
	Invoices	Receipts	Standard Forms	User-defined	Document types such as Arrival Notice, Bill of Landing, Packing List, Unstructured documents, Utility bill, Waybill
English	X	X	X	X	X
German	X	X	X	X	
French	X	X	X		
Spanish	X	X	X		
Afrikaans				X	
Albanian				X	
Arabic					
Bulgarian					
Catalan				X	
Chinese (Simplified)					
Chinese (Traditional)					
Croatian				X	
Czech				X	
Danish				X	
Dutch	X	X	X	X	
Estonian	X			X	
Finnish				X	
Flemish				X	
Greek					
Hungarian				X	
Icelandic				X	
Indonesian				X	
Italian	X		X	X	
Japanese		X	X		

Language	Document type				
	Invoices	Receipts	Standard Forms	User-defined	Document types such as Arrival Notice, Bill of Landing, Packing List, Unstructured documents, Utility bill, Waybill
Korean			X		
Latvian	X			X	
Lithuanian	X			X	
Malay				X	
Norwegian				X	
Polish					
Portuguese	X			X	
Romanian	X				
Russian					
Serbian (Latin)					
Slovak					
Slovenian					
Swedish	X				
Tagalog					
Turkish					
Vietnamese					

## OCR Engine

The following table provides the links to supported languages for all Document Automation supported OCR engines:

Document Automation supported OCR engines	List of supported languages
ABBYY FineReader Engine	<a href="#">ABBYY FineReader Engine OCR supported languages</a>
Google Vision API	<a href="#">OCR Language Support</a>

## Document Automation Community Edition

The Community Edition version offers users limited features from the document processing solutions Document Automation and Automation 360 IQ Bot. This version is available to users for free.

Users are not required to purchase a license and there are no time limitations. However, there are some functionality constraints as follows:

- You can create a maximum of five learning instances per user.
- You cannot delete a learning instance.
- In the learning instance list, you can view and access only the learning instances and data that you created.
- You cannot integrate a Community Edition version of Document Automation with an Automation 360 IQ Bot environment.
- Google Document AI and Standard forms are not supported.

### Get started with Community Edition

---

#### Important:

Automation 360 IQ Bot Community Edition will no longer be available from November 28, 2023. Use the Document Automation Community Edition for enhanced intelligent document processing.

Users who have created automations using Automation 360 IQ Bot will need to rewrite them using Document Automation.

---

To begin using Community Edition:

1. Register and log in to Community Edition:  
Complete steps one and two of [Set up Community Edition](#) on page 1428.
2. Install the Bot Agent and set user device credentials.
  - a) Navigate to **Manage > Devices** and click **Connect local device**. Follow the steps in the wizard to connect the Control Room to your device.
  - b) Click **Refresh** to verify that your device is connected.
  - c) Click your username. Navigate to **My settings > Devices > Credentials**. Click **Edit** to provide your device username and password.
3. Navigate to **Manage > Learning instances** and select a version of IQ Bot to begin creating learning instances:
  - Option 1: Click the **Create learning Instance** option.  
Create learning instances to extract data from invoices in Document Automation: [Create a learning instance in Community Edition](#) on page 3974
  - Option 2: Click the **Train other documents** option.  
Create learning instances to extract data from other document types using Automation 360 IQ Bot: [IQ Bot Community Edition quick start guide](#)

**Note:** From Automation 360 v.31 onwards, the **Train other documents** option is not available for Community Edition users as IQ Bot is deprecated.

---

## Create a learning instance in Community Edition

Create a learning instance to begin processing documents. In Community Edition, you can extract data from invoices in English using the ABBYY OCR provider.

1. From the Control Room home page, navigate to **Manage > Learning Instances > Create Learning Instance**.
2. Enter a name and description for the learning instance.  
Document Automation does not allow duplicate learning instance names, so the name you provide must be unique.
3. Click **Next**.

We recommend that you open a sample document side by side with the Control Room window as you configure the form and table fields.

---

### Note:

- A form field is a type of field that occurs only one time in a document.
- A table field is a type of field that reoccurs throughout a document, typically in the form of a table.

- 
4. Configure the form and table fields for extraction. For more details, see [View and search fields](#) on page 3884.
    - a) Click a field to open the fields editor. For more details, see [.Guidelines to edit the fields and create custom aliases](#) on page 3885
    - b) Hover over the menu icon to the right of a field to access the up/down arrows.
    - c) Use the arrows to rearrange the order of the fields for a more efficient manual validation. The order of the fields does not impact extraction.

To learn more about the other field attributes, see [Considerations for form and table fields](#) on page 3885.

5. Click **Add a field** and specify the fields details such as field name, fields label, confidence, data type, format date/number, and so on. For more details, see [Considerations for form and table fields](#) on page 3885.

The following image shows form and table fields configured in a learning instance:

6. Click **Create**.

Upload documents to the learning instance, fix validation errors, and verify the extracted data: [Process documents in Community Edition](#) on page 3975

## Process documents in Community Edition

Upload sample invoices to train the learning instance, verify the extracted data, and fix validation errors.

- If you have not done so already, [Create a learning instance in Community Edition](#) on page 3974
- Ensure that each file is 2 MB or less.
- Ensure that the sample invoices are in the following supported document types:
  - PDF
  - JPG
  - JPEG
  - PNG

- TIF
- TIFF

Upload sample invoices to a learning instance to test the learning instance's data extraction capabilities. If a document requires manual validation, the system sends it to the Validator, where you must manually enter the correct data.

**1.** Upload documents to the learning instance:

---

**Note:** Community Edition can process a maximum of five documents at a time. You must wait for a document to successfully complete processing (and validation if necessary) to upload another document.

---

- a) Click **Process documents**.
- b) In the **Process Documents** window, click **Browse** to select the files to upload.
- c) In the **Download data to** field, enter the file path where the extracted data is output to a CSV file.
- d) Click **Process documents**.  
The Bot Runner window appears. The window disappears when the documents are done processing. Refresh the **Learning instances** table to see the updated metrics.

If there is a value next to the **Validate documents** link, you must manually validate the fields with errors. Otherwise, proceed to step 2b to review the extracted data.

**2.** Fix the validation errors

- a) Click **Validate documents**.  
The Automation Co-Pilot Task Manager opens in a new tab, with the first failed document in queue. For an introduction to the Validator user interface, see [Using the Automation Co-Pilot Task Manager Validator for Document Automation](#) on page 3933.
- b) Review each field to verify the data type and extracted value.  
Document Automation supports the following data types: text, number, date, address, and check box  
Alternatively, from the drop-down list on the right panel, you can select **Show fields that need validation**.

---

**Note:** When documents are awaiting validation, if you edit the learning instance, click **Reprocess** to reattempt extraction.

Reprocessing documents does not affect the uploaded documents metric.

---

- c) Update the fields with errors.  
Click the field or draw a box around the values that you want to extract.  
For Automation Anywhere pre-trained models, you can configure the learning instance to extract specific values in a field and ignore others. For more information, see [Use validation feedback to extract specific values in a table](#) on page 3908.

- To skip a document without correcting errors, click **Skip** to proceed to the next document in the validation queue.
- To remove a document that cannot be processed, click **Mark as Invalid**.

- d) After you make the necessary corrections, click **Submit** so that the document can finish processing.  
The next document in queue appears. When all the documents are corrected, the system displays a message stating that no more tasks are available.
  - e) Close the tab to return to the **Learning Instances** page.
3. Verify the output results:
- a) Open the file in the **Success** folder that contains the extracted data and review the results to ensure that it matches your use case.  
The Microsoft forms return extracted values (OCR data) in the JSON format, such as `GUID_0-MSFormTableResult.json`. Along with the extracted document data in `<<GUID>>_FileName` CSV file, the **Success** folder also shows the extracted table data separately in another CSV files. Based on the number of tables in the document, you can find different CSV files for each table. For example, `<<GUID_PAGE_NUMBER-Table_FILENAME_PAGENUMBER_TABLENUMBER`.  
  
With separate table data, you can compare extracted data with Microsoft engine data in the `GUID_0-MSFormTableResult.json` file.
  - b) Optional: Review the **Learning Instance** dashboard.  
The dashboard displays the total number of uploaded documents and the number of documents pending validation.

Congrats! You have now successfully processed your first documents in the Community Edition version of Document Automation.

## Automation 360 IQ Bot

Automate document-centric business processes, end to end, by using IQ Bot, a web-based, Cloud-native intelligent document processing solution that can read and process complex documents and email. This solution combines RPA with AI techniques to extract and classify semi-structured and unstructured data.

Automation 360 IQ Bot is a hybrid solution for On-Premises and Cloud deployments.

---

**Note:** From Build 4695 (A2019.13), Automation 360 IQ Bot has feature parity with IQ Bot Version 11.3.4.2 and some features from Version 11.3.5. For feature parity information between Automation 360 IQ Bot and the corresponding IQ Bot 11.x versions, see [Automation 360 IQ Bot feature comparison matrix](#) on page 1101.

---

### Overview

The technologies of IQ Bot and RPA together constitute cognitive automation. With cognitive automation, IQ Bot extracts semi-structured and unstructured data and converts it into structured data, and RPA bots subsequently use this structured data for automating business processes.

IQ Bot works by using learning instances. A learning instance is a structure that holds information such as document type, language, and fields to be extracted from tables and forms. A learning instance also includes bots that are trained to extract data from documents.

IQ Bot is also supported by RPA bots that are built for functions such as training the Classifier, sharpening document resolution, and downloading the extracted data.

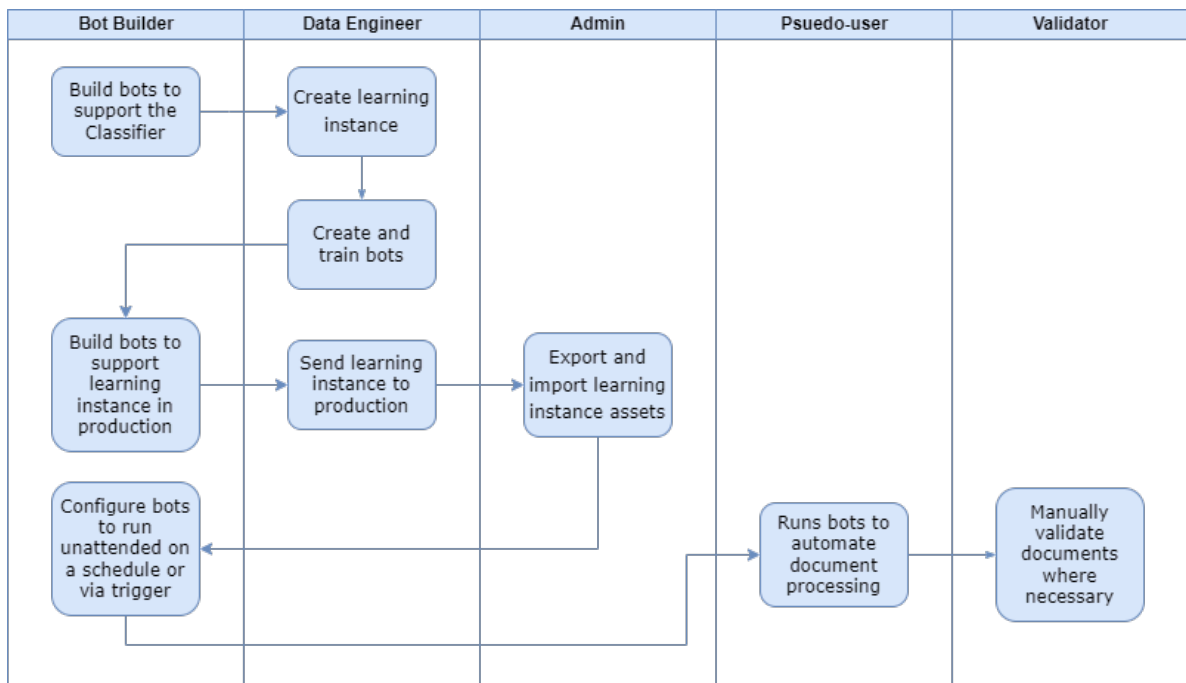

After the bots in a learning instance are trained and the necessary RPA bots are built, a learning instance is set to production mode. After that, IQ Bot can start processing documents automatically, through the following steps:

1. Retrieves documents from a source, such as attachments in incoming email
2. Improves document quality
3. Classifies documents into groups
4. Extracts data
5. Either downloads the extracted data or first sends the document for manual validation and then downloads the data

### Types of IQ Bot users

In many organizations, different types of users perform specific tasks within their product area to create, configure, and publish a learning instance and the supporting assets. To learn more about the user types, required licenses, roles, and permissions, and the assigned product areas, see [IQ Bot user personas](#) on page 3981.

The following diagram demonstrates the sequence of how a learning instance and supporting assets are built, as well as which user performs which task.

### Get started with learning instances

Perform the following these steps to create a learning instance, train bots, and set the bots to production:

- [Using Automation 360 IQ Bot On-Premises](#) on page 3980
- [Using Automation 360 IQ Bot Cloud](#) on page 3980

## Build RPA bots for IQ Bot

The following links guide you in configuring RPA bots to support IQ Bot functions.

- Use the Document Classifier package to improve classification and prevent invalid documents from being uploaded to a learning instance.

[Train the classifier](#) | [Classify documents](#)

- Use the IQ Bot Pre-processor package to prepare documents and extract data before processing.

[Using Enhance Image action](#) on page 2946 | [Using Convert Image To PDF action](#) on page 2943

- After sending a learning instance to production, configure a bot with the **Process documents** action from the IQ Bot Extraction package: [IQ Bot Extraction package](#) on page 2934
- [Download extracted data](#)

## Resources

For more information, review the courses in the IQ Bot Developer learning trail: [IQ Bot Developer Training \(A-People login required\)](#).

You can also search for the following courses in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#):

- Intelligent Document Processing with IQ Bot
- Unleash Your Intelligent Bots: Develop Cognitive Bots Driven by AI & Machine Learning (IQ Bot)

Related concepts

[Install and update Automation 360 IQ Bot](#) on page 1532

This collection of topics guide you through the process of installing or setting up Automation 360 IQ Bot On-Premises and Cloud.

[Languages supported in Automation 360 IQ Bot](#) on page 3986

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

## IQ Bot architecture diagram

This diagram shows the different components of IQ Bot architecture.

Use the IQ Bot, components, Designer and Validator for designing and validating bots, respectively. In a typical scenario, IQ Bot portal and IQ Bot platform communicate through a network firewall and a load balancer.

Various protocols are used to communicate between the different components. A database server, a file storage server, and servers for IQ Bot are used. An organization has the flexibility of using a separate server for the database or using the Control Room clusterdatabase. A firewall

is between the external components, web browser and Bot Runner, and the data center load balancer. Chrome is the supported browser.

## Using Automation 360 IQ Bot On-Premises

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

Complete the steps to [install IQ Bot](#).

You must be assigned either the IQ Bot Admin or IQ Bot services roles.

As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **LEARNING INSTANCES** tab to create a new learning instance, upload sample documents to train, and select the OCR engine for document processing.  
[Create a learning instance](#) on page 3993  
[Select an OCR engine](#) on page 3995
2. Train the uploaded sample documents in the IQ Bot Designer.  
[Train a learning instance](#) on page 4003
3. As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.  
[Tasks performed from Bot page](#) on page 4007  
[Set learning instance to Production](#) on page 4034

## Using Automation 360 IQ Bot Cloud

Create a learning instance, train the bots to extract data from documents, and push the learning instance to the production environment.

- Complete the steps to [install IQ Bot](#).
- You must be assigned either the IQ Bot Admin or IQ Bot services roles.
- As you configure a learning instance, a Bot builder creates RPA bots to support the learning instance functions. For more information, see [IQ Bot process overview](#).

1. In Automation 360 IQ Bot, click the **Learning Instance** tab to create a new learning instance and upload sample documents to train.  
[Create a learning instance](#) on page 3993

---

### Note:

You might encounter the `IQ Bot is starting up or 502 Service Temporarily` issue for IQ Bot on Cloud. If there are no requests to IQ Bot instance URL for 480 hours/20 Days, the IQ Bot instance is scaled down. It takes about 15 minutes to come up. The trigger for this scale up is when requests are made to the IQ Bot instance.

- 
2. Train the uploaded sample documents in the IQ Bot Designer.

[Train a learning instance](#) on page 4003

- As you finish training each bot, set it to Production mode. When all the bots are in Production mode, set the learning instance to Production mode so it can start processing real documents.

[Tasks performed from Bot page](#) on page 4007

[Set learning instance to Production](#) on page 4034

## IQ Bot user personas and roles

Learn about the users that contribute to IQ Bot and the associated roles and licenses. IQ Bot users and roles are defined in the Control Room.

### IQ Bot user personas

A persona refers to the type of tasks that a user performs and the product areas with which a user interacts. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Bot builder	Builds RPA bots to support IQ Bot functions such as training the Classifier and pre-processing documents	Bot developer role + Bot creator license	Automation 360	<a href="#">Build RPA bots for IQ Bot</a> on page 3979
Data engineer	Creates learning instances, trains bots, and sends bots to production	IQ Bot Admin or IQ Bot services roles	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> <li>• <b>Dashboard</b></li> <li>• <b>Learning Instances</b></li> <li>• <b>Bots</b></li> <li>• <b>Domains</b></li> <li>• <b>Administration (IQ Bot Admin only)</b></li> </ul>	<a href="#">Using Automation 360 IQ Bot On-Premises</a> on page 3980 <a href="#">Using Automation 360 IQ Bot Cloud</a> on page 3980

User type	Description	Roles, permissions, and licenses	Access to product areas	Related links
Admin	Uploads custom domains and migrates learning instances between IQ Bot environments	IQ Bot Admin role or a custom role with the migration utility permission	Following tabs in Automation 360 IQ Bot <ul style="list-style-type: none"> <li>• <b>Dashboard</b></li> <li>• <b>Learning Instances</b></li> <li>• <b>Bots</b></li> <li>• <b>Domains</b></li> <li>• <b>Administration</b></li> </ul>	<a href="#">Custom domains in IQ Bot</a> on page 4043 <a href="#">Migrate learning instances</a> on page 1831
Pseudo-user	Runs the RPA bots to upload, pre-process, classify, and extract data from documents in IQ Bot	Unattended Bot Runner license + view learning instance permission	Automation 360 and IQ Bot	
Validator	Manually corrects fields in documents that IQ Bot could not process	Validator role	Only the learning instances to which permission is granted	<a href="#">Use the IQ Bot Validator</a> on page 4037

## IQ Bot roles

A role determines the areas in IQ Bot to which you have access. Roles are assigned in the Control Room and are of two types, predefined system roles and custom roles. If your user type is Admin, you can create custom roles.

- System roles: These roles are built in and have a predefined set of permissions that cannot be customized.
- Custom roles: These roles can be customized and modified to grant granular permissions to an IQ Bot user. An admin can configure the scope of a role with organization-wide permissions to manage all organizational resources or more narrowly to be limited to department-level resources. For more information, see [Defining a custom role for IQ Bot](#) on page 3983.

The following table describes the permissions and access areas applicable to each system role:

System role	IQ Bot permissions	Access to tabs
AAE_IQ Bot Admin	Access to all IQ Bot features and can migrate learning instances between environments	<ul style="list-style-type: none"> <li>• <b>Dashboard</b></li> <li>• <b>Learning Instances</b></li> <li>• <b>Bots</b></li> <li>• <b>Domains</b></li> <li>• <b>Administration Migration utility</b></li> </ul>
AAE_IQ Bot Services	All permissions related to learning instances	<ul style="list-style-type: none"> <li>• <b>Dashboard</b></li> <li>• <b>Learning instances</b></li> <li>• <b>Bots</b></li> </ul>
AAE_IQ Bot Validator	Can launch the Validator for granted learning instances	Learning instances

Related concepts

[Defining a custom role for IQ Bot](#) on page 3983

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

Related tasks

[Creating a user with an IQ Bot specific role](#) on page 3984

Create users in the Control Room to access IQ Bot.

Related reference

[Automation 360 licenses](#) on page 1511

The **All Licenses** page displays detailed information about current product and device licenses.

## Defining a custom role for IQ Bot

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

IQ Bot supports two types of role definitions:

- System roles in Control Room: These roles are built-in and have a pre-defined set of permissions that cannot be customized. To learn more, see [IQ Bot roles](#) on page 3982.
- Custom roles in Control Room: These roles can be customized and modified to grant granular permissions to an IQ Bot user. If you are an admin, by creating a custom role, you can grant users access to specific learning instances.

If you are a user with the **View and Manage Roles** permission, you can use the Control Room to create and assign custom roles.

Permission	Description
View my learning instances	Allows a user to access their own learning instances.

Permission	Description
View learning instances from the same role	Allows a user to view only learning instances created by the same role.  <b>Note:</b> If multiple users are assigned the same role, then all these users will have access to the same learning instances.
View all learning instances	Allows users to view all learning instances created by any user across all roles.
Edit learning instance	Allows users to edit learning instances.
Delete learning instance	Allows users to delete learning instances.
Send learning instance to production	Allows users to move learning instances from staging to production.
Import domain	Allows users to import domains into IQ Bot.

Things to remember:

- Ensure that users with **View learning instance from the same role** do not have non-IQ Bot roles. Example: When you create a learning instance, all the roles that you have under your name gets assigned to the learning instance. So, if you have AA\_Basic role in combination with View learning instance from the same role, then all the users with AA\_Basic role have access to IQ Bot. Therefore, users who create learning instances must not be assigned non-IQ Bot roles.
- It is required that creators of learning instances for a specific department must be assigned a minimum of two roles:
  - A role that allows them to create learning instances
  - A department-specific role with the **View learning instance from the same role** permission
- When new learning instances are migrated, existing roles will not be migrated. After the roles are assigned in the target system, they cannot be changed. IQ Bot Automation 360 does not support changing role assignments of learning instances.

Related tasks

[Create a role](#) on page 1855

As an administrator, you can configure roles with permissions to access features and perform operations such as create, edit, or delete a bot in the Control Room, and assign the role to a user.

[Creating a user with an IQ Bot specific role](#) on page 3984

Create users in the Control Room to access IQ Bot.

## Creating a user with an IQ Bot specific role

Create users in the Control Room to access IQ Bot.

Create administrator, services, and Validator IQ Bot users with Microsoft Windows credentials using the following roles in the Control Room:

- **AAE\_IQ Bot Admin**
- **AAE\_IQ Bot Services**

- **AAE\_IQ Bot Validator**

---

**Tip:** The Active Directory users are authenticated with their Active Directory credentials, and the non-Active Directory users are authenticated with the credentials stored in the Control Room database.

---

Users in Control Room are created depending on the type of user configured during installation.

---

**Note:** IQ Bot supports 50 concurrent users. However, Document Extraction if all users are active at the same time, then you cannot run Document Extraction in parallel. Additionally, if the number of concurrent users exceeds 50, system performance might degrade.

---

1. Log in to Control Room as a user with the **AAE\_Admin** role.
  2. Go to **Administrator > Users**.
  3. Click the **Create User** icon.  
The **Create User** page appears.
  4. Enter the required information on the Create User page.
- 

**Note:**

- The **First name**, **Last name**, and **Description** fields are optional. For a first name and last name, use numbers, spaces ( ), period (.), hyphen (-), and underscore (\_).
  - For a Non-Active Directory user, provide information in each field.
- 

5. To create a user with the administrator role, select **AAE\_IQBotAdmin**. To create a user with the services role, select **AAE\_IQBotServices**. To create a Validator role, select the **AAE\_IQBotValidator** role.
6. Select a license to be allocated to the user from the **Allocate a device license to user** section.  
If no license slots are available for a role, an alert message appears.
7. Click **Save** to create the user.

To switch a user type from Development to Run-time or vice versa, depending on the automation requirements of your organization, update the license type from the License Management section in Control Room.

After a Validator or a services user is created, an email is sent to the user. The user is asked to do the following:

- Verify the email ID and set the Control Room access password, if the Control Room is configured for the Non-Active Directory users.
- Verify the email ID, if the Control Room is configured for the Active Directory users.

Related concepts

[Defining a custom role for IQ Bot](#) on page 3983

For various roles within IQ Bot, you can use role-based access control (RBAC) to enable or restrict user access to learning instances, related features, and functionality by defining granular permissions. You can also use RBAC to define custom roles in IQ Bot.

## Languages supported in Automation 360 IQ Bot

Up to 31 languages are supported in IQ Bot. You can also access up to 190 languages in IQ Bot by using an OCR engine.

When you review the list of languages in IQ Bot, you will observe the following:

- Some languages are listed multiple times as variants, for example, Norwegian, Norwegian (Bokmal), Norwegian (Nynorsk).
- Among languages that are written from right to left, only Arabic is currently supported on IQ Bot.
- For languages not in the IQ Bot UI by default:
  - These rely on ABBYY FineReader Engine 12.2 for text segmentation and OCR, then IQ Bot for classification, extraction, and auto-correction.
  - Contact your Cognitive Services or Sales Engineering representative to create IQ Bot custom domains to access these languages.
  - In the SQL database and .json file, IQ Bot requires language codes for 160 of the additional languages to appear in the UI, and culture codes to allow numeric and date validation.

### Note:

- For ABBYY FineReader Engine and Microsoft Azure Computer Vision OCR engine, IQ Bot uses its text segmentation + OCR.
- For Microsoft Azure Computer Vision OCR engine, user can select any language from IQ Bot's drop-down, but the API aims to auto-detect the language during processing, and override user selection.

The following table provides a list of supported languages in IQ Bot for various document types:

Language	Document types such as invoice, contracts, health insurance, purchase order, and so on	Document type
English	X	X
German	X	X
French	X	X
Spanish	X	X
Italian	X	X
Afrikaans		X
Arabic		X
Bulgarian		X
Catalan		X

Language	Document types such as invoice, contracts, health insurance, purchase order, and so on	Document type
Chinese (Simplified)		X
Chinese (Traditional)		X
Czech		X
Danish		X
Dutch		X
Flemish		X
Greek		X
Hungarian		X
Indonesian		X
Japanese		X
Korean		X
Latin		X
Malay		X
Norwegian		X
Polish		X
Portuguese		X
Romanian		X
Russian		X
Serbian (Latin)		X
Slovak		X
Swedish		X
Turkish		X

The following table lists the languages that are supported in IQ Bot through a custom domain:

Abkhaz	Galician	Mari	Sioux (Dakota)
Adyghe	Ganda	Maya	Slovenian
Agul	German	Miao	Somali
Albanian	German (new spelling)	Minangkabau	Sorbian
Armenian (Eastern)	German (Luxembourg)	Russian and English	Sotho
Armenian (Grabar)	Guarani	Mohawk	Sunda
Armenian (Western)	Hani	Mongol	Swahili

Avar	Hausa	Mordvin	Swazi
Aymara	Hawaiian	Nahuatl	Tabassaran
Bashkir	Icelandic	Nenets	Tagalog

The following table provides you with links to supported languages for all IQ Bot supported OCR engines:

IQ Bot supported OCR engines	List of supported languages
ABBYY FineReader Engine	<a href="#">ABBYY FineReader Engine OCR supported languages</a>
Microsoft Azure Computer Vision OCR engine	<a href="https://docs.microsoft.com/en-us/azure/cognitive-services/computer-vision/language-support">https://docs.microsoft.com/en-us/azure/cognitive-services/computer-vision/language-support</a>
Google Vision API	<a href="https://cloud.google.com/vision/docs/languages">https://cloud.google.com/vision/docs/languages</a>
Tesseract4 OCR 4.0.0	<a href="https://tesseract-ocr.github.io/tessdoc/Data-Files-in-different-versions.html">https://tesseract-ocr.github.io/tessdoc/Data-Files-in-different-versions.html</a>
Tegaki API	<ul style="list-style-type: none"> <li>• Japanese</li> <li>• Korean</li> <li>• Japanese - English</li> <li>• Korean - English</li> </ul>

**Note:** The supported languages in IQ Bot must be considered in concurrence with the OCR supported languages.

**Tip:** If you are unable to see all languages in the IQ Bot UI or if IQ Bot is unable to extract data from multiple languages in a document, troubleshoot the issue:

[Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

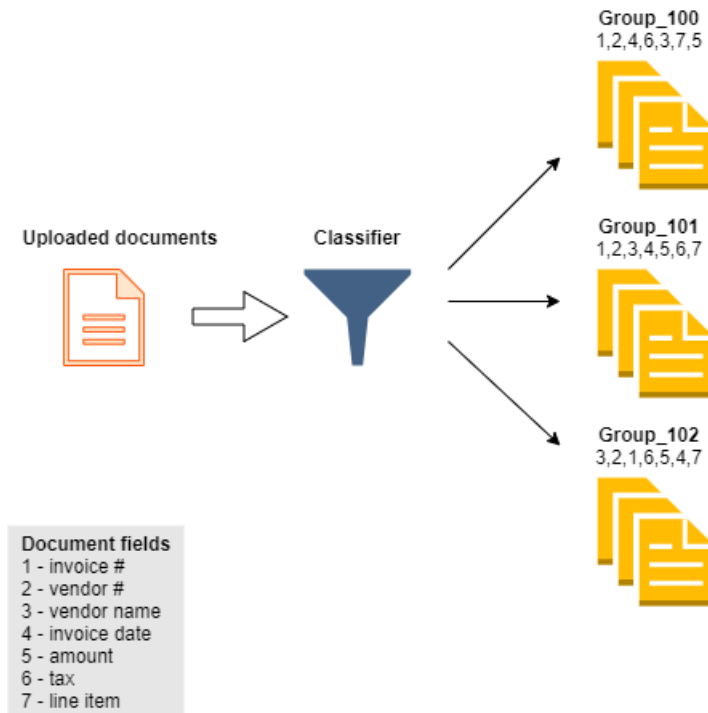

**Note:** If you are adding custom language to a custom domain, then you must retain the language ID across all installations from where IQ Bot learning instances will be exported and imported.

## About the Classifier

Learn about how documents are classified and the factors that affect classification.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

The following graphic illustrates how uploaded invoices that contain specific fields are sorted into one of three groups, depending on the order in which the fields appear in the invoice.

Alternatively, you can manually define a document group to process all the documents with an identical layout. In this case, IQ Bot bypasses the Classifier and sends the document to the group you created that has the same layout as the uploaded document. This option is useful when the OCR fails to detect one or more fields in a document, causing the Classifier to unnecessarily create a new document group or send the document to the wrong group. See [Create a new document group](#) on page 3992.

---

**Note:** User-created document groups cannot be deleted.

---

The Classifier is supported by RPA bots and the Document Classifier package. It contains actions that automate identifying and sorting the different document types. See [Document Classifier package](#) on page 2661.

## Resources

Watch the following videos to learn more about how the Classifier works and how to use it:

## Learning instances created with out-of-box or custom domains

IQ Bot checks for a minimum number of fields that you selected to successfully classify the document. In all other cases, the document will be marked as unclassified.

For example:

- If you create a new learning instance with one to four fields selected, IQ Bot checks for at least four fields from the total number of fields presented for that specific learning instance. Similarly, if you create a learning instance with five fields selected, IQ Bot checks for at least five fields.
- If you create a learning instance with six or more fields selected in the learning instance, IQ Bot checks for at least six fields. For example, if you selected eight fields in an invoice domain, IQ Bot checks for at least six fields out of the total fields available.

## Learning instances created with other domains

If you create a learning instance with multiple fields, IQ Bot checks for at least one field and classifies the document. If IQ Bot does not find any field, the document will be marked as unclassified.

## Factors that impact classification

Factor	Notes
Page layout	If the page layout is different from the original document with respect to document content position, IQ Bot sends the document to a different group.
Label orientation	All the labels in a document must be oriented in the same direction. If some of the labels are vertical and some horizontal, the document is sent to a different group.
Label position	Labels can be positioned anywhere on the page. However, the label sequence from left to right and top to bottom must be the same as in the training documents.
Match percentage	IQ Bot uses a 70% match for labels.
Fields added after the learning instance is created	Fields added after a learning instance is created are excluded from the classification process.

Related tasks

[Limit the creation of document groups](#) on page 4000

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

## Create a new document group

Manually define a user-created document group to process documents with an identical layout. For example, invoices from a specific supplier.

- If you have not done so already, [Create a learning instance](#) on page 3993. After you create a learning instance, you are redirected to the document groups page, where you create a new document group.
- Identify the group label. This is the name of the folder in the `documents\classify\train` directory where documents with an identical layout are sent. You will provide the group label in the steps below.
- Identify sample documents (maximum 150) that have an identical layout. You can upload more documents to train the group after the group is created.

1. Navigate to the learning instance details page and click **Create group**.
  2. In the **Group label** field, provide the folder name that contains the sorted documents in the `documents\classify\train` directory.
  3. Click **Browse** to upload sample documents to define the layout.
  4. Click **Save**.
1. Configure the mechanism to sort incoming documents to the correct group:
    - To use the Classifier, run the bot with the **Train Classifier** action to create the classification model and sub-folders to hold the sorted documents in the `documents\classify\train` directory. See [Using Train Classifier action](#) on page 2665.
    - Alternatively, create RPA bots identify and sort incoming documents using conditional statements, such as string-matching the file name or sender. See the String condition in the [Loop package](#) on page 2975 or [If package](#) on page 2902.
  2. Update the following actions:
    - Optional: Update the **Classify Document** action to use **Express mode**. See step 6 in [Using the Classify document action](#) on page 2664.
    - Update the **Upload document** action to provide the group label. See step 4 in [Upload document action](#) on page 2923.
  3. Upload more documents to train the group. When you are done with training, set the group to production.
  4. After you set the group to production: If you have a bot with the **Process Documents** action, you must update the action with the group label. See step 7 in [Using IQ Bot Process documents action](#) on page 2941.

---

**Note:** During the production process, you must not move the learning instances or bots from Staging to Production or vice-versa.

---

## Create a learning instance

Create a learning instance and upload sample documents for training. In this step, you define the data elements for a single document type, such as an invoice or a purchase order, and the fields which you want to extract.

Ensure the sample documents meet the following requirements:

- Each document is a separate file. For example, if you have downloaded an email and its attachments into a single PDF, you must separate the email body from the attachments. See [Using the Split document action](#) on page 3078.
- The documents are in one of the following supported file types:
  - PDF
  - JPG
  - JPEG
  - PNG
  - TIFF
- Use documents with a resolution value of at least 300 dots per inch (dpi).
- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- You can upload up to a file size of 12 MB. You can upload additional documents after creating the learning instance.
- The file names of the documents that you upload should not start with special characters, such as the hyphen (-).

---

### Note:

- With the Tesseract4 OCR, currently there is a known limitation which restricts the number of pages per document to less than 60 pages.
- Azure confidential computing enables organizations to upload encrypted data to secured storage, such as private folders on a virtual machine. If you upload documents from such secured folders to IQ Bot, these are moved to **Unclassified** status as data extraction is not supported for such documents.

---

When you start with a collection of documents to insert into a digital process, you will probably have a mix of documents types, formats, and orientations. An invoice, for example, has a consistent set of data elements, whereas a purchase order contains a different set of data elements. You must create a different learning instance for each of these document types, using the following steps:

1. Navigate to **LEARNING INSTANCES** and click the **New instance** option.
2. In the **Create new learning instance** screen, enter the following information:
  - a) **Instance name:** Enter a unique name.  
IQ Bot version A360.21 and below does not allow duplicate learning instance names. Even if you delete a learning instance, the name cannot be reused. From IQ Bot version

A360.22, it is possible to create duplicate learning instance names, as well as reuse the name of a deleted learning instance.

**b) Optional: Description:** Enter a description.

**c) Document type:** Select the document type from the drop-down list.

Do not choose standard forms as **Document type** while creating learning instance. Based on the option you select, a predefined set of form and table fields for the domain type appears. For example, when you select **Invoices**, the common forms and tables of an invoice appear.

---

**Note:** If you want to create a domain to use specifically for this learning instance, select **Document type > Other** and enter a domain name. In the upcoming steps, you will customize the domain.

For more information on creating a custom domain, watch the following video:

If you want to create a domain to use in more than one learning instance and you have the required access permissions, you can work with Automation Anywhere support to create a custom domain. See [Custom domains in IQ Bot](#) on page 4043 for more information.

---

**d) Primary language of documents:** Use the drop-down menu to select a language for the learning instance.

[Languages supported in Automation 360 IQ Bot](#) on page 3986

To create custom domains in other languages and access up to 190 languages that IQ Bot supports, contact Automation Anywhere support.

---

**Important:** If you are unable to see all languages in the IQ Bot interface, troubleshoot the issue: [Unable to extract data from Multiple languages in a document \(A-People login required\)](#)

---

**e) Upload your documents:** Click the **Browse** option to upload sample documents.

**3. Select or de-select fields in the Common form fields and Common table/repeated sections fields sections.**

Form fields appear one time in a document, such as the invoice date or number. Table fields are fields that reoccur throughout the document, such as the item total or quantity.

To see all the possible fields, click **Additional form fields** or **Additional table/repeated section fields**.

**4. Optional: Add additional fields by entering the field name in the Additional form fields or Additional table/repeated section fields section.**

Follow the naming conventions when you enter a name in the **Add fields (Optional)** field:

- Field names can only begin with alphabetical characters (A-Z and a-z).
- Field names can only include alphanumeric characters and spaces.
- Field name cannot end with a space.

**5. Optical Character Recognition:** Select the required OCR engine.

[Select an OCR engine](#) on page 3995

**6. Optional: De-select the My PDF documents do not have images check box.** To learn more, see [Disable PDFBox option](#) on page 4002

When this check box is selected, IQ Bot uses PDFBox OCR to process PDF documents; non-PDF documents are processed by the OCR you selected in the previous step.

- 7. Checkbox auto-detection:** Select the **Detect checkboxes** check box to enable this feature. Selecting this option allows IQ Bot to automatically detect check boxes in a document. However, it might increase the processing time of documents.
- 8.** Click the **Create instance and analyze** option to create the learning instance. The system analyzes and sorts the training documents into logical groups based on field identification and shows the details in the **Learning Instance > Summary** tab.

When a new learning instance is created, the sample documents you uploaded are analyzed and sorted into groups based on the document characteristics. To learn more, see [About the Classifier](#) on page 3990.

After the Classifier finishes sorting the documents, you are redirected to the Designer, where you will train bots to extract data from each sample document. [Train a learning instance](#) on page 4003.

Related tasks

[Select an OCR engine](#) on page 3995

You can select an OCR engine that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

Related reference

[Create a learning instance for standard forms](#) on page 4056

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

## Select an OCR engine

You can select an OCR engines that suits your requirement for data extraction based on your document types. Restarting IQ Bot services is not necessary for implementing an engine change.

During IQ Bot installation, the system sets the latest version of Tesseract Optical Character Reader as the default OCR engine. This is also the default setting for the product. However, you can manually set the OCR engine in the `Settings.txt` file, which becomes the default engine. Similar to the prior releases of IQ Bot, you can continue to manually update the `Settings.txt` file with the OCR engine name you want to set as default.

When creating a learning instance, you can select an OCR engine from the **Optical Character Recognition** drop-down menu. See [Create a learning instance](#) on page 3993

---

### Note:

- Selecting an OCR engine in the interface overrides the settings in the `Settings.txt` file.
- As Tegaki API OCR requires a separate On-Premises set up that is not supported in Automation 360 IQ Bot Cloud, all other OCR engines except the Tegaki API OCR are available.

You will always have the latest version of the OCR engines supported by Automation 360 IQ Bot Cloud, but cannot select a specific OCR version.

---

The following table lists the various OCR engines supported in IQ Bot and the corresponding options:

Table 17: List of OCR engines and their specifications

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Tesseract OCR	4	Cloud and On-Premises	N/A	English German Spanish Italian French	No noise No dark background No stamps/watermarks 200+ dpi	Invoices, POs, etc. Semi-structured formats
ABBYY FineReader Engine	12.3, or 12.4	Cloud and On-Premises	N/A	English All Latin+ Chinese Japanese Korean	Less noise Dark background with white fonts Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats
Microsoft Azure Computer Vision OCR engine	2.0 or 3.2	Cloud and On-Premises	English only	English All Latin+ Chinese Japanese Korean	Less noise Dark background Has stamps/watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Passports, Driving license, etc. KYC documents

Qualifiers	OCR Version	Supported installation	Handwritten	Languages Supported	Document Quality	Document Type
Google Vision API	Version is updated automatically to match current release	Cloud and On-Premises	N/A	English All Latin+ Asian	Less noise Dark background Has stamps/ watermarks 96+ dpi	Invoices, POs, etc. Semi-structured formats Mortgage Forms, Tax Forms Unstructured Formats

1. On the **Create a new learning instance** page, select the domain and language of the documents.  
In the **My learning instance** list page, a new **OCR Engine** column is available that shows the OCR engine used for creating each learning instance. This information is useful to the user when deciding on document processing.

2. The **Fields to extract** and **Advanced Settings** sections are displayed when you select the domain.

Each domain is available with a predefined list of primary supported languages. Language selection is enabled and available from the **Primary language of documents** drop-down list based on supported languages for a specific domain.

**Note:** If you select a language from the **Primary language of documents** drop-down list and then select an engine that does not support that language, the system displays an error message in the **Optical character recognition** drop-down list.

3. Click **Advanced Settings > Optical character recognition** to display the OCR engine options drop-down list.

If the OCR engine selection is invalid, the **Create instance and analyze** option is not enabled.

**Note:** IQ Bot automatically installs all OCR engines during the installation process, except for ABBYY FineReader Engine.

**Important:** You can only configure the selected OCR engine in Automation 360 IQ Bot On-Premises. OCR settings in Automation 360 IQ Bot Cloud cannot be edited as they are not accessible except for ABBYY FineReader Engine. You can edit the configuration settings for ABBYY FineReader Engine using the `appConfigurations` REST API.

You can select from the following:

Option	Description
Tesseract OCR 4	This is the default engine, unless changed in the <code>Settings.txt</code> file.

Option	Description
ABBYY FineReader Engine	<p>To verify if ABBYY FineReader Engine is installed and available for use on your machine, check the <code>Settings.txt</code> file, the OCR Plug-ins folder for the SDK files, and the <b>Optical character recognition</b> drop-down list.</p> <hr/> <p><b>Note:</b> Also supported in IQ Bot [Local Device] package and IQ Bot Extraction package.</p> <hr/> <p><a href="#">Use ABBYY FineReader Engine OCR engine in IQ Bot</a> on page 1568</p>
Microsoft Azure Computer Vision OCR engine	<p>IQ Bot supports all languages supported by this OCR engine.</p> <p><a href="#">Use Microsoft Azure Computer Vision OCR engine</a> on page 1565</p>
Google Vision API	<p>IQ Bot supports Google Vision API as an OCR engine and supports all languages supported by this engine.</p> <p><a href="#">Use Google Vision API OCR engine</a> on page 1571</p>
My PDF documents do not have images	<p>All the PDF documents that you upload are processed using the PDFBox OCR by default, regardless of the OCR engine you have specified or selected.</p> <p>If you are uploading non-PDF documents or PDF documents that contain images, clear the <b>My PDF documents do not have images</b> check box to ensure that the OCR engine that you have specified or selected is used to process the documents.</p> <p>The <b>My PDF documents do not have images</b> check box is enabled by default. To disable this feature, see <a href="#">Disable PDFBox option</a> on page 4002.</p>

**Tip:** If IQ Bot is unable to extract data from low quality or handwritten documents, troubleshoot the issue:

[IQ Bot unable to extract data from low quality and Handwritten documents \(A-People login required\)](#)

**Note:** Use the following files to change the OCR settings:

- `AbbyyImagePreProcessingSettings.json`
- `LanguageCodeToAbbyyLanguageCode.json`
- `Azure3OCREngineSettings.json`
- `GoogleOCREngineSettings.json`
- `AzureOCREngineSettings.json`

[How to change OCR Settings in IQ Bot \(A-People login required\)](#)

## Edit a learning instance

Edit a learning instance to change its name, description, add additional training documents, or include additional fields for extraction.

You can only edit a learning instance on Staging. So ensure you move any learning instance in Production environment to Staging to edit it.

1. On the **Learning Instances** page, click a learning instance.
2. Click the **Edit** icon to edit the learning instance.
3. Optional: Update the description field.
4. Optional: Change or update the learning instance name.

When you change the name of a learning instance, the following changes occur:

- A separate folder with the new learning instance name is created in the configured output directory to store the .csv files of processed documents.

The previous folder containing the .csv files before the learning instance name was changed remains as is in the output folder.

- When you migrate a learning instance with an updated name using overwrite or remove options, it is updated in the source environment after the .iqba file is imported.
  - An entry in the audit logs is created for this activity.
5. Optional: Click **Browse** to select additional training documents.

The file names of the documents that you upload should not start with special characters, such as the hyphen (-).
  6. Optional: Select additional fields and table columns to add to the learning instance for data extraction.
  7. Use the **New groups creation setting** field to restrict creation of new groups or set the threshold for the number of groups.

---

**Note:** The **New groups creation setting** field only applies to the documents in Production. However, this field option is not applicable for IQ Bot [Local Device] and IQ Bot Extraction packages.

---

For more information, see [Limit the creation of document groups](#) on page 4000.

8. Optional: Use the **Default validations group** option to select a default group for document validations.

All new documents use the custom logic and validations defined in the default group. Validation rules from this default group are applied when a document does not belong to any of the existing group. If you delete the selected default group, the validation rules are not applied to any of the new documents that were supposed to use this group.

---

**Note:** If you select a default group, you can only change it to another group. However, you cannot select **Select default validation**, which is the default setting.

---

9. Click **Save** to view a confirmation message.
10. Click **Yes, proceed with field addition** to upload, analyze, and classify the selected training documents (if any) that were added to the learning instance.

The classification of documents remain unaffected by the newly added fields.

All additional fields become available in all the bots and appear as optional fields in the selected learning instance. The bots must be retrained for these fields.

See [Errors generated while editing learning instances](#) on page 4001.

## Limit the creation of document groups

Limit the number of new document groups that the Classifier can create when a learning instance is in production.

You can only edit a learning instance that is in staging. If the learning instance is in production, you must revert it to staging.

When documents are uploaded to a learning instance, the Classifier sorts the documents into document groups based on the layout, which is the order in which the fields appear on the page. If a document is uploaded to a learning instance in production and the document does not match the layout of any of the document groups, the Classifier creates a new group for that document.

Use the following steps to either configure a limit for the number of total document groups in the learning instance, or opt to disallow the Classifier from creating new document groups.

1. Navigate to **LEARNING INSTANCES**, select a learning instance, and click **Edit**.
2. Select from the following options:

Option	Description
Select the <b>Never create new groups</b> check box	<p>No new groups are created, irrespective of the number of document uploads. The uploaded documents are sent directly to the Validator.</p> <ul style="list-style-type: none"> <li>• This check box is deselected by default.</li> <li>• When this option is selected, the <b>Threshold to create new groups</b> field is disabled.</li> <li>• You can create new groups manually by uploading them to the learning instance in staging.</li> </ul>
Set a value for the <b>Threshold to create new groups</b> field	<p>When you set a threshold value, IQ Bot does not create a group for the uploaded documents till it reaches the defined value. Till the set threshold value is reached, all documents are sent to the Validator.</p> <ul style="list-style-type: none"> <li>• By default, the value is set to 10 for all new learning instances.</li> <li>• You can set a value of up to 10 digits.</li> <li>• IQ Bot does not allow you to enter non-numerical characters, zero, or floating points.</li> </ul>

3. Save your updates, which are then reflected in the **Summary** tab.

The **Summary** tab displays all the staging and production details. The information is updated based on any applied setting in the **New groups creation setting** section.

For new learning instances, unless you set the minimum threshold in the **New groups creation setting** section, IQ Bot applies the default set value of 10 and does not create groups for the first 9 uploaded documents.

4. For existing learning instances, you can set the minimum threshold in the **Learning Instance > Edit** page. The new threshold is applied to all documents from then onward.

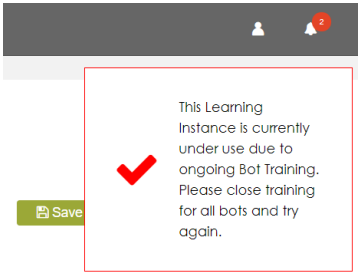

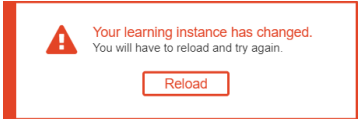

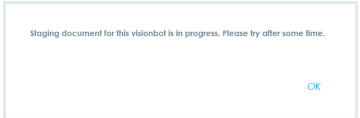

All existing learning instances, even after upgrade, will continue with a threshold as 1.

All changes take effect only on the documents uploaded in production after the setting is edited. If you change the setting to a new threshold or never create new groups with an existing learning instance, this check will be performed only on the next document uploaded in production.

In the production environment, all classified documents that do not belong to any group and do not meet the minimum threshold requirement are sent to the Validator. You can update the values and make necessary corrections. However, all fields are optional and are text data type. The user can **Save current document** without making any corrections, or choose the **Mark as Invalid** option.

### Errors generated while editing learning instances

Use case scenarios and error messages generated while editing a learning instance are explained in this topic.

Case	Details	Message
Bot in training	<p>Learning instance is in use because of ongoing bot training and you edit the same instance</p> <p>A) User 2 is editing the same learning instance</p>	
Case 1: Simultaneous editing of same learning instance	<p>Example for case 1:</p> <p>User 1 uploads a document to the same learning instance.</p> <p>User 2 adds a field when editing the same learning instance.</p>	
Run and edit the same bot	<p>Run the bot and then edit the same bot using the same user login or two different user logins.</p>	

## Delete a learning Instance

Use the Learning Instances page to delete a learning instance from the **View Details** page.

You cannot delete a learning instance that is in the production environment. To edit a learning instance, do the following:

1. On the **Learning Instances** page, click the learning instance or **View Instance Details** icon to show the **Summary** tab.
2. On the details page, : click the **Edit** icon. The learning instance becomes available for editing.
3. To delete the learning instance, click the **Delete Instance** button. A confirmation message appears.
4. Enter the learning instance name in the field and delete the learning instance.

---

### Important:

Unless you have already exported the learning instance as a backup, the following occurs after you delete a learning instance:

- It is permanently deleted and cannot be restored.
  - All the associated bots are deleted and cannot be reused.
  - You cannot reuse a deleted name for a learning instance to create a new one.
- 

## Disable PDFBox option

The PDFBox option is enabled by default. Disable the option when you are training hybrid PDF documents containing images and text.

The PDFBox option works best with completely digital documents only. When using hybrid documents containing images and text, our recommendation is to disable the PDFBox option for better document classification.

---

**Note:** The PDFBox option is enabled in the system by default. Ensure that the PDFBox is kept enabled only if you plan to process digital documents, otherwise processing will fail.

---

If PDFBox is enabled, you can process the following PDF types:

- Vector and Hybrid PDF can be processed using PDFBox
- Raster PDF can be first processed using PDFBox, and if no segment is found then the PDF is processed again using Document Image OCR

There are two ways in which you can disable/enable the PDFBox option in IQ Bot:

- Directly in the UI during the creation of a learning instance. In the **Create new learning instance** page go to **Advanced Settings > Optical character recognition** and disable/enable the **My PDF documents do not have images** check-box.
- In the `Setting.txt` file described as follows:

1. Navigate to `C:\Program Files (x86)\Automation Anywhere IQ Bot\Configurations`.

2. Open the `Setting.txt` file, and change `PDFBoxOCREnabled=true` to `PDFBoxOCREnabled=false`  
This turns off the processing of uploaded documents by PDFBox for new learning instances (after applying this change), and does not apply to the existing learning instances. IQ Bot will use your selected OCR engine for PDF documents as well.

---

**Note:** When PDFBox is disabled, ensure that your PDF document is less than 60 pages.

---

3. After updating the `Setting.txt` file, execution of `stoppedanduninstalled` and `installedandstartedstart` of IQ Bot services is not required.

## Train a learning instance

Use the staging environment to train a learning instance and extract data from sample documents. Review each field to verify whether the correct value is extracted and where necessary, map the correct field.

When you upload sample documents while creating a learning instance, the Classifier analyzes and categorizes these documents into logical groups. The system creates a bot for each document group, which you must train to extract data from specific fields in the sample documents.

Multiple users can train documents that are in one group (of document layouts). However, if multiple users try to train documents (even if within same group) in the same learning instance simultaneously, the system notifies you with the `Group currently being trained` message.

For example, if User 1 uploads a document in a learning instance and User 2 tries to edit the same learning instance.

---

**Note:** When User 1 locks the learning instance to train a document and if the learning instance remains inactive for 15 minutes, that learning instance will be automatically released. And, then User 2 can continue editing the same learning instance.

---

The following steps provide an overview of the training process:

- |                                             |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1: Open the Designer                   | From the <b>My Learning Instances</b> page, open a learning instance and click <b>Edit bot</b> or <b>Create bot</b> to start training the learning instance.<br>For an introduction to the components, see <a href="#">Introduction to the Designer</a> on page 4006.                                                                                                                                              |
| Step 2: Map the document fields             | In the <b>Fields</b> section, click each form field to verify whether the correct value is extracted. If the value is incorrect or if the field was not found (indicated by a grayed-out check icon next to the field), you must remap the field. <ul style="list-style-type: none"><li>• <a href="#">Map a field</a> on page 4010</li><li>• <a href="#">Delete mapping in the Designer</a> on page 4018</li></ul> |
| Step 3: Map the check boxes (if applicable) | If you configured the learning instance and uploaded sample documents containing check boxes or option buttons, see <a href="#">Extract data from</a>                                                                                                                                                                                                                                                              |

[check boxes or check box groups](#) on page 4015

---

**Note:**

- Check boxes and check box groups can be extracted as either a form or table field depending on whether the check box appears one time or on a recurring basis in the document.
- We do not support classification of encrypted or password-protected documents.

Step 4: Map the table fields

Review each table field to ensure that the correct column name is identified in the **Column Value** field. If IQ Bot did not find the correct Column Name, remap the column name by using the same approach as you did for the form fields. Then, configure the table settings. [Map a table](#) on page 4011

If the document contains more than one table, define the additional tables:

1. Add all the table fields to the **Additional table/repeated fields** section of a learning instance. [Edit a learning instance](#) on page 3999.
2. Map the additional table fields. [Add multiple tables in Designer](#) on page 4014.

To establish a relationship between the fields of the different tables, see [Define one or more linked fields in a child table](#) on page 4014.

Step 5: Review the training results

Click **See extraction results** to check the extracted data from the document group. [Preview extracted data](#) on page 4016

If not all of the fields are extracted, try resizing the mapping areas for those fields.

Alternatively, train the bot by using a different document. [Change the training document for a group](#) on page 4007

Step 6: Save the bot

Click **Save and go to next group** to train the bot for the next document group.

A menu appears, with the option to **Cancel**, **Save**, or **Save and send to Production**.

---

**Note:** We recommend that you test the bot (see next step) before sending it to production.

---

You can view the status of all the bots in all your learning instances from the **BOTS** tab. [Manage IQ bots](#)

Step 7: Test bot extraction capabilities

Navigate to the **BOTS** tab and click **Test bot**.

The bot processes the remaining documents in the document group based on the trained document. To see the bot performance, review the values in the **Learning instance summary** page, particularly the straight-through processing (STP) metric. [Review the learning instance details](#) on page 4017

If the STP number is low, you can either retrain the bot, such as by resizing the mapping areas or train the bot on a different document. [Change the training document for a group](#) on page 4007

Step 8: Send the bot to production

When you are satisfied with the extraction accuracy of the bot, switch it to production mode. Then, switch the learning instance to production mode. Once a learning instance is in production mode, IQ Bot is ready to begin processing documents in real time: classifying the uploaded documents to the document groups with bots in production and either extracting data or sending the document for manual validation.

From the **Learning Instance Details** page, click the switch at the top right to move the learning instance into production mode. [Set learning instance to Production](#) on page 4034

---

**Note:** If you want to retrain a bot, both the learning instance and the bot must be in staging mode.

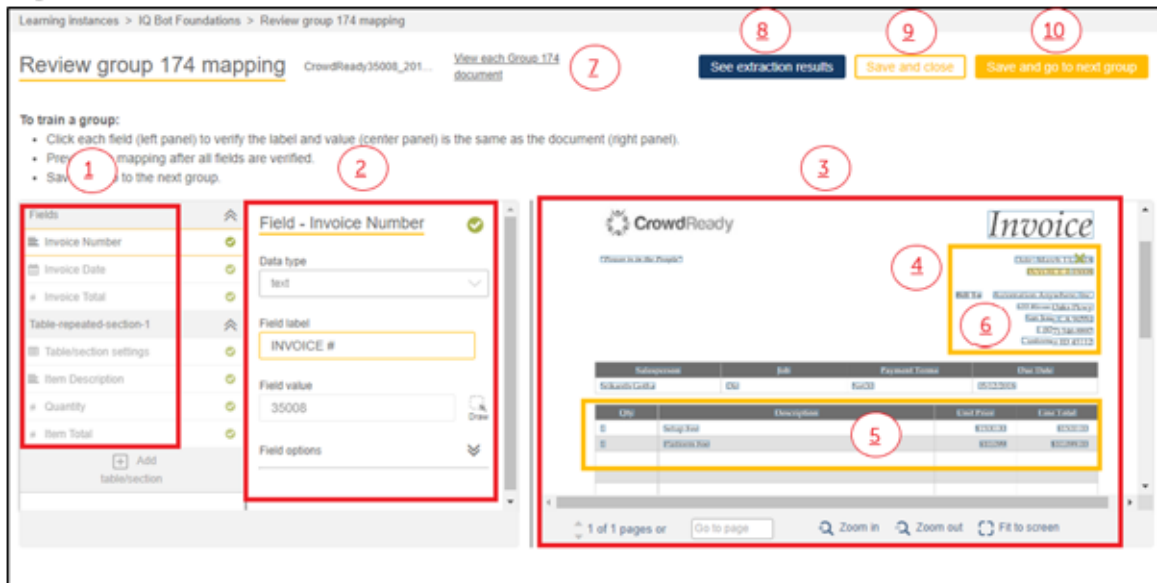

---

Related concepts  
[About the Classifier](#) on page 3990

Learn about how documents are classified and the factors that affect classification.

## Introduction to the Designer

The Designer is the user interface where you train bots to extract data from uploaded sample documents. The Designer contains auto-mapped fields and table columns, where you can you edit the existing mapping or add new fields and tables.

Highlighted areas are:

1. Fields panel: List of fields selected for extraction during Learning Instance creation. Fields successfully found are indicated with a green check mark.
2. Field Details panel: Details for the highlighted field in the Fields Panel, including data type and extracted value.
3. Document Image panel: Rendered image of the document with image view controls
4. Form fields: A field that has a single value in the document, such as the invoice number or invoice date.
5. Table fields: A field with values that appear more than one time in a document, such as the item description or quantity.
6. The blue boxes indicate System Identified Regions (SIRs) where IQ Bot found out extractable data.
7. The training document can be changed by clicking **View each Group (#) document**.
8. The extraction can be tested using **See extraction** results.
9. Save and close: Saves the changes and returns to the Learning Instance details page.
10. Save and go to the next group: Saves changes, allows the Group to be set to Production mode, and moves to the next available Group.

**Note:** If you have multiple files in a group and one of the document is deleted, then you will see an error message **Unable to load document** and you will not be able to change the document for training in the Designer. When the entire multi-page document is deleted or corrupted, you will

not be able to navigate between the pages. If you click the next page button, then the **Loading document** screen is displayed.

---

## Change the training document for a group

During document training, look at unique document layouts available in a group, and choose a different document than the default one chosen by IQ Bot Designer, that is more representative of documents across that group. That helps maximize straight-through processing (STP).

Follow the steps to choose a different document from a document group.

1. User can see the **View each Group 'x' document** button in the Designer training page next to the document name.  
The **View each Group 'x' document** button is disabled if there is a single document in the group.
2. Click the **View each Group 'x' document** button to display the previous and next arrows that will let you move to another document. You can also cancel out of the task.  
Choosing a different document as the group's training document will clear all mapping from the previous document. IQ Bot displays a warning message stating the same.
3. Select a new document and click the **Change the training document** button to see a message confirmation stating: `If you change the training document for this group, any mapping from the previously trained document will be lost. Do you want to change the training document for <group name> to <document name>?`
4. Choosing **No, cancel** takes you back to the Designer, whereas confirming the message **Yes, change** loads and launches the new document with auto-mapped fields.
5. Click **See extraction results** to view extracted data from the new document.

## Tasks performed from Bot page

This page lists all the available bots for a learning instance, and enables you to perform tasks such as run, change the status, or launch the IQ Bot Designer.

Create a bot to extract text from a document. Define the field labels and values in a document so that the system can learn from it and automatically process other documents in the document group..

Monitor the progress and status of all bots created for a learning instance and set the status from Staging to the Production environment.

Testing a bot verifies that the bot can reach the required accuracy based on the training. It also runs it against all the sample documents associated with that category or group and benchmarks document and field accuracy. Test a bot only in the Staging environment.

---

### Note:

- To view the updated document and field accuracy, refresh the **Bots** page and click the bot name. The updated document and field accuracy appear in the details area.
  - You cannot edit a bot that another user is already editing.
-

## Various bot states

The status of a bot is dependent on the state of the learning instance as well as the bot. The table below shows the relationship between learning instance state, bot state, and bot status.

Learning Instance State	Bot State	Bot Status
Staging	Staging	Training
Staging	Production	Ready
Production	Staging	Training
Production	Production	Active
Created	Not created	No listing

## Delete a bot

The following are some key points:

- Clicking the **Delete bot** button displays a message asking if you want to delete the Bot. Selecting yes displays a success message in the Learning Instance details page. The **Summary** tab shows the updated information in the **Staging** and **Production** results sections for the **Groups found** and **Bots created** fields.
- You can delete a Bot in Staging only. Once deleted, the Bot does not display in the Learning Instance details page or the Bot listing page.
  - All associated staging documents are removed from the system.
  - All associated unprocessed production documents get moved to the Validator for processing.

---

**Note:** A new Bot is created when the same documents are uploaded again to Staging or Production.

- On re-uploading the deleted documents from the learning instance, the system classifies the documents and displays the groups again with the **Create Bot** option for each group. Clicking the **Create Bot** option creates the Bot and you can see it in the **Create Bot** details page.
- In case of backend exceptions, such as disruption of Services, the system does not let you delete the Bot. Instead, it displays an error message saying that an unexpected error has occurred.

Related tasks

[Create your first bot](#) on page 1595

Perform the following steps to create your first bot that prints the message, `Go be great!`, the Automation Anywhere version of `Hello World!`

## Improve output quality using OCR confidence

Improve the output quality of the IQ Bot platform using the system-identified region (SIR) and optical character recognition (OCR) confidence by comparing it to a predefined threshold.

Confidence-based validation is useful for a text type field and for Date or Number fields because it helps route a document, with contentious values, for a human to view despite the fields satisfying the set validation criteria.

### Enable OCR confidence-based validation

---

**Note:** This option is applicable only if you selected Tesseract OCR when creating the learning instance.

---

This feature is disabled by default. To enable this feature, open the `Settings.txt` configuration file available in `<IQ Bot Installation Folder>\Configurations\`, and set the desired threshold value in the `ConfidenceThreshold` property. For this example, set the character-level confidence threshold value to 99, that is `ConfidenceThreshold=99`. When this feature is disabled, the default value is set to 0, signifying that the feature is disabled.

---

**Note:** The confidence threshold value is uniformly applicable across all the learning instances.

---

### How OCR confidence-based validation works

In a document if a field's SIR character level confidence is lower than that of the set confidence threshold, the validation for that field fails, resulting in the failure of that document.

---

**Note:** If a field value fails due to a validation rule (for example, `Invalid Number Format`) other than an OCR confidence validation failure, you see that tooltip, and not the tooltip for Low confidence.

---

While training a document, a confidence-based validation failure against a field appears in an orange box during preview if no other validation errors exist for that field. Other validation errors take precedence over OCR character-level confidence validation.

---

**Troubleshoot:** If the OCR engine is not able to identify SIRs for Chinese language PDF documents, troubleshoot the issue:

- [Data objects \(SIRs\) are not identified by OCR for Chinese PDF documents \(A-People login required\)](#)
  - [How to convert PDF files to TIFF files \(A-People login required\)](#)
-

## Map a field

When you are training a learning instance, if a field value was extracted incorrectly or if the field was not found, you must remap the field.

If you have not done so already, first create a learning instance with sample documents. [Create a learning instance](#) on page 3993

For an introduction to the components, see [Introduction to the Designer](#) on page 4006.

The Designer image display panel contains blue boxes that surround text, date, or number type data. Each of these blue boxes is a system identified region (SIR) that indicates that IQ Bot has identified that region as containing extractable data. Perform the following steps to map a field to teach IQ Bot to extract data from that field (for example, the invoice number) from a specific region (for example, the top-right side of SIR).

---

**Note:** These steps apply only to text, number, and date data types. IQ Bot also supports check boxes. For more information, see [Extract data from check boxes or check box groups](#) on page 4015.

---

1. Select a field and specify the data type from the **Data type** list.

---

**Note:** If a field value contains a mix of letters and numbers, such as invoice number, select the **Text** option.

---

2. In the image display panel, click the field from where you want to extract data.  
IQ Bot tries to identify and autopopulate the corresponding field value in the field details panel.

---

**Tip:** Use the pipe symbol (|) to add field aliases, which represents alternative text that might be present in an SIR. For example, if the recipient's information is in a field labeled `Sold to` in some of the documents and in `Ship to` in other documents, enter `Sold to | Ship to` as the field label.

---

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.  
Alternatively, draw a new mapping area by holding and dragging the cursor.  
When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.  
Reset a fixed field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.  
For additional information, see [What are the different ways to map form fields in IQ Bot \(A- People login required\)](#).
4. Optional: If the column value is not consistently available in the training documents, expand the **Field options** section and select **Optional**.
5. Optional: Add validation patterns or custom logic.  
[Designer validation patterns](#) on page 4019|[Adding custom logic to improve automatic extraction in production](#) on page 4029

Review each field to verify whether the correct value is extracted. Then, proceed to mapping table fields. See [Map a table](#) on page 4011.

## Use list validation to improve accuracy of a text field

Setting validations while defining any field or table column while mapping the document class helps validate a field or table column against predefined parameters so that you can be warned if any mismatch is found during the data digitization process.

Enter each text value in a separate line.

- The bot validates extracted value of field/table column against this predefined list and checks for any mismatch found during the **See Extraction Results** phase.
- Besides validating, the process also helps auto correct the extracted values.
- Errors in validation are marked with a red border and can be seen in the **See Extraction Results** phase. Move your cursor over the error to know the error type.

If list validation value is Adam, and the extracted value is Adem; the extracted value will be auto corrected to Adam. In this example, there is a 75% match of characters; and threshold for match is at least 66%.

## Use validation patterns/lists to flag discrepancy in extracted data

Use validation patterns/lists to flag discrepancies in extracted data and prevent incorrect data from going through.

When a date/number format pattern is explicitly specified, the date/number is auto corrected.

See the following examples:

Table 18: Example of date format pattern

Incorrect OCR Data	Pattern	Auto-Correction
15 10-2015	dd-mm-yyyy	15-10-2015

Table 19: Example of number format pattern

Incorrect OCR Data	Pattern	Auto-Correction
123 4567	9999999	1234567

## Map a table

IQ Bot uses column names as reference points when extracting values from tables. As part of training a learning instance in the Designer, you must map the column names and configure the table settings.

Create a learning instance and map all the form fields in the Designer. For more details, see [Map a field](#) on page 4010.

1. Skipping the **Table settings** section, click the first table column in the **Table fields** section.

2. Click the name of the column from where you want to extract data in the image display panel.

There are two ways to map the column values:

- Option 1: For a basic table that is contained within one page, map the column name to the **Column value** field.
- Option 2: If the table spans multiple pages, we recommend mapping the **Column value** field to an entry in that column that has the greatest height and width among the entries in that column.

Depending on which mapping option you choose, IQ Bot autopopulates the **Column value** field in the field details panel with either the name of the selected column or the value of the selected table entry. In addition, the selected SIR in the document is highlighted with yellow color for easy identification.

3. Optional: Drag the corners of the green-bounded box to resize the mapping area.

Alternatively, draw a new mapping area by holding and dragging the cursor.

When you resize any value region or create your own value region using select, its position is fixed relative to the field label. The value for that field is always searched in that relative region.

Reset a fixed-field region defined by the user in the autodetected mode by clicking the close button at the top-right corner of the field.

---

**Tip:** For additional information, see [How to map tables in IQ Bot \(A-People login required\)](#)

---

4. Expand the **Field options** section and select **Required** or **Optional**. Use the optional value if the column value is not consistently available in the training documents.
5. Optional: Provide validation patterns.

[Designer validation patterns](#) on page 4019

Configure the **Table settings** section. Ensure that you map all the other fields in the document before populating this section.

6. Review the selected option in the **Best field for table/repeated section** field. IQ Bot auto detects the table field that best defines the height of the rows in the table. You can select a different column from the list.

Other columns are extracted in reference to this column. For example, if the **Best field for table/repeated section** has five rows, then a maximum of five rows will be extracted from the other columns.

---

**Note:**

- Ensure that this field does not contain multiple lines or is empty.
- Sometimes, the system suggestions are not updated when you validate the documents.

Workaround: You must update the correction manually in the validator for IQ Bot Cloud if the system suggestions are not displayed.

7. Optional: Map a field label for the **End of table indicator** field to specify where to stop extracting data from that table.

For example, an invoice might contain the subtotal, sales tax, and total in the table, but because each of these fields has only one value per document, they should not be extracted as part of the table.

Provide the name of the first field that appears where the table ends, for example, Total or Grand Total.

Provide the value for the **End of table/section indicator** field in any of the following ways:

- In the Image display panel, select an SIR to populate that text value as the **End of table/section indicator**.
- Alternatively, type a value directly into the **End of table indicator/section** field, in the middle panel.

---

**Tip:** Use the pipe symbol (|) to add field aliases, which represent alternative text that might be in an SIR. For example, `Subtotal | Subtotal Amounts` refers to Subtotal OR Subtotal Amounts.

---

For an example of how to map one table for extraction in a document that contains multiple tables, see [Mapping a table in a page with many tables](#) on page 4013.

8. If you mapped a table value for the Column value field (option 2 in step 2): Expand the **Advanced table options** section and select **Stop extraction at "end of table indicator"**.
9. Optional: Enter custom logic.  
[Adding custom logic to improve automatic extraction in production](#) on page 4029

Click **See extraction results** to check the training results for table data and remap the fields if required. [Preview extracted data](#) on page 4016

## Mapping a table in a page with many tables

This example guides you in using the **Extract Table Summary Rows** and **End of table indicator** fields to extract one table in a page that contains many tables.

If you have not already done so, create a learning instance and map all the form fields in the Designer. [Map a field](#) on page 4010

In this example, a page in a document contains more than one table, but the objective is to extract only one of the tables. User is in the Designer training a bot, with at least one table having duplicate or similar regions matching those of another table. **Extract Table Summary Rows** functionality does not impact data extraction irrespective of whether user specifies the **End of table indicator** value.

1. Create two tables with similar or duplicate areas. For example, one table with claims total and other with record details related to line number.
2. Map all table columns related to line number.
3. Map all value columns without table label, but related to claims total.  
Claim totals table has duplicate or similar areas like another table related to line number. So the billed amount column is a duplicate area for both tables.
4. Map one column of claims total table with the claims total label, as at least one column label is required for data extraction for a table.
5. Click on **See extraction results** to see duplicate rows that have duplicate or similar areas on claims total table. For example, When single page has multiple claim totals records.
6. Click **Back to training** to return to the training page.
7. Navigate to **Claim totals table > table settings**, and check the box for **Extract Table Summary Rows** label under **Advance Table Options**.
8. Enter value for **End of table indicator** and click on **See extraction results**.
9. User can see rows in claims total table related to claims total only.
10. Click on **Export to CSV** to open the file.

11. User can see table related to claims total extraction, as seen in preview.
12. Next, set the learning instance, and bot to production and upload some files related to the bot.
  - If the bot does not have any validation errors, the user can see claims total table as per mapping in production CSV file.
  - If the bot has some validation errors, the user can see claims total table as per mapping in the Validator.

## Add multiple tables in Designer

If the sample documents contain more than one table, you must map the columns and configure the table settings for each table.

Create a learning instance and map all the fields in the Designer. [Map a field](#) on page 4010

Map the columns for the first table. [Map a table](#) on page 4011

Add multiple tables in the Designer to extract their value and validate them. Move one or more table fields from one table to another to train extraction. To add tables do the following:

1. In the **Table fields** panel, click Add Table.
2. Select the columns to add from the **Available columns** list and click the arrow to add to the new table column list.
3. Map the column names and values as you did for the first table, then configure the **Table settings** section.

### Resources

Click **See extraction results** to check the training results for table data and re-map the fields if needed. [Preview extracted data](#) on page 4016

## Define one or more linked fields in a child table

In the Designer, define one or more linked fields/sections in a child table, to link parent and child tables in a flexible way.

Use the linked fields in a child table feature in Designer to create table links, and a hierarchy of table links among parent and child tables. This helps efficient data extraction of the linked fields besides easy linking among tables. Foreign key data extraction allows the following relationships only:

- Link single parent row to a single child row (one-to-one linking).
- Link single parent row to multiple child rows (one-to-many linking).

---

**Note:** IQ Bot does not support linking of check boxes.

---

Use the feature for documents with a list of names or IDs with specific information on each. For example, documents from an electric company with a list of customers and their billing/usage information. Or a document with a list of student names displaying their test scores. Create multiple tables and link the common fields thus allowing efficient and accurate data extraction. IQ

Bot supports linking of up to 50 columns and unlimited rows. However, data extraction from rows spanning across multiple pages is not supported.

- Single parent-child table field/section linking:

In the **Table/Repeated Section** of the Designer, choose one or more fields/sections from a parent table to link to a child table.

1. Click **Table Settings** in the child table and click on **Link Table Fields** and select the parent table from the drop-down list of table names. This displays the available column options in the parent table you can choose to link to.
2. Select the columns you want linked and click the downward arrow to link the columns to the child table.
3. The linked columns display under **child table > Table Settings > Linked to (table name)**.
4. When previewing the extracted data (click **See extraction results**), the linked fields from the parent table show up in the extreme left columns of the child table.

- Multiple hierarchical table field/section linking:

When linking table 1, 2, and 3 in a hierarchy, link in a way so that table 1 is the parent of table 2, and table 2 is parent of table 3. All three tables would be linked. Child table 3 would display linked fields from table 2 and 1. IQ Bot supports hierarchy linking up to six tables at a time.

---

**Note:** For table 3, you can only choose fields from table 2 that are not from table 1.

---

When previewing the extracted data for child table 3 (click **See extraction results**), the extreme left columns show linked fields from table 1. The next columns show linked fields from table 2.

---

**Important:** For successful linking, the child table must be at the same or lower level than the parent.

---

## Extract data from check boxes or check box groups

Train a bot to extract data from a single check box or a group of check boxes.

A check box is a user interface object that allows you to make a binary choice - select or leave unselected. IQ Bot supports extracting data from check boxes or radio buttons marked with a tick, cross, or dot. In addition to square check boxes and round radio buttons, IQ Bot supports triangle and rhombus outlines.

When IQ Bot processes documents with a check box, it extracts either a **Yes** (check box selected) or **No** (check box not selected) value.

You can also combine multiple check boxes into a single group, for example a payment methods group that contains check boxes for cash, credit card, and check. When IQ Bot processes documents with a check box group, it includes the group name in the extraction results.

Recurring check boxes or groups

By default, IQ Bot extracts check box values as a form field. However, if a check box or group appears on a recurring basis in the uploaded documents, you manually select the **Column** option so that IQ Bot extracts the values as table fields. This enables IQ Bot to extract values from the

subsequent occurrences. Otherwise, IQ Bot will only extract the check box value the first time it appears.

1. Click the field you want to map from the left panel.
2. In the center panel, in the **Data type** drop-down field, select value as **check box** or **checkbox group**.
  - To extract data from single check box or check box groups, click the **Field label** field and then click the corresponding value in the document in the right pane.
  - Extract data from recurring check box or check box groups, click the **Column name** field and then click the corresponding value in the document in the right pane.
3. To extract the check box value, draw an outline around the check box excluding the value.
  - For a single check box, use the **Draw** tool to draw over the check box or select the auto-mapped check box segment.
  - For a check box group, use the **Draw** tool to draw over the region covering all the check boxes in that group.
4. For single check boxes or check box groups: Verify the extracted data either in the **Field value** field in the Designer or click **See Extraction Results** to see the extracted data.  
For recurring check boxes or check box groups: You can only view the extracted data by clicking **See Extraction Results**; the extracted data is not shown in the Designer.
5. Optional: To add an individual check box to a check box group, select the desired value from the **Checkbox group** drop-down menu.
6. When you are done configuring the check boxes, click **Save and close** or **Save and go to next group**.

## Preview extracted data

Click **See Extraction Results** to review the extraction accuracy of the bot. This is the only way to see extraction results for table data, since the Designer does not show extracted table data during training. Alternatively, click **Export to CSV** to review the data in a CSV file.

The extraction result window displays the following information:

- Successfully mapped fields and the extracted values.
- Table headers and the values for each row.
- Extraction errors, which are highlighted within a red box. Hover on the error to learn more, such as if there was a validation error or lack of OCR confidence.

---

### Note:

- The time required to display the extraction results can vary based on the complexity of the Python logic that you have created.
- To ensure successful previewing of a training document, its entire end-to-end processing, including value extraction, execution of any Python logic (if applicable), and validation of all fields, must be completed within a 2-minute time frame.

Training documents must be limited to a maximum of 20 to 30 pages. This ensures efficient processing and successful previewing within a 2-minute time frame.

---

**Important:** A training document can pass in spite of an error flagged by the validation pattern. Sometimes we want a validation pattern to flag an error, so it would not pass specific documents at a later stage in production; instead enter them in the manual validation queue.

---

Close the window to return to the Designer.

---

**Important:** If you upload 30 documents and all documents are classified into one group, you can see only one document for each unique layout.

---

## Export data to a CSV file

You can export the extracted data to a CSV file for ease of review. When you click **Export to CSV**, the current document is downloaded to your device. To download other documents you must navigate to them using the < and > buttons.

The data in the downloaded CSV file is displayed exactly how it will appear when IQ Bot downloads data from a successfully processed document from a learning instance in production mode.

## Review the learning instance details

Review various details of a learning instance such as associated groups, environment status, staging and productions results, total number of tested documents, modified date and so on.

On the **My learning instances** page, select a learning instance and use the following tabs to review the details:

- **Document Groups**- Contains a list of the document classification groups for the learning instance.  
  
When you create a learning instance and upload documents to train, documents are automatically categorized in the same document group based on their content and classified accordingly. These are termed as classification groups. A bot is more likely to succeed extracting text across documents in a group with similar content.
- **Summary**- Contains various details about the learning instance such as Staging and Production results, current environment that the selected learning instance is in, total number of associated groups and bots, and so on.

---

**Note:** The system does not automatically refresh (auto-refresh) the **My learning instances** unless the user loads a screen or clicks the **Refresh** button, thereby manually refreshing data on a page. This feature helps reduce the response time for loading new data or performing any action in IQ Bot.

---

[Review the dashboard](#) on page 4040

The dashboard summarizes the performance report and provides document processing information in a graphic format.

## Delete mapping in the Designer

Delete mapping of field labels and field values, selecting the **X** delete symbol next to the mapped label or value.

The following use cases explain the delete field labels and value mapping options in the Designer.

Delete a field label and its mapped value:	Select a field label in the middle panel and click the <b>X</b> delete symbol of the bound box in the document view to delete both, label and value mapping . The label and the value from the middle panel gets deleted as well. The mapping check mark in the left and middle panels turns from green to gray indicating incomplete mapping.
Delete field value:	Select the field value and click the <b>X</b> delete symbol of the mapped box in the document view, to delete the mapped value. The value from the middle panel gets deleted as well. The check mark in the left and middle panels turns from green to gray indicating incomplete mapping.
Delete auto mapped value fields:	<p>The <b>X</b> delete symbol of the mapped box in document view is not visible till user resizes or manually maps it.</p> <p>For a form field, when a user deletes a resized or manually mapped box around a the field value, IQ Bot repopulates the original auto mapped value.</p> <p>For a table/section field, that same behavior does not apply, as a user has the option to map a table/section field name but not a field value, and vice versa.</p>
Delete a field label/value with or without auto mapped value:	Select a field label/value with or without auto mapped value. The field label bound box displays in the document with an <b>X</b> delete symbol allowing users to delete the label.
Delete field label mapping with validation pattern:	In spite of deleting a field label, the validation pattern that was assigned to the field remains in place.
Delete option ('X') when bounded box reaches space limit:	If the label/field value bounded box in the document view covers a bigger area, extending to the edge of or beyond the document view, the 'X' delete symbol appears in the nearest corner of the box.

---

**Note:** The field value box in the middle panel is disabled and users cannot enter text manually.

---

## Designer validation patterns

IQ Bot Designer allows you to validate a field and table column against a set of predefined parameters so that you can be warned if any mismatch is found during data digitization process.

### Validate a field or table

Validate a field or table column against the following predefined parameters of validation options:

- Start With / End With
- Pattern
- Lists
- Formulas

IQ Bot classifies documents into groups based on similar content, structure, and layout, which is easily identifiable. The sample documents for training are chosen based on these criteria as well. When you launch the Designer to train your learning instance, IQ Bot loads and displays a sample document from each classified group in the document pane.

---

**Tip:** In the Designer set the validation parameters by defining any field and or table column during document training.

---

### Starts With and Ends With

While all validations can be set at the time of Design definition, you can set **Starts with/Ends with** and **Pattern** validations during training.

To validate whether data in a field starts or ends with a certain value, use the **Starts With** and **Ends With** validation option fields. While defining the design of a field or table column, you can specify whether the data is part of the selected field.

- Start with a certain value using a Starts With field
- End with a certain value using an Ends with field

If the Start With value is "IN" and extracted value is "1N7646464", then validation fails. While if End With value is 2017 and the extracted date value is 10-Aug-2017, the validation passes.

### Pattern

A pattern helps define an acceptable format for data.

Validate data in the field or table column against a specific pattern. While defining the field or column in the Design view, specify a pattern of the data in the selected field.

Specify a pattern for date, number, or text fields based on the different available patterns. Reference the tables below for common examples:

## Text

Field	Pattern	Notes	Description
Email	<code>^ ([a-z0-9_ \.-]+)@ ([\da-z \.-]+) \. ([a-z\.] {2,6})\$</code>	This regular expression validates emails like john@ado.com.	The Email field supports regular expressions.
Phone Number	<code>^ (\ (? \+? [0-9]* \) ?) ? [0-9_ \- \ ( \) ] *\$</code>	This regular expression validates phone numbers like (+64) 38 3235393.	The Phone Number field supports regular expressions.
Website	<code>^ ([a-zA-Z0-9]+ (\.[a-zA-Z0-9]+)+).*\$</code>	This regular expression validates websites like www.domain.com.	The Website field supports regular expressions.
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.
Alpha-numeric	<code>^[A-Za-z0-9_@./#&amp;+]*\$</code>	This regular expression validates a string containing alphanumeric values like INV-001.	The Alpha-numeric field supports regular expressions.

## Number

Field	Pattern	Notes	Description
Number string	<code>^[0-9]{1,45}\$</code>	This regular expression validates a string with numbers 0 - 9 and limit length to 45.	The Number string field supports regular expressions.

## Auto Correction for date and number fields

This is one of the built-in features of IQ Bot for date and number format types. It performs automatic validation and correction based on the defined pattern, even when the date/number in the scanned document is incorrect.

---

**Note:** Auto correction is only supported for special patterns.

---

The following table illustrates the auto-correction of an incorrect date and numbers by IQ Bot.

	Incorrect OCR value	Pattern	Auto-Correction	Description
DATE	12 F3B 2 0 1 5 15 10-2015	dd mmm yyyy dd-mm-yyyy	12 FEB 2015 15-10-2015	In the first example, IQ Bot auto corrects incorrect OCR "F3B" to "FEB".  In the second example, IQ Bot auto corrects "15 10-2015" to "15-10-2015".
NUMBER	123 4567 12.34,S67.12	9999999 99,99,999.00	1234567 1234567.12	In the first example, the extra space between "3" and "4" is deleted after validation against the pattern.  In the second example, the alphabet "S" is corrected as "5".

**Note:** English language numeric value with at least one digit to the left and two consecutive digits to the right (for example, 1.23) gets auto corrected if there is a space found between the decimal and the digits. For example, values 1 . 23 or 1. 23 or 1 .23 get auto corrected to 1.23.

To use this feature, add Pattern (in validation options) to the selected date and number format fields.

## Special number patterns

A special pattern consists of a Prefix, a Number Pattern, and a Suffix. Use for each is explained as follows:

- Prefix: Any symbol or a text string that is appended before the Number Pattern.
- Suffix: Any symbol or a text string that is appended after the Number Pattern.
- Number Pattern: Number pattern has two parts:
  - Integer-part:

They are represented by nines (9s).

The 9s in the integer part represents integer pattern and separators such as commas, spaces, and so on.
  - Fractional part

They are represented by zeros.

If you need two fractional number, then it will be represented by two zeros.

Specifying fractional part is optional.

Format of numbers defined for validating numeric data.

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

---

**Note:** IQ Bot automatically recognizes these currency symbols: \$, ¥, £, #, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

---

IQ Bot supports prefixes and suffixes to make processing and validation of data easier. Specifying a suffix and prefix in the pattern and in the numeric fields is optional. Even if you do not specify the suffix or prefix, IQ Bot auto corrects and includes the required currency symbols and units of measure for the numeric fields as prefix or suffix. If you specify the currency symbols and units of measurements in the pattern and in the numeric data, IQ Bot deletes the currency symbol and unit of measure from the data.

---

**Note:** IQ Bot automatically recognizes these currency symbols: \$, ¥, £, #, €, Rs, USD, EUR, CAD, AUD, GBP, and INR. We recommend specifying valid currency symbols in the data.

---

## Examples of special number patterns

Pattern	Example
Supported patterns	Supported format for numeric patterns: <ul style="list-style-type: none"> <li>• Decimal (India)</li> <li>• Decimal (US, UK, Australia and others)</li> <li>• Number (India)</li> <li>• Number (US, UK, Australia and others)</li> <li>• Normal Decimal</li> <li>• Normal Number</li> </ul>
9,999,999.00	2,597.23
9.999.999,00	7.562.597,23
9 999 999.00	2 597.23
9 999 999,00	7 562 597,23
9999999,00	2597,23
9999999.00	7562597.23

Pattern	Example
99,99,999.00	75,26,569.56
\$ 9.999.999,00	\$ 7.562.597,23
\$9 999 999.00	\$7 562 597.23
9 999 999,00 \$	2 597,23 \$
€ 9999999,00	€ 7562597,23
€9999999.00	€7562597.23
99,99,999.00 €	75,62,597.23€
EUR 9,999,999.00	EUR 7,562,597.23
EUR9 999 999.00	EUR7 562 597.23
9999999,00 EUR	62597,23 EUR
9.999.999.00	62.986.51
9, 999, 999. 00	232, 510. 68

## Special date patterns

Supported date separators include /(forward slash), -(dash), space, .(dot), and ,(comma).

- d - Numeric day of the month, from 1 through 31 (eg. 5, 15 etc.)
- dd - Numeric day of the month, from 01 through 31 (eg. 05, 15 etc.)
- m - Numeric month (eg. 1 for January)
- mm - Numeric month (eg. 01 for January)
- mmm - First 3 letters of the month (eg. NOV for November)
- mmmm - Full name of the month (eg. June)

## Examples of special date patterns

Pattern	Example
mm-dd-yy	01-31-18
mmm-dd-yyyy	Jan-31-2018
mmmm dd, yyyy	January 31, 2018
Mmmm d, yyyy	January 9, 2018
D M YY	9 5 15
D MM YY	9 11 15
D MMM YY	7 MAR 15
D MMMM YY	7 MARCH 15

Pattern	Example
M DD YYYY	5 05 2018
D/MM/YY	5/05/18
M/D/YY	9/5/15
DD / M / YYYY	05 / 9 / 2018
MMM / DD / YY	MAR / 05 / 18
D-MMMM-YY	09-APRIL-18
M-D-YY	5-5-18
MM-D-YY	11-5-18
MMM-DD-YYYY	NOV-13-2018
DD - M - YYYY	13 - 5 - 2019
MMMM - DD - YY	OCTOBER - 05 - 18
D.MMMM.YYYY	05.APRIL.2018
MMMM.DD.YYYY	APRIL.05.2018
D . M . YY	5 . 5 . 18
D . MM . YY	5 . 05 . 18
DD . MMM . YY	05 . JUL . 18
M . DD . YYYY	5 . 11 . 2018
MMMM . DD . YY	MAY . 13 . 13
YYYY-MM-DD	2018-01-27
YYYY/MM/DD	2017/07/27

## Lists

While defining a field or table column in the Design view, you can specify a list as part of validation option for a selected field or table column. The extracted value of the field is validated against this predefined list during Preview and Test Run.

You can only specify list validation when format of field or table column is "Text". If the lookup returns multiple values for a word, the value is not auto corrected and the validation fails.

To specify list validation, do the following:

1. Select the validation type as **List** from the **Validate** drop-down menu.
2. Type a predefined list and click **Define** to save.

Each value in the list should be in a separate line.

If the extracted value does not match any value in the predefined list, the field is considered to have failed validation.

## Formulas

Specify a formula as part of validation options for a selected field or table column. Use basic arithmetic, comparative, logical, and functional operations.

**Tip:** We recommended using functional operators instead of mathematical operators when validating fields and tables for better accuracy.

When formulating an expression remember the following:

- All function names must be in capital letters.
- All formulas must result in either a true or false validation.
- Field and column names are case sensitive when used within formulas. If field is defined as Qty in design, using qty or QTY in formula results in an invalid formula.
- For variable declaration or manipulation, ensure not to use certain keywords that are reserved for formulating an expression, including SUM, SUB, DIV, MUL, COLSUM, IF.

## Mathematical Operators

Operations	Description	Syntax
+	Addition	Field/Column_Name1 + Field/Column_Name2
-	Subtraction	Field/Column_Name1 - Field/Column_Name2
*	Multiplication	Field/Column_Name1 * Field/Column_Name2
/	Division	Field/Column_Name1 / Field/Column_Name2

## Comparative Operators

Operations	Description	Syntax
==	Equal To	[Current Field/Column Name] == [expression comprised of one or more field/column name or fixed numeric values]  For example, AMOUNT == MUL(QUANTITY, UNIT_PRICE)

Operations	Description	Syntax
>=	Greater than or Equal To	<p>[Current Field/Column Name] &gt;= [expression comprised of one or more field/column name or fixed numeric values]</p> <p>For example, TOTAL_BILL_AMOUNT &gt;= AMOUNT_PAID</p>
<=	Less than or Equal To	<p>[Current Field/Column Name] &lt;= [expression comprised of one or more field/column name or fixed numeric values]</p> <p>For example, AMOUNT_PAID &lt;= TOTAL_BILL_AMOUNT</p>
>	Greater Than	<p>[Current Field/Column Name] &gt; [expression comprised of one or more field/column name or fixed numeric values]</p> <p>For example, BILL_AMOUNT &gt; 0</p>
<	Less Than	<p>[Current Field/Column Name] &lt; [expression comprised of one or more field/column name or fixed numeric values]</p> <p>For example, DISCOUNT_PERCENTAGE &lt; 100</p>
!=	Not Equal To	<p>[Current Field/Column Name] != [expression comprised of one or more field/column name or fixed numeric values]</p> <p>For example, DEBIT_AMOUNT != 0</p>

## Logical Operators

Operations	Description	Syntax
&&	And: Field/Column is valid if all conditions are true	<p>&lt;Current Field/Column Name&gt; &lt;operator 1&gt; &lt;expression 1&gt; &amp;&amp; &lt;Current Field/Column Name&gt; &lt;operator 2&gt; &lt;expression 2&gt;</p> <p>For example, DISCOUNT_PERCENTAGE &gt;= 0 &amp;&amp; DISCOUNT_PERCENTAGE &lt;=100</p>
	Or: Field/Column is valid if any one of the given conditions is true	<p>&lt;Current Field/Column Name&gt; &lt;operator 1&gt; &lt;expression 1&gt;    &lt;Current Field/Column Name&gt; &lt;operator 2&gt; &lt;expression 2&gt;</p> <p>For example, DISCOUNT_PERCENTAGE &gt;= 0    DISCOUNT_PERCENTAGE == 'Net'</p>
!	Not: Converts a true expression to false and also the other way round	<p>!&lt;expression&gt;</p> <p>For example, !(AGE &lt; 18) ==&gt; valid when AGE is not less than 18</p>

## Functional Operators

Operations	Description	Syntax
SUM	Summation: gives result of addition of one or more field/column/fixed-number values	<p>SUM(n1,n2,...,nN)</p> <p>For example, SUM(SUB_TOTAL, SERVICE_TAX, EDUCATION_CESS) ==&gt; equivalent to SUB_TOTAL plus SERVICE_TAX plus EDUCATION_CESS</p>

Operations	Description	Syntax
SUB	Subtraction: gives result of subtraction of one or more field/column/fixed-number values from the first specified value	<p>SUB(n1,n2,...,nN)</p> <p>For example, SUB(SUB_TOTAL, TOTAL_DISCOUNT, ADJUSTMENTS) ==&gt; equivalent to SUB_TOTAL minus TOTAL_DISCOUNT minus ADJUSTMENTS</p>
MUL	Multiplication: gives result of multiplication of one or more field/column/fixed-number values	<p>MUL(n1,n2,...,nN)</p> <p>For example, MUL(QTY_IN_BOX, UNIT_PRICE, SHIPPED_BOXES) ==&gt; equivalent to QTY_IN_BOX multiply-with UNIT_PRICE multiply-with SHIPPED_BOXES</p>
DIV	Division: gives result of division of one or more field/column/fixed-number values from the first specified value	<p>DIV(n1,n2,...,nN)</p> <p>For example, DIV(AMOUNT, SHIPPED_BOXES, UNIT_PRICE) ==&gt; equivalent to AMOUNT divide-by SHIPPED_BOXES divide-by UNIT_PRICE</p>
COLSUM	Sum of a given Column in a table: gives result after evaluating given expression for each row of specified table and adding them all together	<p>COLSUM("&lt;table-name&gt;", "&lt;expression to evaluate for each row of specified table-name&gt;")</p> <p>For example, FINAL_TOTAL == COLSUM("LINE_ITEMS", "MUL(QTY, UNIT_PRICE)")</p> <p>Say there are 3 rows for table LINE_ITEMS, then FINAL_TOTAL should be equal to MUL(QTY1, UNIT_PRICE1) + MUL(QTY2, UNIT_PRICE2) + MUL(QTY3, UNIT_PRICE3)</p> <p>where, QTY1 is QTY value in row 1, similarly UNIT_PRICE1 is UNIT_PRICE value in row 2, and so on for other rows as well.</p>

## Adding custom logic to improve automatic extraction in production

Enter the logic in the IQ Bot Designer to improve text extraction and validation, and to reduce the number of documents entering the Validator that requires RPA post processing.

### Overview

For Automation 360 IQ Bot Cloud, there is an identified list of Python libraries and packages that are safe to use for the Custom Logic feature. Use only these packages to ensure security for your cloud infrastructure, file systems, databases, and network resources: [List of supported Pandas Libraries in Automation 360 IQ Bot \(A-People login required\)](#)

Keep in mind the following:

- Custom logic executes in a sequential order across all tables and fields.
- Applying custom logic might increase the extraction time per document.
- Automation 360 IQ Bot validation rules apply over the extracted values processed by the custom script.
- Custom script only works on the extracted data and does not influence the OCR extraction quality.
- Always test your Python script before processing documents in a learning instance in production

The custom logic feature helps clean up extracted values ahead of the validation step but does not replace all the post-processing currently done using the Task Bot. In addition to adding inline scripts, users can use the Python scripts in a central location, import those as modules, and call functions to reduce the amount of Python code at the field or table level.

---

**Restriction:** If the number of characters in the Python code along with other information exceeds 32000, and when this code is sent to the back-end as a Windows runtime argument for the process, the execution fails, and does not display any error message.

---

### Resources

To learn more, search for Using Custom Logic in IQ Bot course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

### Next step

Using scripts, in the IQ Bot Designer add the **Form fields** and **Table fields**.

### Form fields

Add scripts in Designer for form fields.

The List validation via external file can be implemented as a part of the field custom logic using python scripts directly in the Designer.

1. In the IQ Bot Designer, left-hand panel, highlight a form field whose extraction/validation you aim to improve further.

2. In the middle panel, scroll down to **Field options** > **Logic**.
3. In that **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify IQ Bot's extracted text value. See example below:

```
variable that stores the value: field_value

import the Python regular expression library, re
import re

call the regular expression library's method, findall, to extract
the date value only
field_value = re.findall(r'\d{2}-\d{2}-\d{4}', field_value)[0]
```

5. Select **Test Run** to test your script and see the results before vs. after.

```
value_before: 2018/11/09 B210
value_after: 2018/11/09
```

## Table fields

Add scripts in Designer for table fields.

1. In IQ Bot Designer, left-hand panel, highlight **Table/section settings** for the table whose extraction/validation you aim to improve further.
2. In the middle panel, scroll down to **Logic**.
3. In the **Logic** section, toggle between **fullscreen** and **smallscreen** for ease of use.
4. Add code to modify the extracted table values, which are stored as a Python dictionary in a user variable called `table_values`. See example below.

Each row has a Guid (Global unique identifier), which allows IQ Bot to auto track rows that are added and deleted. If you add a row, you need not enter a Guid. IQ Bot will handle this automatically.

```
variable that stores the value: table_values

convert from dictionary to dataframe
df = pd.DataFrame.from_dict(table_values)

print dataframe before update
print(df)

Item Description: drop rows with a missing value
df = df[(df["Item_Description"] != "")]

Quantity: extract first part of the string, the numeric part only
df['Quantity'] = df['Quantity'].str.split(' ', 1).str[0].str.strip()

print dataframe after update
print(df)

convert back from dataframe to dict to override what IQ Bot stores
table_values = df.to_dict()
```

5. Select **Test Run** to test your script and see the results before vs. after.

```

 Item_Description Guid
product_id Quantity Item_Total
0 wafer, NO172 43ea78f4-7b9b-413a-83ce-89d671478d6c 2

VAT : Total - 4.00PCS GR: 5,905.00
3 2dc642a7-8e6e-4bc6-9672-85afff8c21db
 Total - KGD: 0.00

 Item_Description Guid
product_id Quantity Item_Total
0 wafer, NO172 43ea78f4-7b9b-413a-83ce-89d671478d6c 2
COMS5A-18090220 4.00 5,840.00
1 Visual Iaspection + cc774f5f-2507-4a15-8e45-7b2abf84fabe
 1.00 65.00

```

6. If you select **See extraction results** or save the bot, your script is saved.

## Use cases and examples

These are some use cases the Designer script feature supports.

For examples of user scripts and use cases, see: [IQ Bot custom logic use cases and examples](#)

Following are some use cases:

- Query an extracted value vs. a database in an ERP system to validate values.
- Extract "0123456" from "PO 0123456".
- Remove table rows that contain "Page x of y".
- Extract the currency from one table field (for example: Item Total) and save in an empty table field.
- Extract the product number from a table field (for example: Item Description).
- Extract the zip code from an address.
- Query a REST service (for example: add NLP, retrieve data from an outside system, and so on).
- Return a Boolean yes/no value on whether handwriting exists for a field.

## Pre-installed Python packages

To facilitate ease of use and consistent behavior across servers, IQ Bot auto installs Python v3.11.0 and some popular Python packages mentioned as follows.

Table 20: Pre-installed Python packages

Main package	Version	URL
difflib	In-built Python with installer	<a href="https://docs.python.org/3/library/text.html">https://docs.python.org/3/library/text.html</a>

Main package	Version	URL

cx_Oracle  <b>Note:</b> As of Build 16685, this module is replaced by oracledb. See <a href="#">Upgrading from cx_Oracle 8.3 to python-oracledb</a>	7.1.3	<a href="https://github.com/oracle/python-cx_Oracle">https://github.com/oracle/python-cx_Oracle</a>
oracledb	1.2.1	<a href="https://github.com/oracle/python-oracledb">https://github.com/oracle/python-oracledb</a>
Python Arabic Reshaper	2.0.15	<a href="https://github.com/mpcabd/python-arabic-reshaper">https://github.com/mpcabd/python-arabic-reshaper</a>

### Additional Python packages

To allow further empowerment, you can add more Python libraries for use in IQ Bot.

1. Open the `Command Prompt`.
2. In the `Command Prompt`, change directory to IQ Bot's Python dictionary. For example: `c:\Python354-x86-IQBot`.
3. Install your Python package there. For example: `pip install PyArabic`.
4. In **IQ Bot Designer** > **Logic**, you can import and use that Python package.
5. If step 4 does not work, then stop/uninstall and then install/start services.

**Note:** Additional Python packages is allowed only for the On-Premises deployments and not applicable for Cloud deployments.

### Extract data using magnetic ink character recognition

Use the magnetic ink character recognition (MICR) OCR feature with ABBYY FineReader Engine version 12.2 support to extract MICR data from financial checks.

**Note:** Documents in Non-Latin based languages cannot be processed if MICR is enabled on ABBYY FineReader Engine OCR version 12.3 and 12.4.

- Ensure that ABBYY FineReader Engine is installed in the plug-ins folder: `\OCR Plugins\ABBY SDK\12\ . . .`
- From the `C:\Program Files (x86)\Automation Anywhere IQ Bot (version)\Configurations` folder, open the `Settings.txt` file, change `OCREngine=Tesseract4` to `OCREngine=Abby`, and save the file.

**Note:** A system restart is not required.

The MICR feature is supported with ABBYY FineReader Engine versions 12.2 .

1. Set ABBYY FineReader Engine in your `settings.txt` file as the primary OCR engine.
2. Navigate to the `IQ Bot\Configurations\AbbyyImagePreProcessingSettings.json` file.
3. Update these parameters:
  - `TextTypes = 129`
  - `DetectTextTypesIndependently =true`

The MICR feature is activated in the system.

- Create a learning instance and add form fields to extract MICR data from financial checks such as **MICR** and **Pay to** fields.
- Scan and upload a check to IQ Bot for training. In production, upload the financial checks for accurate MICR data extraction.
- In the Designer, map the MICR data in the financial check for extraction.
- In production, upload the financial checks for accurate MICR data extraction.

## Set learning instance to Production

After you have trained a learning instance on Staging to extract data from documents with high accuracy, you can move the learning instance to Production. This enables you to deploy the learning instance on production documents for real time data extraction.

Use the **Set instance to production** button to move a learning instance to Production. When you move a learning instance to the Production environment, a confirmation message appears. To confirm, click **Yes, send to production**. Learning instances in the Production environment are identified by the **Production** label next to their name.

---

**Tip:** You can also use the **My Learning Instances** page to move a learning instance to Production.

---

**Note:** During the production process, you must not move the learning instances or bots from Staging to Production or vice-versa.

---

---

## Manage learning instances

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

A learning instance can be either in staging or production mode. These modes determine whether the learning instance is a draft or live version.

### Staging

In the staging mode, you can create and edit learning instances, upload sample documents, and train bots to extract data from the sample documents you uploaded. You can test and improve the accuracy of a learning instance

and its bots before deploying it to production mode.

**Note:** Because the data generated by learning instances in the staging mode is based on sample documents, it is kept separate from data pertaining to learning instances in production mode. For example, sample documents are not counted against your organization's purchased pages. For more information, see [Review the dashboard](#) on page 4040.

## Production

In the production mode, a learning instance can automatically process real business documents, extract data, and send documents requiring manual validation to the validation queue.

To find out which mode a learning instance is in, navigate to the **LEARNING INSTANCES** tab, where the **My learning instances** page displays the learning instances in the environment. Each learning instance has a toggle in the **Actions** column, which indicates whether it is in staging (toggle to the left and is colored gray) or production (toggle to the right and colored orange).

Instance name	Provider	# of IQ Bots	# of Files	Training %	Actions
IQBotDemo	Tesseract4 OCR	1	1	0%	
IQBotDemoDLCA	MicrosoftAzureAPI OCR	1	2	100%	

Based on the mode that a learning instance is in, different user types contribute to IQ Bot. For example, in the staging mode, the Data engineer creates learning instances and the Bot builder builds supporting RPA bots, and in the production mode, the Validator manually corrects the fields in the documents that IQ Bot could not process. To learn more about how each user contributes to IQ Bot, see [IQ Bot process overview](#).

**Note:** The following are the file size restrictions in each stage:

- In staging, you can upload a maximum of 150 documents of 10 MB file size per learning instance.
- In production, you can upload a maximum of 50 MB file size per document. However, the maximum number of documents allowed per learning instance depends on the license.
- There are no limitations on the number of pages per document in a pdfbox OCR.
- You can upload 60 pages per document in an image-based OCR.
- With the Tesseract4 OCR, there is a known limitation that restricts the number of pages per document to fewer than 60 pages.

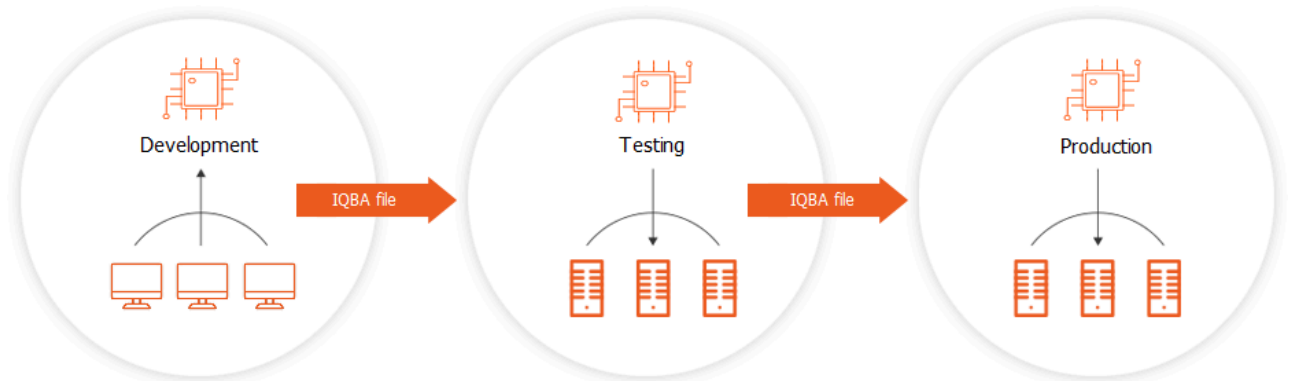

## The learning instance lifecycle

The staging and production modes are independent from the IQ Bot environment when it comes to the traditional DevOps workflow of separate development, testing, and production

environments. A learning instance can be in either mode in any of the environments in the development life cycle.

**Note:** When you transfer a learning instance, it remains in the mode in which it was exported. For example, if you export a learning instance in staging mode from the development environment and import it to the testing environment, the learning instance will still be in staging mode and it will not perform document processing automatically.

The following image shows the typical lifecycle of a learning instance:

You can transfer learning instances across environments by using the Migration Utility. This helps you to avoid having to recreate similar learning instances and better manage the lifecycle of the associated bots. To learn more, see [Migrate learning instances](#) on page 1831.

## Rotate the external key

The Control Room supports using CyberArk to store keys for encrypting and decrypting IQ Bot data. A user with the **AAE\_IQ Bot Admin** role can change the object name in IQ Bot to start the key rotation process.

- The IQ Bot must have been connected with CyberArk during installation. See [Installing IQ Bot in Custom mode](#) on page 1546.
- Update the password in the CyberArk vault to generate the new key. Note the new key name because you will provide it in IQ Bot.

### 1. Navigate to **Administration > Key rotation**.

Most of the fields in the **Key rotation** page are auto-filled with the connection details you provided during installation.

### 2. In the **Object name** field, provide the new key name from CyberArk.

### 3. Click **Rotate key**.

The IQ Bot retrieves the new key from the CyberArk vault and encrypts data with this new key. When the encryption process completes, a success message appears.

If the encryption process is not successful, use the key rotation synchronizer to recover from the error.

## Use the IQ Bot Validator

Use the Validator to manually validate documents from which IQ Bot could not extract data.

When IQ Bot processes documents in a learning instance that is in production mode and encounters one of the following scenarios, IQ Bot sends that document to the Validation queue.

- Data is not readable, such as blurry text or dark background.
- Data is missing from a required field.
- Document failed an automated processing rule.
- Fields did not meet the set optical character recognition (OCR) confidence threshold.

---

**Note:** To learn more about how field-level OCR confidence can be used to improve the quality of STP output, see [Improve output quality using OCR confidence](#) on page 4009.

---

A user with the **AAE\_IQ Bot Validator** role opens the Validator window, where they correct the flagged fields.

Once all the fields in the document are corrected, IQ Bot finishes processing the document and exports the data to a .CSV file in the Learning Instance success folder.

---

**Note:** If a document required manual validation, it is excluded from the straight-through processing (STP) metric. For more information on the dashboard metrics, see [Review the dashboard](#) on page 4040.

---

As you work on a document in the Validator queue, if you leave the Validator queue or log out of IQ Bot, the lock on the document is released, allowing other users to access or validate the document.

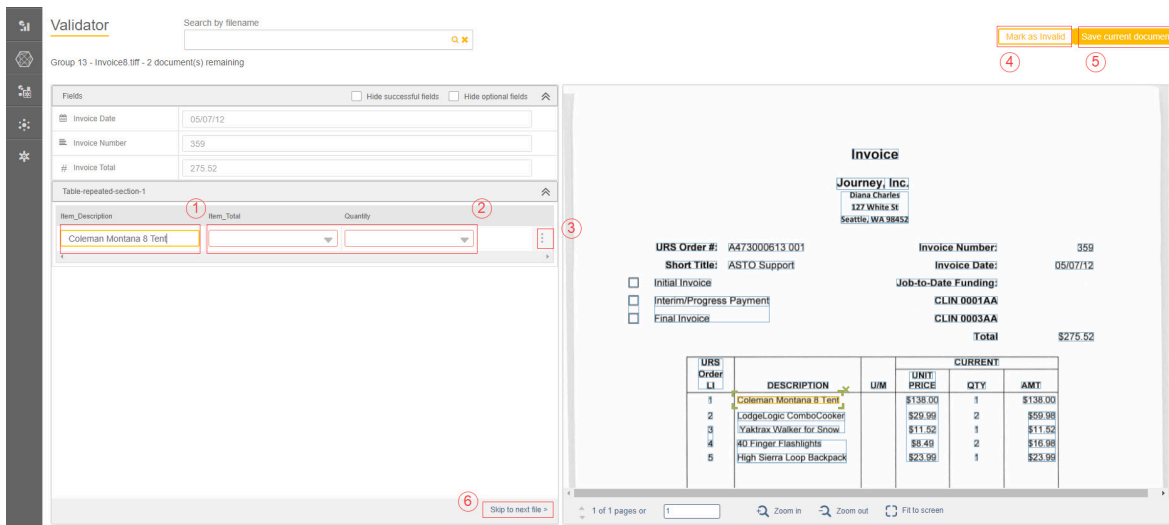

### Validator interface overview

The Validator interface opens with the first document from the validation queue. The data requiring validation distinguished with red text or outlined in red boxes.

---

**Note:** An empty page with a notification message appears in the following scenarios:

- If no files are available in the validation queue.
  - If a file does not exist in the validation queue.
  - If another user is working on the remaining file in the validation queue.
-

1. Provide the values for fields IQ Bot could not extract

Click the empty text field, then select the blue-bordered box in the document that contains the data to extract. After you select a box, the data is highlighted in yellow and a green outline appears, which you can resize or reposition to include all the data that you want to extract.

2. Fields awaiting validation are outlined in red

In the example above, the table fields **Item total** and **Quantity** require manual entry.

3. Add or delete a row

To insert or delete a row, hover over the ellipses to show the icons for adding or deleting table rows.

4. Mark document as invalid

Removes the document from the validation queue and saves a copy of the document to the Invalid folder. Click here to mark a document as invalid, then select from the following reasons:

- Fields missing
- Tables missing
- Wrong values

5. Save current document

After you have validated all the fields, click here so IQ Bot can finish processing this document.

6. Skip to next file

Skip a file without correcting the errors in the current document.

### Linked tables in the Validator

Some pages in a document might contain more than one table. When there is a relationship between the tables, such as in the example page below, where a parent table contains patient information and child tables contain additional information related to that patient, these are called linked tables.

In the example page below, the red box outlines the parent table and each of the blue boxes outline a child table.

Patient Name: Irrfan Khan Member ID: IQ_Bot0001 Date of Birth: 07 Jan 1967 Provider Name: Cognitive		Patient Account No: AASPL_3100 Claim ID: Cognitive_123XXX Claim Status: PAID					
Gender: <input checked="" type="radio"/> Male <input type="radio"/> Female <input type="radio"/> Other		Type of payment: <input type="checkbox"/> Cash <input type="checkbox"/> Cheque <input checked="" type="checkbox"/> Bank Account					
Line	Date of service	Rev Code	Units	Billed Amount	Allowed Amount	Discount /Penalty	N
1	02/02/18	0211	1	100.00	100.00	0.00	10
2	03/02/18	0221	5	500.00	500.00	0.00	50
3	03/02/18	0200	3	300.00	300.00	0.00	30
Claim Totals			9	900.00	900.00	0.00	90

Payment Mode (If Bank Account):

Net Banking

Debit Card

Credit Card

Type of Card (Only for Debit or Credit card) Payment:

Master Card

Visa Card

◆ Paid

To successfully validate a page with linked tables, add the fields from the child tables to same **table-repeated** section as the parent table.

If shared fields between the linked tables do not match values, the Validator does not let you complete validation and save your changes. This functionality helps avoid manual validation errors that can occur when there is a mismatch of field values between the parent and child tables. The Validator shows an error message and prevents the save.

**Note:** In Validator, if you mark an already corrupted document as invalid then that document is lost in the IQ Bot system. Instead, you will see a placeholder image and you must refresh the page to go to the next document. This applies to single page as well as multi-page documents. When the entire multi-page document is deleted or corrupted, you will not be able to navigate between the pages. If you click the next page button, then the Loading document screen is displayed.

## Using the Validator

Open the Validator user interface from the **LEARNING INSTANCES** tab. If a learning instance contains documents that require validation, there will be a document icon with a red exclamation mark in the Actions column. Click the document icon to launch the Validator.

---

**Note:** Only users with an assigned Validator role can view the Validation page. For more information, see [IQ Bot user personas and roles](#) on page 3981.

---

## Review the dashboard

The dashboard summarizes the performance report and provides document processing information in a graphic format.

The report appears when you log in to the IQ Bot. The information shown consists of: document classification, straight-through processing (STP), accuracy, and human validation for information on actions for a specific learning instance so you can focus on areas that require attention.

The IQ Bot dashboard is divided into two primary areas:

- **My Totals**
- **My Learning Instances**

### My Totals area

**My totals** is a display area of the Dashboard that provides a quick overall view of the status of all learning instances in the Production environment.

View the following information in the **My Totals** area:

- Documents Processed: The total number of files processed in the production environment.

---

**Note:** If a file is corrupt and cannot be opened, it is not included in this count.

---

- Pages purchased: The number of pages purchased in the current license period.

For example, if 4000 pages were purchased before Dec 31, 2020 and another 20,000 pages were purchased between January 1, 2021 and February 28, 2021, the pages purchased metric shows a count of 20,000 pages, not 24,000. This is because 4000 of the pages were purchased before the license validity period.

---

**Note:** This metric is visible only to users with the **AAE\_IQ Bot Admin** role or a custom role with the **View administration** permission.

---

- Pages uploaded: The number of pages uploaded to a learning instance in the production environment in the current license period. When the license is renewed, the value reverts to zero.

This metric is different from the documents processed metric because one document can contain multiple pages. Additionally, the metric count includes pages that were uploaded but have not completed processing.

The number of pages uploaded is refreshed every time the Control Room license is renewed. So, the Pages uploaded shows the pages uploaded or processed in the current license period. The Documents Processed count remains unaffected.

---

**Note:** In releases prior to Automation 360 v.23, this metric reflected the number of pages uploaded to learning instances in the production environment from the time of IQ Bot installation.

---

- Straight-through processing (STP): The percentage of total number of uploaded files that were successfully processed without manual intervention.
- Accuracy: The field accuracy, which is a percentage value of fields that have been accurately identified. This includes fields whose Optical Character Recognition (OCR) confidence levels exceed the confidence threshold that were set.

## My Learning Instances area

View details of learning instances you have created that are in the Staging and Production environments.

View information for learning instances in the staging environment:

- Name of the learning instance
- The domain or type of documents. For example, invoices and receipts.
- Number of documents in the learning instance
- A graphical representation of trained documents showing the details in percentages

View information for learning instances in the production environment:

- Number of files processed
- Straight-Through Processing (STP) percentage of files that were successfully processed without manual intervention
- Field accuracy in percentages

---

**Important:** Sometimes, the number of documents in the Dashboard and in the Learning Instance summary page do not match the number of documents submitted for processing. This can occur when documents are classified into groups that are not in production. Documents in this category are not processed (by design), leading to a mismatch between the number of processed documents and the number of total documents. In such a case, if these groups are moved to production, the total numbers of documents will match.

---

## Performance report page

The performance report page displays the details of a learning instance in the production environment.

Navigate to **My learning instances > Production** button to view the **Performance report** page showing details of all learning instances in the production environment.

---

**Note:** The **Performance report** page is not available for learning instances that are in the staging environment.

---

The top right corner of the performance report page displays the percentage of bots trained for the learning instance. The following is an example of how to interpret the percentage information.

Cathy has uploaded 10 documents and has created three bots for the learning instance:

- Bot1
- Bot2
- Bot3

Of these, three documents are a part of Bot1, four documents of Bot2, and three documents of Bot 3. When Cathy sets Bot1 into the production environment, the label displays 33% as the percentage of bots trained for the learning instance, which means that 3 out the 10 (33%) uploaded documents (for Bot1) have been trained.

## Performance report details

In the **My learning instances** area, click any displayed information to bring up the **Performance report** page. The following sections describe the information for each displayed section of the performance report.

### Instance totals and Processing results

The instance totals and processing results area shows the following information for a learning instance:

- Number of files uploaded for the learning instance – total number of files uploaded that need to be processed.
- Number of files processed for the learning instance - number of files that was processed by a bot.
- Number of files successfully processed for the learning instance – includes files that were successfully processed by a bot without human intervention.
- Number of files sent to validation for the learning instance – files flagged with one or more errors that need human intervention for review.
- Number of files validated for the learning instance – number of files that were reviewed by an individual and the results were saved.
- Number of files marked as invalid for the learning instance – number of files that were reviewed by an individual and marked as invalid.

### Classification results

The Classification area provides a statistical display of the field representation graphically.

### Accuracy results

The Accuracy area provides a graphical representation of the field types.

## Validation

The Validation area provides the following information:

- A statistical representation of the corrections made to individual fields during the process of validating a document.
- A statistical representation of the average time spent to validate a group.

## Custom domains in IQ Bot

A domain contains information about the language of the documents and the data fields that the system extracts from the documents. The IQ Bot environment includes seven domains; users with the **AAE\_IQ Bot Admin** role can also create and import custom domains to the **Domains** tab.

If your documents contain specialized fields, you can create a custom domain with these fields to make learning instance creation quicker. Otherwise, the learning instance creator must manually define each specialized field, every time they create a new learning instance.

For example, for documents from the pharmaceutical industry, you might add fields like prescription name, dose, or delivery format to the custom domain. Likewise for financial industry documents, you might add fields for margin, call price, or limit order.

The **Domains** tab displays all available domains for use in the system and their associated languages. Besides out-of-box domains offered by IQ Bot, you can also create a custom domain and import it into IQ Bot.

[Create a custom domain \(A-people login required\)](#)

For information on creating a custom domain, see: [How to create a Custom Domain](#)

When creating a learning instance using a custom domain:

- The languages assigned to the domain when creating the domain is displayed and is available for selection from the **Primary language of documents** drop-down list.
- The fields that were selected when creating the custom domain are displayed in the **Fields to extract** section of the create **New instance** page.

You can import or export a domain using the **Import** or **Export** option in the **Domains** tab.

---

**Note:** Domains are created and saved with the `.dom` extension in the system.

---

**Tip:** Troubleshoot classification issue with Chinese language documents:

[Classification issue with Chinese Invoices \(A-People login required\)](#)

---

## Import a domain

You import a domain for the following scenarios:

- Import a new domain.
- Import an existing domain from another system to your current system.

When you are ready to import a domain into your system:

1. Go to the system where you want the domain to be imported.
2. Click **Import new domain** in the **Domains** tab and select the `.dom` domain file in your local machine that you want to import.

The domain import success message is displayed in the **Domains** tab.

The imported domain appears for the selection in the **Document type** drop-down list of the create **New instance** page and is displayed in the domains list in the **Domains** page.

## Export a domain

When you click the **Export** option next to a domain, it is exported to an output folder on your local drive. The exported domain is encrypted and is created with a `.dom` filename extension.

You export an existing domain from one IQ Bot system to import to another.

To export a domain from your IQ Bot system, do this: In the **Domains** list page, click the **Export** option next to the domain you want to export.

The system displays a success message for the exported domain.

The file is exported to a local output folder on your machine with a `.dom` filename extension.

---

**Note:** The domain files are encrypted for security.

---

## Current limitations to the domain import and export actions

---

**Important:** Import or export of domains is independent of the migration action in the Migration Utility feature.

---

When you migrate learning instances that were created using a custom domain from one system to another, the field names and IDs must be the same in the target machine as well. Otherwise, even though the learning instances are imported, the custom domain will not be imported and the associated field names and IDs for the custom domain will not work in the imported learning instance. If you run the imported learning instance on documents, the documents will not be classified.

Even if you import the custom domain to your new system, the field names and IDs will still not match as these are automatically generated by the system. Hence classification will fail. This is the current limitation of the Migration Utility feature using a custom domain.

Workaround: First import the `.dom` file to the target machine, then migrate the learning instances. Move all learning instances to the staging environment, and test them before moving the learning instance to the production environment.

## Custom domain enhancements

Import custom domains in any order

When you migrate learning instances (created using a custom domain) from the staging server to the production server, migration fails unless you import the different versions of the custom domain in the same order as they were created.

As the capability to edit a custom domain to add additional fields and aliases was not available, the user had to create a new domain and add the additional fields and aliases to it. Then the user had to assign that new domain to the learning instance. So when the user wanted to use the new domain, they had to re-import the original and the new domain to the production server in the order they were created in.

#### [Importing custom domain to IQ Bot production \(A-People login required\)](#)

From release Automation 360 Build 5322, this restriction does not exist.

- You can edit and update an existing custom domain multiple times, and import them to the production server multiple times as well.
- You can import the custom domains in any order. The system successfully migrates the updated fields (form or table), and field aliases (variations of field values found in the training documents, associated with a field) to the production server.

---

**Important:** Perform all edits or updates to a custom domain in the staging server before importing it to the production server to avoid errors.

---

IQ Bot performs document classification based on the defined fields and aliases of the version of custom domain used when the learning instance was created.

Editing the same custom domain (with additional fields) changes the version of the custom domain. For new learning instances created using the new version of the custom domain, classification occurs on the updated fields as well. The edited fields (whether form or table fields) are displayed in the learning instance with a double asterisk next to them to help identify them.

## Using IQ Bot for standard forms

Standard forms are fixed format type documents that usually contain a large number of fields with very little or no variation in the overall layout, which can include both hand-written and digital content. IQ Bot enables you to extract data from standard forms.

Some examples of standard forms are W-4 (Employee Withholding Certificate), income tax form, sale deed and partnership agreement. You can extract data from standard forms by customizing and building a model before setting it up in IQ Bot. A machine learning model is a file that can be trained to recognize certain types of patterns from documents. You can use a sample document with a set of data to train a model to recognize patterns.

Based on the associated role or permission defined by the Control Room administrator, you can then create a learning instance using a model for extracting data from standard forms.

---

**Note:** Users must have the Standard forms pages product license to upload documents for processing. For more information, see [Automation 360 licenses](#) on page 1511.

---

The following workflow describes the various stages and procedures for setting up data extraction from standard forms:

1. Evaluate your use case for standard forms.

[Evaluate your use case](#) on page 4047

- 2.** Review the type of standard forms extraction service that fits your requirement.  
[Review extraction service](#) on page 4049
- 3.** Review the service implementation prerequisites.  
[Review implementation prerequisites](#) on page 4050
- 4.** Set up and configure an extraction service.  
[Set up extraction service](#) on page 4054
- 5.** Configure IQ Bot for the selected extraction service.  
[Configure IQ Bot for extraction service](#) on page 4055
- 6.** Build a data extraction model.  
[Build extraction model](#) on page 4055
- 7.** Log in to IQ Bot and create a learning instance.  
[Create a learning instance for standard forms](#) on page 4056
- 8.** Add validation rules for standard forms learning instance.  
[Define validation rules for standard forms learning instance](#) on page 4058
- 9.** Transfer the third-party extraction models  
[Transfer third-party extraction service models](#) on page 4056
- 10.** Move standard forms learning instance across different IQ Bot environments.  
[Transfer standard forms learning instance](#) on page 4060
- 11.** Upload documents in IQ Bot.  
[Upload documents for standard forms learning instance](#) on page 4059
- 12.** Validate the processed documents for standard forms learning instance.  
[Use the IQ Bot Validator](#) on page 4037
- 13.** Download the content extracted from standard forms.  
[Download extracted content](#) on page 4059
- 14.** Review the performance report and document processing information.  
[Review the dashboard](#) on page 4040

Learn about the users that contribute to IQ Bot and the associated roles and licenses. IQ Bot users and roles are defined in the Control Room.

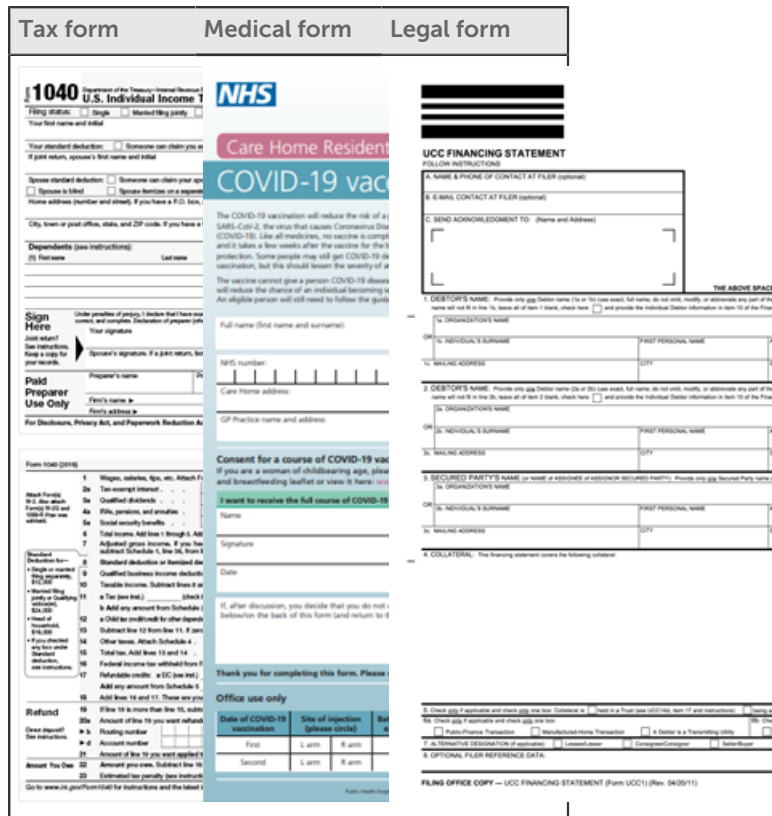

## Evaluate your use case

Content extraction models can be integrated into IQ Bot for extracting data from specific type of documents.

Before you proceed further with standard forms, evaluate your use case to determine if the content extraction from standard forms suits your requirement. Use the following questions as a guide to determine whether your use case needs Standard forms processing

What are standard forms?

Fixed format type documents that have a defined template, with very little or no variation in the overall layout. Standard forms are also known as structured documents, are generally characterised by high density of information, and are typically official or legal forms. The following table illustrates some examples of standard forms:

Does the layout of your documents vary across vendor?

If yes, then this use case for content extraction using standard forms is not the best option.

Are the positions of the various data elements (checkboxes, tables, and so on) fixed in your documents?

If no, then these are not standard forms and this type of content extraction is not suitable.

Is the document a dynamic form? For example, you have documents where the values depend on other data elements.

If yes, then content from such documents cannot be processed using standard forms content extraction.

Is the document in a supported language?

See [Azure Form Recognizer Supported Languages](#). If no, then the document cannot be processed as a standard form.

Does the documents have repetitive sections?

If yes, then this is not a standard forms use case. However, if there are a fixed number of such repetitive sections that do not vary between documents, then it can be processed as a standard forms.

Does your documents contain tables that have a different number rows and columns?

If yes, then these documents cannot be considered as standard form. The number of rows and columns have to be fixed for standard forms.

Can document layouts that vary per year be considered as standard forms? For example, a

If the document layout does not vary within the same year or vary across organizations, then it can be considered as standard forms. If there

W-4 document in 2020 and W-4 document in 2021? are layout variations across years, then different standard form models must be used to process these documents.

## Review extraction service

After you have confirmed that the documents you want to extract content from are standard forms, you can then plan the type of standard forms extraction service that fits your requirement.

The following technologies are available for processing standard forms:

### IQ Bot extraction service

This is a template based extraction service that uses OCR and heuristics to extract content from standard forms. You have to train one template per standard form.

Guidelines for using IQ Bot extraction service

- Documents are of good quality (300 dpi)
- Document content is not very dense
- Input documents do not have any handwritten copies (limited support)
- Signatures are currently not supported
- Contains simple table layout (span within a page) with clear header, table boundaries, and so on
- Does not contain any tables or content that have checkboxes (limited support)
- Does not have any repeated sections (limited support)

Benefits of IQ Bot extraction service

- An integrated and simple out-of-the-box setup
- Various OCR engines to increase accuracy of extraction
- Complex layouts (repeated sections, continuous tables etc) can be extracted for specific cases (needs testing)
- Only requires IQ Bot license

### Microsoft Azure Form Recognizer service

Third party technology, that provides custom built Artificial Intelligence (AI) models to extract content from standard forms. You can create custom models where documents can be labelled and trained.

Guidelines for using Microsoft Azure Forms Recognizer service

- Input documents:
  - can be dense (contain lot of details and information) and have a reasonable quality (>200 dpi)
  - can contain checkboxes and radio buttons
  - can have handwritten content
  - can contain signatures
  - can contain tables

The input documents can also contain tables that span over a single page. However, if the standard forms contain table that span across multiple pages, the content extraction can fail.

- None of the sections in the input documents are not repeated
- Documents that contain transpose tables

Benefits of Microsoft Azure Forms Recognizer service

- Diverse standard form type documents can be processed
- Auto detection feature can identify different types of tables such as header-less table, inverted tables, and so on
- Good support for handwritten forms

## Review implementation prerequisites

After you have finalized the type of extraction service that suits your requirement, ensure that you review the prerequisites before proceeding with the implementation of the service.

### IQ Bot extraction service

Review the operating system and database compatibility, database information, and various hardware and software requirements as part of prerequisites for using IQ Bot extraction service.

See [IQ Bot system requirements](#) on page 1537.

### Microsoft Azure Form Recognizer service

Review the prerequisites of Microsoft Azure Form Recognizer service installation for standard forms.

- Cloud setup and installation  
No additional configurations are required. However, based on the page processing volumes, the Transactions Per Second (TPS) must be increased for the Microsoft region where your service is running. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) with the expected page volume and Microsoft region where the service is running to update the TPS.
- On-Premises setup and installation

[Pre-requisite for Azure Container on-prem installation for Standard Forms \(A-People login required\)](#)

## Considerations for optimum performance

Review the considerations to capture the performance metrics of IQ Bot standard forms with a new Model containing more number of forms or table fields.

### Test summary

- Performance test was run for 10000 COVID Form documents (two pages per document = 20000 pages) on a single node IQ Bot server using a single Bot Agent (using IQ Bot Extraction package). This test was conducted to benchmark the performance metrics such as processing time, Straight Through Processing (STP), validation, and documents processed (#successful processed pages/documents and #failed pages/documents).
- New Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6) with 26 Form Fields & 8 Tables fields are trained and used for extraction.
- With new Model (WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6), all the documents were moving to validation during extraction. To get STP we marked below 5 fields as optional for this test: A2PatientSign, B2Date, B2Sign, Phone, InsuranceCard(Table)->Card Details.
- Total time take to process 20000 pages using single Bot Agent was 25 hours, 21 minutes, & 42 seconds. This was based on IQ Bot On-Premises Build 12350.
- Average time take to process single page using IQ Bot Extraction package on single Bot Agent is approximate 4.56 seconds.
- Achieved STP: 100% and Accuracy: 100%.
- During our test execution, the requests were served by Microsoft standard forms services hosted in us-west2 region.
- As confirmed, Microsoft team TPS (Transactions Per Second) supported by us-west2 region was 100 TPS

**Note:** KPI (Key Performance Indicators) like processing time, STP, accuracy might vary based on the regions where Microsoft standard forms service is hosted and its transactions per second (TPS) rate.

### Infrastructure configurations

The following table lists the infrastructure configurations:

Server	Parameters	Values
Server 1 [Web Server]	Control Room	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]-uee
Server 2 [Database]	Database	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]
Server 3 [Application Server]	IQ Bot	Windows Server 2019 → 8vCPU, 16 GB RAM, 512 GB Disk [Rackspace Platform]

Server	Parameters	Values
Server 4 [Client]	Bot Agent	Windows Server 2019 → 4vCPU, 8 GB RAM, 256 GB Disk [Rackspace Platform]

## Product configurations

The following table lists the product configurations:

Parameters	Values
Automation Anywhere Enterprise	Automation 360 Build 12313
Bot Agent	21.80.10273
IQ Bot	A360.24.28441-20220311
IQ Bot Extraction package	1.0.0-20220307-024320
Database	Microsoft SQL Server Developer (64-bit)
Protocol	HTTPS
Network services	Non-Active Directory

## Data configurations

The following table lists the data configurations:

Parameters	Values
Domain	Standard forms
Provider	Forms Extractor Type 1
Model	WalgreenComplete 3260b299-68b5-4118-87df-b313bd5c30f6
Document Type	Multi page PDF document
Pages	Two pages per document
Form Fields	26 [A2Date, A2PatientSign, Address, Age, B2Date, B2Sign, City, DOB, Email, FirstName, LTCFName, LastName, Phone, PrintName, Race-American, Race-Asian, Race-Black, Race-Native, Race-Other, Race-UnableToReport, Race-Unknown, Race-White, RefusedInformation, State, VaccinationType, Zipcode]

Parameters	Values
Table Fields	8 tables, 23 table fields Table1: DriversLicense[Issuance, LicenseNo]Table2: Ethnicity[Hispanic, NotHispanic, UnableToReport, Unknown]Table3: Gender[Female, Male]Table4: InsuranceCard[Card Details, Medical Card, Pharmacy Card]Table5: MedicareDetails[Medicare, Medicare PartB]Table6: PatientCardHolder[DontKnow, No, Question, Yes]Table7: PatientType[Resident, StaffMember]Table8: ScreeningQuestions[DontKnow, No, Question, Yes]
Configuration	COVID forms
# of Documents	10000
# of Pages	20000
Language	English

## Test results

The following table lists the test results:

Parameters	Values
Total Documents Uploaded	10000
Total Pages Uploaded	20000
Total Processed documents	10000
Total Processed pages	20000
Success	10000 documents
Pending Review (Validation)	0
STP	100%
Accuracy	100%
Processing Time	25 hours, 21 minutes, and 42 seconds

## Resource consumption data

The following table provides the resource consumption data:

Parameters	CPU Utilization in %	Memory Utilization in %
IQ Bot	Average: 3.4 Maximum: 26.8	Average: 70.9 Maximum: 78.9

Parameters	CPU Utilization in %	Memory Utilization in %
Control Room	Average: 1.4 Maximum: 14.5	Average: 83.3 Maximum: 84.8
Database	Average: 3.3 Maximum: 20.6	Average: 91.5 Maximum: 94.1
Bot Agent (Extraction)	Average: 4.8 Maximum: 48.9	Average: 52.4 Maximum: 58.7

## Set up extraction service

To extract content from standard forms, you must setup and configure an extraction service. Review this topic to understand how to setup each of the extraction service.

### IQ Bot extraction service

No specific setup is required for content extraction through IQ Bot service. Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See [Create a learning instance](#) on page 3993.

### Microsoft Azure Form Recognizer service

#### 1. Subscribe to Microsoft Azure service

Microsoft provides the Azure Form Recognizer service. This service enables you to build automated data processing software that can identify and extract specific content from documents. You must have Microsoft Azure subscription in order to access Azure resources (OCR, Form Recognizer), Automation Anywhere provides access to these resources through its subscription. Contact your Customer Success Manager (CSM) or Partner Enablement Manager (PEM) who will help you setup the services.

[Request access for Microsoft Azure resources \(OCR and Form Recognizer\) \(A-People login required\)](#)

#### 2. Setup Microsoft Azure Form Recognizer service

##### a) For Cloud deployment

- If you have Automation Anywhere subscription, no additional configurations or changes are required.
- If you have Microsoft Azure subscription, review the following article to setup and configure your Microsoft Azure Form Recognizer for extracting content from standard forms.

[Setup Azure Form Recognizer and Storage \(Cloud\) \(A-People login required\)](#)

##### b) For On-Premises deployment

[Setup Azure Form Recognizer and Storage \(On-Premises\) \(A-People login required\)](#)

## Configure IQ Bot for extraction service

IQ Bot must be connected to the extraction service for processing standard forms. The following section provides details on how to configure IQ Bot for the selected extraction service. However, your IT Service team can help you setup and configure the extraction service in IQ Bot.

### IQ Bot extraction service

If you choose IQ Bot extraction service, no additional configurations are required.

### Microsoft Azure Form Recognizer service

If you choose the Microsoft Azure Form Recognizer service, you must add Microsoft Form API and the corresponding configurations in IQ Bot.

[How to Setup and configure standard forms in IQ Bot \(A-People login required\)](#)

## Create the model in Document Automation

In Automation 360 v.26, you can configure the extraction model in the Control Room:

[Create a custom extraction model using Standard Forms](#) on page 3944

## Build extraction model

Data extraction model typically leverages Artificial Intelligence (AI) and Machine Learning (ML) technologies to accurately extract text, key-value pairs, and tables from documents.

### IQ Bot extraction service

Requires no separate AI model as this will be done as part of creating and training a learning instance in IQ Bot.

See [Create a learning instance](#) on page 3993.

### Microsoft Azure Form Recognizer service

During your use case evaluation, Microsoft Azure Form Recognizer models can be created by Sales Engineering. But for any production deployment, contact Professional Services, or Partner Enablement Manager (PEM) at Automation Anywhere.

[How to Create and train Azure Form Recognizer model \(A-People login required\)](#)

The benchmarks for the time taken for labeling fields in the Microsoft Azure Form Recognizer service are as follows:

- Up to 30 fields: 1 hour
- 30 to 100 fields: 2 hours
- 100 to 400 fields: 4 hours

---

**Note:** While creating a model, ensure there are no duplicate model names. And while creating a table, ensure that the table name does not contain a space. For example, `Sales chart.xls`.

---

## Transfer third-party extraction service models

Third party extraction models can be transferred from one subscription to another. Contact your Automation Anywhere Customer Success Manager (CSM) for assistance.

### IQ Bot extraction service

If you are using IQ Bot extraction service, no changes required.

### Microsoft Azure Form Recognizer service

- Transfer models from one On-Premises to another On-Premises environment.  
[Transfer models from one environment to another \(On-Prem\) \(A-People login required\)](#)
- Transfer models from one Cloud to another Cloud environment.  
[Transfer models from one environment to another \(Cloud\) \(A-People login required\)](#)

---

**Note:** You can transfer standard forms learning instance along with an associated model between your IQ Bot instances using API configurations. For more information, see [Transfer standard forms learning instance and associated model \(A-People login required\)](#)

---

## Create a learning instance for standard forms

Learning instance is used in IQ Bot to extract, train, validate content from standard forms. Use the following instructions to create a learning instance for processing standard forms in IQ Bot

### Using IQ Bot extraction service

Ensure that you have access to an active IQ Bot environment so that you can create a learning instance.

See [Create a learning instance](#) on page 3993.

### Using Microsoft Azure Form Recognizer service

1. From the **Document type** drop-down menu select **Standard Forms**.
2. In the **Standard form settings** tab, from the **Provider name** drop-down menu, select a provider for processing the form.

3. From the **Configuration type** drop-down menu, select the supported configuration.  
This enables you to connect to one of the provider services configured during installation.
4. From the **Select Model** drop-down menu, select a pre-trained model for the selected configuration.
5. Click **Browse** to upload a reference document.  
For example, if you have selected the configuration type and model as invoice, you can upload an invoice file that must be analyzed.

---

**Note:** The reference document is only a representation of the document type you want to extract data from.

---

6. From the **Fields to extract** tab, select the fields from where the values must be extracted.  
The fields are displayed based on the selected Form set in the pre-trained model, and no additional fields can be added.
7. Click **Create instance and analyze**.  
The system analyzes and sorts the document into logical group.

---

**Note:** Only one default group is created. The system-identified region (SIR) are not visible and all the training related fields are greyed out. As the standard forms learning instance contains pre-trained model, no additional training of the group is available. You can only add validation patterns and custom logic.

---

After you have created a learning instance, you must add a group specific to standard forms.

8. On the **Learning Instance details** page, click **Add group**.
9. Create group label as <Standard Forms layout name>.  
For example, if you have W-4 documents for the year 2021, enter W4\_2021.
10. Click **Save**.
11. Open the system generated group
12. Click **Delete Bot**.  
System generated group is removed from the **Learning instance details** page

## Edit a standard forms learning instance

As the learning instances created by using standard forms have pre-set configurations, you can edit only the name and the description. Also, you cannot edit instances in the production environment without moving them to staging.

---

**Note:** If you want to change the model associated with a learning instance, you must create a new model and follow these instructions:

1. Create another learning instance similar to the previous one.
2. Associate the new model with this learning instance.
3. Select all the fields you had selected in the previous learning instance.
4. Update the validation rules.

5. Move the learning instance to production and associate a bot with this learning instance.

- 
1. On the **My learning instances** page, select the learning instance you want to edit.

You can also use the **Search** bar to locate the learning instance.

2. Click **Edit**.

3. Edit the name of the learning instance in the **Instance name** field.

The document classification options are not available as the standard forms use a pre-trained model and configurations.

4. Optional: Use the **Document Groups** tab to review the groups associated with the learning instance.

---

**Note:** The **Add group** button is not available as adding groups is not supported for a standard forms learning instance.

---

5. Optional: Click the **Summary** tab to review the learning instance.

Standard Forms details such as **Provider**, **Configuration**, and **Model** are available under this tab.

6. Click **Save**.

Changes made to the learning instance are updated on staging.

## Define validation rules for standard forms learning instance

To prevent wrong or invalid data extraction, you can edit the bot associated with any standard forms learning instance and customize the validation rules.

You can only edit a bot on staging. So ensure that you move any bot that you want to edit to staging if it is in production.

## Using IQ Bot extraction service

Use IQ Bot Designer to train a learning instance and extract content from sample documents. Review each field to ensure the correct value is extracted and where necessary, map the correct field.

For more information, see [Train a learning instance](#) on page 4003.

## Using Microsoft Azure Form Recognizer service

1. On the **Bot** page, select the bot you want to edit.

You can also use the **Search** bar to locate the bot.

2. Click the **Edit Bot** icon.

3. In the **Field** column, click **Field options**.

4. Enter any custom validation rules in the fields under the **Validate Pattern** tab.

Documents that are not processed are moved to the **Validator**, and fields with errors are flagged. You can review the flagged fields in the Validator.

[Use the IQ Bot Validator](#) on page 4037

5. Enter post processing logic under the **Logic** tab, and click **Save**.
6. Click **Save**.  
The updated bot is saved on staging and you can move it to production.

## Upload documents for standard forms learning instance

Upload your documents to IQ Bot for an existing standard forms learning instance for content extraction.

For extracting content from a single document, use the **Upload Document** action from IQ Bot package in Automation Workspace.

See [Upload document action](#) on page 2923

For content extraction from multiple or large number of documents, you can use the **Process documents** action from IQ Bot Extraction package in Control Room. Use the following instructions to upload multiple or large number of documents:

1. Drag the **Process documents** action into the workflow.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Desktop folder** tab, enter the file path for the input folder or click **Browse** to select it.
4. Select the output folder from the **Output folder path** field.
5. Select the **Send documents to IQ Bot Validator for validation** check box.

Although the documents are processed using Bot Runners on your local machine, you must use this option if you want to validate the documents in the Validator

6. Click **Save**.

## Download extracted content

After you have trained learning instance, use the **Download all documents** action from the IQ Bot package to download extracted content from standard forms.

1. Drag the **Download all documents** action from the **IQ Bot** package.
2. Click the **Learning instance name** drop-down menu and select a standard forms learning instance.
3. In the **Local output folder** field, provide a path to your local folder where you want to extract the content.
4. In the **IQ Bot Document status**, select the appropriate status for the documents:
5. Select **Delete files from the server after downloading** check box if you want to remove the files from IQ Bot server.
6. In the **Save the response to a variable** field, add a variable.

A variable value in this field provides information if the download was successful or the reason for a failure.

7. Click **Save**, and run the bot.
8. Navigate to the local output folder to review the downloaded files.  
The output folder can have up to three subfolders:

- **Retrain:** Contains documents that were sent for validation.  
These documents are stored in their original input format and you can train them by uploading them to your existing learning instance.
- **Success:** Standard form documents that have been processed successfully.  
The output is a `.json` file. Tables in the input documents are auto extracted and saved as separate `.xls` file with the table name.
- **Validate:** Contains documents that require validation.  
These documents will be available in the IQ Bot Validator and you can download the output separately.

---

**Note:** Depending on the content in the uploaded documents, you can also get the following additional subfolders:

- **Failed:** Documents that failed the validation process.
  - **Unprocessed:** Documents that could not be classified.
- 

## Transfer standard forms learning instance

A standard forms learning instance is similar to the regular IQ Bot learning instance that describes the data in a single document type, for example an invoice. It contains information such as the language used in the documents and the fields to extract.

- Ensure that the source and destination systems are running the same IQ Bot version. Learning instances from different IQ Bot versions cannot be imported because their database schema will not match.
- Back up your database before importing learning instances.
- Export the `.iqba` file from the source IQ Bot environment.
- Import the `.iqba` file into the destination IQ Bot environment

Related concepts

[Manage learning instances](#) on page 4034

A learning instance is an IQ Bot structure that describes the data in a single document type, for example an invoice. It contains information such as the language used in the document and the fields to extract.

## Export a standard forms learning instance

Standard forms learning instance can be used across similar IQ Bot environments. Export an existing learning instance to avoid creating another one with the same configurations.

IQ Bot administrator can use the following instructions to edit a standard forms learning instance:

1. Click **Administration > Migration**.
2. Click **Create Backup**.

Backing up your existing learning instance enables you to save and restore the configuration if required.

3. Select the learning instances that you want to back up and then click **Backup**.
4. Enter a name for the IQ Bot archive (IQBA) file.

The name of the archive file is appended with a time stamp to make it unique. You can download this file and export it to the target environment.

5. Click **Backup** to begin the export process.

The exported data file with the `.iqba` extension is available in the `BackupData` folder in your IQ Bot output directory.

## Import a standard forms learning instance

Import an existing learning instance from a similar environment to avoid creating learning instances and associated bots multiple times. Use the Automation 360 IQ Bot Migration Utility feature to import any standard forms learning instances.

Ensure that you have migrated the associated configuration to the target server before importing a learning instance.

When you export an `.iqba` file, only a single document associated with every available bot (Group) training is exported.

1. Log in to IQ Bot as an administrator.

2. Click **Administration > Migration**.

A list of backed-up learning instances is displayed.

3. Click the **Import** icon under the **Actions** tab for the selected learning instance.

4. Select the import method, and click **Accept**.

The selected standard forms learning instance is imported and is displayed under in **My learning instances** page.

# Process Discovery

Process Discovery is a data-driven approach to analyze, monitor, and improve business processes by extracting insights and knowledge from the user interactions with various systems. It uncovers the actual flow of activities, decisions, and interactions that occur within an organization's processes.

Process Discovery drives organizational efficiency, cost reduction, and enhanced quality control. This approach fosters insights into process operations, pinpointing areas for enhancement like automation, workflow streamlining, and step elimination. Leveraged in process improvement, compliance, and risk management endeavors, Process Discovery proves invaluable.

## Components

The Process Discovery platform is used in combination with the Process Discovery Sensor and Privacy Enhanced Gateway (PEG) applications to streamline data capture, analysis, and process modeling.

### Process Discovery Platform

The Process Discovery platform is used in combination with the Process Discovery Sensor and Privacy Enhanced Gateway (PEG) applications to streamline data capture, analysis, and process modeling. The Process Discovery interface enables users to perform the following tasks:

- Capture, parse, and analyze user interactions with various systems.
- Identify and map all relevant pathways (including variations) and automatically documents the most common workflow.
- Compare the potential ROI from automating these processes and enables Business Analysts to accelerate automation and maximize RPA ROI.
- Convert automation opportunities into bot prototypes using the Process Definition Document (PDD) for further development and deployment by the Automation Developer.

Process Discovery is part of the Automation 360 platform. To learn more, see [Automation 360](#)

### Process Discovery Sensor application

The Process Discovery Sensor is installed on end-users' machines to capture data on user activities. This data is sent to Process Discovery for analysis to determine what business processes are candidates for automation.

Privacy Enhanced Gateway

The Privacy Enhanced Gateway (PEG) redacts sensitive data collected by the Process Discovery Sensor application, which prevents Personally Identifiable Information (PII) from being included in the data sent to Process Discovery for analysis.

Companies often start automation projects by manually observing and documenting processes. This involves interviewing users, mapping workflows, and can be time-consuming and prone to inaccuracies. Process Discovery uses visualization tools to identify automation opportunities and compare processes across regions or teams.

**Workflow**

The following diagram shows the Process Discovery workflow for Process Discovery Admin, IT Infrastructure Admin, and Business Analyst users:

## Process Discovery workflow

(Click the links to navigate to the sections.)

The Process Discovery helps Power/Discovery users find automation candidates by:

- Capturing and analyzing user interactions with systems.
- Documents common Workflows and provides visualizations (Flow and Path graphs)
- Comparing the ROI for potential automation.

## Overview of Process Discovery

Process Discovery enables organizations to accelerate the automation of business processes and discover the fastest path to process optimization and business ROI (return on investment). You can use Process Discovery in various industries such as: healthcare, life sciences, and finance.

### Why use Process Discovery

Many companies begin their automation projects with manual observation and documentation. Manual production and review of process documentation requires interviewing business users and mapping work flows while they are performing daily operations. This involves additional resources which can be time-consuming for all involved. This additional effort is also subject to inaccuracies due to users behaving differently while being monitored. As a result, many of the automation opportunities remain undiscovered. Process Discovery uses visualization tools to view process details and metadata, and review identical processes that differ across regions, teams, or apps.

### Process Discovery Platform capabilities

The Process Discovery application enables Power or Discovery users to identify the business processes that are candidates for automation. Use Process Discovery to do the following:

- Capture, parse, and analyze user interactions with various systems.

- Identify and map all relevant pathways (including variations) and automatically documents the most common workflow.
- Compare the potential ROI from automating these processes and enables Business Analysts to accelerate automation and maximize RPA ROI.
- Convert automation opportunities into bot prototypes using the Process Definition Document (PDD) for further development and deployment by the Automation Developer.

## Process Discovery user roles

Learn about the various users in the Process Discovery platform and their privileges from creating mining runs and exploring processes, to creating web applications and creating a Process Definition Document (PDD).

The Process Discovery platform includes the following user types:

Limited user

A Limited user has access to only the Client Dashboard by default, and view-only access to select assets attached to that tenant's Client Dashboard by a higher-privileged user.

Data Review user

Selects and reviews data for all observers in the Process Discovery platform. The data reviewer user has access only to the **Review** tab and **Data Review** page.

The Data Review role grants a user access to only the Virtual Interviewer flow.

---

**Note:** Discovery and Power Users can access Virtual Interviewer via the URL, but there is no direct link from the main navigation. While a Virtual Interviewer user has access to only the Virtual Interviewer interface, they can currently select and see the data for any and all observer names on the tenant.

---

Discovery user

The Discovery user is designed for anyone who wants to create Mining Runs and Processes or explore the work of others. Restricts access to features around signature creation that could have impacts on other users data and processes if misused. They do not have access to the Cycle page but can be given access to specific cycles by a higher-privileged user. They can look through the events, mining runs, or processes generated for those specific cycles. For instance, a Discovery user from a IT team has access to only IT team cycles and cannot view Accounts team cycles.

Power user

The Power user is an expansion of the Discovery user, granting access to those non-

admin interfaces that the discovery user lacks. They can do everything in the application, from creating Mining Runs and exploring processes to managing application signatures and creating Web Applications. The power user does not have administrator privileges.

Administrator

The Administrator role is the same as previous - it can do everything a power user can, plus all the additional administration screens related to management of the tenant, cycles, users, observers, and integration/plugins.

## Create Process Discovery users and assign roles

As an Administrator user, you can create users and assign roles in the Process Discovery platform.

1. Log in to your Process Discovery platform as an administrator.
2. Click your account initials in the upper-right corner and select **Manage Users**.
3. Click **Create User**.  
The **Create New User** window appears.
4. Enter the first name of the user in the **FIRST NAME** field.
5. Enter the last name of the user in the **LAST NAME** field.
6. Enter the email address of the user in the **EMAIL** field.  
This is also the unique user ID for the user.
7. In the **ROLE** field, click the drop-down to select a Process Discovery role for the user. For more information on Process Discovery role, see [Process Discovery user roles](#) on page 4065.
8. To select an avatar for the user, click **Choose Image file**.
9. Navigate to an image on your computer and click **Open** to select the image.
10. Click **Create User**.  
Process Discovery automatically generates and sends an email inviting the user to log in and use the platform.

---

**Note:** If the user does not activate the account within 24 hours of receiving the email invitation, click the **Didn't receive confirmation instructions** link on the login page to resend the confirmation email. Enter the email address in the field provided and click **resend confirmation instructions**.

---

11. To reset a user password for a fully registered user, click **Actions** > **Force Password Reset**.
12. Click **Yes** to reset the user password.  
A message appears notifying you that the user will have to change their password on the next login attempt.

Related concepts

[Integrate SAML with SSO for Process Discovery](#) on page 4067

With SSO enabled, users can securely sign in to Process Discovery with the same credentials used in other applications such as Microsoft 365 Outlook or Microsoft 365. Users are no longer

required to create separate credentials to access Process Discovery and customer administrators can manage employee access control to Process Discovery as needed.

## Integrate SAML with SSO for Process Discovery

With SSO enabled, users can securely sign in to Process Discovery with the same credentials used in other applications such as Microsoft 365 Outlook or Microsoft 365. Users are no longer required to create separate credentials to access Process Discovery and customer administrators can manage employee access control to Process Discovery as needed.

Single sign-on (SSO) with the Security Assertion Markup Language (SAML) v2.0 protocol requires the identity provider and the application or service provider (Process Discovery) to exchange authentication credentials with each other.

### SAML integration overview

Use SAML v2.0 protocol to enable single sign-on in your Process Discovery tenant with your corporate identity provider.

These are prerequisites to enable SAML configuration in Process Discovery:

- Set up SAML in Process Discovery and the identity the provider at the same time.
- Refer to the identity provider's documentation for instructions on adding a SAML application, such as Process Discovery.
- Ensure you add users in your directory in the source identity provider. Typically, a user directory should exist for your organization.

### Required user details

Users must provide the following details to facilitate the SSO integration with your Process Discovery tenant:

- Process Discovery tenant URL: URL used by customers to log into and access Process Discovery.
- Process Discovery Admin account: email address of a Process Discovery admin that would be used for the SAML admin as well.
- IDP Issuer: issuer URI from the IdP.
- IDP Certificate (X.509 certificate): file representing the IDP certificate.
- IDP Single Sign-On URL: sign-on URL from the IdP.
- IDP Metadata URL: location of the IdP's metadata for automatic renewal of the signing certificate.
- Required Process Discovery issuer as per request: the following will be added `https://saml.fiq-process-intelligence.com/`

After customer IdP SSO integration is created within Process Discovery, the following Service Provider (SP) details can be provided on request:

- Single sign-on URL
- Recipient URL
- Destination URL

- Audience restriction
- Default relay state

## Integration details

Once a customer tenant is successfully configured with SAML integration here are some important details to note:

- This configuration will provide SSO integration via SAML for the Process Discovery web app. However, this does not include integration into Privacy Enhanced Gateway (PEG).
- Any users created prior to the transition to SAML will need to be transitioned to SAML-enabled users. Customers are required to provide a list of these users when requesting for SAML integration.
- All new user accounts will be automatically created with SAML integration.
- Process Discovery does not support multiple IdPs per tenant.
- Individual accounts can be reverted to traditional login accounts, which are non SAML enabled. The customer would need to create a support ticket with this request to start this process. The ticket must include these details:
  - Process Discovery tenant URL
  - List of user emails that should be reverted back to non-SAML logins.

## FAQs

Following are FAQs for some common queries related to this topic:

What is SAML?	Security Assertion Markup Language (SAML) is an open standard for exchanging identity authentication data between an identity provider and an application or service provider such as Process Discovery.
What is SSO?	Single sign-on (SSO) is an identity authentication system that allows users to access multiple applications by using one set of credentials.
What are the three main entities involved in single sign-on?	Application or service provider: The application or service provider we want to enable with single sign-on. In this use case, our application or service provider is Process Discovery. Identity Provider (IdP): An identity provider authenticates and manages the identities of users. Process Discovery supports all IdPs that support standard implementations of the SAML v2.0 specification. A user: A person whose credentials are authenticated in the identity provider. The account credentials include an email address with a domain used in both the

	application and identity provider. For example, <a href="mailto:user.name@automationanywhere.com">user.name@automationanywhere.com</a> .
Which identity claims does Process Discovery require from the IdP?	First name Last name Email
Does Process Discovery support Single Log Out (SLO)?	SLO is not supported. We only support SP-initiated SSO.

## Create your event reporting password

As an Administrator user, you can create your own password for the Event Reporting interface.

The Event Reporting interface uses Kibana which provides you reports about how people interact with applications and screens. Using the reports, you can determine where to focus your process discovery.

1. To create your Event reporting password, log in to your Process Discovery platform tenant.
2. Click your account initials in the upper-right corner and select **Manage Users**
3. Locate your account details in the users list.

---

**Tip:** To quickly locate your account, click **Filter**. Enter your email address, select a role, and click **Apply**.

---

4. In the Actions column, click the drop-down arrow and select **Set Event Reporting Password**. The Set Event Reporting Password window displays.
5. Enter your password and click **Set Password**.  
The password is ready to use the next time you log in.

## Create a URL and application list

Learn how to create a domain list (containing the URL) and application list for data that you want to capture or exclude on an Observers machine.

This task is performed by an Administrator. Before you configure Observer activity for data collection, you create domain list and application list.

To create a domain list, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.
2. Click your account initials in the upper-right corner and select **Domain List**.
3. Click **Create List**.
4. In the **Name** field, enter a name for the list.  
For example, enter Business applications.
5. In the **Type** field, select **Allow** to capture URLs or **Block** to exclude the URLs.

---

**Note:** The blocked URLs will not be displayed in the screen shots from the Events page.

---

6. In the **Domain** field, enter the full URL address.

For example, enter [www.servicenow.com](http://www.servicenow.com), [www.sap.com](http://www.sap.com), or [www.oraclefinancials.com](http://www.oraclefinancials.com).

---

**Note:** When specifying domains, you must explicitly indicate what domains to include or exclude. For example, if [chase.com](http://chase.com) is blocked, the [secure05c.chase.com](http://secure05c.chase.com) would not be blocked. You must include [secure05c.chase.com](http://secure05c.chase.com) on the list.

---

7. Click **Add** to add the specified domain to the list.
8. Click **Create List**.

You can now select this Block or Allow URL list from the **Observers** page for data you want to capture or exclude, for an individual observer or group observers, based on your requirements.

To create an application list, perform the following steps:

1. Click your account initials in the upper-right corner and select **Application List**.
2. Log in to your Process Discovery platform as an administrator.
3. Click **Create List**.
4. In the **Name** field, enter a name for the list.  
For example, enter Business applications.
5. In the **Type** field, select **Allow** or **Block** from the drop-down.
6. In the **Application** field, select an application from the drop-down or enter an application in the text field.
7. Click **Add** to add the application to the list.
8. Click **Create List**.

You can now select this Block or Allow Application list from the **Observers** page for data you want to capture or exclude, for an individual observer or group observers, based on your requirements.

---

**Note:** To create a default Block and Allow URL or Application list for all new observers in a tenant, click your account initials in the upper-right corner and select **Manage Account**. In the Observer Settings section, update the URL or Application Block and Allow List.

---

## Configure Observer activity

As an administrator, you can configure an individual Observer or a group of Observers to capture or exclude specific sets of data from collection on an Observers machine. This topic describes how to enable or disable the capture settings (screenshots, keystrokes, title, and keyboard) and apply this to specific applications.

After the Process Discovery Sensor is installed on the Observers' machines, ensure that you:

- Enable the sensor recording. For more information on enabling or disabling the recording, refer to [Enable and disable the users recording](#) on page 4135.
- Create your domain and application list. For more information, see [Create a URL and application list](#) on page 4069.

**Note:** To enable or disable the recordings for new observers in a tenant, click your account initials in the upper-right corner and select **Manage Account**. In the New Observer Recording section, select **Enable** or **Disable** to set the recording configuration for all new observers. Click **Save** to save your changes.

To configure an individual observer or group configure observers for data collection with capture settings, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.
2. Navigate to **Data > Observers**.
3. To configure all observers, select **Configure <number> Observers**.  
This configuration is for all observers using the current filter. You can create filters for specific departments in your organization (for example, HR or Finance) to filter data collection for a subset of Observers. Click **Filters** to create filters.
4. To configure an individual observer, navigate to the **Actions** column for the Observer and select **Configure** from the drop-down arrow.
5. In the Capture section, use the individual toggles to capture or exclude screenshots, keystrokes, title, or clipboard globally for all applications.
6. In the URL Block and Allow List section, select one of the these options:

Option	Action
None	No action to select. All URLs are captured by the Process Discovery Sensor.
Allow	Select the <b>Allow</b> URL list you created from the Domain List page from the drop-down field.
Block	Select the <b>Block</b> URL list you created from the Domain List page from the drop-down field.

7. In the Application Block and Allow List section, select one of the these options:

Option	Action
None	No action to select. All URLs are captured by the Process Discovery Sensor.
Allow	Select the <b>Allow</b> Application list you created from the Application List page from the drop-down field.
Block	Select the <b>Block</b> URL list you created from the Application List page from the drop-down field.

8. In the **Configure Applications** window, enter specific applications in the text field you want to capture and click **Add**.

Based on your business needs and the applications you set to capture or exclude, you might need to capture Screenshots and Titles for data processing of screen signatures.

The application is listed in the Application Name column.

9. To disable capture settings for the application, select the icon for Screenshots, Keystrokes, or Titles.  
An X mark appears on the icon.

10. To configure observers by a single user, or group of observers with the same user name, select **Use configuration for observers owned by this user (<user name>)**.

This option is available for an individual observer only.

---

**Note:** When you use this option, the allow and block list that is created for new observers is used for users with the same user name.

---

11. Click **Configure**.  
The capture settings are now set for Observers.
12. To enable the capture settings for all observers by default, click your account initials in the upper-right corner and select **Manage Account**.
13. In the Observer Settings section, perform steps 5 through 7.
14. Click **Save** to save your changes.

## Use Process Discovery with Kibana dashboard

The Process Discovery Kibana dashboard (elastic) is used in the pre-mining determinations to understand the process data with Kibana's intuitive and customizable visualizations. You can analyze your Process Discovery tenant data with Kibana.

---

**Important:** Kibana and Elastic mark and logo are trademarks or registered trademarks of Elastic NV and are used for identification purposes only.

---

Use Process Discovery with the Kibana dashboard to analyze, manage, and visualize your process data in the form of charts, gauges, maps, graphs and more. The dashboard helps you analyze the process data and identify relevant processes for tracking in Process Discovery. You can then define your mining runs based on your findings.

This dashboard can be used by administrators, data analysts, and business users to discover insights into their data, visualize the data on dashboards, and share findings to influence automation decisions. Your data can be text, numerical data, time series data, geospatial data, logs, metrics, security events, and more. You can uncover patterns and relationships and visualize the results.

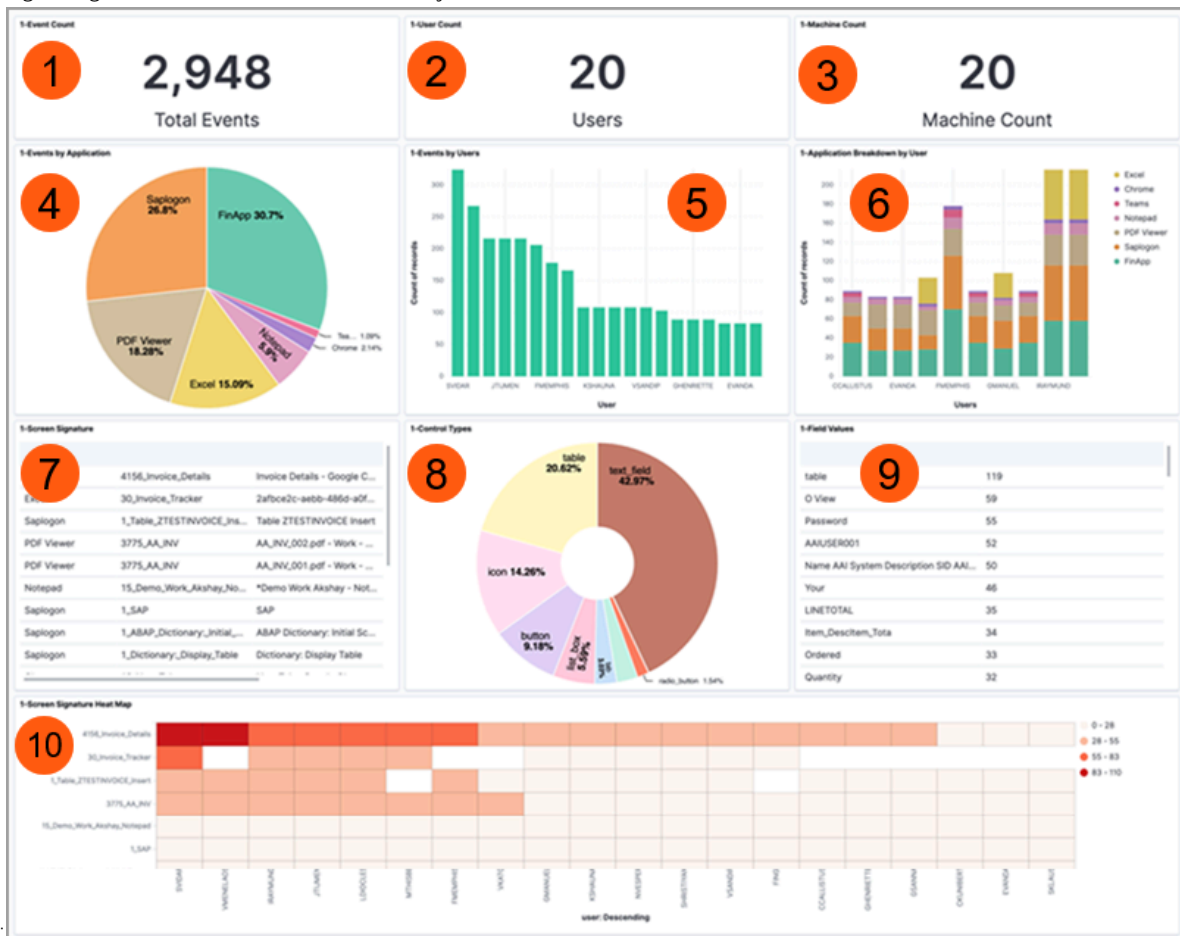

The Process Discovery Kibana dashboard provides three dashboards, such as Activity, Events, and User for all Process Discovery tenants to help you define process mining before passing the data for mining to the Process Discovery platform. The data is synchronized between your tenant and the Kibana dashboard. Watch the following video to use elastic to gain insights into your mining runs and processes.

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

The following image shows a Process Discovery Kibana **Events**

dashboard:

	Description
1	The <b>Events Count</b> widget displays the total count of events collected by the observers.
2	The <b>User Count</b> widget displays the number of users.
3	The <b>Machine Count</b> widget displays the total number of machines used by the observers.
4	The <b>Events by Application</b> pie chart displays the distribution of applications accessed by the observers, revealing the most commonly used application, such as BillrMD.
5	The <b>Application Breakdown by User</b> bar graph displays the applications accessed by each user, allowing you to identify the common application among all observers.
6	The <b>Events by Users</b> exhibit the number of events captured by each user account.
7	The <b>Screen Signature</b> table displays the most common screen signatures.

	Description
8	The <b>Control Types</b> displays the percentage of interactions by types that the observers are performing. From the Pie chart, you notice that 23.34% of the observer's time is spent working in a table, and 19.02% is spent clicking buttons.
9	The <b>Field Values</b> table displays the percentage of interactions by field value as performed by the observers. From the table you can understand that the observers spent most of the time in a table, adding charges, and clicking the save button.
10	The <b>Screen Signature Heat Map</b> lets you determine the most common screen signature. From the chart, you can understand that 2433_Charge_ChargePosting_Posting is the common screen signature among all observers/users.

Kibana is a powerful tool that can be used to prepare data for creating mining runs in Process Discovery. By using Kibana to clean, analyze, and visualize the data, businesses can improve the accuracy and efficiency of their process mining efforts.

## Access the Kibana dashboard

You can access the Kibana dashboard to identify the screens or applications that observers most frequently access and also determine the observer's actions such as clicking buttons, savings forms and areas where they are spending the most time.

---

**Important:** Kibana and Elastic mark and logo are trademarks or registered trademarks of Elastic NV and are used for identification purposes only.

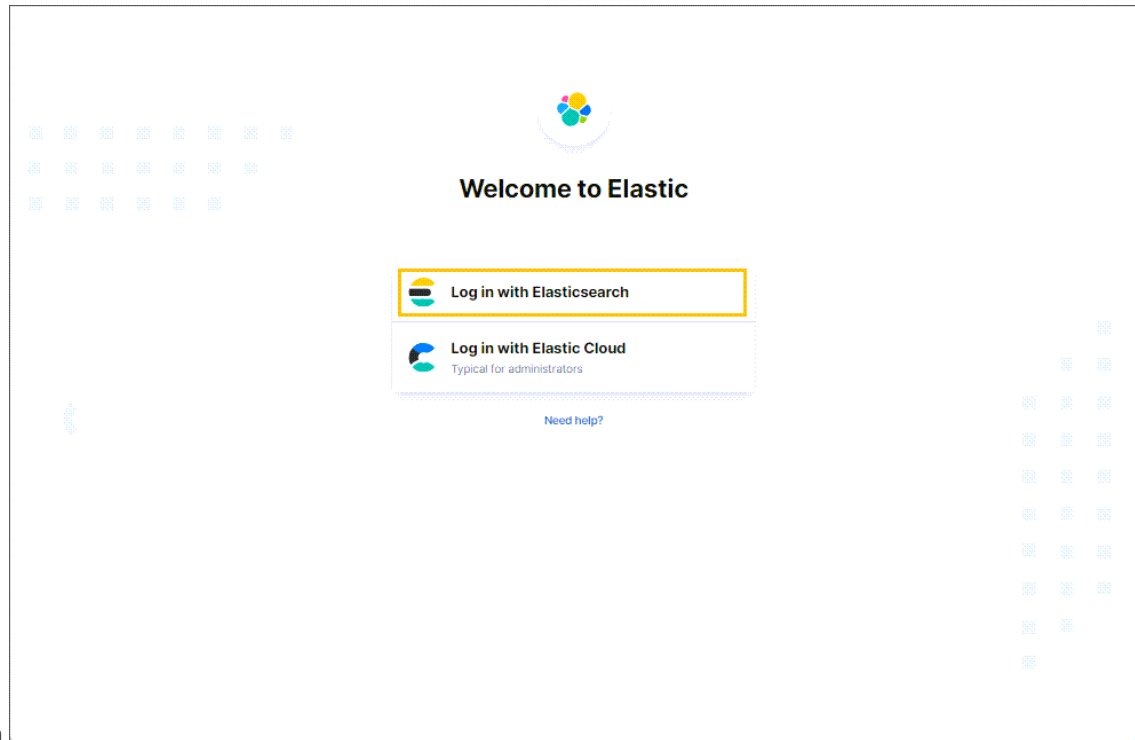

---

**Note:** The examples and graphics provided on this page are for representation purposes only and may not accurately reflect your specific instance. We do not assume responsibility for their maintenance or accuracy.

---

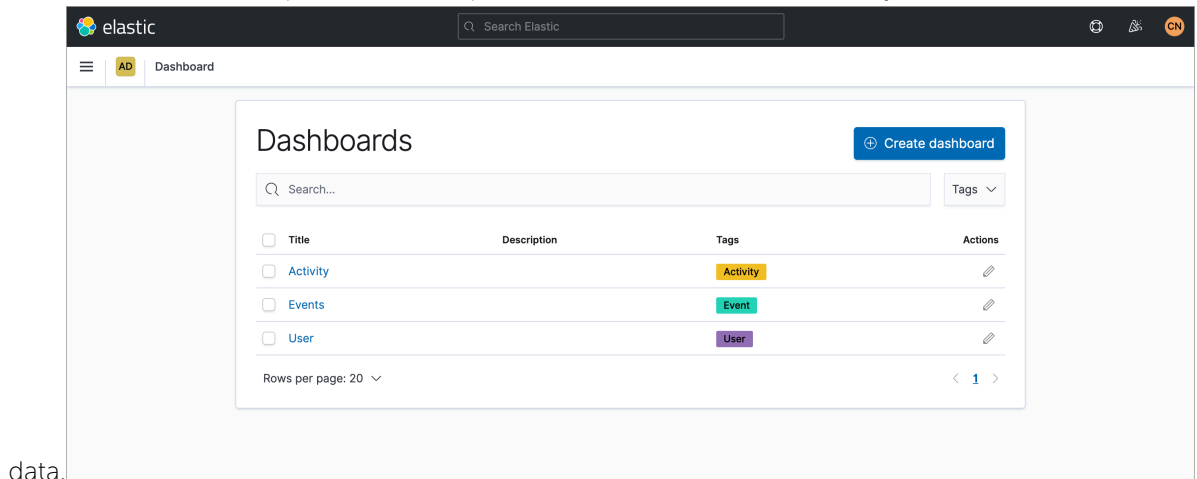

1. Launch the browser and go to your Kibana dashboard. If you do not have a URL to access the dashboard, contact you Automation Anywhere Customer Success Manager (CSM) to get an URL to access the Kibana dashboard.

2. Click **Log in with**

Elasticsearch.

3. Enter the Username and password.
4. Click **Log in** to load the Elastic homepage.  
Elastic displays the three Kibana dashboards Activity, Events, and User assigned to your ID. You can click to select any of these dashboards to explore the observer events which provides a comprehensive and interactive view of your

data.

## Create a cycle

Learn how to create a cycle for each data collection and add permitted users to the cycle so they can access the associated events for data analysis. Cycles are defined as a collection of events based on a set of Observers during a given time range.

Administrators have access to all event data, and can define which Permitted Users (Data Review, Discovery, or Power user roles) can access the cycle data in the Process Discovery platform. The Administrator informs users when the cycle is ready for them to review. Power users and all other non-admin users do not have access to create their own cycles and cannot review data until the Administrator creates the cycle for them. Creating a cycle for Power and all other non-admin users allows the users to access the data to review events and mine for processes.

To create a cycle, perform the following steps:

1. Log in to your Process Discovery platform as an administrator.
2. Navigate to **Data > Cycle**.
3. Click **New Cycle**.
4. In the **CYCLE NAME** field, enter a name for the cycle.  
For example: Cycle 1: Order Entry and Processing.
5. In the **PERMITTED USERS** field, select the users that you want to give access to.  
Permitted users include only the Data Review, Discovery, or Power user roles. You do not need to add Admins as permitted users because Admins can access all event data.
6. In the **OBSERVED AT** field, select the time data range from the Start date to the End date for the set of Observers.
7. In the **OBSERVERS** section, you can multi-select Observers or Observer Users from the drop-down lists. Alternatively, you can select a tag from the Observer tag drop-down list to populate the Observers.  
You can create Observer tags from the Observers page and can use them to identify a team for a cycle. For example, the team is payroll or recruiting in HR where you can select as many Observers as required. In a VDI environment, we recommend that you select Observers from the OBSERVER USER section. This option enables you to easily select from hundreds of Observers and customize based on the cycle you want to create.
8. (Optional) APPLICATION NAMES, click the drop-down list to select applications.
9. (Optional) In the START SIGNATURES, click the drop-down list to select a start signature.
10. (Optional) In the END SIGNATURES, click the drop-down list to select an end signature.
11. (Optional) In NOTES, enter any notes you want to share with the permitted users.
12. Click **Create Cycle**.

## Classify application screens and create web applications

You can review unclaimed browser events such as Google Chrome, Internet Explorer, and so on, to assign them to a specific web application.

When using web applications from the Process Discovery platform, the browser name is captured but the web application or software as a service (SaaS) is not. Web application events (where the application name is not captured) are stored in the Unclaimed Browser Events section of the Web

Applications page. To classify web application events that are related to the task or process, you must create specific web applications for the events to be claimed in the application. From the Web Applications page, you can:

- Review events in the Unclaimed Browser Events section to locate and filter related process events from their native browser applications. Typically, Google Search, personal searches, or web mail events are not relevant to a task or process.
- Create specific web applications that are used in the task or overall process flow, for example: Amazon Web Services, Slack, Zendesk, and so on.

To review events in the Unclaimed Browser Events section and create web applications, perform the following steps:

1. Log in to your Process Discovery platform as a power user.
2. Navigate to **Data > Web Applications**.  
In the Existing Rules section, you will see previously created web applications. In the Unclaimed Browser Events column, you will see various browser application events.
3. In the Unclaimed Browser Events column, click:
  - **Grouped by: Title** to organize the browser events listed in the column by window title.
  - **Grouped by: URL** to organize the events by URL.
4. To filter events in the column, use the data range option under the Unclaimed Browser Events header. Select the start date (Month/Date/Year) and end date (Month/Date/Year). The events column will update and display your results.  
To filter events by specific event tiles, use the search icon. Enter the title in the search field. The events column will update to display your results.
5. To view a browser event, click the link to view the set of events from the Events page.  
The browser events with the highest frequency titles or URLs are displayed at the top of the column. These are the most important events for processes that users are recording.

WINDOW TITLE	EVENTS
New Tab - Google Chrome	82
Prostate cancer lcd10 - Google Search - Google Chrome	9
university radiology npi number - Google Search - Google Chrome	6

Showing 1 - 3 of 3 results

6. From the Events page, verify what web application the events belongs to.

**Tip:** We recommend that you note the web titles or URLs as you review the events because you will create a web rule pattern (regular expression or regex) for each of the targeted web applications. Additionally, you can use the Filter option to locate specific web applications by Observer Name (for example) and click through the events in their workflow. Based on your situation, you might filter on URLs because URLs are unique, whereas titles are not necessarily unique. For example, if you have two applications with HOME as the title, you should use a URL web based rule instead of the title.

7. From the Unclaimed Browser Events column, continue to review the set of browser events from the Events page and determine if the events need to be claimed as web application events.
8. After you have located the titles or URL that you need to create web applications, navigate back to the Web Applications page.

9. Click **Create Web Application**.
10. In the **APPLICATION NAME** field, enter the name of the application.  
For example, enter Google Search ICD 10 Lookup.
11. In the APPLIED RULE TYPE section, select the rule type (Title or URL) to use.  
For example, select Title.
12. In the RULE PATTERN (REGEX) section, enter a pattern that matches the title or URL of your target application in the text box.  
For example, enter icd10 lookup in the text box. We recommend that you remove "Google Search" from the application name because there may be similar events (icd10 lookup) in other browsers that you can also include in the rule pattern.  
You can also click the copy icon to copy the title of the web application and paste into the text box.

For example, you only need the title, KTBSonline and there are two KTBSonline titles listed in the browser events column. The two titles are:

- Verify Login Information | KTBSonline - Google Chrome
- Enroll in Open Enrollment Benefits | KTBSonline - Google Chrome

To capture the events from both titles, you can enter the rule pattern as: Verify Login Information \| KTBSonline - Google Chrome|Enroll in Open Enrollment Benefits \| KTBSonline - Google Chrome, or you can just enter KTBSonline and keep the rule pattern simple.

Continuing with the example for KTBSonline, the backslash (\) character precedes the vertical (|) character to indicate that this is not an OR function in the rule.

To include more than one title in the rule pattern, use the vertical bar (|) character to indicate the OR function. For example, to include results for PDFfiller OR pdfFiller, enter the rule pattern as: PDFfiller|pdfFiller.

The caret (^) character is another commonly used character for creating web rules. Use the caret character at the beginning of the rule pattern when you want to match the exact event title at beginning of the text. For example, you want events only where KTBSonline is at the beginning of the text in the application. In the text box, enter the rule pattern as: ^KTBSonline.

13. Click **Create**.  
The system takes a few minutes to create the web application. To verify that the rule is updated, click the magnifying glass icon in the Actions column. After the web application has completed, a pop-up notification appears in the bottom left corner.

## Applications with auto-assigned screen signatures

Process Discovery automatically assigns a screen signature to the following productivity tools. A screen signature is a descriptive name that identifies a page within an application, such as a spreadsheet in a workbook.

- Adobe Acrobat Reader
- Calculator

- Foxit PDF Reader
- Google Chrome
- Microsoft Access
- Microsoft Excel
- Microsoft InfoPath
- Microsoft Internet Explorer
- Microsoft OneNote
- Microsoft Outlook
- Microsoft Power BI
- Microsoft PowerPoint
- Microsoft SharePoint
- Microsoft Teams
- Microsoft Terminal Services Client
- Notepad
- SAP Logon
- Snipping Tool
- 1cv8

## Review Events and filter data

You can review and filter Events collected from the Observers machine to develop mining insights.

We recommend that you collect Observer events for at least two to five weeks to ensure that all processes assigned to Observers are completed before data analysis begins. After a few weeks of collecting Events, you can review the Events. From the Events pages, Power users can:

- Review events to ensure that data is collected from Observers.
- Use the **Filter** option to sort and display events by single or multiple Observers, application, Observed at (date range), and so on.
- Enlarge individual screens to view Observer events (mouse clicks and keystrokes) in detail.

To review and filter Events, perform the following steps:

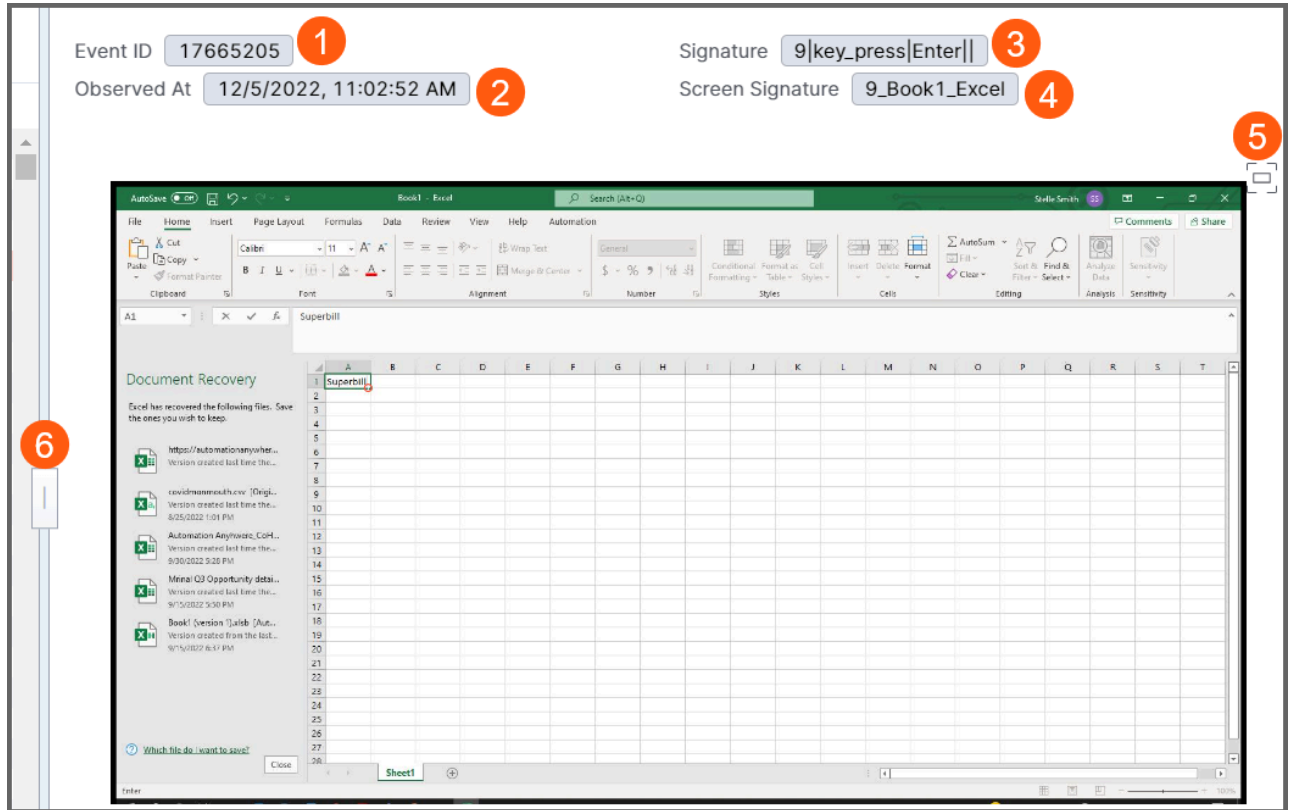

1. Log in to your Process Discovery platform as a power user.
2. Navigate to **Data > Events**.
3. In the upper left side, click the drop-down to select an Observer.  
By default, all Observers events are displayed on the Events page.  
The events collected by the Observer are displayed in the Events table. The total number of Events collected by the Observer is displayed in the Events text box above the table.
4. Click through the event IDs to view the date range (Observed At), Application, Title, and Field columns.  
Click the gear icon to select additional data to view. The selected data displays a green checkmark. For example, you can select Screen signatures, Application, Field, and so on. The data displays in another column within the Events table.

---

**Note:** In the Events table, the Observed At date and time range is the time that a user is looking at the events in the application. The Observed At date range is not related to the Observers location. For example, if the Observer is in India and the user is looking at the events in the application in California, the Observed At date and time is in California time.

---

For each Event ID, the associated Event screen appears to the right. The following image and table describe the metadata (1-4) details associated with the screen and the icons (5 and 6) used to enlarge the image.

	Metadata	Description
1	Event ID	The ID number associated with the event.
2	Observed At	The exact date (Month/Day/Year) and recording time of the event captured by the Observer.
3	Signature	The application screen associated with that event. Each application has a unique ID.
4	Screen Signature	<p>A unique label pattern applied to an application screen to enable process mining.</p> <hr/> <p><b>Note:</b> Although, Screen signatures are partially automatic, modifications are required for data mining. As long as the Screen Signature is logical, multiple Events may share the same Screen Signature. It is important that Screen Signatures describe the screen appropriately because they enable further process mining.</p> <hr/> <p>When you are ready to modify your Screen Signatures work, we recommend that you work with your Customer Success Manager (CSM).</p>

	Metadata	Description
5	Image Viewer icon	Enlarges the image to full screen mode.
6	Slider	Expands the width of the image.

- Click **Filter** to customize the events you want to view.  
Filtering events allows you to better understand the individual steps as part of the overall process you might optimize. For example, you might refer to the Field column for potential start and end tasks of process.
- To filter events for a cycle, select a cycle from the **Cycles** drop-down and click **Apply**. The Events table is updated and updates events for that cycle.
- To filter events using a set of rules with conditions (AND, OR) or create a group (combination of rules), select from the following options or a combination of options:

Option	Action
Add Rule	A Rule is single condition. Use this to add additional conditions, such as AND, OR. Refer to the AND,OR examples for more information.
AND	<p>Filter events only which satisfy BOTH conditions will be included.</p> <hr/> <p>For example, the AND operator is selected and you select Application Name = Acrobat and Application Type = web. The filter rules include events from both Acrobat and web.</p> 
OR	<p>Filter events only which satisfy EITHER condition will be included.</p> <p>For example, the OR operator is selected and you select Application Name = Chrome and Application Type = windows. The filter rules will include only events EITHER in Chrome or in windows.</p> 

Option	Action
Add group	<p>Use this to filter for a combination of rules. A Group can also be a collection of Groups, or a mix of both.</p> <div data-bbox="472 327 1414 772" style="border: 1px solid black; padding: 10px;"> <p>For example, there is a combination of Groups, each with their own group of Rules, collected by an OR operator. The filter rules will include events that are either (on machine AAIComputer_7 AND in Chrome) OR (on machine AAIComputer_4 AND in Excel).</p>  </div>

Option	Action								
Operators	<p>Select from one of the following operators:</p> <table border="1"> <thead> <tr> <th>Option</th> <th>Result</th> </tr> </thead> <tbody> <tr> <td>=</td> <td>The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.</td> </tr> <tr> <td>&gt;, &lt;</td> <td>The condition is greater than, or less than those in the input. For example: ID &gt; 1000. This filter rule will include events where the ID is greater than 1000.  <b>Note:</b> This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.</td> </tr> <tr> <td>&gt;=, &lt;=</td> <td>The condition is greater than or equal to, or less than or equal to those in the input.  <b>Note:</b> This applies only for Observed At and ID conditions.</td> </tr> </tbody> </table> <p><b>Note:</b> The examples provided include some of the more commonly used operators. The full list of operators include:</p> <ul style="list-style-type: none"> <li>• In</li> <li>• !=</li> <li>• Not In</li> <li>• Is Null</li> <li>• Is Not Null</li> <li>• Matches</li> </ul>	Option	Result	=	The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.	>, <	The condition is greater than, or less than those in the input. For example: ID > 1000. This filter rule will include events where the ID is greater than 1000.  <b>Note:</b> This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.	>=, <=	The condition is greater than or equal to, or less than or equal to those in the input.  <b>Note:</b> This applies only for Observed At and ID conditions.
Option	Result								
=	The condition is equal to the input. For example: Application Name=Google. This filter rule will include events where the application is Google only.								
>, <	The condition is greater than, or less than those in the input. For example: ID > 1000. This filter rule will include events where the ID is greater than 1000.  <b>Note:</b> This applies only for Observed At and ID conditions. The Observed At filter is the quantity of any event that is recorded in that exact time.								
>=, <=	The condition is greater than or equal to, or less than or equal to those in the input.  <b>Note:</b> This applies only for Observed At and ID conditions.								

8. Click **Apply** to apply your filter settings and view events.

## Mining for processes

A mining run identifies and analyzes variations in how a business process is performed.

### Determine your mining strategy

Before you create your first mining run, decide on a mining strategy. We suggest the following strategies, however, you should use the strategy that is appropriate for your use case.

- Find the most popular screen in your event reporting interface. You can use the most popular screen as the Center screen. Create a Butterfly Mining Run first using the Center screen Screen

Signature to identify the Start and End Screen Signatures. Next, create a Path-Based Mining Run using the start and end Screen Signatures to identify processes.

For more information, see [Create a Butterfly mining run](#) on page 4092 and [Create a Path-based mining run](#) on page 4090

- Select a single Observer first and delve into their data. Also known as a "day in the life" view, with this strategy, you review the Events for the Observer and identify their processes through mining. Then, mine all Observers together to see which processes they have in common.

For more information, see [Create a Mining Run](#) on page 4084

- Select all Observers and mine all data for processes without using Screen Signatures or parameters. The number of processes generated by the Mining Run might be too many to analyze. This strategy is more appropriate with smaller data sets and a small number of Observers.

For more information, see [Create a Mining Run](#) on page 4084

## Create a Mining Run

Perform exploratory mining to discover processes across an open dataset. You can narrow the results by observer, application, or screen signature. This approach might yield multiple processes, each with different start and end points.

Create a mining run where you can specify time frame, observer, application, and screen signatures.

**Note:** When you run a basic mining run the **Mining Type** (visual output) is a [Flow Graph](#) on page 4086. For Advanced mining runs, the **Mining Type** by default is Flow Graph, but you can select **Path** or **Butterfly**.

1. Navigate to **Data > Mining Runs**.
2. Click **New** and provide the following information:

Field	Description
Observed at	The start and end dates and times for the recorded steps to include in this mining run.
Observers	<p>Select <b>All</b>, <b>Include</b>, or <b>Exclude</b>.</p> <p>If you select <b>Include</b> or <b>Exclude</b>, use the <b>Observers from tag</b> menu to select observers by tag or the <b>Select observers</b> to select observers by device name.</p> <hr/> <p><b>Note:</b> Observer tags are created by an admin and are used to identify a team, such as payroll or recruiting.</p>

Field	Description
Applications	<p>Select <b>All</b>, <b>Include</b>, or <b>Exclude</b>.</p> <p>If you select <b>Include</b> or <b>Exclude</b>, use the <b>Applications from tag</b> menu to select applications by tag or the <b>Select applications</b> to select applications by name.</p> <hr/> <p><b>Note:</b> Application tags are created by an admin and are used to identify a grouping, such as payroll or recruiting.</p> <hr/>
Start screen signature	The screen signature is a descriptive name assigned to each recorded screen. You can view and search for screen signatures from the <b>Data &gt; Events</b> tab.
Stop screen signature	

**3. Click **Create & Run**.**

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 4095.

## Flow Graph

The Flow-based mining run produces the visual output for the Flow Graph, which shows each screen signature only once, resulting in a simplified visual. Additionally, the Flow Graph shows loops and common steps in the process.

## Create a Flow-based mining run

Create a flow graph to visualize the flow-based mining run resulting in a simplified visual.

[Create a cycle](#) on page 4076

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and select the cycle from the drop-down list.
3. Select the **Flow** mining type.
4. Optional: Provide the following information:

Field	Description
Min path length	Set the minimum length for a path to be included in the output.
Max path length	Set the maximum length for a path to be included in the output.
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	<p>If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens:</p> <ul style="list-style-type: none"> <li>• <b>Dependency:</b> Uses a statistical model based on the frequency that certain events lead to one-another or to many others</li> <li>• <b>Frequency:</b> Returns the screen signatures appearing most frequently in the event logs for the given filter rules</li> <li>• <b>Interactivity:</b> Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates</li> <li>• <b>Copy Paste:</b> Looks at controls to determine which screens are copied from most frequently</li> </ul>

Field	Description
Path filter	<ul style="list-style-type: none"> <li>• Frequency: Ranks paths by total frequency of occurrence</li> <li>• Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths</li> <li>• Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -&gt; B -&gt; A -&gt; C], it is converted to [A -&gt; B-&gt; C]</li> </ul>
Merge starts (optional)	If there are multiple start screens, Process Discovery combines all those start screens into a single process, instead of creating a process for each start screen
Shortest path (optional)	If the mining run has a defined start and end screen, Process Discovery finds the longest path between a start and an end screen, which might generate a path with repetitions of the start screen. If you select <b>Shortest path</b> , Process Discovery looks for the shortest path between the start and end screens

**5.** Click **Create & Run**.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page with the discovered processes below it.

[Using the Flow Graph to find common steps and loops](#) on page 4089

## Export Process as CSV

You can export a process to a CSV file for offline data analysis

To export the process as a CSV:

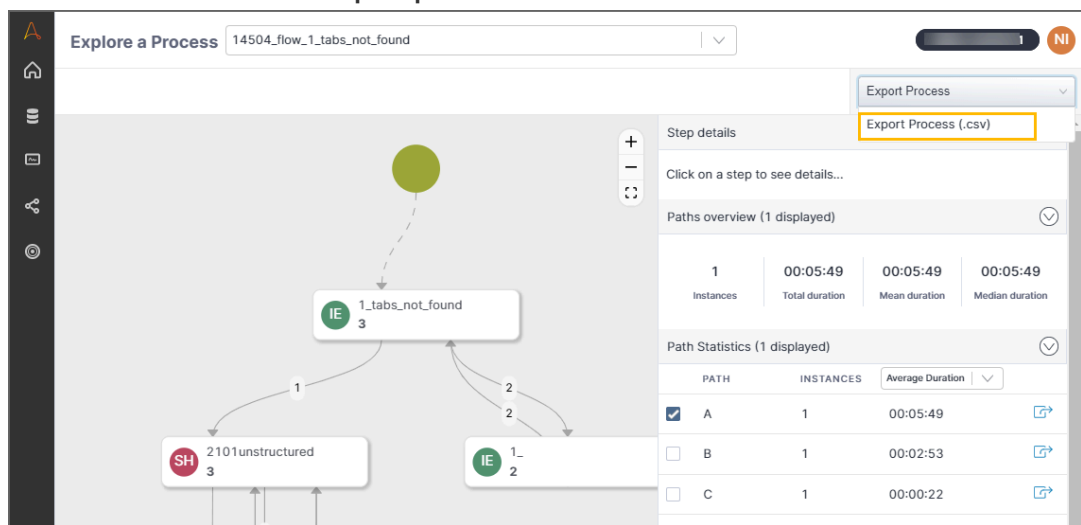

- 1.** Click **Mining Runs**.
- 2.** Expand the process that contains the Flow Graph you want to export.
- 3.** Do one of the following:
  - a)** Click **Export Process as .csv**.

The screenshot shows the Mining Runs interface. On the left is a navigation menu with 'Mining Runs' selected. The main area displays a table of processes. A detailed view of a process is shown on the right, including mining level, observer name, and observed time ranges. A table below shows a list of processes with columns for Mining Type, Name, Tags, Comment, Applications, Total, Step Count, and Actions. A context menu is open over one of the processes, showing options like 'Visualize Process' and 'Export Process as .csv'.

MINING TYPE	NAME	TAGS	COMMENT	APPLICATIONS	TOTAL...	STEP COUNT	TOTAL...	ACTIONS
Flow	14763_flow_7_54731...		+ Add comment	IE EX + 1	1	11	00:01:10	View Details
Flow	14763_flow_7_32064...		+ Add comment	EX + 6	4	29		Visualize Process
Flow	14763_flow_7_32064...		+ Add comment	EX + 4	1	17		View Instances
Flow	14763_flow_7_31025...		+ Add comment	NO EX + 1	1	10		Export Process as .csv
Flow	14763_flow_7_28156...		+ Add comment	EX + 1	1	3		Delete
Flow	14763_flow_7_23753...		+ Add comment	EX	1	3	00:00:04	

b) Click **Visualize Process > Export process.**

4. Open the CSV file to see the exported data.

## Using the Flow Graph to find common steps and loops

Identify the most common steps in a path or the paths which contain that step, as well as any process loops, where a user returns to a previous screen or application.

Create a flow-based mining run. See [Create a Flow-based mining run](#) on page 4087

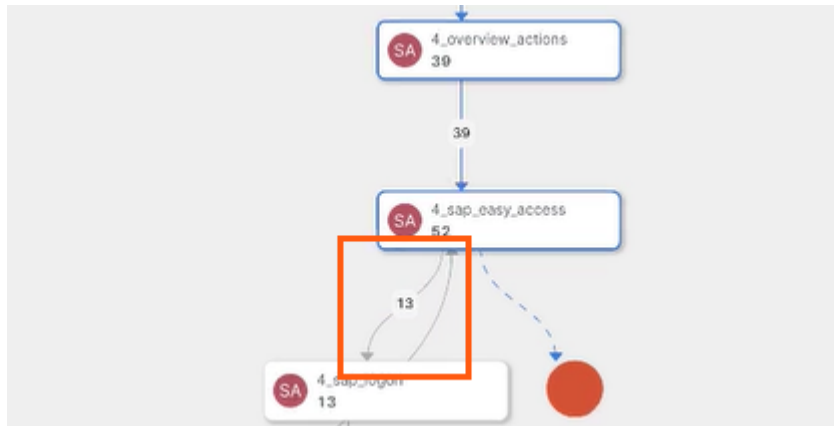

After the mining run is completed, the Mining Runs page displays the flow-based mining run with the identified processes.

1. Expand the list of processes for the completed mining run.
2. Under the Actions column, click the downward-pointing arrow then **Visualize Process.**
3. Use the following flow graph visualization features to identify automation or optimization opportunities:
  - Most popular path: The first path in the right-side panel is the path that contains the most commonly-occurring steps. The subsequent paths are organized in descending order of how often the steps occur in the variations of that path.

- Most common steps: A pink line highlights the most common connection between steps. Click on a step that is intersected by a pink line to see all the paths that contain the connection.

- Process loops: In a process loop, a user returns to a previous application or screen. Look for arrows that point to a previous step, such as in the graphic below.

[Analyze and prioritize processes](#) on page 4095

## Create a Path-based mining run

The Path-based mining run type finds patterns in the data and generates processes based on the set parameters.

[Create a cycle](#) on page 4076

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and select the cycle from the drop-down list.
3. Select the **Path** mining type.
4. Optional: Provide the following information:

Field	Description
Min path length	Set the minimum length for a path to be included in the output.
Max path length	Set the maximum length for a path to be included in the output.
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	<p>If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens:</p> <ul style="list-style-type: none"> <li>• Dependency: Uses a statistical model based on the frequency that certain events lead to one-another or to many others</li> <li>• Frequency: Returns the screen signatures appearing most frequently in the event logs for the given filter rules</li> <li>• Interactivity: Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates</li> <li>• Copy Paste: Looks at controls to determine which screens are copied from most frequently</li> </ul>
Path filter	<ul style="list-style-type: none"> <li>• Frequency: Ranks paths by total frequency of occurrence</li> <li>• Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths</li> <li>• Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -&gt; B -&gt; A -&gt; C], it is converted to [A -&gt; B-&gt; C]</li> </ul>
Merge starts (optional)	If there are multiple start screens, Process Discovery combines all those start screens into a single process, instead of creating a process for each start screen

Field	Description
Shortest path (optional)	If the mining run has a defined start and end screen, Process Discovery finds the longest path between a start and an end screen, which might generate a path with repetitions of the start screen. If you select <b>Shortest path</b> , Process Discovery looks for the shortest path between the start and end screens

5. Click **Create & Run**.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. When the mining run is complete, it appears in the **Data > Mining Runs** page with the discovered processes below it.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 4095.

## Create a Butterfly mining run

The Butterfly Mining run type shows the flow in and out of a screen. Use this type to identify all the paths that include this screen, as well as the steps before and after that screen.

1. Navigate to **Data > Mining Runs**.
2. Click **New**, navigate to the **Advanced** tab, and provide the following information:

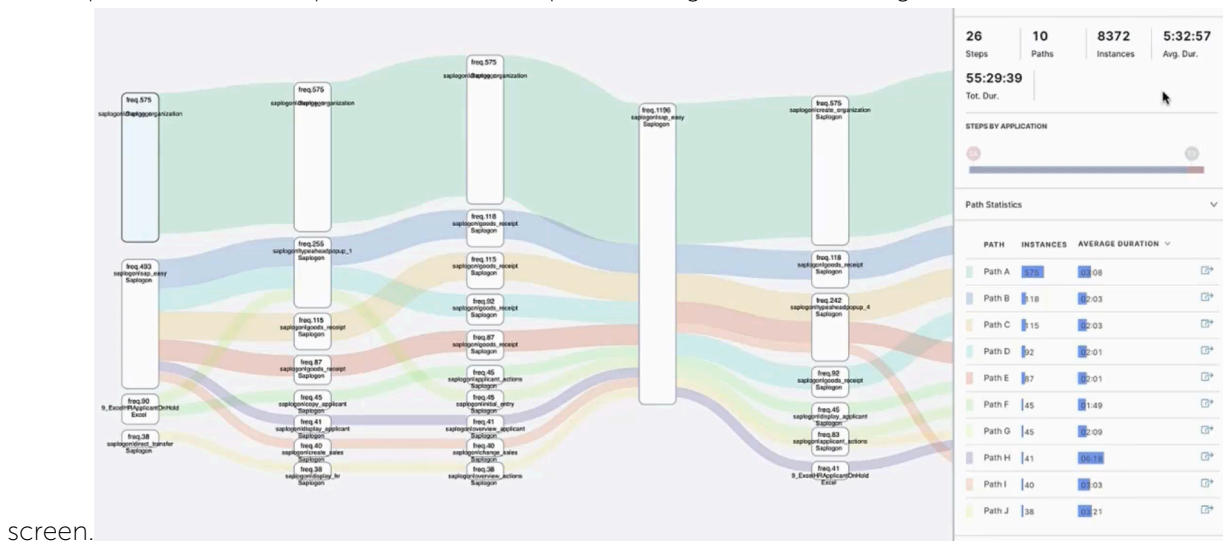

Field	Description
Mining level	Ensure <b>Screen Signature</b> is selected
Mining type	Ensure <b>Butterfly</b> is selected
Filters	Create rules to filter which of the recorded screens to include in this mining run.

Field	Description
Center Screen Signature: Screen signature	Specify a screen that all the paths must include.  The screen signature is a descriptive name assigned to each recorded screen. You can view and search for screen signatures from the <b>Data &gt; Events</b> tab.
Center Screen Signature: Signature label	<b>Field:</b> The name of the field the user interacted with  <b>Control key:</b> The keyboard or mouse control key the user pressed, such as a left click or "Enter"  You can find field and control key data in the <b>Data &gt; Events</b> page.
Must Include Screen Signature (optional)	Include additional screen signatures that the paths must contain
Number of events before center	The number of steps before the center screen to include in the paths
Number of events after center	The number of steps after the center screen to include in the paths
Number of processes	Sets a maximum number of unique starting screens
Number of paths	Sets a maximum number of total paths
Start strategy	If you do not provide a start screen, Process Discovery uses one of the following algorithms to determine potential start screens: <ul style="list-style-type: none"> <li>• Dependency: Uses a statistical model based on the frequency that certain events lead to one-another or to many others</li> <li>• Frequency: Returns the screen signatures appearing most frequently in the event logs for the given filter rules</li> <li>• Interactivity: Uses a ratio of unique appearances of screens to the amount those screens are interacted with to determine good start candidates</li> <li>• Copy Paste: Looks at controls to determine which screens are copied from most frequently</li> </ul>

Field	Description
Path filter	<ul style="list-style-type: none"> <li>• Frequency: Ranks paths by total frequency of occurrence</li> <li>• Levenshtein: Ranks paths based on frequency and similarity to other frequently appearing paths</li> <li>• Dedup: Includes only the first occurrence of a screen in a unique path, then runs the default filtering on the results. For example, if a process flows through these screens [A -&gt; B -&gt; A -&gt; C], it is converted to [A -&gt; B-&gt; C]</li> </ul>

3. Click **Create & Run**.

Process Discovery performs the mining run. The length of time necessary to complete the mining run depends on the size of the data set. The output is a sankey chart, which provides a visual representation of the paths through the selected signature

screen.

Review the processes identified by the mining run. See [Analyze and prioritize processes](#) on page 4095.

## Export Mining Runs

You can export a mining run to a CSV file for offline data analysis.

To export a mining run as a CSV:

### 1. Click **Mining**

CREATED AT	CREATED BY	COMMENT	DETAILS	PROCESSES	STATUS	ACTIONS
Jul 16, 2023		+ Add comment	Mining Level: Screen Signature End Screen Signatures: 2347_Invoice_Detail s:Submit(Field) AND Application Name In Excel,FinApp,Saplogon, PDF Viewer Observer Name In aaicomputer_3-user_3,aaicomputer_6-user_6,aaicomputer_12-user_12,aaicomputer_10-user_10,aaicomputer_13-user_13,aaicomputer_15-user_15,aaicomputer_4-user_4,aaicomputer_9-user_9,aaicomputer_17-user_17,aaicomputer_5-user_5,aaicomputer_16-user_16,aaicomputer_7-user_7,aaicomputer_20-user_20,aaicomputer_1-user_1,aaicomputer_14-user_14,aaicomputer_11-user_11,aaicomputer_18-user_18,aaicomputer_2-user_2,aaicomputer_19-user_19,aaicomputer_8-user_8 Observed At >= 2022-11-09T00:00:00.000Z Observed At <= 2022-11-09T23:59:00.000Z	3	import..	Clone Delete Export Mining Run as .csv Explore Events
Jul 13, 2023		+ Add comment	Mining Level: Screen Signature AND Application Name In Saplogon,Excel	20	import..	
			Mining Level: Screen Signature AND Observer Name In AAIComputer_0-User_0,aaicomputer_6-user_6,aaicomputer_10-user_10,aaicomputer_11-user_11,aaicomputer_12-user_12,aaicomputer_13-user_13,aaicomputer_14-user_14,aaicomputer_15-user_15,aaicomputer_16-user_16,aaicomputer_17-user_17,aaicomputer_18-user_18,aaicomputer_19-user_19,aaicomputer_2-user_2,aaicomputer_3-user_3,aaicomputer_4-user_4,aaicomputer_5-user_5,aaicomputer_7-user_7,aaicomputer_8-user_8,aaicomputer_9-user_9			

2. Click the drop-down in the **ACTIONS** column corresponding to the mining run you want to download.
3. Click **Export Mining Run as .csv**.
4. Open the CSV file to see the exported data.

## Analyze and prioritize processes

Map and compare workflows using data visualization tools. Prioritize processes based on ROI and select a process for automation opportunities.

- Create a mining run from the Mining Runs page: [Mining for processes](#) on page 4083
- From the Process Explorer page, review the various paths taken by the observers, where the thickest path is the most frequent path taken.
- Identify the path you want to view from an event-level.
- Click the **View in Instances Viewer** icon to navigate to the Instances Viewer page where you can select and annotate events to include in a PDD. You can also select a process to annotate directly from the Instances Viewer page.

1. Log in to your Process Discovery platform as a power or discovery user.
2. Navigate to **Data > Instances Viewer**.
3. In the upper-left side next to **View Instances**, click the drop-down to select a process to visualize.

Order	Title	App	Action	Value	Observer Name	INSTANCE	EVENTS
1	2afbc2c...	Excel	MOUSE_CL...		aaicomputer_20-user_20	Instance 4 of 60	78
2	2afbc2c...	Excel	MOUSE_CL...		aaicomputer_20-user_20	Instance 5 of 60	78
3	2afbc2c...	Excel	MOUSE_CL...		aaicomputer_20-user_20	Instance 6 of 60	78
4	SAP logn...	Saplogon	MOUSE_CL...		aaicomputer_20-user_20	Instance 2 of 60	76
5	SAP logn...	Saplogon	MOUSE_CL...		aaicomputer_20-user_20	Instance 1 of 60	62
6	SAP	Saplogon	KEY_PRESS		aaicomputer_20-user_20		

**Note:** Instances are different methods used to navigate through the same path to complete a process. Each instance can share the same screen signatures, but can also contain different signatures depending on the path taken.

4. After the process displays on the page, click the drop-down to select the instance to include in the PDD.
5. Click the gear icon to add the **Include in Process** column.  
The **Include in Process** column provides you a check box for each line order (refer to the Order column) used to specify which steps to include in the PDD.
6. Click **Annotate** to update field labels for the selected steps. For all steps that you want to include in the PDD, leave the box checked and update the action and label from the screen on the right.  
Two fields will appear above the screen image.
7. From the drop-down, select a **Control Type**.  
The **Control Type** refers to the selection performed in the application.
8. In the text field, enter a control label description for the **Control Type** and click **Update**.  
We recommend that you enter a label description that corresponds with the label in the screenshot so that when users review the PDD, the output makes sense to them.  
For example, select Button from the **Control Type** drop-down and enter Click New Ticket in the description field.  
The **Ann** column will display user and the **Field** column will display the description entered in the text field.
9. Repeat steps 6 through 8 for all steps that you want to annotate.  
The **Save Instance to Process** button is enabled for all checked items that include both a label and description. You must annotate all instances you want included in the process for the **Save Instance to Process** button to appear.
10. Click **Save Instance to Process**.  
The **View Process Details** button appears.
11. Click **View Process Details** to name the process.
12. In the **Name** field, enter a name for the process using this suggested format: 5577-21245E Instance 1 for <Mining Run><Process><Path><Instance>.
13. Click **Save Process** to save the process with a name.

A message appears at the bottom left side notifying you that the process is saved successfully. Click the hyperlink to return to the **Process Explorer** page. You can now create groups for the events and generate a PDD.

[Creating groups for the process and generate a PDD](#) on page 4097

## Creating groups for the process and generate a PDD

Learn how to create different groups with start and stop events, and use the groups to design a Process Definition Document (PDD).

After you selected your instances, you can create groups for the events and build your PDD.

1. Click **Create Group** to place the steps in different groups for the PDD.

You can create groups for tasks that are part of the process.

2. In the **Create Group** window, drag a step from the process workflow and move it into the **Start Node**.

The Start Node is the beginning of the task. For help building the group of steps as tasks in the overall process, refer to the **View Instances** page for the selected screens. For example, to create tasks related to completing fields on a checkout page, you can

- Group all steps in one group and name the group Checkout; or
- Create multiple groups for individual tasks like Add Payment in one group or add Shipping address in another group.

3. Select the last step in the group and place the screen in the **End Node(s)**.

The End Node(s) is the end of the task.

4. Enter a name in the **Group Name** text box.

5. Select a color for the group from the drop-down next to the **Group Name** text box.

6. Click **Save** to save the group.

7. Repeat steps 2 through 6 for all steps you want to group.

8. Open a new browser tab and navigate to the Process Discovery platform.

9. From the left pane, navigate to **Models > Diagram Composer**.

In the **Browser Processes and Groups** section, the instances and groups are displayed.

10. Click the + sign to add a flow box for each group.

Each flow box appears on top of the previous box. Move these boxes into a row or column. The groups are listed in reverse order from when they were created.

11. To connect one flow box to another flow box, click the > on the side of the flow box and drag the arrow to connect the boxes.

12. To document a process with branches, click the **Decision Point**.

A diamond shape flow box appears in the composer.

13. In the **Details** window, click the pencil symbol to enter a name for the decision point.

14. Repeat steps 10 through 13 until you have completed adding flow boxes for all groups in the PDD.

15. Click **Auto Layout** to display any missed connections.

16. Update the flow boxes as needed.

17. To save your PDD, specify a name in the text field and click **Save**.

The **Generate PDD** button appears.

18. Click **Generate PDD** to start generating a PDD.
19. Select **Yes** or **No** to include an image appendix.  
The image appendix includes full-sized screen shots of the steps.

---

**Note:** The default images for each step is a zoomed-in snippet of the events interaction point.

The events interaction point is the area on the screen where the user is focused which is typically denoted by a red circle on the screen shot.

---

The Process Specifications page appears and the message Generating PDD displays in the bottom left corner.

20. Click **Download PDD** to open the PDD document.  
The generated Word document is available from your Downloads folder on your machine. The zip file contains all the images.
21. Review and modify the document, (if needed) and then save your PDD.

## Getting started with Privacy Enhanced Gateway

Control the data that the Process Discovery cloud platform receives by using the Process Discovery Privacy Enhanced Gateway (PEG). PEG redacts sensitive data that is included in video frames collected by the Process Discovery desktop sensor. This redaction occurs within your own Virtual Private Cloud (VPC) before the data is forwarded to the Process Discovery cloud for analysis.

Install Privacy Enhanced Gateway (PEG) to limit Personally Identifiable Information (PII) and sensitive data capture: [Install PEG on page 4099](#)

---

**Important:** We recommend using Process Discovery version 3.3.16 and above for higher data reliability. This would ensure that the error rate, if any, is within acceptable limits of the Process Discovery Platform to process events data effectively without any issues for events synced across Privacy Enhanced Gateway (PEG) and the Process Discovery Platform.

---

After performing the installation steps, configure PEG to mask words and send the redacted images to the Process Discovery platform: [Configure PEG image redaction on page 4114](#)

---

**Note:** Learn how to use Process Discovery Privacy Enhanced Gateway (PEG) with Automation Anywhere University for hands-on learning that is designed for beginners to advanced developers. Instructor-led training options are also available.

For more information, see [Process Discovery for Administrators \(A-People login required\)](#): Access the Process Discovery for Administrators learning trail.

---

## Install PEG

Review the prerequisites and installation process.

### Before you start installation

- PEG runs as a virtual machine (VM) in your Virtual Private Cloud (VPC). PEG deployments are supported on AWS, Microsoft Azure, and Google Cloud Platform. Automation Anywhere will provide cloud images for you to deploy. To obtain the PEG image, see [Obtain the PEG image \(A-People login required\)](#).
- Review the information on [Deployment and networking requirements](#) on page 4099

### Installation steps

1. [Create certificates](#) on page 4102
2. [Create DNS entries and deploy PEG VM](#) on page 4104
3. If you require a proxy: [Configure PEG to work with a proxy](#) on page 4104
4. [Set up and configure PEG](#) on page 4106
5. [Validate PEG is running](#) on page 4108

---

**Note:** Through the installation process, replace the values within angle brackets with your actual values and remove the angle brackets. For example:

- <apex domain> might be replaced by example.com.
  - <UID> might be replaced by 123456ab-789c-12de.
- 

### After installation

[Create image viewer user in analytics portal](#) on page 4111

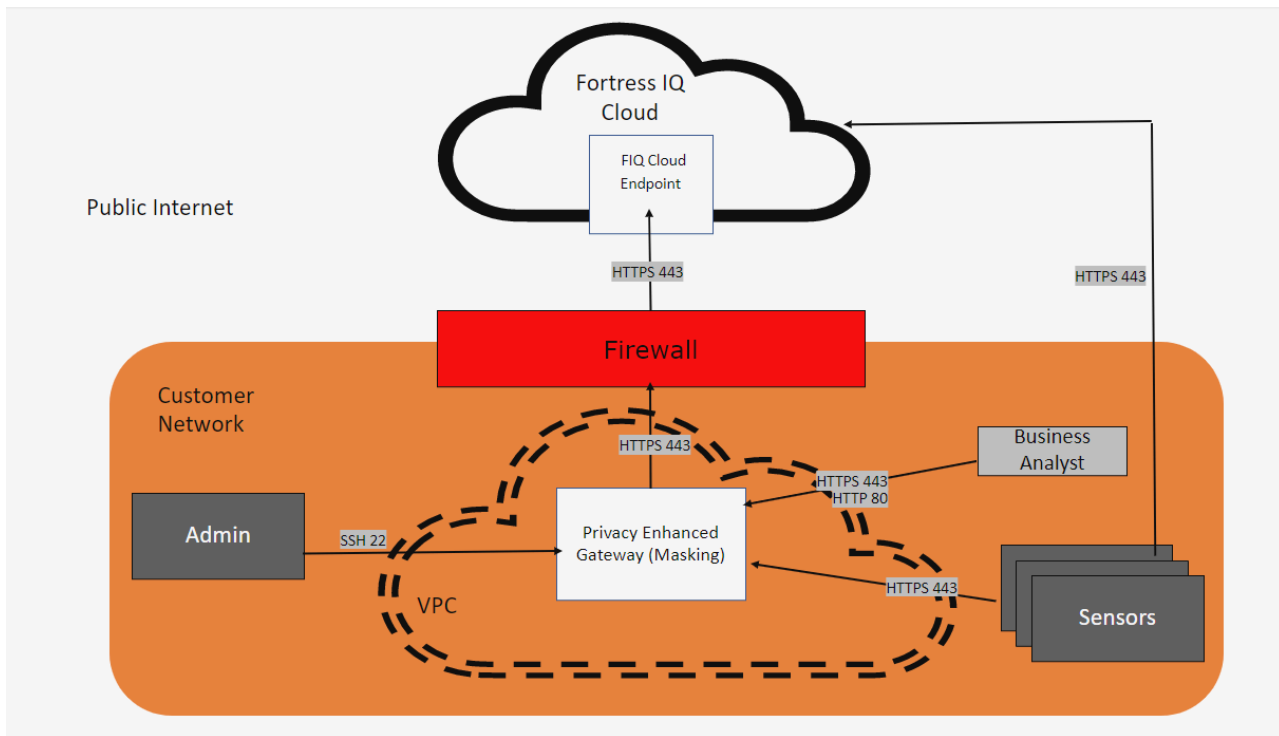

## Deployment and networking requirements

Learn about the deployment architecture based on certificates for HTTPS connections and the associated port, storage, VM and DNS requirements.

### Deployment

With this deployment model, all connections to PEG remain within networks that you control.

Architecture

## Port requirements

The following table lists the port requirements for ingress and egress IP addresses.

Port	Protocol	Purpose	Ingress private IP	Ingress public IP	Egress to public internet
22	TCP	ssh connectivity for Admin	#		
443	TCP	Ingress Desktop sensor and business analyst connectivity over HTTPS (TLS 1.2) Egress PEG sends redacted data to Process Discovery. Also used to pull down PEG installer, updates, and so on from our repositories Sensor connects directly to Process Discovery cloud to get configuration information only. No collected data is sent directly from the sensor to the Process Discovery cloud.	#		#

Port	Protocol	Purpose	Ingress private IP	Ingress public IP	Egress to public internet
80	TCP	Used for redirection from http to HTTPS (443)	#		

## Data encryption

Data is encrypted when transmitted from PEG to the Cloud environment. The following are data encryption policy and practices in place to ensure data privacy and security:

- Secure Transmission Protocol (STP): The PEG system employs HTTPS for all data transmissions to the cloud platform, ensuring the use of encryption in transit and safeguarding against data breaches.
- Transport Layer Security (TLS) Encryption: Data transferred from PEG to the Cloud is encrypted using the TLS protocol, which is an industry standard for secure web communications.
- Confidentiality and Integrity: The encryption provided by HTTPS preserves the confidentiality and integrity of the data sent from PEG, preventing unauthorized disclosure and alterations.
- Authentication via Certificates: The Cloud platform's identity is authenticated using digital certificates as part of the HTTPS protocol, which helps prevent hacks and attacks, and unauthorized data access.
- Robust Encryption Algorithms: HTTPS incorporates strong encryption algorithms, including Advanced Encryption Standard (AES) and Rivest–Shamir–Adleman (RSA), to create a secure channel for data exchange.

## VM size requirements

The following VM sizes are supported for PEG installation:

- Microsoft Azure: NC8as T4 v3
- AWS: g4dn.4xlarge
- Google Cloud Platform: N1-highmem-8 with 1 nvidia-tesla-t4 GPU

Note: Each PEG VM can handle 10 sensors per calendar week, with each sensor sending data for approximately eight hours each day for five days a week.

## Storage requirements

Ensure that your OS or root disk has 2 TB of nearline SSD storage or more. Encrypt the disk using your platform's storage encryption mechanisms.

---

**Note:** The MiNIO and K-Lite marks and logo are trademarks or registered trademarks of MiNIO and K-Lite Codec Pack and are used for identification purposes only.

---

MiNIO serves as our in-house unstructured data storage that stores all images that are generated by the Process Discovery sensor:

- Data Protection: MinIO supports erasure coding and bitrot protection to safeguard data against hardware failures and data corruption.
- Security: MinIO provides robust security features such as encryption in transit (TLS) and at rest, identity and access management (IAM), support for bucket policies, and access control lists (ACLs).

In addition to storing unstructured data some text files such as the past list and block list are also stored in MinIO. However, the images are accessed from the K-Lite url and never directly from MinIO. The storage has a browser-based access which can be used in case of a debugging procedure or if an additional check is required for any original image that has been forwarded.

The following scenarios are supported:

- A read only user which is used by K-Lite to read images and display them in the UI
- A storage admin user that can be used for tasks requiring additional permissions

## DNS requirements

You will provide PEG with an apex domain name that you want to use (for example, example.com). Based on that, PEG will inform you about the DNS sub domain records that you must create.

## Create certificates

Create certificates as part of installing PEG.

You can create certificates by using one of two options.

- Option 1: [PEG generates keys and CSRs](#).
- Option 2: Create your own keys and certificates.

In both cases, you will need the following:

- Unique ID (UID): Each PEG VM you run must have a unique id. You can define the UID to be anything you want as long as it meets the following criteria:
  - Less than or equal to 18 characters in length
  - Contains only letters from a to z, numbers from 0 to 9 and/or hyphens
  - Must not begin or end with a hyphen
  - Must not contain consecutive hyphens
- **Tip:** To easily create a UID, take the last 18 characters of a GUID generated from an online GUID generator.
- The apex domain that you want to use for the PEG DNS names (for example, example.com)

---

## Option 2 - Create your own keys and certificates

Learn how to create keys and certificates before you deploy PEG.

Keys and certificates must be in Base64 PEM format (called openssl or PKCS #8 for the key format in some systems). Create certificates according to [Common Tasks - Creating the certificates](#) on page 4103. Keys must not be password protected. Also, ensure that your keys match the file names in the Key File Name column of, [Common Tasks - Creating the certificates](#) on page 4103.

## Common Tasks - Creating the certificates

Learn how to create Base64 PEM certificates.

When you create the certificates, create six server Base64 PEM certificates (called openssl format in some systems), with domain names and file names mapped as follows, where the UID is provided to you by Process Discovery and the apex domain is your apex domain that you will use for PEG. Each certificate you create must just contain the leaf certificate and not the full chain.

Table 21: Mapping of domain names to certificate file names

Domain	Cert file name	Key file name (Required only if you created your own keys)
analytics-fiq-<UID>.<apex domain>	analytics-cert.pem	analytics-key.pem
proxy-fiq-<UID>.<apex domain>	proxy-cert.pem	proxy-key.pem
storage-fiq-<UID>.<apex domain>	storage-cert.pem	storage-key.pem
st-fiq-<UID>.<apex domain>	st-cert.pem	st-key.pem
dlp-fiq-<UID>.<apex domain>	dlp-cert.pem	dlp-key.pem
es-fiq-<UID>.<apex domain>	es-cert.pem	es-key.pem
klite-fiq-<UID>.<apex domain>	klite-cert.pem	klite-key.pem

**Note:** You can create one certificate with all of the SANs. You can also create just one key if you create keys if you want. However, you will still need to make sure there are seven copies of that certificate and seven copies of that key (if you created keys) named as indicated previously. Do not create a wildcard certificate.

### Create certificates option 1: PEG generates keys and CSRs

Learn how to use PEG to generate the keys and CSRs for you.

1. Log in to PEG through ssh.  
If you do not log in as user named `peguser`, then ensure that you switch to the `peguser` per this command before performing these steps.  

```
sudo su - peguser
```
2. If you already have a unique ID (UID) by Process Discovery, run the following command:  
`echo "<UID>" > ~/.kudzu/appliance.txt`, where UID is the unique ID that you were provided. If you do not have a UID, the next few steps will generate one for you.
3. Run `cd peg && ./peg_start.sh`.
4. Select **Cluster management**.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←)
> Cluster Management
 Redaction Management
 Vault Management
```

5. Select **Generate Certificate Requests**.

```
Which function would you like
 Install Cluster - Cloud Managed
 Install Cluster - On Premise
> Generate Certificate Requests
```

6. Fill out the options that follow.
7. Exit the menu.
8. Please record the UID value that you see in the output of this command: `cat ~/.kudzu/appliance.txt`  
The CSRs are located in `~/peg/csr`.
9. Create certificates from those CSRs per [Create certificates](#) on page 4102.

## Create DNS entries and deploy PEG VM

Create DNS entries and deploy PEG VM as part of installing PEG.

Create DNS entries where each domain mentioned in [Table 1](#), points to the PEG VM (PEG must have a static IP or a static domain name).

## Configure PEG to work with a proxy

Configure PEG to use a proxy for outbound traffic if required.

Deploy PEG VM

---

**Note:** When you deploy the PEG VM, ensure that it has a static IP or at least a static domain name. To configure the VM static IP address, use the mechanism provided by your VPC provider.

---

1. Log in to the PEG VM through ssh.
2. Copy your proxy certificate, if one is required, to the following locations:

---

**Note:** The proxy file name must have a `.crt` extension and must be in the Base64 PEM format (called openssl format in some systems).

---

- ```
sudo cp <your proxy certificate.crt> /usr/local/share/ca-certificates/
```
- ```
sudo cp <your proxy certificate.crt> /peg_v/certs/
```

3. For the OS to load the certificate, run the following command: `sudo update-ca-certificates`

4. Add the following to the `/etc/environment` file (including the username and password if required) using the `http_proxy` and `https_proxy` values for your environment.

**Note:** Although this is not a requirement, the `https_proxy` value is often the same as the `http_proxy`, with the protocol being HTTP for both.

Enter the URL in the following format: `<your http/https proxy url>`

Enter the username and password if required: `http://username:password@host:port/`

```

```

```
http_proxy=<your http proxy url> https_proxy=<your https proxy url>
```

```
no_proxy="localhost,::1,127.0.0.0/8,0.0.0.0,10.0.0.0/8,192.168.0.0/16,172.16.0.0/16"
```

5. Log out of your ssh session and then log back in.  
This allows the proxy settings to be picked up by the operating system.
6. Edit the following values as follows in `~/peg/text_pipeline/values-gpu.yaml`. (These values are at the bottom of the file).  
Enter the URL in the following format: `<your https proxy url>`. Enter the username and password if required. `http://username:password@host:port/`

If you do not use a certificate for the proxy, `fluentd_cert_path` should be left as follows: ""

```

```

```
has_fluentd_proxy: "true"
```

```
fluentd_cert_path: "/peg_v/certs/<your proxy.crt>"
```

```
https_proxy: "<your https proxy url>"
```

```

```

7. If you performed the steps in before performing the proxy steps outlined in the previous steps, perform the following steps:
  - a) Run `cd peg && ./peg_start.sh .`
  - b) Select Cluster Management and press Enter, and then select Load Certificates and press Enter again.

```
No Products Found
[~] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and Enter)
> Cluster Management
```

```
Which function would you like
Install Cluster - Cloud Managed
Install Cluster - On Premise
Generate Certificate Requests
> Load Certificates
```

## Set up and configure PEG

Configure PEG for your environment.

If you require a proxy configuration, first perform the steps outlined in [Configure PEG to work with a proxy](#) on page 4104.

Ensure the following:

- Unique ID (UID) provided by Process Discovery
- Platform endpoint provided by Process Discovery
- PEG-managed certificates: the apex domain that you want to use for the PEG DNS names (for example, example.com)

1. Log in to PEG through ssh.

---

**Note:** If you do not log in as user named peguser, then ensure that you switch to the peguser before performing these steps: `sudo su peguser`.

---

2. Run the following commands:

```
echo "<apex domain>" > ~/.kudzu/apex_domain.txt
```

```
echo "<UID>" > ~/.kudzu/appliance.txt
```

```
echo "127.0.0.1" > ~/.kudzu/external_ip.txt
```

```
echo "CSRs Generated" > ~/.kudzu/csr_log.txt
```

3. Modify the existing values in `~/peg/text_pipeline/values-gpu.yaml` as seen here. Do not include a slash at the end of the URL.

```
external_fluentd_url: "https://<Automation Anywhere provided platform endpoint>"
```

```
external_fluentd_port: "443"
```

4. Confirm that the PEG VM can reach the Process Discovery platform by running the following: `curl https://<Automation Anywhere provided platform endpoint>`

Use the platform endpoint based on where your cloud tenant is located:

Region	Process Discovery provided platform endpoint
United States	https://tr-na-000-fluentd-web.fortressiq.com
United Kingdom	https://tr-uk-00-fluentd-web.fortressiq.com
Australia	https://tr-au-00-fluentd-web.fortressiq.com
Canada	https://prod-ca-001-fluentd-web.fiq-process-intelligence.com

The following message is displayed:

400 Bad Request

'json' or 'msgpack' parameter is required.

Although that result is an error response, it is expected as the curl is not sending a well-formed message. The response confirms that the server received the request and responded.

5. Copy the PEG certificates that you created to `/peg_v/certs/` directory.  
Ensure that they are named according to the certificate file names in [Create certificates](#) on page 4102.
6. If you also created your own keys, copy the PEG keys that you created to the `/peg_v/keys/` directory. Ensure that the keys are not password protected. Also, ensure that they are named according to the certificate file names in Table 1.  
If you did not create your own keys, the PEG-generated keys are automatically included by PEG.
7. Run `~/peg/scripts/validatecerts.sh`.  
To confirm that the certificates are valid, continue only if the script passes with "All checks passed!"
8. Reboot to ensure that any updated drivers are applied correctly: `sudo reboot now`
9. Run `cd ~/peg && ./peg_start.sh`.
10. Select Redaction Management and press Enter, and then select Install module and press Enter again.

```

 Install Cluster - Cloud Managed
 Install Cluster - On Premise
 Generate Certificate Requests
> Load Certificates
```

14. Change the analytics page password. Run the following and enter your password. `cd ~/peg/scripts/ && ./change_elastic_password.rb`

---

**Note:** The username for logging in to `https://analytics-fiq-<UID>.<apex domain>` is admin.

---

15. Add storage users as needed . You will need at least one user with at least read access to confirm that PEG works. These are the users that can review the redaction of the images. `~/peg/scripts/add-storage-user.rb` .

This script also gives you the option to create users that can edit the pass-and-block (allow/deny) list.

---

**Note:** The username that you create corresponds to the **Access Key** in the login page for `https://storage-fiq-<UID>.<apex domain>`. The password corresponds to the **Secret Key**.

---

Configuration is now complete.

## Validate PEG is running

Verify whether your PEG configuration is operating correctly in review mode.

Review the following table for the format and purpose of various URLs in PEG:

URL format	Purpose
<code>analytics-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Provides access to Kibana dashboards where we can monitor the number of logs, number of users, what is being forwarded, and so on.
<code>dlp-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Is a critical URL as this is where the sensor sends all its logs to. This URL must be used as an input while setting up the sensor.
<code>es-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Used for accessing database directly.  This is very important as the key light application accesses database to align meta data with the images.

URL format	Purpose
<code>klite-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Provides access to the Klite application where the raw data and the corresponding screen shots can be visualized.
<code>proxy-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Monitors the health of Kubernetes services. <b>Note:</b> This is only required for debugging.
<code>st-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Provides a direct link to the OCR service. <b>Note:</b> This is only required for debugging.
<code>storage-fiq-&lt;UID&gt;.&lt;apex domain&gt;</code>	Provides Direct Access to the image storing application. <b>Note:</b> Images are in raw S3 bucket format that can be accessed through Klite.

To confirm that PEG is running as expected, perform the following steps:

1. In a browser, go to `https://storage-fiq-<UID>.<apex domain>`. You will see a screen like this: ("Access Key" = "your username" and secret key = "your password")

2. Log in to `https://storage-fiq-<UID>.<apex domain>` using a user you created in the configuration steps previously (by running `~/peg/scripts/add-storage-user.rb` on the VM).
3. After you log in, you will see these folders on the left. If you do not, run the "Storage Management" "initialize storage" steps in the configuration steps. If you still do not see them after that, contact Process Discovery.

4. In a browser, go to the analytics URL: `https://analytics-fiq-<UID>.<apex domain>`  
You will see a screen similar to the following:

If you do, go to the next step.

5. In a browser, go to `https://dlp-fiq-<UID>.<apex domain>`.  
You will just see a blank page. If you encounter an error or it times out, then there is something wrong.
6. Install the Process Discovery Sensor on a Windows machine. Open a web page, such as <https://www.fortressiq.com>, and then click the page several times.
7. After 10 minutes (which is the approximate duration for review images to be generated), log in to `https://storage-fiq-<UID>.<apex domain>`. Log in with one of the storage users that you created previously in the configuration steps.

Note on the folders on the left side:

- **fiq-screenshots**: Shows the screenshot that PEG received
- **forwarded**: Shows what the screenshot looks like if it is forwarded. This is populated regardless of whether it was actually forwarded or not.
- **review**: PEG adds annotation to the images here to show more clearly what will be redacted. PEG includes a blue rectangle around where the redacted word previously existed and includes the text it found above the rectangle.

8. Click the **fiq-screenshots** folder on the left.

9. Download some of the images from this folder and confirm that they look like the results of your test.
10. Click on the **review** folder.
11. Download some of the images from this folder and confirm that they appear to be from your test. If PEG finds words that must be redacted, PEG includes a blue rectangle around where the redacted word existed and it includes the text it found above the rectangle, as follows.

If this looks as expected, you have validated that PEG is working in review mode.

## Create image viewer user in analytics portal

Learn how to create an image viewer user and add the user to the analytics portal. Use the image viewer to find, view, and compare images in PEG.

To create a user in image viewer user and add a user to the **klite\_read\_only** role in the analytics portal, perform the following steps:

---

**Note:** The image viewer uses the same logins as those used in the PEG analytics portal.

---

1. In a browser, go to the analytics portal: `https://analytics-fiq-<UID>.<apex domain>`
2. Enter your admin username and password.  
Your admin password is the same password as the elastic password you set when you configured PEG.
3. Go to **Security > Internal users**.
4. Click **Create internal users**.
5. In the **Create internal user** form, enter your username and password.
6. Click **Create**.
7. Go to **Security > Roles**.
8. In the search field, enter **klite\_read\_only**.
9. Click **klite\_read\_only**.
10. Select the **Mapped Users** tab, and click **Map Users**.
11. Select the users you want to map.
12. Click **Map**.

Users can now log in to the image viewer.

## Update PEG

Use the following instructions to update PEG to the latest version.

Review the following considerations before updating the PEG version:

- The current version of the PEG installation.

- The Operating System (OS) version that the PEG is currently using.

Run `ssh` in the PEG to retrieve the OS version.

---

**Note:** If you see 18.04 as the Ubuntu OS version, then it is recommended that you get the latest PEG image and start a new configuration rather than updating the PEG version. The most recent PEG image is based on Ubuntu 20.04.

---

- The Keys and Certificates that must be deployed for updating the PEG version.
1. Use the following instructions to test if PEG can access the required update files from the cloud storage:
    - a) SSH into your PEG Virtual Machine (VM).
    - b) Create a directory that will contain the update files.  
For example, `mkdir update`.
    - c) Use the following command to navigate into the `update` directory:  
`cd update`
    - d) Download the `update_peg.rb` script using the following command:

```
curl "https://figpeg.blob.core.windows.net/updates/update_peg.rb?si=get_updates&sv=2020-08-04&sr=c&sig=vVI3fmLfJyu2zsCC9nxhxUKBhsgkp5K5DnrFCDQJ%3D" -o update_peg.rb
```

- If the above command was successful, PEG VM must be able to download all of the required files for the update. Review step 2 for instructions.
- If the command times out or fails in any way, the PEG VM cannot download the update files directly. Review step 3 for instructions.

2. If the above command was successful, use the following instructions to download the PEG update file directly to the PEG VM:
  - a) Ensure that you are in the directory of PEG that you had previously created.  
Use the `cd update` command to get to the directory.
  - b) Use the following command in order to make the update script executable:  
`chmod ugo+x update_peg.rb`
  - c) Run the following update script:  
`./update_peg.rb`

This script will not update the PEG but will only download all the dependent files for the update.

---

**Note:**

By default, `update_peg.rb` downloads the update files from United States server. However, If the download times out or you encounter an error, you can download it from the Australia server by using the following command to switch the country:

```
./update_peg.rb --country au
```

---

If the download was successful, **You have all files needed for the upgrade** message is displayed.

- d) Run the following update script:  
`./update_peg.rb --upgrade-peg`  
This can take a while (about an hour or less).

---

**Note:** If the script fails before the update completes, do not run it again. Contact Automation Anywhere support for assistance.

---

If the update was successful, an **Update done** message appears.

3. If the PEG is unable to access the required update files from the cloud storage, use the following instructions to download the file outside the PEG VM:
- a) Run the following command on a Windows machine with curl (for example, Windows 10) or a Linux machine that has access to a public internet:

```
curl "https://fiqpeg.blob.core.windows.net/updates/update_peg.rb?si=get_updates&sv=2020-08-04&sr=c&sig=vVI3fmLfJyu2zsCC9nxhxUKBhsgkp5K5DnrFCDQJ%3D" -o update_peg.rb
```

---

**Note:** If the above command fails or times out, you need not access the PEG update files. Try another machine that has outbound `https` port `443` access to `fiqpeg.blob.core.windows.net`.

---

- b) If the above command was successful, copy the downloaded `update_peg.rb` to the update folder in your PEG VM.
- c) Sign in to PEG.
- d) Use the following command to navigate to the update folder:  
`cd update`
- e) Use the following command in order to make the update script executable:  
`chmod ugo+x update_peg.rb`
- f) Use the following command to run the update script:  
`./update_peg.rb`  
The update script will create a `./download_peg_updates.sh` file. Run this script on a machine that can access the public internet you used earlier. If it is a windows machine, you can copy the contents of the `./download_peg_updates.sh` file and run those curl commands.
- g) Copy all the files that were downloaded into the update folder in your PEG VM.
- h) Repeat the step c and g until `./update_peg.rb` completes with a message **You have all files needed for the upgrade**.

---

**Note:** You might have to repeat these steps multiple times as with each file you add to the update directory, the `update_script.rb` learns new info about what other update files are required. Typically, you have to run through this cycle of steps three times before the update script has the necessary files for the update.

---

- i) When the above step is successful, run the following update script:  
`./update_peg.rb --upgrade-peg`  
This can take a while (about an hour or less).

If the update was successful, an **Update done** message appears.

## Configure PEG image redaction

After performing the installation steps, configure PEG to mask words and send the redacted images to the Process Discovery platform.

### Configuration steps

Step 1: [Manage redaction list configurations](#) on page 4115

PEG redacts words based on the pass and block lists for forwarding.

The pass list: PEG will not redact the built-in pass list of words. Only words in the pass list will be included in images and other data sent to the Process Discovery platform. Words that are not on the pass list are redacted.

The block list: The block list is a list of words that PEG will redact. PEG redacts words based on this list before processing the pass list.

The block list is useful in situations where you know words exist on the pass list that you want redacted, but you do not want to have to modify the pass list. One common use case is that some people's names are also everyday words that appear on the default pass list. You can create a block list of all of the names of your employees or common names in various countries, which can be obtained from the Internet.

---

**Note:** The redaction of all information is subject to the OCR accuracy. Please note that 100% redaction accuracy of all information can be difficult to achieve and might require a high degree of manual review.

---

Step 2: [Review redaction results](#) on page 4118

The image viewer enables users to review incoming images and redaction results.

Step 3: [Manage forwarding configurations](#) on page 4124

Redacted images are processed in one of two modes, the review mode and the forwarding mode.

The review mode: This is the default mode for PEG when it runs for the first time. In this mode, you can review the redacted images, make changes to the pass-and-block lists, without PEG forwarding data to the Process Discovery platform.

The forwarding mode: When you are comfortable with the results of your review of the images, you can enable the forwarding mode. In this mode, PEG will redact sensitive data from newly incoming images and send the redacted data to the Process Discovery platform. (Existing images from review mode will not be forwarded.)

## Manage redaction list configurations

Learn how to manage your redaction configurations from the Privacy Enhanced Gateway (PEG) UI and export logs, instead of running commands on the Command Line Interface (CLI).

**Note:**

This is no longer valid from version 0.31 Release Features - Version: 3.3.17.

To update your redaction settings from the UI, perform the following steps:

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fig-  
<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Admin > PEG configuration**.
3. In General Settings, select **Redaction List**.
4. In the **Pass List** section, select from the following options:

Option	Action
Upload new list document	Click to upload a new list of words. The words on this list are not redacted and are sent to the platform. Words on this list typically do not contain sensitive, private information (such as credit cards numbers, phone numbers, names, and so on).  <b>Note:</b> Any word that is not on the pass list is redacted.

Option	Action
<pass-list>.txt	<p><b>a)</b> Click to edit the existing pass list. The list is saved in the Downloads folder.</p> <p><b>b)</b> Open the file, add your changes, and save the file.</p> <p><b>c)</b> Click <b>Upload new list document</b> to upload the document.</p> <p>A pop-up message appears notifying you that the pass list is updated successfully.</p> <p>Each line can only contain one word. A word can contain letters, numbers, and symbols, but no spaces. For words with numbers and symbols, those words will only be used for comparison if the <b>Cleaning</b> field is set to <b>false</b>. The words are case-insensitive. For more details about cleaning, see step 11.</p>
Text field	<p>Enter the words in the text field to update the existing pass list followed by the <b>Enter</b> key. For example, to update the pass list to include a category (such as Support), enter Support in the text box followed by the <b>Enter</b> key.</p>

5. Click **UPDATE** to save your changes for the pass list in the text field.
6. Click **CLEAR ALL** to clear your changes in the text field and start over.
7. In the **Block List** section, select from the following options:

Option	Action
Upload new list document	Click to upload a new list of words. The words on this list are redacted and not sent to the platform.

Option	Action
<block-list>.txt	<p><b>a)</b> Click to edit the existing block list. The list is saved in the Downloads folder.</p> <p><b>b)</b> Open the file, add your changes, and save the file.</p> <p><b>c)</b> Click <b>Upload new list document</b> to upload the document.</p> <p>A pop-up message appears notifying you that the block list is updated successfully.</p> <p>Each line can only contain one word. A word can contain letters, numbers, and symbols, but no spaces. For words with numbers and symbols, those words will only be used for comparison if the <b>Cleaning</b> field is set to <b>false</b>. The words are case-insensitive. For more details about cleaning, see step 11.</p>
Text field	Enter the words in the text field to update the existing block list followed by the <b>Enter</b> key.

8. Click **UPDATE** to save your changes for the block list in the text field.
9. Click **CLEAR ALL** to clear your changes in the text field and start over.
10. In the **Redaction Word Filter Setting** section for **Fuzzy Matching**, select **true** to allow Optical Character Recognition (OCR) some level of variation (fuzzy matching) to consider a word a match. By default, **Fuzzy Matching** is set to true and PEG does not require an exact match when comparing a word with a word on the pass for the block list. Select **false** to disable fuzzy matching.

---

**Note:** When reviewing the redaction levels, you might find some sensitive text (that is not on the allow list) displaying unexpectedly in the applications screenshots. In that case, select **false** to disable fuzzy matching to provide a preferable result.

---

For example, if OCR reads a word as kello. There is a chance that OCR might be right or wrong in how it reads the word kello. Kello is not in the pass or block list. Kello might be considered a close enough match to hello (with the idea that kello was just OCR misreading hello). So, if the word hello is in the pass list, then the word kello would also be allowed and not redacted.

11. In the **Cleaning** field, click the drop-down to select **true** to remove all non-alphabetic (anything not a letter in the alphabet) from a detected word before comparing it to the words in the dictionaries. Select **false** to allow numbers for cleaning. By default, cleaning is set to true.

---

**Note:** Cleaning defines whether non-alphabetic characters should be ignored when comparing a word with the dictionaries.

For example, there are category types (PURCH2A, PURCH2B, and PURCH2C) that are a mix of numbers and letters that appear in your application screens that should not be redacted. To ensure that PURCH2A, PURCH2B, and PURCH2C are not redacted, add the words to the allow list and disable cleaning. PEG will not remove the numbers from these words when comparing with the words on the allow list. Another example is if you have an account ID,

such as SA31LE. If cleaning is set to true, then PEG removes the number 31 from SA31LE and compares the word, SALE with the words in the allow list. If SALE is in the allow list, then it is not redacted. However, if you set cleaning to false, cleaning compares SA31LE with the words on the allow list. Since SA31LE is not in the allow list, SA31LE is redacted.

12. Click **UPDATE** to save your changes.

A pop-up message appears notifying you that your changes are successfully deployed.

13. Click one of the following buttons to export the logs from the UI:

- **Export Logs**

The logs begin generating. After the logs have generated, click **Download Logs** to download the `logs.zip`. The log files contain information about the system (including logs for the last 24 hours).

- **Export PEG metrics**

After the metrics are generated, click **Download PEG Metrics** to download the `pegMetrics.zip`. The file contains operational and performance metrics about the system.

## Review redaction results

Use the image viewer to see the incoming images and review the redaction results to determine what changes to make to the redaction configurations.

You can use the image viewer to see images in the following buckets:

- `fiq-screenshots`: This contains the screenshots that PEG received.
- `forwarded`: This is what the screenshot looks like when it is forwarded to the Process Discovery platform. This is populated regardless of whether it is forwarded or not.
- `review`: This includes annotated images. PEG adds annotation to the images to clearly show what will be redacted. PEG puts a rectangle around where the redacted word previously existed and includes the text it found above the rectangle.

To review the images, perform the following steps:

**Note:** These instructions show you the filters that are used frequently, but you can change the selection as needed.

1. Log in to the image viewer.

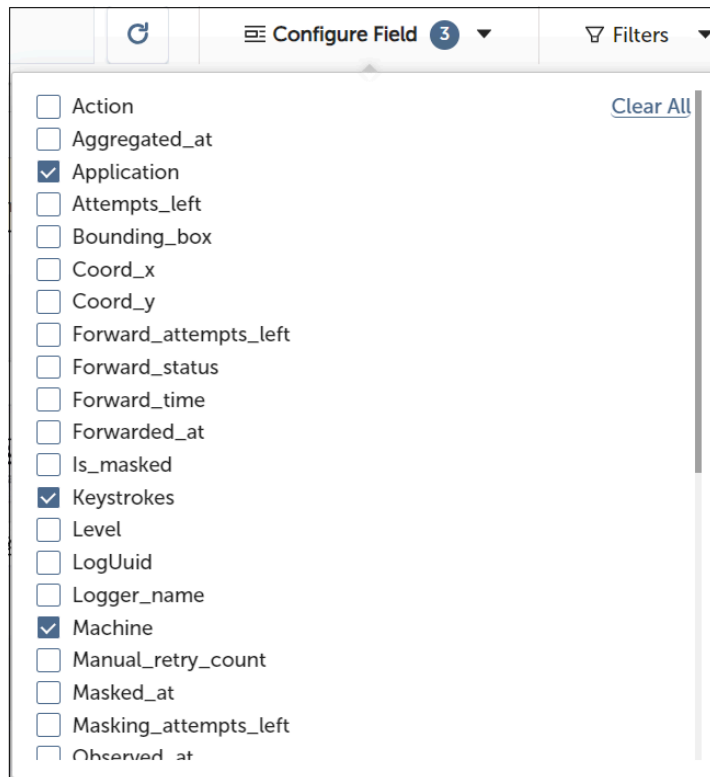

To open the image viewer application, enter the following address in a web browser:

```
https://klite-fiq-<UID>.<apex domain>
```

2. Click the **Bucket 1 (Mandatory)** field and select **fiq-screenshots**.
3. Click the **Bucket 2 (Optional)** field and select **forwarded**.
4. Use the calendar to select a date range for reviewing the data.

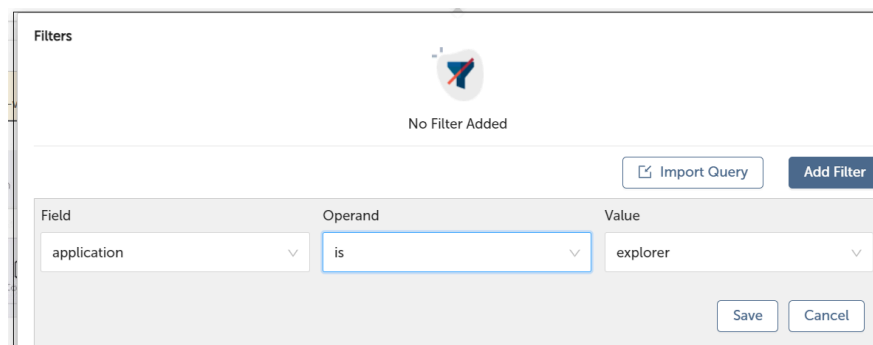

- Click the **Configure Field** drop-down menu and select fields that you want to apply the filter on.  
For example, select the **Application**, **Keystrokes**, and **Machine** fields.

The image viewer displays the selected fields above the screenshot.

- Click **Filters** to specify a value for the fields that you have selected in the **Configure Field**.  
For example, select the **Field** as **application**, **Operand** as **is**, and the **Value** as **explorer** to see the images that contain explorer.

- Optional: The **Carousel View** is default display option. Click the drop-down menu and select **Real Time Redaction**.

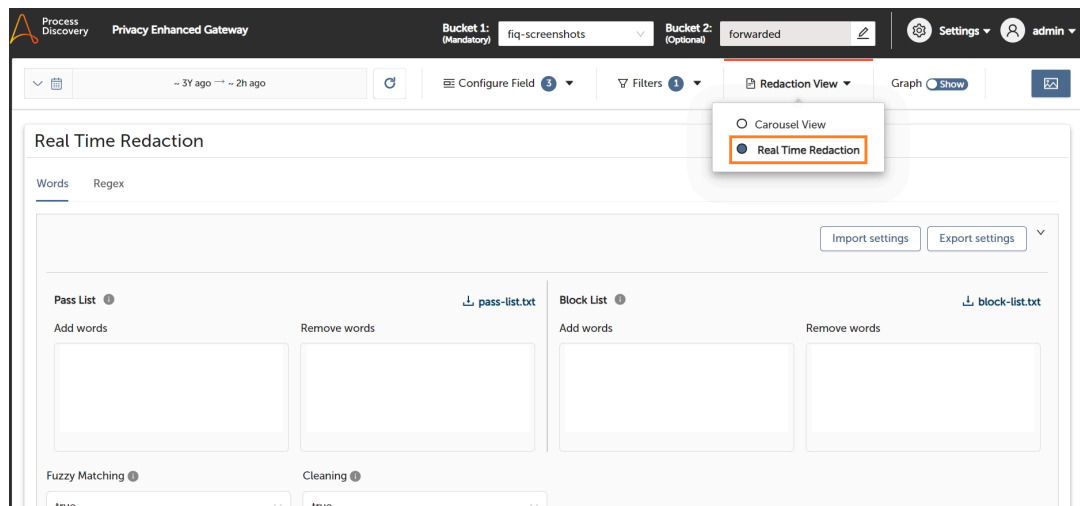

To see the **Real Time Redaction** option, set **Bucket 1** to **fiq-screenshots**, and **Bucket 2** to **forwarded**.

You can use real-time redaction as a **sandbox environment**, where you can edit the pass and block lists and immediately see the impact of those edits. When you are ready, you can commit your edits to the system redaction configurations.

- From the toolbar at the top, click **Carousel View > Real Time Redaction**.

**Note:**

This is no longer valid from version 0.31 Release Features - Version: 3.3.17 .

- b) Use the slider to review the image before and after redaction.
- c) Use one of the following filters for the images:

**Note:**

This is no longer valid from version 0.31 Release Features - Version: 3.3.17

- **Words**

Use the following two fields to add or remove the words:

- **Pass List:** The words on this list are not redacted and are sent to the platform. Words on this list typically do not contain sensitive, private information (such as credit cards numbers, phone numbers, names, and so on).
- **Block List:** The words on this list are redacted and not sent to the platform.

- **Regex**

Use regular expressions (regex) to create string patterns that help match, locate, or manage text:

1. Click the **Create regex** icon for new regex expression.
2. Enter a regex pattern in the **Regex expression** field.
3. In the **Description** field, add a description for the new regex expression.
4. Use the **Action** field to select one of the following redaction conditions:
  - **Allow**
  - **Block**
5. Click **Commit** to save the regex filter.

**Note:**

From 0.31 Release Features - Version: 3.3.17

---

- Words

Use the following fields to add the words:

- Default Allow List: The words on this list are not redacted and are sent to the platform. Words are on this list typically do not contain sensitive, private information (such as credit cards numbers, phone numbers, names, and so on).
  1. User can download or upload allow list
  2. User can add, search, update and delete words from the word list.
- Default Block List: The words are on this list are redacted and not sent to the platform.
  1. User can download or upload block list
  2. User can add, search, update and delete words from the word list.
- Create New List: user can create or delete custom allow/block list for the specific cluster of images (scope).

- Regex

Use regular expressions (regex) to create string patterns that help match, locate, or manage text. If a user wants criteria-specific redaction, then scope should be added; otherwise, redaction will apply to all images globally. Global effects apply to all images. However, scope can override these global effects only if the scope is higher in priority (BAR: Block, Allow, Replace).

1. Click the Create regex icon for new regex expression.
2. Enter a regex pattern in the Regex expression field.
3. In the Description field, add a description for the new regex expression.
4. Use the Action field to select one of the following redaction conditions:
  - Allow
  - Block
  - Replace with - user input
5. Click Commit to save the regex filter.
6. Allow All - The provided regex key, "#! %AllowAllDisableRedactionTurnOffMasking^&\*\"", when applied within the specified

scope, guarantees that no words are redacted. It effectively bypass the redaction process, permitting all words to remain visible.

**Create regex expression**

**Add Scope**

**User Input** ⓘ

Note: Any replacement with user input will be random selection from the list of values below.

**Cancel** **Preview** **Commit**

- d)** Click **Preview** to see the redaction results of your edited Pass and Block lists. Continue making changes to the lists and reviewing the image until you are satisfied with the redaction results.
  - e)** Click **Commit** to apply your changes to the system redaction configurations.
- 8.** Optional: Export images for further review. To export images, do the following steps:
- a)** Click the **Export image** icon located in the top-right corner of the page.
  - b)** Select the range of images to export using the modal bar.
  - c)** Select the slot from which to export the images.  
A slot is a container for up to 100 images.
  - d)** Alternatively, select the **Random** export option.
  - e)** Click **Download**.
- 9.** Review the images to ensure the correct content is being redacted.

10. To change the redaction configurations, do the following steps:
  - a) Return to the Redaction list page to update the pass and block lists.  
For more information on editing the pass and block lists, see [Manage redaction list configurations](#) on page 4115.
  - b) From the upper right corner, navigate to **Admin > PEG configuration > Forwarding**.
  - c) Click **Run re-redaction sync job** to apply the new redaction configurations on images that were not forwarded to the Process Discovery platform.
  - d) Return to the Image viewer to review the newly-redacted images.

When you are satisfied with the redaction results, turn on image forwarding. See [Manage forwarding configurations](#) on page 4124

## Manage forwarding configurations

Learn how to manage your forwarding configurations from the Privacy Enhanced Gateway (PEG) UI instead of running commands on the Command Line Interface (CLI).

To update your forwarding settings from the UI, perform the following steps:

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fiq-  
<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Admin > PEG configuration**.
3. In General Settings, select **Forwarding**.
4. In the **Forward to platform** field, select **true** to forward redacted data platform, or select **false** to prevent sending forward redacted data to the platform.  
By default, the **Forward to platform** field is set to false.
5. In the **Port for forwarding** field, the default port number is 443.  
We recommend that you leave the default port number as 443 unless you need to change it.
6. In the **Forward live records** field, select **true** to forward the live events to the platform, or select **false** to prevent sending any events to the platform.  
You can use this setting to forward new incoming events. It will not forward existing events that are masked. If you select **false**, the incoming events are redacted, but not sent to the platform.
7. In the **Forward existing masked records** field, select **true** to forward existing events that were already recorded but have not been sent to the platform. Select **false** to prevent sending any existing events collected on your machine to the platform.  
You use this field only to forward data that was previously collected. For example, you might have collected events for two weeks and forgot to send the events to the platform.
8. In the **UTC start date for forwarding** field, enter the start date for the observed at date range. The observed at date range is when the Process Discovery Sensor recorded the event on the machine. You must specify the range in the UTC time zone.  
Based on the date range you enter, PEG forwards previously redacted events that were not already forwarded to the platform.
9. In the **UTC end date for forwarding** field, enter the end date for the observed at date range.
10. To use a proxy, click the **Use Proxy** checkbox.
11. In the **https proxy** field, enter the proxy URL address to use.

If required, include the username and password in the URL: http://  
username:password@host:port/

## 12. Click **Deploy**.

### Switch between modes

Change PEG to the forwarding mode and then back to the review mode.

By default, PEG initially starts in the review mode.

1. To switch to the forwarding mode:
  - a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to `true` and save the changes.  
`forward_to_fluentd: "true"`
  - b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-${new_gen_uuid}.${apex_domain} --set masking.name=dlp-fiq-${new_gen_uuid}.${apex_domain}
```

2. To switch back to the review mode:
  - a) Edit the `~/peg/text_pipeline/values-gpu.yaml` file. At the end of the file, change the `forward_to_fluentd` value to `false` and save the changes.  
`forward_to_fluentd: "false"`
  - b) Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t} --namespace text-pipeline --set ocr.name=st-fiq-${new_gen_uuid}.${apex_domain} --set masking.name=dlp-fiq-${new_gen_uuid}.${apex_domain}
```

## Manage disk space

Manage disk space by managing the duration for which images are kept in the review folder.

When the disk usage is over 80 percent, PEG stops processing new messages. To manage the setting in the review folder, perform the following steps:

1. Add the following block of code to the end of the `~/peg/text_pipeline/values-gpu.yaml` file. (Alternatively, if an entry already exists, modify it.)

```
#Archive Info
review_retention_days: 365
```

The value that you include here will be the number of days for which PEG will keep an image in the review folder. Replace the number 365 with the number of days for which you want to retain review images. This will affect only the review images. The original images and the images in the forwarded folder will not be affected.

2. Push the change to PEG by running the following from any folder:

```
source ~/peg/scripts/vars.sh
```

```
kubectl delete cronjob.batch/text-pipeline-masking-masking-cron -n
text-pipeline
```

```
kubectl get pods --output=jsonpath={.items..metadata.name} -n text-
pipeline -o=name | grep cron | xargs -n1 kubectl delete --grace-
period=0 --force -n text-pipeline
```

```
helm upgrade text-pipeline ${text_pipeline_dir} -f ${values_file_t}
--namespace text-pipeline --set ocr.name=st-fiq-$new_gen_uuid.
$apex_domain --set masking.name=dlp-fiq-$new_gen_uuid.$apex_domain
```

## Manage PEG events

An event consists of a screenshot and logs (meta data of actions performed while the screenshot was captured). Events can be used to review any data reliability shortcomings that might occur between PEG and Process Discovery platform when data is not in sync.

The **Events Console** screen enables you to review the status of the events, search any failed or pending events, or use a start and end date to filter all the events. However, the **Date Filter** can be used only for the events with **Completed** and **Failed** status. The status can be used to reduce errors caused while forwarding events from PEG to Process Discovery.

Consider a scenario where you want to review the list of events that must be forwarded to the Process Discovery platform. After filtering these event, you want to forward them together (bulk).

1. Log in to your PEG klite URL platform as an administrator: `https://klite-fiq-<UID>.<apex domain>`.
2. In the upper right-corner, navigate to **Settings > Events Console**.  
Events Console screen is displayed that contains the status for all the events, a search and filter fields.

3. Click the **Status** drop-down menu and select **Forward Pending**.

The **Total events** field is refreshed and the number of events that are pending to be forwarded is displayed.

---

**Note:** You can click any of the events to review the event details such as the transmission timestamps, the reason why the forwarding of the event failed, number of times the forwarding was attempted and so on. PEG attempts to forward an event to Process Discovery for a maximum of five times before moving it to the **Failed** status.

---

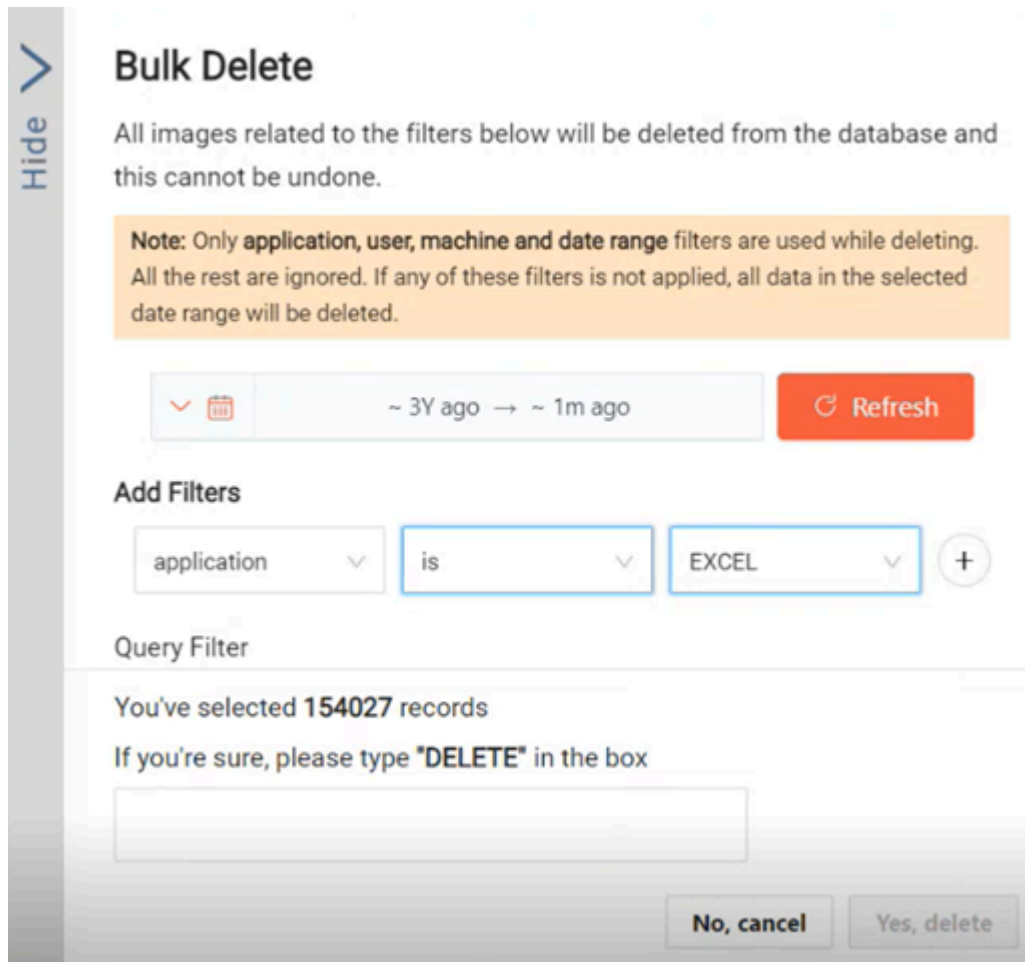

4. Select all the events and click the **Bulk retry** icon at the top of the table.  
An alert is displayed that an attempt to forward the events in bulk is initiated and would take sometime. You can click **Status > Forward Pending** and review the total number of events.

## Using Bulk delete

Free up storage space by generating a list of images that meet a specific criteria, then selecting the images for deletion.

You must be an admin user to perform bulk deletion.

1. To access Bulk delete for the first time, navigate to **Settings > Enable bulk delete**.  
The Bulk Delete modal opens.  
In the future, access the Bulk Delete modal from the right side of the window.
2. Specify the time range for when the images were collected.
3. Optional: Select from the following filters and provide the acceptable values: **application**, **user**, or **machine**.  
PEG displays the number of images that match your search criteria.

4. Enter DELETE in the text box.
5. Click **Yes, delete**.

## Renew and replace certificates and keys using PEG

In the customer-managed certificates deployment model, certificates and keys that are set to expire are not renewed and replaced automatically.

When your certificates are set to expire, you must perform the following tasks to renew them:

1. Create a new certificate. You can create a new certificate with two options:
  - You can choose to have PEG create the new certificate signing request and the keys, or
  - You can create your own certificates and keys. To create your own certificates and keys, see [Create certificates](#) on page 4102.
2. Upload the new certificate. To upload the new certificate, see [Upload the new certificates](#) on page 4129.

If you choose to have PEG generate new keys and the certificate signing requests, perform the following steps:

1. Run `cd peg && ./peg_start.sh`.
2. Select **Cluster Management**.

```
No Products Found
[^] Initializing Installer ... Initialized!
Which function would you like (Use ↑/↓ and ←)
▶ Cluster Management
 Redaction Management
 Vault Management
```

3. Select **Generate Certificate Requests**.

```
Which function would you like
 Install Cluster - Cloud Managed
 Install Cluster - On Premise
▶ Generate Certificate Requests
```

4. Enter information for the options that follow.
5. Exit the menu.  
The certificate signing requests are located in `~/peg/csr`.
6. Create certificates from the CSRs that PEG generated. For more information, see [Create certificates](#) on page 4102.

## Upload the new certificates

Learn how to upload the new certificates and keys after they are created.

1. Copy the PEG certificates that you created to the `/peg_v/certs/` directory.  
Ensure that you name them according to the certificate file names in [Table 1](#).
2. If you also created your own keys, then copy the PEG keys that you created to the `/peg_v/keys/` directory.  
Ensure that the keys are:
  - Not password protected
  - Named according to the certificate file names in [Table 1](#)

---

**Note:** If you choose to have PEG generate the keys, then you do not need to perform this step. The PEG-generated keys are placed into a folder for you.

---

3. To confirm that the certificates are valid run `~/peg/scripts/validatecerts.sh`.  
Continue to Step 4 only if the script displays: All checks passed!
4. To load the latest certificates, run the following command on PEG:

```
kubectl rollout restart deployment.apps/traefik -n kube-system
```

## Process Discovery Sensor application

Use the Process Discovery Sensor to record activity on a user's machine to determine what business processes are candidates for automation.

The Automation Anywhere Process Discovery Sensor is a lightweight application that integrates to the machines' video card to record user activities. The sensor operates in both thick and thin client applications, and across multiple monitors. You can configure which applications and domains can be used to capture activity.

### Minimum system requirements

The following minimum system requirements are supported for installing the Process Discovery Sensor:

- Operating Systems
  - Desktop: Windows 10, Windows 11

---

**Note:** Windows 7 is capable, but does not support stronger security. Therefore, is a less secure connection to our server. Further notice to the Cloud Ops needed to use Win 7.

---
- Citrix VDI: Windows Server 2016
- Memory: 1GB RAM for 32-bit OS, 2GB RAM for 64 bit OS
- CPU: 1Ghz or faster
- Internet connection: application able to upload securely to our server (pass firewall, security software etc and use desired encryption)

### Suggested configurations

Operating specifications for your application can be adjusted. We recommend the following configurations for optimum performance.

---

**Note:** The processing speed of any security software will effect performance of the Process Discovery Sensor.

---

- 60 screen shots, per user, per minute (1920x1080 single monitor)
- Internet: 3 Mbps upload speed
- RAM: 256 MB spare memory for application to use

## Installing Process Discovery Sensor

Learn how to install Process Discovery Sensor on your machine.

Ensure that you install Process Discovery Sensor as a user on your machine, and not on a system level. Any user with privileges to run an MSI installer, and write permissions to their own user folder, can perform the installation. If you are using Microsoft SCCM or other software

deployment solutions to deploy the MSI, make sure it is deployed as the user you are deploying it to.

1. Contact your Automation Anywhere Customer Success Manager (CSM) to obtain the msi package.
2. Unzip the msi file if you have received it as a zip file.
3. Double-click the msi file to launch the Installation Wizard.
4. Click **Next**.
5. Click **Next** to continue with your organization, endpoint, and port information. Your customer information is already populated in the fields provided.
6. Click **Install** on the Ready to Install Process Discovery window to begin the installation.
7. Click **Finish** to exit the Setup Wizard. The installation is complete and the Process Discovery Sensor is now running. A shortcut displays on your desktop and a pop-up message displays informing you that Process Discovery Sensor has started recording. The Process Discovery icon is displays in your system tray.
8. To quit the recording, right-click the Process Discovery icon in the system tray and click **Quit**. A message displays that the recording has stopped. To restart the recording, double-click the Process Discovery icon shortcut on your desktop.

---

**Note:** Depending on how the Sensor is configured, the quit option might not be available.

---

**Note:** After you enable the Observer and install the Process Discovery Sensor, the recording will automatically start even after a system reboot. To prevent the Process Discovery Sensor from automatically recording, click the caret symbol on the taskbar to access the system tray. Right-click the Process Discovery icon in the system tray and select **Quit**.

---

## Uninstalling Process Discovery Sensor

Learn how to uninstall Process Discovery Sensor on your machine.

In a centralized deployment, IT will uninstall Process Discovery Sensor. If you choose to manually uninstall Process Discovery Sensor from your system, perform the following steps:

---

**Note:** Before you begin uninstalling Process Discovery Sensor, ensure that you close the Process Discovery Sensor application on your system.

---

**Note:** Uninstalling Process Discovery Sensor from the Observers machine will not delete the previous recordings from the Process Discovery Cloud.

---

1. Navigate to **Windows > Control Panel > Programs and Features**.
2. Right-click the Process Discovery (IQ) icon and click **Uninstall**.
3. Click **Yes** to uninstall.

---

**Note:** If you receive a pop-up message informing you that the following applications should be closed before continuing the install, select, **Automatically close applications and attempt to restart them after setup is complete** and click **OK**.

---

## Installing Process Discovery Sensor in a VDI environment

Learn how to install the Process Discovery Sensor in a Virtual Desktop Infrastructure (VDI) environment and create a portable package.

Many VDI environments do not allow msi installs that install as the user, especially if they are non-persistent desktops. If the msi installer does not work in your environment, you must create a portable installer on a machine with access to the Automation Anywhere Process Discovery platform.

1. Install the Process Discovery Sensor using the MSI installer. For more details, see [Installing Process Discovery Sensor](#) on page 4130.

Ensure that Process Discovery Sensor is running. The Process Discovery Sensor icon displays in the bottom right corner of the system tray.

2. Navigate to `C:\Users\\AppData\Local\Programs\Neo2` and copy the files that the Process Discovery Sensor installer created in that folder to a different folder. For example, you can name the folder Process Discovery Sensor files.

3. In Windows Explorer, search in **Add or remove programs**.

4. Locate the Process Discovery Sensor app and remove the program.

This removes the existing install folder and the registry settings.

5. Copy the Process Discovery Sensor files that you put in a folder to any folder on the VDI server.

6. Create a startup script to start the Neo2.exe on login for users that will run the Process Discovery Sensor.

By default, the Process Discovery Sensor needs write access to the folder it is running from because that is where the Process Discovery Sensor writes the logs and downloads the configuration from the platform. Since the Process Discovery Sensor runs in the user space, users need write access to that folder. If you do not want users to have write access to that folder, you can specify a different writable folder to store the logs and the Process Discovery Sensor configuration. For more details on storing the logs and sensor configuration to a writable folder, see [Modifying the log and configuration storage location](#) on page 4132.

## Modifying the log and configuration storage location

Learn how to change the location of the logs and the Process Discovery Sensor configuration storage folder to a folder that is writable to all users who have the Process Discovery Sensor running on their machine.

1. Copy the `NeoRemoteConfig.json` file to the folder where you want to store it.

The `NeoRemoteConfig.json` file is one of the Process Discovery Sensor files you should see in your portable installer folder. The folder you copy it to must be the same writable folder where you want to store the logs.

2. Set the log and config file location by specifying the absolute path to the new folder in the `Path.config` file. In the folder with the `Neo2.exe`, there should be a `Path.config` file. For example, your `Path.config` file might contain: `z:\user_shared_storage\neo2_logs_and_config`.

You can assign it to an absolute path or can use one special reserved variable `{MyDocuments}`.

If you use the {MyDocuments} variable in the Path.config file, the logs will be stored in a folder named Neo2 in the user's Documents folder.

---

**Note:** The Process Discovery Sensor expects to see the NeoRemoteConfig.json in that folder.

---

## Verify Process Discovery Sensor Installation

Use the log files to verify that the Process Discovery Sensor is installed correctly on your machine.

1. While the Process Discovery Sensor is running and in recording mode, click a few times anywhere on your machine.

Clicking a few times on your machine triggers the Process Discovery Sensor to collect and send a screenshot to the Platform which results in entries in the Process Discovery Sensor logs that you can use for validation.

For more details on enabling the Process Discovery Sensor in recording mode, see [Enable and disable the users recording](#) on page 4135.

2. From Windows Explorer, open the C:\Users\\AppData\Local\Programs\Neo2 folder. If you changed the default location for the logs, then open the folder you have changed it to.
3. Locate this log file: Neo\_<machine name>\_<userid>.log
4. Double-click to open the log file.

If the Process Discovery Sensor is working as expected, the following lines display as an example towards the bottom of the log file. If everything is correct, a job number displays, followed by OK.

```
2022-11-08 22:03:39.3775 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [INFO]
Worker id: 5b1bd418-2e19-4097-8ba7-31af6f22bd0a, queue size: 0,
current job 152 OK, time elapsed: 0ms, type: fiq.win.keylog
```

```
2022-11-08 22:03:39.3775 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [INFO]
Worker id: 61849714-b916-43b7-8878-eced56dd1d65, queue size: 0,
current job 151 OK, time elapsed: 5ms, type: fiq.win.screenshot
```

If the Process Discovery Sensor is not working, you will see words such as error and failed in the log files output.

---

**Note:** If you experience issues, please contact Automation Anywhere for assistance.

---

```
2022-11-08 14:13:32.5720 TEST\testuser
com.FIQ.Neo2.Utility.Network.RawLogForwardingPostConsumer [ERROR]

```
sending the request. ---> System.Net.WebException: The remote name
could not be resolved: 'test.example.com'
```

## Event Recording

This topic describes the event recording using the Process Discovery (PD) Sensor application. This application seamlessly integrates with the users' desktop environments and captures on-screen activities.

The mouse movement and keystrokes, are observed and captured as screenshots by the PD Sensor. These screenshots are sent to the Process Discovery Cloud platform. The essence of this process lies in the aggregation of these recorded events within the Process Discovery Cloud platform. Here, the events combine, enabling the platform to find patterns. These patterns, representative of sequences of events, subsequently serve as the foundation for the development of recommended processes.

**Note:** Check the **Data > Events** page to ensure the Process Discovery platform is receiving data from sensors.

The following lists the scenarios when an event is recorded:

1. Keystrokes: The Process Discovery sensor take screenshots when any key outside alphanumeric keys are pressed.

**Note:** Alphanumeric keys are all letters and numbers and some different symbols. These keys include all letters starting from A leading to Z and numbers from 0 to 9.

When Screenshot is taken	When Screenshot is not taken
Pressing a combinations of keys such as Control-C, Control-V or set of keystrokes followed by enter key.	Pressing all number keys (both on the top row of a keyboard but also specific number pads as well)
Pressing Enter and editing keys	Pressing all character keys such as QWERTY.
Pressing Function keys	Pressing modifier keys that change case – either Shift or Caps Lock  Pressing single key strokes: <ol style="list-style-type: none"> <li>a) Control key</li> <li>b) Shift key</li> <li>c) Alt key</li> </ol>

2. Mouse Clicks: When a mouse click is made the PD Sensor captures a screenshot as an event.

The captured events are sent to the Process Discovery Cloud platform through two pathways: direct transmission or through Privacy Enhanced Gateway (PEG). This gateway serves as an enabler of security and privacy, effectively redacting sensitive visual information before dispatching screenshots to the PD cloud.

Capturing these events is similar to creating a digital tapestry of user interaction. Each time an end-user performs a predefined keystroke, clicks the mouse, or even presses the enter key, an event is generated, and in conjunction, a screenshot is taken. This combination of mouse actions, keystrokes, and screenshots forms a complete event.

For instance, if you type "Wikipedia login" into a search box and then press the enter key constitutes an event. This single interaction, a combination of keystrokes and mouse clicks or enter key presses, creates an event. At this instant a screenshot is taken.

In short, a Process Discovery Event consists of metadata from keystrokes and mouse actions combined with the screenshots.

## Enable and disable the users recording

Learn how to enable or disable the Observers recording in the Process Discovery platform.

1. Log in to into the Process Discovery platform.
2. Navigate to **Data > Observers**.
3. Identify the Observer you want to enable or disable the recording.
4. From the **Actions** column, click the drop-down arrow to enable **Start Recording** for that Observer. To disable, select **Stop Recording** for that Observer.

## Process Discovery FAQ

Answers to frequently asked questions (FAQs) on the Process Discovery, Process Discovery Sensor, and Privacy Enhanced Gateway (PEG) applications.

This document describes Process Discovery and Privacy Enhanced Gateway security features: [Process Discovery Security Brief](#)

What versions of TLS is supported by Process Discovery?	Process Discovery supports TLS protocol versions 1.2 and 1.3 only.
Do the Automation Anywhere security risk assessment reports apply to the Process Discovery platform? What Audits are performed?	<p>Automation Anywhere has the following reports with Process Discovery as a component: ISO 27001</p> <p>Process Discovery is audited to the following frameworks and has the following reports:</p> <ul style="list-style-type: none"><li>• SOC 2 Type 2</li><li>• HIPAA</li><li>• PCI</li></ul> <p>In addition, the product is GDPR and CCPA compliant.</p>
Can users export their Security Information and Event Management (SIEM)?	<p>Users can export process data and event data into a .csv file. Process Discovery cannot be connected directly to a SIEM. The audit logs track all changes, who made the change, and when the changes are made to the following elements:</p> <ul style="list-style-type: none"><li>• Allow/block list</li><li>• Event logs</li><li>• Process Discovery configuration policy</li><li>• Observers</li><li>• Tenants</li><li>• Processes</li><li>• Windows</li><li>• Username</li></ul>
Is Multi-Factor Authentication (MFA) supported?	Yes, Single sign-on and SAML 2.0 are supported.
Does the Process Discovery platform use vulnerability management?	We have internal and external security testing programs. Internal testing spans planning, development, and testing phases, with each test building on previous work. We have an established approach to static and dynamic code analysis at both the development and testing phases. External testing is done on

	production and is built around the concept of ongoing assurance.
What is the Process Discovery Security Incident Management process?	<p>Incident Response: Automation Anywhere maintains an incident response program designed to analyze, contain, eradicate, and recover from security and safety incidents impacting Automation Anywhere managed networks and/or systems or customer data.</p> <p>Incident Notification: If Automation Anywhere determines that customer data within its control has been subject to a security incident, the customer will be notified under and according to applicable law.</p> <p>Incident Post-Mortem: Automation Anywhere runs a post-mortem after an incident has occurred to analyze and improve tools and processes to mitigate future occurrences.</p>
How does Process Discovery handle security configurations and changes?	<p>Automation Anywhere takes care of the following items:</p> <ul style="list-style-type: none"><li>• Secure multi-tenant environment on Google Cloud Platform</li><li>• Boundary security (FW, IDS)</li><li>• Source code scanning</li><li>• Pen testing Threat &amp; vulnerability scanning</li><li>• Container security management</li></ul>
Does Process Discovery have a disaster and recovery plan?	<p>We perform daily backups.</p> <p>As per our current disaster recovery policy of 2021, our recovery point objective (RPO) is 6 hours and recovery time objective (RTO) is 24 hours.</p>
Does the PEG redaction process allow users to set anonymized values instead of clearing out redacted values?	No.
Where are Support Teams located?	Our support teams are based around the world to provide follow-the-sun support with personnel located in the US, Europe, Japan, India, and Poland. Our support plans are designed to help you get the answers you need, when you need them, maximizing your investment in Automation Anywhere.
Can Automation Anywhere customer support see masked customer data?	No, the support teams do not have specialized access.
Is there any consent management platform to register client/consumer consent regarding data collection?	Since the customer organization owns their data, it is the responsibility of that customer to collect and maintain consent.

Is there a mechanism to delete stored data?	Yes, we can delete all of the data collected for various different criteria, including all of the data for specific times for a specific observer. If you want to delete data from storage, please notify Automation Anywhere customer support. The data will be permanently removed during the next backup process.
Is there a backup data retention policy in place?	Yes.
How do I increase the storage capacity of my Process Discovery cloud instance?	This is done automatically through the cloud service provider.
What is the total time required to get the PEG VM Image working on the Cloud Provider Environment (AWS, GCP, Azure)?	The time required to perform this task is highly dependent on skill set of the person completing the steps. For more information on the process, see <a href="#">Install PEG</a> on page 4099.
Does using PEG delay the transfer of data from the customer's instance to the Process Discovery cloud instance?	Yes. Data collected within an 8 hour period should transfer to the platform within 24 hours. The platform then can take up to 24 hours to process.
What will happen with PEG VM if the cloud service is down temporarily?	If forwarding mode is enabled, PEG will not forward events. After multiple attempts per event (about 5 attempts), PEG will mark the event as not forwarded and will not try it again.
How is Advanced Redaction implemented?	The latest PEG versions have all redaction settings now available in the user interface.
What is the PEG Analytics Portal?	It is the web interface to the Elastic database. It uses Open Distro (a Kibana-like tool) to enable customers to see the data, including a dashboard that shows which data is masked or in forwarding mode.
What encryption methods or key pairs are recommended for storage options specific to Azure, AWS and GCP?	We recommend you use the standard hard drive encryption methods available in those respective clouds using whatever mechanisms they provide.
How often does the Process Discovery Sensor upload data?	Every 5 minutes.
What is the CPU (VDI) Performance impact?	Typically 2 - 5 %
Are there any bandwidth metrics for typical usage?	Process Discovery Sensor typically sends about 10kpbs outbound.  For PEG, it is typically 10kpbs outbound multiplied by the number of concurrent sensors.
Will there be an admin who has access by default to the platform? What other users will have access to the instance and data?	See <a href="#">Process Discovery user roles</a> on page 4065.
Which versions of Microsoft Edge does Process Discovery support?	Any of the Chromium-based versions released after January 15, 2020.

Does the customer organization determine the apex domain for PEG DNS names, such as example.com?	Yes
Are events and PEG events stored off-site in case of a disaster recovery incident?	PEG events are not stored off-site. Process Discovery data is backed-up on a regular basis.
What are the storage requirements?	We require 2TB of storage and recommend SSD standard. Customers might need to delete data to free up space for each cycle.

## Process discovery by using Discovery Bot

You can use Discovery Bot to identify the processes in your business that can be automated. Discovery Bot identifies such processes by recording and analyzing user interactions with various systems for processes, comparing the potential ROI from automating these processes, and creating bots to automate the processes.

### What is process discovery

Process discovery is the first step in automation, in which the processes that can be automated in a business are identified. Process discovery is a method used to uncover business processes by recording user interactions with various systems and analyzing the recorded interactions to identify patterns. User interactions with any of the following types of systems can be recorded and analyzed:

- Enterprise solutions, such as ERP, CRM, business process management (BPM), and ECM
- Personal productivity applications, such as Microsoft Excel and Outlook
- Terminal and virtual environments, such as Citrix XenApp and Remote Desktop

### Why use Discovery Bot

Many companies begin their automation projects with manual process discovery and documentation. Manual review of process documentation requires interviewing business users and mapping work flows while performing daily operations involving additional resources, which can be time-consuming for businesses. This additional effort prevents or delays businesses from reaching the decision to automate their processes and reaping the benefits of automation. As a result, many of the automation opportunities are left undiscovered. Discovery Bot allows businesses to assess ROI from potential opportunities that can help with deciding and implementing automation for their processes.

### Capabilities

Discovery Bot helps in the following ways:

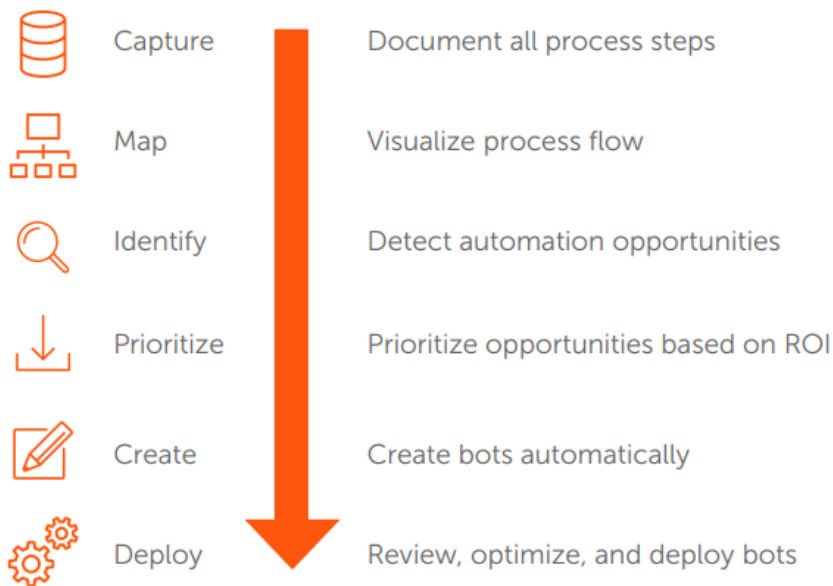

- Enables automatic process documentation and analysis, thereby saving time and resources
- Identifies the correct processes for automation for business users and citizen developers
- Enables business analysts and RPA developers to accelerate automation and maximize RPA ROI

- Converts automation opportunities into bot prototypes for further development and deployment by the automation developer

## How Discovery Bot is used

The Discovery Bot administrator creates processes and invites business users through an email invitation to participate in the recording of these processes. Business users record the steps they perform for various business processes. Discovery Bot aggregates the recordings and generates a proposed work flow. The business analyst can adjust the work flow to select and merge steps into branches from different recordings. From the work flow, the analyst identifies and prioritizes potential automation opportunities based on ROI. Opportunities are approved by the analyst, and Discovery Bot converts the opportunities to Task Bots for deployment.

The following image illustrates how Discovery Bot supports your automation journey from process discovery to bot creation.

To view Discovery Bot tasks in an interactive visual format, see [Get started with Discovery Bot](#).

For an overview of how to get started with Discovery Bot, watch the following video:

See [Get started with Discovery Bot](#).

## Get started with Discovery Bot

Discovery Bot enables organizations to accelerate the automation of business processes from process discovery to bot creation.

- Ensure the system requirements are met.  
[Prerequisites for Discovery Bot](#) on page 4147
- Install and configure Discovery Bot for users in your organization.

[Installing Control Room On-Premises](#) on page 1279

1. Set up users and assign Discovery Bot roles.  
Assign Automation 360 users with the relevant Discovery Bot permissions and associated licenses.
  - [Discovery Bot users](#) on page 4141
  - [Supported licenses for Discovery Bot](#) on page 4143
  - [Create users for Discovery Bot](#) on page 4149
    - [Create multi-role users for Discovery Bot](#) on page 4151
    - [Create a custom role for Discovery Bot](#) on page 4153
    - [Assign the Discovery Bot custom role to a user](#) on page 4154
2. Set up the business process within your organization.  
Create a placeholder for collecting all of the recordings associated for a given process. Invite one or more users through email notification to a Discovery Bot process recording session.  
[Create a Discovery Bot process](#) on page 4156
3. Record the process.  
Business users record their work for the associated processes, annotate their steps, and submit for review a proposed automation work flow.
  - [Supported applications and browsers for Discovery Bot](#) on page 4159
  - [Record a Discovery Bot business process](#) on page 4161
  - [Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant](#) on page 4165
4. Analyze the process.  
The relevant business users (subject matter experts (SMEs), RPM or business analysts (BA)) review the recording data and opportunities associated with the process for specific usage patterns.  
[Analyzing opportunities for automation](#) on page 4166
5. Create opportunities. Merge specific recordings or steps as required. Prioritize opportunities and generate bots automatically.
  - [Review opportunities, convert to bot, and generate PDD](#) on page 4167
  - [Using the Filter and Toggle frequency counter options](#) on page 4174

## Discovery Bot users

Various users are involved in the discovery process, and each user's role and responsibility helps in identifying potential automation opportunities for a business process. The streamlined workflow in Discovery Bot enables various users to collaborate without changing their operations in a major way.

Discovering processes for automation involves the following users:

Control Room administrator

Creates other users, assigns roles to users, and assigns Discovery Bot licenses for users

Discovery Bot administrator

Creates, edits, and deletes processes; also, associates Discovery Bot roles to and disassociates Discovery Bot roles from processes

Users with the Discovery Bot administrator privilege cannot view the recorded data of any process, participate in the recording analysis, or create new opportunities for automation.

Discovery Bot business user

Represents the task force in an organization that will benefit from process automations. The business user performs the following associated tasks for business processes:

- Performs the steps in the assigned process and records the steps

The business user is responsible for recording the steps in the process that are being reviewed and evaluated for potential automation candidates. The business user is invited to participate in recording session by the Discovery Bot administrator.

- Edits the **Step description** (annotated user text) field for recordings.

For each recording, the business user can review the recorded screen captures and provide annotations to capture the business context for the analyst to review. The business user can update the **Data** (keyboard entered) text field if the information should not be shared with the analyst, for example, user ID and password. If the captured steps are not relevant to the process, the business user can delete the steps before submitting the recording for review.

---

**Note:** After a recording has been submitted, it cannot be edited.

- Controls the recording of processes using the media control symbols on the Discovery Bot recorder.

Users can start, pause, resume, and stop the recording on demand by using the Discovery Bot recorder to capture the relevant steps for each process.

---

**Note:** After the recorder has been stopped, additional steps cannot be inserted into that recording.

---

## Discovery Bot analyst

This user can also be known by other names in an organization, such as process owner, process analyst, business analyst, or subject matter expert. The Discovery Bot analyst is responsible for reviewing the associated recordings and identifying potential candidates for automation. The analyst can perform the following steps:

- View all approved recordings from assigned users for a given process.

The analyst cannot edit the recordings; however, they can merge the necessary variations from multiple recordings and create an aggregate view of the process.

- Create opportunities from individual recordings and the aggregated view created from multiple recordings, and convert the opportunities into bots.
- Export a potential opportunity to a Word document for reference.

While it is not a prerequisite for the analyst to be knowledgeable about the processes they are reviewing, it is beneficial because this knowledge helps in easily selecting and analyzing the recordings.

## Supported licenses for Discovery Bot

Learn about the supported Discovery Bot licenses to ensure business workers are ready to begin using Discovery Bot.

Process Discovery licenses must be purchased for use for business analysts and business users using Discovery Bot. Discovery Bot supports two licenses:

- Process analyzer license for the Discovery Bot analyst

This license allows a user to view and manage the metadata from all recordings within the process and create, view, and manage opportunities created from the recordings.

- Process recorder license for the Discovery Bot user

The process recorder license allows a user to view, record, and submit a process using the Discovery Bot recorder.

The following table displays detailed information for supported licenses and permissions for Discovery Bot business workers:

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot admin	<b>AAE_Discovery Bot Admin</b>	<ul style="list-style-type: none"> <li>Create, view, update, and delete processes.</li> <li>Assign Discovery Bot analyst and business user to processes.</li> </ul>	None
Discovery Bot analyst	<b>AAE_Discovery Bot Analyst</b>	View assigned processes.  <b>Note:</b> Assigned processes are only displayed after the processes are created by the Discovery Bot admin.	Process analyzer
		View only recordings (including annotated steps and metadata) that they have created or been assigned to.  If a user is no longer assigned to a process, the user will lose access to the recordings.	Process analyzer
		View recordings, including metadata and annotated steps, for a given process.	Process analyzer
		<ul style="list-style-type: none"> <li>Create, view, update, and delete manual generated aggregation</li> <li>View all manually generated aggregations</li> </ul>	Process analyzer
		Create and view own opportunities for a given process.	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
		Convert an opportunity to a bot.	Process analyzer for opportunity creation. Bot Creator license is required to convert an opportunity to a bot.
		Export opportunity to Word.	Process analyzer

Discovery Bot user	System-provided Discovery Bot role	Discovery Bot features	Discovery Bot license required
Discovery Bot user	<b>AAE_Discovery Bot User</b>	<ul style="list-style-type: none"> <li>• Using the Discovery Bot recorder, create or more recordings for an assigned business process.</li> <li>• Update own recording to include annotations for the steps.</li> <li>• Delete one or more steps from own recording before submission.</li> <li>• View only recordings (including annotated steps, keyboard entered text, and application type) that they have created or been assigned to. The user can update the keyboard entered text field if the information should not be shared with the analyst (e.g. user ID and password).</li> </ul> <hr/> <p><b>Note:</b> Assigned processes are only displayed after the processes are created by the Discovery Bot admin.</p> <hr/> <p>If a user is no longer assigned to a process recording, the user will lose access to the recording data.</p>	Process recorder

## Prerequisites for Discovery Bot

To use Discovery Bot for your enterprise business processes, you must have an Automation 360 working environment and the associated dependencies installed: Bot Agent, browser extension, and so on.

### Supported versions and server requirements

Verify that you have the correct Control Room version installed. The Control Room deployment can be cloud or on-premises.

Ensure your Control Room server requirements are set up before installation. See [Control Room server requirements](#) on page 1289.

### System requirements

For Discovery Bot users' recording processes or assigned bot creation privileges, verify that your device meets the following system requirements:

- Windows machine is only supported for recording sessions.
- Oracle database is not supported on Discovery Bot.
- Set your local device credentials for any device that is connected to the Control Room. This is a one-time setup for each device. Ensure each device that you use accepts the credentials in your profile.
- [Set user device credentials](#) on page 1457
- Register your device and install the latest Bot Agent version on your machine. If you have not already installed the Bot Agent, when you log in initially, you will be prompted to install the Bot Agent from the **Processes** tab. Follow the prompts to install the Bot Agent. This will automatically add your user credentials.

[Install Bot Agent and register device](#) on page 1450

- To record processes using Google Chrome, the Chrome plug-in must be installed.

[Browser requirements for Automation Workspace](#) on page 1312

- Ensure your environment is ready to begin recording and analyzing processes using the Discovery Bot recorder. The prerequisites are similar to the Universal Recorder.

[Record a task with the Universal Recorder](#) on page 2389

- Verify the Discovery Bot recorder requirements are completed.

[Supported applications and browsers for Discovery Bot](#) on page 4159

### Update proxy settings

You must update your proxy settings to add the Automation Anywhere URL domain to the trusted list. The added URL domain is specific to your region of Automation Anywhere cloud. If you are using your proxy to access our cloud, you must avoid a redirect to your proxy. Remove any authentication type settings and policy acceptance.

## Installation requirements

The Discovery Bot installer is integrated with the Automation 360 installer. No separate installation is required for Discovery Bot On-Premises users. The IT administrator in your organization performs this task. See [Installing Control Room On-Premises](#) on page 1279.

---

**Note:** Ensure your database server requirements are met before using SQL authentication mode to connect to the Control Room: [Installing Control Room using Custom mode](#) on page 1346.

---

For custom installation, you can now change the default repository path location to a new location on your server after installation. The default path is: `C:\ProgramData\AutomationAnywhere\ServerFiles`. The Process Discovery files now reside in the ServerFiles folder.

---

**Note:** For Control Room admin. You must manually copy and paste the existing data into the new location if you change the default path to the new location.

---

The generated PDD file for an opportunity is now stored locally on your server by Automation 360 On-Premises. The path to the file storage is: `C:\ProgramData\AutomationAnywhere\ServerFiles\ProcessDiscovery\opportunity`. The existing PDD files will automatically be moved to the new location and will not be deleted when a reinstall or upgrade occurs in the Control Room.

## Verify installation

After the installation is complete, log in to your Control Room as an administrator. The Discovery Bot tab is available for use from the left panel.

## Process Discovery package

The Process Discovery package contains actions that record various object operations such as click (right or left), recording, and window resizing that are used during process recording sessions. View information about the Process Discovery package from the **View package** page (**Manage > Packages > Process Discovery**).

The package is included in the default packages. You can preload the default package when you connect to your device. Preloading the package helps to speed the start time of the recorder the first time you begin recording a process.

The actions in the package are not available for use from the Bot editor.

Related concepts

[Preload packages](#) on page 2460

You can preload packages on your local device to shorten the bot runtime.

## Upgrade Discovery Bot from Enterprise A2019.15 to later versions

Upgrade Discovery Bot from Enterprise A2019.15 (On-Premises) to a later version for the latest features and enhancements.

Enterprise A2019.15 provides a separate installer (executable file) for Discovery Bot On-Premises users to install and use Discovery Bot from the Control Room. Starting from A2019.16, the Discovery Bot installer is integrated with the Enterprise A2019 installer. To upgrade from Enterprise A2019.15 to a later version, you must first uninstall Discovery Bot from your machine and install the Control Room.

1. In your Windows device, go to **Apps & features**.
2. Search for Discovery Bot.
3. Click **Uninstall**.
4. Install the latest version of the Control Room.  
[Installing Control Room On-Premises](#) on page 1279
5. From your local machine, log in to your Control Room as an administrator.  
The **Discovery Bot** tab is available for use from the left panel.

## Create users for Discovery Bot

Create the Discovery Bot admin, analyst, and users to begin using the Discovery Bot functionality for front-office and back-office business processes. The Control Room admin creates these users and assigns the required system roles.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users before you begin creating users: [Prerequisites for Discovery Bot](#) on page 4147.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses. See [Supported licenses for Discovery Bot](#) on page 4143.

---

**Note:** The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 4141.

---

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.

First name Optional: Enter the first name of the user.

Last name Optional: Enter the last name of the user.

Email Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select one of the following roles from the **Available roles** column:

Discovery Bot user	Select this role
Admin	<b>AAE_Discovery Bot Admin</b>
Analyst	<b>AAE_Basic</b> and <b>AAE_Discovery Bot Analyst</b>  <b>Note:</b> The <b>AAE_Basic</b> role is required to view or add actions to the bots.
Business user	<b>AAE_Basic</b> and <b>AAE_Discovery Bot User</b>  <b>Note:</b> The <b>AAE_Basic</b> role is required to view or add actions to the bots created by the analyst.

6. Click the right arrow to move the role to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin	Retain the default <b>None</b> for the user.  This user only has access to the Control Room.
Analyst	Assign the <b>Bot Creator - Development license</b> to this user.  <b>Note:</b> This license is required to convert an opportunity to a bot.
Business user	Retain the default <b>None</b> for the user.  This user only has access to the Control Room.

8. Under **Allocate other types of licenses for this user? > Discovery Bot licenses**, select the following:

Discovery Bot user	Action
Admin	No license is required.
Analyst	Select the <b>Process analyzer</b> license.

Discovery Bot user	Action
Business user	Select the <b>Process recorder</b> license.

9. Click **Create user**.

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 4156

You can begin capturing business processes using Discovery Bot. Create a process and assign users to record and capture the process using the Discovery Bot recorder.

## Create multi-role users for Discovery Bot

Create multi-role users when you want to combine system-generated Discovery Bot roles and licenses to provide additional functionality for your users. Depending on your business requirements, you can combine up to three Discovery Bot system-generated roles and two process discovery licenses.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 4147.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

**Note:** The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 4141.

Multi-role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

The following actions are available for multi-role users (Admin + Business user + Analyst) on a tile for a process:

Admin actions

- View process details
- Edit process details
- Delete process
- View/edit process details

Business user actions

- Start recording
- The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.
- Edit my recording

Analyst action

Analyze processes  
View process opportunities

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

- In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Optional: Enter your password and confirm the password.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

- In the **Select Roles** section, select the following roles from the **Available roles** column to create multi-role users:

Discovery Bot user	Select this role
Admin + Business user	<b>AAE_Discovery Bot Admin</b> and <b>AAE_Discovery Bot User</b>
Admin + Analyst	<b>AAE_Basic</b> , <b>AAE_Discovery Bot Admin</b> , and <b>AAE_Discovery Bot Analyst</b>
Business user + Analyst	<b>AAE_Basic</b> , <b>AAE_Discovery Bot User</b> , and <b>AAE_Discovery Bot Analyst</b>
Admin + Business user + Analyst	<b>AAE_Basic</b> , <b>AAE_Discovery Bot Admin</b> , <b>AAE_Discovery Bot User</b> , and <b>AAE_Discovery Bot Analyst</b>

- Click the right arrow to move the roles to the **Selected** column.

- In the **Allocate a device license to this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Retain the default <b>None</b> for the user. This user only has access to the Control Room.
Admin + Analyst	Assign the <b>Bot Creator - Development license</b> to this user.  <b>Note:</b> This license is required to convert an opportunity to a bot.

Discovery Bot user	Action
Business user + Analyst	Assign the <b>Bot Creator - Development license</b> to this user.  <b>Note:</b> This license is required to convert an opportunity to a bot.
Admin + Business user + Analyst	Assign the <b>Bot Creator - Development license</b> to this user.  <b>Note:</b> This license is required to convert an opportunity to a bot.

8. In the **Allocate other types of licenses for this user** section, select the following:

Discovery Bot user	Action
Admin + Business user	Select the <b>Process recorder</b> license.
Admin + Analyst	Select the <b>Process analyzer</b> license.
Business user + Analyst	Select the <b>Process analyzer</b> and <b>Process recorder</b> licenses.
Admin + Business user + Analyst	Select the <b>Process analyzer</b> and <b>Process recorder</b> licenses.

9. Click **Create user**.

The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 4156

Log in with your multi-role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

## Create a custom role for Discovery Bot

Learn how to create a Discovery Bot custom role that allows users to select Discovery Bot feature permissions from standard business user roles (Admin, Business user, or Analyst roles), and a single Control Room admin feature permission for viewing users.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 4147.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

**Note:** The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 4141.

Use case

The Discovery Bot custom role user is enabled with Control Room Admin feature permissions for viewing users, but does not have edit permissions. The role allows the user to view and manage all Discovery Bot feature permissions for processes, recordings,

aggregations, and opportunities. However, the role does not allow the user to view opportunities or the associated metadata created by other analysts in the **Opportunities** tab. The permission to view all opportunities is not enabled for the user.

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Roles**.
3. Click **Create role**.  
The icon is located at the top-right of the **All roles** table.  
The **Create role** page is displayed.
4. Enter a **Role** name, and optionally enter a **Role** description.
5. Scroll to the **Administration** section.
6. Select **View users**.
7. Select **View roles**.
8. Scroll to the **Discovery Bot** section.
9. Select **View assigned process** at the parent level.  
The child-level permissions are enabled.
10. Select all the following feature permissions: .
  - a) **Discovery Bot** process feature permissions at the child level
  - b) **Discovery Bot** recording feature permissions at the parent and child levels
  - c) **Discovery Bot** aggregation feature permissions at parent and child levels
  - d) **Discovery Bot** opportunity feature permissions at the parent and child levels

---

**Note:** Do not select **View all opportunities**.

---

11. Click **Create role**.  
The **Discovery Bot** custom role is created.

[Assign the Discovery Bot custom role to a user](#) on page 4154

## Assign the Discovery Bot custom role to a user

Create a new user and assign the **Discovery Bot** custom role you created to the user.

Ensure that you have purchased the necessary Discovery Bot licenses for your business users: [Prerequisites for Discovery Bot](#) on page 4147.

To use the Discovery Bot features, the user must be assigned the appropriate role and licenses.

---

**Note:** The Discovery Bot Admin role and permissions are distinct from the Control Room Admin role. See [Discovery Bot users](#) on page 4141.

---

Custom role users will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process, depending on the permissions given to users. These actions are different from the standard Discovery Bot user actions that are available on a tile for a process.

For this custom role use case, the following actions are available on a tile for a process:

#### Admin actions

- View process details
- Edit process details
- Delete process

#### Business user actions

- Start recording  
The **Start Recording** icon is displayed on a tile for a process, or you can select start recording from the vertical ellipsis icon.
- Edit my recording

#### Analyst action

#### Analyze processes

1. From your local machine, log in to your Control Room as administrator.
2. Go to **Administration > Users**.
3. Click **Create user**.

The icon is located at the top-right of the **Users** table.

The **Create user** page is displayed.

4. In the **General Details** section, enter the following user details:

Enable User	Select the check box so that the user can log in immediately.
Username	Enter a unique user name.
Description	Optional: Enter a description for the user.
First name	Optional: Enter the first name of the user.
Last name	Optional: Enter the last name of the user.
Password	Optional: Enter your password and confirm the password.
Email	Enter and confirm the email address for the user. If SMTP is enabled, the user is sent an email to this address to confirm the account. Click the URL in the email to log in to the Control Room and set up your credentials. All important Control Room notifications will be sent to this email address.

5. In the **Select Roles** section, select the **AAE\_Basic** role and the Discovery Bot custom role you created from the **Available roles** column.
6. Click the right arrow to move the roles to the **Selected** column.
7. In the **Allocate a device license to this user** section, select the **Bot Creator - Development license**.
8. In the **Allocate other types of licenses for this user** section, select the **Process analyzer** and **Process recorder** licenses.
9. Click **Create user**.  
The new user is displayed in the User table. If SMTP is enabled, an email will be sent to the new user inviting them to log in.

[Create a Discovery Bot process](#) on page 4156

Log in with your custom role credentials and create a process. Assign users to record and capture the process using the Discovery Bot recorder. Review and analyze business processes.

## Create a Discovery Bot process

Create a Discovery Bot process and assign users to record and analyze a process for your automation requirements.

- This task is performed by the Discovery Bot admin who manages the creation, deletion, and editing of Discovery Bot processes.

---

**Note:** Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

---

- Ensure the **Process recorder** license is allocated to Discovery Bot users assigned to recording a process.
- Ensure the **Process analyzer** license is allocated to the Discovery Bot analyst assigned to analyzing a process.
- Create a process and assign users:
  - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
  - b) Go to **Discovery Bot > Processes**.
  - c) Click **Create Process**.  
The **Create process** page is displayed.
  - d) In the **General Details** tab, enter a **Process Name**.  
Special characters are not supported. Creating a process with a duplicate name is not supported.
  - e) Optional: Enter a **Process Description**.
  - f) Click **Next** to assign users to a process.
  - g) Optional: In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
  - h) Click the right arrow to move the roles to the list in the **Selected** column.
  - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
  - j) Click **Create Process**.
  - k) Click **Close** to exit the page and return to the **Processes** page.

---

**Note:** An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

---

The newly created process is displayed in the **Processes** page on a tile.

For users, all of their assigned processes are available for viewing from the **Processes** page. Use the search field to help you locate a specific process by name. The field is not case-sensitive. For users, use the field to search on a process you are assigned to. For admin users, use the field to search on all processes. Use the sort field to help you locate a process tile quickly. Click the drop-down to sort for a process tile based on the process

name in alphabetical order or you can sort in the order of newest process created to oldest process and vice versa. The tile for a process displays the following information for an admin user:

Process tile	Description
Recordings	The number of the recordings captured and stored for a process by users.
Process Cycle	The average time, in minutes and seconds, across all recordings captured for a process.

Process tile	Description
<p>Vertical ellipsis icon (three dots)</p> <hr/> <p><b>Note:</b> You might see a different set of menu actions available from the tile if you are a Discovery Bot standard user, multi-role user, or custom role user.</p> <hr/>	<p>View, edit, or delete information for a process.</p> <ul style="list-style-type: none"> <li>Click <b>View process details</b> to view more information about a process, edit and update information, and save changes.</li> <li>Click <b>Edit process details</b> to edit a process. Enter your changes and click <b>Save changes</b>. Click <b>Close</b> to return to the <b>Processes</b> page.</li> </ul> <hr/> <p><b>Note:</b> The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> <li>Click <b>Delete process</b> to delete a process. A message window appears.</li> <li>Click <b>Yes, delete</b> to delete a process.</li> </ul> <p>All recordings and associated data are permanently deleted. This cannot be undone.</p> <p>Click <b>No, cancel</b> to return to the <b>Processes</b> page. <ul style="list-style-type: none"> <li>Click <b>View/edit process details</b> to view more information about a process, edit and update information, and save changes. To edit a process, click <b>Edit</b>. Enter your changes and click <b>Save changes</b>. Click <b>Close</b> to return to the <b>Processes</b> page.</li> </ul> <hr/> <p><b>Note:</b> The name of the process cannot be changed.</p> <hr/> <ul style="list-style-type: none"> <li>Click <b>Edit my recording</b> to edit and review recordings.</li> <li>Click <b>View process opportunities</b> to view auto-generated or custom opportunities created from the <b>Opportunities</b> tab.</li> </ul> </p>

- Create a process and add users at a later time:
  - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
  - b) Go to **Discovery Bot > Processes**.

- c) Click **Create Process**.  
The **Create process** page is displayed.
  - d) In the **General Details** tab, enter a **Process Name**.  
Special characters are not supported. Creating a process with a name previously used for another process is not supported.
  - e) Optional: Enter a **Process Description**.
  - f) Click **Create Process** to create a process without assigning users.
  - g) Click **Close** to exit the page and return to the **Processes** page.
- Update an existing process and add users.
    - a) From your local machine, log in to your Control Room as a Discovery Bot administrator.
    - b) Go to **Discovery Bot > Processes**.
    - c) Go to the process you want to edit.
    - d) Click **Edit** from the **Options** icon.
    - e) In the **Edit process** page, click **Next** to assign users to a process.
    - f) In the **Users** tab, select the Discovery Bot business user or analyst from the list of **Available** users.
    - g) Click the right arrow to move the roles to the list in the **Selected** column.
    - h) Click **Save changes**.
    - i) Click **Next** to view the invitation that is sent to users to begin recording processes.
    - j) Click **Close** to exit the page and return to the **Processes** page.

---

**Note:** An email invitation is sent to assigned users (new users or users added at a later time) to begin a Discovery Bot process recording session.

---

The newly created process is displayed in the **Processes** page on a tile.

[Record a Discovery Bot business process](#) on page 4161

Log in to your Control Room as a Discovery Bot user and record a business process assigned to you.

## Supported applications and browsers for Discovery Bot

Learn about supported applications and browsers to ensure your environment is ready before you begin using the Discovery Bot recorder.

### About the Discovery Bot recorder

The Discovery Bot recorder is similar in function to the Automation 360 Universal Recorder with one significant difference: pre-selection of the application to be used for recording is not required.

The Discovery Bot recorder captures data across many user interface (UI) objects such as Windows applications, native applications, executable file, or browser window on PC devices and

machines or virtual machines running Windows OS. Use the Discovery Bot recorder to capture, read (data extraction), write (data entry), and click (left or right) operations when working across various operations. A single recording per user can capture up to 8 hours of user actions.

The Discovery Bot recorder displays the performed action by using highlighter. Click the object control, for example, a button, form field, or a table. A red outline highlights the control when you move the mouse over it to capture the action.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

## Supported applications and browsers

The recorder supports system, web, and virtual applications including the following:

### Applications

- Microsoft applications: Edge, PowerPoint, Excel, Word, Outlook, Calculator, Notepad, Notepad++, Teams
- Zoom
- Snagit
- Java applet, web start, and desktop applications that run using Java Runtime Environment (JRE) 6, 7, 8, 9, 10, and 11 (32-bit and 64-bit versions)
- Microsoft Active Accessibility and UI automation based applications
- Oracle EBS and Forms
- SAP 730, 740, 750 and 760 versions.
- Citrix Virtual Apps

### Browsers

- Internet Explorer version 11
- Google Chrome

---

**Note:** Chrome plug-in must be installed to record processes. If the Chrome plug-in is removed, you must manually add and re-enable the plug-in. [Google Chrome browser extension requirements](#) on page 2399

---

### Desktop

The desktop refers to the device screen when all application and browser windows are minimized.

### Taskbar

The taskbar is the horizontal or vertical bar containing icons of open applications and browsers, as well as the notification area. You can capture application, browser, system, and other icons, for example such as the clock and calendar, volume, and Wi-Fi.

## Record a Discovery Bot business process

Record, capture, and annotate steps for a business process using the Discovery Bot recorder. The process recording allows the Discovery Bot analyst to view all recorded steps for a quantitative and comparative analysis. The steps along with the captured metadata and user actions help the analyst make the decision to create opportunities and bots.

- This task is performed by the Discovery Bot user who records assigned business processes and submits the same for review and analysis.

---

**Note:** Multi-role and custom role user can also perform this task depending on the roles or the permissions given to users. You will see a different set of menu actions (vertical ellipsis icon) available on a tile for a process.

---

- Ensure that you have set your device credentials and installed the latest Bot Agent version on your machine before using the Discovery Bot recorder.
- Ensure that the machine on which you will be performing the recordings is also duly registered.

[Prerequisites for Discovery Bot](#) on page 4147

### 1. Record a business process:

- a) From your local machine, log in to your Control Room as Discovery Bot business user.
- b) Go to **Discovery Bot > Processes**.  
The **Processes** page appears, displaying all processes assigned to the user for recording.
- c) Click the **Start Recording** icon from the tile associated with the process you want to begin recording a process.

---

**Note:** You can also select, **Start Recording** from the from the vertical ellipse icon to begin recording a process.

---

A message window appears notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. Allow for a few minutes for the recorder to start the very first time you begin recording a process.

- d) Perform the actions to record.

For example, open an application and fill in a form or open a browser and search a website. Click the object control, for example, a button, form field, or a table. A red outline highlights the control when you move the mouse over it to capture the action. The red outline indicates that the recorder is ready for you to take the next action in recording the process.

You can perform actions like double-click, drag-drop, click and hold, and text select while recording. Actions performed using keyboard strokes are displayed in the **Data** field.

- e) Click **Stop** to end the recording.

You can click **Cancel recording** to cancel a recording at any time.

Wait for a few seconds for the recorder to end. The details in the tile for the process is incremented to include the new recording in the **Recordings** section.

---

**Note:** Once the recording has been stopped, additional steps cannot be added to the recording.

---

**Note:** A maximum of 8 hours worth of user actions can be captured in a single recording.

- f) Enter a name for the recording in the field provided.  
The character limit is 50. Special characters are supported.
- g) Click **Save** to save your changes.
- h) Click **Cancel** to discard the recording.

**Note:** If you discard the recording, you cannot recover it.

2. Review the captured steps, annotate them, and submit a process recording for review to the Discovery Bot analyst:

- a) From **Processes**, select a process by clicking the process name or anywhere within the process tile body. From **Processes**, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings.

If you click the process tile body or the process name, the **Opportunities** page appears. Only approved recordings from the **Opportunities** tab are displayed for the analyst.

For Discovery Bot multi-role and custom role users, click the vertical ellipsis icon and select **Edit my recording** to edit and review recordings. If you click the process tile body or the process name, the **View process** page appears. Only approved recordings are displayed for the analyst on the **View process** page.

The **Recordings** page appears with the **Recordings** table on the left and single recording details on the right. The table displays the following information:

Recordings	Description
Recordings (#) (# selected)	The number of recordings logged in by users.
Customize columns	Click the table icon to display or hide columns (ID, Status, Process Cycle, and Recorder), or edit the layout of the header rows to display right or left as required.
ID	The ID number of the recording in the database. The system collects and sequentially increments the index for each recording captured by the users.  <b>Note:</b> To search for a specific recording, select <b>ID</b> and enter the ID number in the search bar.
Name	The recording name.

Recordings	Description
Status	<p>The status of the recording:</p> <ul style="list-style-type: none"> <li>• Pending: Initial state.</li> <li>• Approved: All user-required edits have been completed and recording is ready for review by an analyst.</li> <li>• Error: There is an error when storing the recording in the system.</li> <li>• Declined: Currently not being used.</li> </ul> <hr/> <p><b>Note:</b> To search on a process status, select <b>Status</b> and choose a status from the drop-down list.</p> <hr/>
Process Cycle	<p>The recording duration, in minutes and seconds, excluding the time that the recorder was paused.</p>
Recorder	<p>The name of the user that created the recording.</p> <hr/> <p><b>Note:</b> To search on users assigned to a recording, select <b>Recorder</b> from the drop-down list and enter the user name in the search bar. The search is case-sensitive.</p> <hr/>

- From the **Recordings** table, select a recording to view all captured steps. In the right pane, the header displays the recording ID details, including the total steps captured during the recording session, recording name, process time, and current recording status.  
Each recorded step includes: screenshot image with the **Screen** option (icon), application type, data (keyboard entered text), and step description (annotated user text) fields.
- Optional: To provide a description for the recording, click in the **Description** area. Using the **Description** field that appears, share the context and the purpose of the recording with the analyst.  
The character limit is 255. The description entered is displayed in the PDD.
- Click **Save** to save the description you entered in the **Description** field.
- Optional: Click the **Screen** icon to display or hide the screenshot image.  
Use the **Screen** option icon when you do not want to share personal image details with the Discovery Bot analyst, multi-role, or custom role users. To remove personal information, for example username and password credentials from the image, edit the **Data** field prior to submission for analyst review.

---

**Note:** If you hide an image and Click **Submit**, you cannot display the image again.

---

7. Click the screenshot to display the image in full size.

The **Screenshot** shows the state of the application at the time of performing the associated action. The red outline highlights where you have performed actions like click and hold and text select. You cannot edit the screenshot. Click the image when you want to display a larger view of the screenshot. Review the step action in more detail from the modal window. Click the pagination located below the image to select a step number or use the right or left arrows to quickly display all captured images. For actions not captured by the recorder such as double-click, drag-drop, and click and hold, you can document the individual steps in the **Step description** field for the analyst.

The duration of the recorded step is displayed in minutes and seconds below the screenshot. Use this information to help prioritize what step or sequence of steps are a better candidate for automation. For example, if a sequence of steps takes longer to perform, you can automate this first for a process to save manual effort.

- Click the **Hide image** icon to hide the image.

The image will not be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

- Click **Show image** to display the image.

The image will be submitted to the analyst for review. Click **X** to close the frame. Click **Save** to save your selection.

8. Optional: Update the application name used in the process recording in the **Application** text field.

The **Application** field represents the name of the application on which the action was performed. If required, the user that made the recording can change this.

9. Optional: Update the keyboard entered text used in the process recording in the **Data** text field.

The **Data** field represents any data entered by the user at that step during the recording.

---

**Note:** You must follow the keyboard data entry with a left or right mouse click. For any step in which the data was entered, you can make changes to the data in the **Data** field. You cannot enter any data for steps which do not have any data entered during the actual recording of the process.

---

10. Optional: Update the context associated with the step in the **Step description** text field.

The **Step description** text field represents any additional description that you would like to provide regarding the operation being performed. The maximum character limit is 2000.

11. Optional: Delete any step that is not required to be included in the process recording.

12. Repeat the above steps for each step as required.

13. Optional: Click **Save** to save your changes.

Use the **Save** option when you want to edit and compare the recording data (including application, keyboard entered text, and annotation text fields) across multiple recordings captured in the **Recordings** table.

14. Optional: Click **Delete** to delete the recording for that process.

Use the **Delete** option when you do not want to submit the recording data to the analyst for review.

The recording and associated data is deleted from the **Recordings** page for that process.

15. Click **Submit**.

The recording is submitted to the analyst for review and approval.

**Note:** After a recording is submitted, it cannot be edited to make additional changes.

---

16. Click the **Download** option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart and the time on each individual step in hours, minutes, and seconds.

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

---

**Note:** If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

---

**Note:** You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

---

On your machine, the document is saved in the folder that is configured for downloads in your browser.

[Analyzing opportunities for automation](#) on page 4166

Log in to your Control Room as a Discovery Bot analyst to review and analyze the recordings to create opportunities or bots as required.

## Record a Discovery Bot process using Automation Co-Pilot Desktop Assistant

Use Automation Co-Pilot Desktop Assistant to record Discovery Bot business processes without signing in to the Control Room.

- Before using the Discovery Bot recorder, ensure that you have set your device credentials and installed the latest version of the Bot Agent on your machine.
- 

**Note:** The Bot Agent installation will load the Automation Co-Pilot icon on your desktop.

---

- Ensure that the machine on which you will be performing the recordings is also duly registered.

[Prerequisites for Discovery Bot](#) on page 4147

- Ensure that your browser settings allow redirects and pop-ups from your browser to access the Control Room.

1. Double-click the Automation Co-Pilot icon to open the Automation Co-Pilot Desktop Assistant.
2. Use Automation 360 credentials to sign in to the application.
3. Click **Processes**.  
The **Recording Processes** page appears, displaying all the processes assigned and available to the user.
4. When you want to start recording a process, click **Start recording**.

A message window appears, notifying you that you are now recording and sharing your screen. The **Discovery Bot Recorder** window is displayed with **Pause** and **Stop** options. Pause and resume the recording as required. The first time you begin recording a process, the recorder might take a few minutes to start recording.

5. Perform the actions to record.
6. To end the recording, click **Stop**.  
You will be redirected to the Control Room to review and edit your recording before you submit it. [Record a Discovery Bot business process](#) on page 4161
7. To review the steps of previous recordings and submit them, click **Previous recordings**.  
You will be redirected to the Control Room to review the recordings.

## Analyzing opportunities for automation

Review opportunities and process recording data by using graphs and charts that help you to analyze and understand the benefits and savings from a potential opportunity with or without automation.

### Opportunities

The Opportunities header provides a snapshot of the recording and opportunity data captured by all users for assigned processes. The following data is displayed in the **Opportunities** header:

Field	Description
Savings	The potential savings (yearly savings or savings per run) associated with the opportunity
Number of opportunities	The number of opportunities that include the selected recordings
Number of process variants	The number of branches included in the opportunity
Average process cycle	The average duration of the recordings provided for the process
Participants	Number of users who submitted recordings for the process

### Opportunities evolution

Use the opportunities evolution map as a guide to decide which opportunities to automate first. Each quadrant displays the following:

- **Proceed now:** These opportunities yield the maximum benefit and ease of implementation.
- **Long term:** These opportunities yield good ROI but will take time to implement. They also require a higher implementation effort to automate.
- **Hold:** The automation benefit is low and the implementation time is high. The recommendation is not to automate.

- **Quick wins:** Always do this first to build momentum.

## Application usage

The donut chart displays the number of applications used across selected recordings. The application usage details are displayed in the table to the right of the chart in the following format: Application | minutes seconds | percentage. The percentage represents the percent of the application used over a total of all applications used.

## Use case

Use this information to quickly understand user participation and process complexity and variability; the higher the application count, the higher the complexity and variability of the process that is being analyzed. The average process cycle time will provide a quick insight into the duration of the process within the expected processing time. If the actual process cycle is higher across application count, this might be an indicator that the process is a more suitable candidate for automation and assists with improving efficiency.

## Process cycle time by process

This graph displays the time associated with the average process cycle (in minutes) for each process and by user.

## Use case

Use this information to help you understand which processes take the most time and therefore, will potentially give you more savings if automated. For example, an analyst can learn why a process recording took longer or was completed in a shorter period for one particular participant and compare this information with other participants. This information is instrumental in narrowing down on a smaller subset of the process recordings to study them for inefficiencies that might result in better or more opportunities for automation.

## Number of steps by a process

This graph displays the average number of manual steps in each process and by user. Use this information to compare the number of steps across processes. Processes with greater number of manual steps are more likely candidates for automation.

## Review opportunities, convert to bot, and generate PDD

Review potential, system-generated opportunities, create custom opportunities from a system-generated opportunity, and convert them to bots. You can also export the opportunity data to a Microsoft Word or PDF document for your reference.

Automation opportunities are of two types, system-generated and manual. System-generated opportunities, also known as auto-generated opportunities, are created when at least one

recording is approved by the user for a process. The auto-generated opportunities are available immediately for you to begin analyzing from the **Opportunities** page for the recording. The **Download** option to generate a Microsoft Word or PDF document is not available for auto-generated opportunities. Creating a branch and merging steps into the branch for auto-generated opportunities is not available from the process diagram.

Manual opportunities, also known as custom opportunities, are created from auto-generated opportunities. A custom opportunity allows you the flexibility to review current and newly added recordings from users and decide to accept or reject the new recording changes to the existing process diagram. You can also create a branch as you add steps from another recording to the process diagram. The **Download** option is available for you to use if you want to download a Microsoft Word or PDF document of the custom opportunity data for your reference.

- This task is performed by the Discovery Bot analyst who is in charge of reviewing and analyzing the associated recordings of business processes.
- Ensure the analyst is assigned a Process analyzer license and the **AAE\_Discovery Bot Analyst** role before processes are analyzed.

[Supported licenses for Discovery Bot](#) on page 4143

- Ensure the analyst is assigned a Bot Creator license to convert opportunities to bots.

[Supported licenses for Discovery Bot](#) on page 4143

1. Review the data in the **Opportunities** tab:
  - a) From your local machine, log in to your Control Room as Discovery Bot analyst.
  - b) Go to **Discovery Bot > Opportunities**.

The **Opportunities** page displays all the opportunities you have created. You can configure the menu option to display as you want using the **Customize columns** icon. The table lists the following information:

Field	Description
Opportunity name	The name created for the opportunity. To identify an auto-generated opportunity from a custom opportunity, the auto-generated opportunity begins with the name of the process hyphen OPPORTUNITY.
Process name	The name created for the process.
Type	The type of opportunity created for a process. The type can be Auto or Custom.
Path	The type of path specified based on the <b>Filter</b> option applied to the opportunity. Auto-generated opportunities use filter default value of Most common path.
Date created	When the opportunity was created.

Field	Description
Date modified	The date the opportunity is modified by the analyst. The modified date can occur when a opportunity is updated or when a custom opportunity is created.
Owner	The name of the process owner. The process owner can be system or analyst.
# of recordings	The number of recordings for a process associated with the opportunity.
# of applications	The number of applications used in a recording session associated with the opportunity.
Process cycle	The duration of the recording session associated with the opportunity.
# of users	The number of users who participated in the recording session for that process.
Cost without automation	The formula used to calculate the cost of the opportunity without automation. Use the formula to help you decide which opportunities to prioritize for your business development based on ROI, applications used, number of users, and so on. The formula is calculated by taking the number of users multiplied by the total hourly pay of number of users multiplied by the average process cycle.
Savings	The potential savings associated with the opportunity (this could have been specified as a yearly savings or savings per run).
Priority	The priority level assigned to the opportunity. The priority can be one of the following: <ul style="list-style-type: none"> <li>• Low</li> <li>• Medium</li> <li>• High</li> </ul>

Field	Description
Bot created	The bot created for an opportunity. This can be Yes or No. The <b>Convert to bot</b> option is not available for auto-generated opportunities. The <b>Convert to bot</b> option is available for custom opportunities only.

- c) Select the required opportunity by sorting, searching, or both from the table using the **Search** field.
  - d) Click the vertical ellipsis icon (three dots) from the table to view an opportunity or download a Word or PDF PDD document.  
The PDD download option for Word or PDF is only available for custom opportunities.
  - e) Select an opportunity from the table for display.
2. Optional: Create a custom opportunity from the autogenerated opportunity.
- a) Expand the **Recordings** section from the left side of the main canvas.  
By default, all selected recordings are displayed in the process diagram.
  - b) Select a single recording from the **Recordings** section for review, as needed.  
The selected recording is colored in blue from the **Recordings** section and displayed in the new feeder canvas to the left of the main canvas. All recordings are displayed in the process diagram to the right of the main canvas. Toggle off the selected recording to select another recording for display.
  - c) Select either the screenshot icon or the application icon to decide how you want to display the steps.  
Use the **Zoom in** or **Zoom out** options as required. Use the **Reset** zoom to bring the view back to the default level and recenter the process in the canvas.  
Contiguous steps performed in the same application are combined together. This is displayed as a single group to allow better readability of the process. The number of steps collated together is indicated in the bottom-right corner of the group.
- 
- Note:** If the screenshot view is the last active view, then the image of the last step in the group is the one that is displayed for the collapsed group. You can drag the process within the canvas by holding down the mouse left button and moving the process to the desired location.
- 
- d) Click a step to expand a group of steps to preview the step in more detail. Alternatively, click the arrow near the top-right corner of the group icon.  
Use the group icon to display groups of steps that belong to the primary and secondary level actions (and subgroup level actions) used during the recording session. As required, expand a group of steps to drill down from the primary to subgroup-level actions to help you decide what group of steps to use when creating a potential opportunity for a task that you want to automate. For example, a primary-level action displays Microsoft Outlook, a secondary-level action displays Outlook mail notification, and subgroup-level actions can display compose email, body email, and send email.
  - e) Select the **Select all steps** check box from the **Overview** pane to select all the steps in the process diagram.

Based on your requirements, use the Shift key to customize the number of steps within a path from the main canvas. If you select a nested branch or loop, the parent branch or loop displays a partial selection.

- f) Optional: Use the **Filter** option to customize a specific opportunity. [Using the Filter and Toggle frequency counter options](#) on page 4174.
- g) Optional: Use the **Toggle frequency counter** option to display the frequency of path as compared to other recordings. For more information, see [Using the Filter and Toggle frequency counter options](#) on page 4174.
- h) Click **Save as** to save the opportunity as a custom opportunity.
- i) Enter a name and description for the opportunity in the fields provided.
- j) Click **Save as** to save your changes.  
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity. The PDD is generated and available for download from the **Opportunities** table. Click the vertical ellipsis to download the PDD in Word format or PDF.

---

**Note:** The filter option you selected for a custom opportunity will not be reflected in the new custom opportunity process diagram.

---

3. Optional: Create another custom opportunity from a custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch.
  - a) Select a single recording from the **Recordings** section.
  - b) Click the branch icon from the right main canvas to add a condition step.  
Moving the subsequent step into a branch on the left and adding a new branch to the right in the empty branch are to receive steps from another recording. In the top-right corner of the yellow box, click the three dots to create a new branch or delete a branch. The branch endpoint is displayed with a small circle.  
By default, you can move the branch endpoint lower in the path flow to include more than one step. To move the branch endpoint, press down with the cursor on the endpoint until you see the dotted lines appear around the branches. Drag the endpoint downward in the path flow. Place the endpoint when you see the dotted lines appear between the arrow. The endpoint is shifted downward in the path flow and includes more steps. To select a custom selection of steps, use the Shift key to select a certain number of steps within a path from the main canvas. Cross-path selection is not available.  
The loop icon is displayed as an orange circle with an arrow. A loop is a sequence of steps that occurs for a specific number of times for a single recording. The loop icon has a **for** condition displayed under this along with **Count**, which describes the number of times the sequence of steps in this loop is repeated in the process. You can change the loop condition (**for** and **while**) by saving the process diagram.
  - c) Click the **Condition** field at the node level.
  - d) In the **Condition** field, enter a name for the condition. Example, `credit score`.
  - e) Click the check mark to save the name for the condition.
  - f) Open the corresponding branches on the right and left and set a value for the condition. For example, enter less than 200 on the right and greater than 700 on the left.

- g)** Drag and drop steps from the recording in the feeder canvas into the receiver step that reads **Drag items here** of the branch in the main canvas.  
Use the Shift key to select one or more steps to drag into the receiver step. To clear a condition in the branch, click the three dots. Select **Clear branch**.
  - h)** Click **Save** to save your changes to the process diagram.  
The PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**.
  - i)** Repeat steps a through h to review additional recordings and create branches and merge steps into the branch.
  - j)** From the **Overview** pane, click the **Edit** icon to update the potential savings associated with the custom opportunity.  
The potential savings and potential cost can be updated at any time as you review the steps from various recordings and make changes within the process diagram.
  - k)** Enter the estimated cost of the process without automation.
  - l)** Enter the potential savings associated with the process when automation is used.  
This is your best assessment of the expected savings on an annual basis if a bot is used to perform all the steps in the opportunity.
  - m)** Select the priority from the drop-down list.
  - n)** Click **Update**.
  - o)** Click **Save** to save your changes to the process diagram.
  - p)** Repeat steps j through o to update the potential cost for the custom opportunity from the **Overview** pane.
  - q)** Click **Save as** to save the opportunity as a custom opportunity.
  - r)** Enter a name and description for the opportunity in the fields provided.
  - s)** Click **Save as** to save your changes.  
A message window appears notifying you that the opportunity is created. Click the hyperlink to view the custom opportunity.
  - t)** Optional: Repeat steps 4a through s to create another custom opportunity from this custom opportunity, as needed.  
All opportunities (autogenerated and custom) can be viewed from the **Opportunities** page.
- 4.** Optional: For custom opportunities, review new recordings submitted by the Discovery Bot user. Accept or dismiss the new changes for the process diagram.
- a)** Click **Review** to accept the updates and review the new recordings.
  - b)** Select the new recording from the **Recordings** section.  
The selected recording is highlighted in blue. The recording opens for display to the left of the canvas. Refer to the dotted lines around the steps. The placement of the steps is displayed in the process diagram to the right of the canvas with a bold border around the steps. The shaded green refers to the placement of the groups of steps from the new recording as they will appear in the process diagram if you update with these changes.
  - c)** Click **Update with changes** to accept the updates to the process diagram.  
A pop-up message is displayed, indicating that your changes are successfully updated.

- d) Click **Back to edit** to return to the current process diagram without the changes.
- e) Click **Dismiss** to dismiss the changes.  
Continue reviewing the current process diagram for the custom opportunity. Add steps from another recording to the process diagram, create a branch, and merge steps from one or more recordings into the branch, as needed.

5. Convert to bot:

- a) Click the **Convert to bot** option.
- b) Enter a bot name.
- c) Optional: Enter a description.
- d) Click **Browse** and accept the default folder location `\Bots\`.  
To change the location where your bot is stored, drill down to the folder in which you want to save the bot.
- e) Click **Confirm**.
- f) Click **Convert**.  
A message window appears notifying you that the bot has started to convert. You will receive an email when the bot is converted successfully. Click the hyperlink in the email to take you to your folder in which the bot was generated.

---

**Note:** In the **My bots** tab, the converted bot displays an error, with 0 byte size while the bot creation is in process. Avoid opening the bot until the bot conversion is complete.

---

The **Convert to bot** option is only available if you have the Bot Creator license. To review the created bot you must have the **AAE\_Basic** role assigned.

6. Click the **Download** option to export the opportunity data into a Process Definition Document (PDD) with the same name as the opportunity. Select the type of PDD (Word or PDF) that you want to export. The PDD includes the process recording flow chart with a URL link to the process diagram inside Discovery Bot , and the time on each individual step in hours, minutes, and seconds. The PDD does not display the process diagram if there are more than 100 steps selected.

When an opportunity is created, the PDD begins processing in the background automatically. When the PDD is generated, the field changes from Processing PDD to **Download**. You can now download the document. An email notification to the business user is also sent to the email address on file. If an error occurs when you download the PDD, click **Download** again to generate the PDD again.

---

**Note:** If you are a multi-role user, you will receive two email notifications for the exported data, one for the recording data and one for the opportunity data.

---

**Note:** You must be the owner of the opportunity to be able to download it; otherwise, the download option is not available.

---

On your machine, the document is saved in the folder that is configured for downloads in your browser.

## Using the Filter and Toggle frequency counter options

Use the Filter and Toggle frequency counter options from the toolbar to help you review, analyze, and compare the various recordings in the process work flow as you look to create a potential opportunity.

### Filter option

Use the **Filter** option when you want to use a set of values to compare the different sections of a process across various recordings by selecting a specific path and step filter. The **Filter** window displays the following:

Option	Action
Path: With the most common flow	Select this option when you want to see what paths have the most common variance of a process that is being used. If you choose to automate this type of path, you will have a higher return on your investment.
Path: With the most deviations	Select this option when you want to see certain sections of the process that have a different deviation in the path. The automation priority for such paths are usually low.
Path: With the most repetitive flow	Select this option when you want to display sections of the process that are more repetitive and cost more. The automation priority for such paths are usually high.
Step: Application	Select the <b>Application</b> option when you want to see the application type used during the recording. Use this option to see which applications are more frequently used, and to decide on which applications should be a priority.
Step: Action Type	Select the <b>Action type</b> option to filter the process steps to display only particular actions that will help you get an idea how the steps are used.
Clear	Select <b>Clear</b> to clear all selected options.
Reset	Select <b>Reset</b> to reset to the previous saved state of the filters in a view.
Apply	Select <b>Apply</b> to apply the selected options for display for the system generated or manual opportunity.

## Toggle frequency counter

Use the toggle frequency counter option to display the number of recordings that a particular path takes in the flow for a system generated or manual opportunity. Use this option to help you understand the frequency of the path as compared to other recordings. From the **Recordings** table, select two or more recordings and the **Toggle frequency counter** displays two at the start of the process flow to indicate the number of recordings selected. If each recording takes a different path, the process flow is divided between the total number of recordings selected and displays accordingly. For example, if there are ten recordings in a view and three paths displayed. Two recordings follow one path, two recordings follow the second path, and six recordings follow the third path. Along the path flow, you will see two, two, and six. If a step is merged, the number gets added between the two paths. Use the thick or thinness of the path to help you prioritize processes for automation. The most commonly used path is the thickest path and this can be useful for prioritizing a process when reviewing many recordings. For example, if there are 5 paths for 20 recordings, you will quickly see which is the thickest and consider automating this path. If you have additional bandwidth to automate another path, you can drill down in the flow and look at the numbers to see what path is next as a possible candidate for automation.

# Bot Insight

Bot Insight is an analytics platform that provides real-time, interactive, and smart insights about business processes and operational intelligence. Bot Insight is available with out-of-the-box dashboards that you can start using instantly. These dashboards provide analyzes to measure the performance of your digital workforce and predict and solve preventable business problems.

## Business analytics through Bot Insight

Automation Anywhere Bot Insight processes real-time and interactive insights about business processes, and provides operational intelligence. Access the bots, and manage and instrument them to gather business analytics and insights, and publish dashboards.

1. [Create and edit bots](#)

The cloud-based bot editor provides tools, packages, and actions to create bots to automate processes.

2. [Instrument the bot for analytics](#)

Business analytics provides information about the transactional analytics for the data that is logged by the variables that are tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, and quote-to-order ratio.

3. [Access Bot Insight](#)

Access Bot Insight to perform the business analytics.

4. [Customize dashboards and widgets](#)

Dashboards represent the RPA infrastructure in the form of meaningful visuals and charts, so that you can analyze, interpret, and take action on the updates that are important to you. The dashboards display dynamically updated information of active users, registered clients, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices.

5. [Publish a business analytics dashboard](#)

Publish a dashboard to display the production data generated by the task. The analytics consumers who primarily analyze and interpret data can access the published dashboard.

To learn more, search for the [Managing RPA Reports Using Automation 360](#) course in [Automation Anywhere University: RPA Training and Certification \(A-People login required\)](#).

Related concepts

[Bot Insight dashboards](#) on page 4180

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Related tasks

[Run your first bot](#) on page 1599

Run a bot from the same device that you used to create the bot.

Related reference

[Analyze package](#) on page 2566

Use the actions in the **Analyze** package to specify the actions and variables to use in the Bot Insight dashboard and widgets. The **Analyze** package enables you to perform transactional analytics for the data that is logged by the variables when the bot runs.

## Accessing Bot Insight

This section provides information about how to access Bot Insight.

To use Bot Insight business dashboard, the Control Room must have the Bot Insight license applied, and you must be logged in as a user with one of the following roles:

1. `AAE_Bot Insight Expert`
2. `AAE_Bot Insight Consumer`
3. `AAE_Bot Insight Admin`

---

**Note:** To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

---

To use Bot Insight external APIs, you must be logged in as a user with `AAE_Bot Insight Admin` role.

## Access Bot Insight from the Control Room

Access Bot Insight to interactively analyze bot data and enhance bot widgets.

Access Bot Insight from the Control Room in one of the following ways:

- From the Control Room, select **Dashboard**.
  - a) Locate the **Insights** tab.
  - b) In the **Insights** tab, click **Explore Bot Insight**.  
The Bot Insight window appears.
- On the left panel, click **Automation**. A list of available bots and forms is displayed.
  - a) In the **Automation** page, click **PUBLIC** to view the public bots that can be viewed, run, and checked out by other people, based on the permissions set by the administrator.
  - b) Click **PRIVATE** to view your bots and files.

---

**Note:** Private bots and files cannot be viewed by other users. If a bot or file is checked out from the **PUBLIC** tab, it can be viewed and run by other users. However, the bots and files cannot be edited by other users.

---

- c) Select your bot from the **Files and Folders** menu.  
Alternatively, enter the search parameters in the **Search Name** field and search for your bot.
- d) Open the bot and click **Analyze**.  
The Bot Insight window appears.

## Roles to access Bot Insight

The Control Room restricts Bot Insight access to users with certain roles.

Access to the dashboard depends on the user roles assigned to a user and the access permission granted to those user roles. See [Role-Based Access Control](#).

System-generated access is provided to all user types for Bot Insight. Administrators can customize the Bot Insight experience by assigning a user-generated role to users. Each role includes a permission set, designed to specialize Bot Insight features to make analytics more simple or comprehensive. Admins should evaluate user tasks and functions to assign the role most appropriate to fulfill user responsibilities, based on the following details.

---

**Note:** Various types of dashboards can be accessed for quick insights. Common types are listed below. For more details on dashboards, see [Bot Insight dashboards](#) on page 4180

- The system-generated dashboard is also known as a Default type.
- The user-generated dashboard is also known as a Custom type.
- The Published dashboard is also known as the Production type.
- When a published dashboard is saved by a user, the dashboard copy is known as a custom production type.

---

Apart from Bot Creators, users with the following roles have access to business analytics dashboards:

### Bot Insight Admin

Use this role to perform the following operations in Bot Insight:

- Access Bot Insight API
- Analyze the Data Profile of the task data for which the dashboard report is generated.
- Analyze and save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

### Bot Insight Expert

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Save the system-generated dashboards.
- Analyze, save, publish, and delete the user-generated dashboards and publish dashboards.
- Bookmark, compare, and share the dashboards.

Bot Insight Consumer

Use this role to perform the following operations in Bot Insight:

- Analyze the data in the dashboards that are deployed in the production environment.
- Bookmark, compare, and share the published dashboards.

---

**Note:** To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

---

## Role-based access control in Bot Insight

Role-based access control (RBAC) enables a Control Room administrator to restrict access to the various components of Bot Insight.

The Control Room administrator can grant access to various user roles based on your requirements. When adding a user, you assign appropriate roles to that user. A user will have access to the components and folders based on the roles assigned to them.

### Requirements

Before you publish the dashboard, ensure that the following requirements are met:

- The bot resides in the Public workspace for which you want to publish the dashboard.
- You must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks to:
  - View the published business dashboards.
  - Move your bots from **Private** to **Public** workspace.

the folder that contains the corresponding tasks to

### RBAC for business analytics

Dashboards for business analytics are available for the tasks that are enabled for analytics. The Control Room administrator and users who have access to a task can view the dashboards for those tasks. You can access the dashboard for a task from the **Insight** tab in the **DASHBOARD** section of the Control Room and from the **ANALYZE** tab in the Workbench.

To view the Bot Insight dashboards, you must be granted access to the folder containing the corresponding tasks.

For example, you have created various tasks related to sales and accounting and stored them in the Sales and Accounts folder. If you want to grant access to the sales-related tasks to members of your sales department, you need to provide them access to the Sales folder. The same applies to grant access to the accounts-related tasks in the Accounts folder.

The following table illustrates the access the various members of the Sales and Accounts team will have:

	Sales_Dep			Accounts_Team	
	John	Mark	Dave	Smith	Micheal
Access to the <b>Sales</b> folder	Yes	Yes	Yes	No	No
<b>Sales1</b>	Yes	Yes	Yes	No	No
<b>Sales2</b>	Yes	Yes	Yes	No	No
Access to the <b>Accounts</b> folder	No	No	No	Yes	Yes
<b>Accounts1</b>	No	No	No	Yes	Yes
<b>Accounts2</b>	No	No	No	Yes	Yes
<b>Accounts3</b>	No	No	No	Yes	Yes

## Bot Insight dashboards

The Bot Insight dashboards provide dedicated graphical insight to help you view your bot information.

Dashboards display meaningful visuals and charts so that you can analyze, interpret, and take action on the updates that are important to you. You can use dynamically updated information about active users, failed tasks, apps, bots, bot schedules, workflows, queues, and the overall status of devices to create custom dashboards and widgets.

**Note:** You must use the Analyze package version 2.3.0-20210922-121532 or later to generate the dashboard when running analysis. This package version is available from Automation 360 v.23.

Perform the following steps to apply the package.

1. From the Control Room, select **Manage > Packages > Analyze**.

**Analyze**

This page shows the package details of the selected version. You can also select a different package version and update the installed version.

Versions

2.4.2-20220414-053004

Enabled

2.4.2-20220414-053004 Default

2.4.0-20220118-153149

Actions (2)

Close

Open

General Details

Last modified 22 hours ago

Modified by System

2. Change the Analyze package version to 2.3.0-20210922-121532 or later.
3. Save your changes.
4. Run the bot and ensure the change to dashboard generation.

**Note:** For changes to be applied to the public workspace, **checkIn** your bot before running analysis.

When you create and run a bot, Bot Insight automatically creates a default dashboard in the collection: My dashboards. If you have a parent bot and a child bot, Bot Insight creates a separate dashboard for each of the bots.

**Note:** The system does not automatically refresh (auto-refresh) the Bot Insight dashboards unless the user loads a screen or clicks the **Refresh** button, thereby manually refreshing data on a page.

When you deploy and run a bot on the Bot Runner machine, Bot Insight aggregates all the information related to that bot. The published dashboard for that bot displays the aggregated bot information.

**Note:** Some data might not populate in a widget if bots were created in Automation 360 v.12 or earlier versions. See the following article for troubleshooting: [Bot Insight dashboard not populating data in specific widgets \(A-People login required\)](#).

My dashboards displays the following dashboards:

- [Operations dashboard](#) on page 4183
- [Business dashboard](#) on page 4186

**Note:**

- You must have either the `AAE_Bot_Insight_Admin` or the `AAE_Bot_Insight_Consumer` role assigned to you to view the published dashboard.
  - The data visible on the dashboards is in the **UTC** time zone.
- 

## Viewing Bot Insight dashboards

The Bot Insight dashboards provide customizable widgets for you to gain insights in specific scenarios. You can view information about your bots on the Bot Insight dashboards from the Control Room.

To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

When you tag variables for analytics in a task and then run the task, Bot Insight generates the analytics dashboard. By default, the system-generated dashboard has the same name as that of the task. You can customize this dashboard to your requirements.

Business analytics provide information on the transactional analytics for data that is logged by the variable tagged in a task. The information provided can be about total sales in a month, invoice, payment trends, new customer insights, or quote-to-order ratio. You can select your dashboard from the **Select a Dashboard** drop-down menu to view the analytics.

Bot Insight provides the following dashboards:

- **Configure**

The system-generated dashboards are available in the **Configure** tab in the Bot Insight window.

- **Analyze**

The customized dashboards can be published and are available in the **Analyze** tab in the Bot Insight window.

- **Operation**

The **Operation** dashboard provides information about bots that are created, deployed, or scheduled to run across different Bot Runner machines. You can use the information to enhance productivity and take measures based on real-time information for RPA deployments.

1. Log in to the Control Room with one of the following roles:

- `AAE_Bot_Insight_Admin`
- `AAE_Bot_Insight_Expert`
- `AAE_Bot_Insight_Consumer`

2. Click **Explore Bot Insight** from the **Insights** tab.

The Bot Insight dashboard appears in a new window.

## Viewing Insights

You can view information about business data in Bot Insight.

Click **Insights** from the **Analyze** tab to view information about interesting facts on business data.

The Insight dashboard provides information about business data that is logged through Bot Insight without the need to analyze the dashboards. It provides a snapshot of data that you can use to

enhance your bot productivity. This feature highlights important facts that are inferred from within the business process data logged by the bots.

A bot created to process orders displays the following information:

- Total processing cost
- Process time
- Monthly payment
- Total payment

The dashboard provides information about the difference between the calculated metric values for a specific time interval:

- Yesterday
- Last 7 days
- Last 30 days

The Insight dashboard enables you to configure the variance thresholds for indicating metric-level health.

Perform the following steps to configure the variance thresholds:

1. Click **Settings**.
2. In the **Variance Threshold** window, move the slider to the left or the right to adjust the variance threshold.
  - Move the slider to the left for a **Poor** metric health level.  
The poor metric level health is represented in red.
  - Move the slider to the right for a **Good** metric health level.  
The good metric level health is represented in green.
3. Enter the values in the **Fair** field to set the **Fair** metric health level.
4. Select the **Switch poor and good** check box to switch between the **Poor** and **Good** metric health levels.
5. Click **Save**.

## Operations dashboard

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

The Operations dashboard provides visual insight into various operational aspects of bots and displays hyperlinks to the following dashboards:

- Bots Dashboard
- Audit Dashboard
- Device dashboard

---

**Note:** Ensure that you have the **AAE\_Admin** role to view all bots information in the operations dashboards.

---

These dashboards appear as the Default dashboards and are automatically created by Bot Insight based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the Visualizations menu to your custom dashboards.

[Using widgets](#) on page 4201

## Bots Dashboard

You can view information about the bots that are created, deployed, scheduled, and running across various Bot Runner machines.

The dashboard displays the following bot information:

- **Total Bot Runs:** Displays the total number of times the checked-in bots executed from the Bot Runner machines. (The number displays the total number of bots that have run successfully and failed to run).
- **Total Completed (Success):** Displays the number of bots that have ran successfully.
- **Total In Progress:** Displays the number of in-progress bots.
- **Total Failed:** Displays the number of bots that had failed to deploy or run.
- **Weekly Bot Status:** Displays the weekly status of bots that are scheduled to run.

---

**Tip:** You can hover over the widget to view the number of bots that have run successfully, failed to deploy, and failed to run. It also displays the weekly bots statistics percentage.

---

- **Failure Reasons:** Displays reasoning information on bots that had failed.
- 

**Note:** The **Error Message** field displays a snapshot of the original error message and extensive details on why the bot failed. You can export the error messages and logs to a CSV file, which you can later use to troubleshoot.

---

Additionally, the Bots dashboard displays the Bot duration (such as minimum, maximum, average, and summation) of each bot. You can create your own dashboard, add any widget, and calculate the minimum, maximum, average, and summation of bot run time.

## Audit Dashboard

This dashboard displays various widgets that provide information about Control Room events. Users with the `View everyone's audit log actions` permission have access to view the audit information captured in the Control Room.

[System roles](#) on page 1882.

The dashboard displays the following information:

- **Event Distribution by Activity Type**
- **Event Distribution by User Name**
- **Event Distribution by Source**
- **Event Distribution by Control Room Source**
- **Event Distribution by Workbench Source**

You can perform the following actions in the Operations dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

You can view information in the following tabs:

- **Total Views:** Displays the number of users who viewed a particular dashboard.
- **Last Refreshed:** Displays the time and date of when a particular dashboard was last refreshed.

You can click the arrow next to the Operations dashboard tabs to organize the dashboards to your requirements.

You can customize the widgets in the Operations dashboard. You can perform the following functions:

- [Working with Bot Insight dashboards](#) on page 4195
- [Comparing dashboards](#) on page 4195
- [Sharing a dashboard](#) on page 4198
- [Taking a screenshot of a dashboard](#) on page 4199
- [Downloading a PDF file from a dashboard](#) on page 4199

## Device Dashboard

The Device dashboard displays various widgets that provide information about resource utilization of the machines on which bots are executed.

The dashboard provides key metrics to analyze the status and utilization of devices. It also displays the activity history of the bots that are deployed on the machines.

The dashboard displays the following information:

- **Online Devices:** Displays the number of Bot Runner machines that are active or online at a point in time.
- **Offline Devices:** Displays the number of Bot Runner machines that are inactive or offline at a point in time. Devices can be online even though no bots are deployed on them.
- **Bot Schedules on Devices:** Displays the number of bots that are scheduled to run on all the Bot Runner machines.
- **Device Utilization%:** Provides the overall time used by bots that are executed across all the Bot Runner machines. You can view and analyze the utilization information by date using the following criteria:
  - Bot duration
  - Unit: %
  - Group 1: Start date time of a bot (interval: day)
  - Group 2: device name

There is no limit on the number of devices that can be displayed on the dashboard.

- **Device Activity History:** Provides information about the execution history of bots deployed on each Bot Runner machine. The Device Activity History table provides the following information:
  - Device name
  - Bot name
  - Bot duration (milliseconds)

- Start date time of a bot
- End date time of a bot
- Status

When the Group1 and Group 2 fields have date type variables and you select **Bot Duration** as a metric, the **Percentage (%)** option appears as an additional option for **Bot Duration Unit**. Based on the selected group interval, the percentage is calculated for the bot duration.

Example: When you select the parameters in the following fields as:

- Group By or Sub By: Date
- Interval: Year
- Metric: Bot Duration
- Bot Duration Unit: Percentage (%)
- The percentage calculated for bot duration is:  
 $(10000/1000ms * 60s * 60m * 24h * 365days) * 100 = \%$

---

**Note:** The percentage calculation of the bot duration is available in all the widgets, except datatable and maps.

---

- **Top Error Messages:** Provides information about the error messages for any bot failure and the frequency of occurrence.

## Business dashboard

The Bot Insight Business dashboard provides information about the Bot Insight data and statistics based on bot performance. You can use this information to enhance your productivity and take measures based on real-time information for RPA deployments.

The Business dashboard provides visual insight into the various business aspects of the bots. From this dashboard, you can access both the Default and Custom dashboards.

Bot Insight automatically creates the Default dashboard based on the variables that are used in the bot. You can use the **Save As** function to save the Default dashboard as a Custom dashboard. You can also add widgets from the **Visualizations** menu to your custom dashboards.

[Using widgets](#) on page 4201

In the Custom dashboard, Bot Insight enables you to export data from a dashboard widget to CSV files.

[Exporting data from a dashboard widget](#) on page 4207

You can perform the following actions in the Business dashboard:

- Enter the name of the dashboard in the **Search** text box to access a dashboard.
- Click the **Favorite** tab to bookmark your dashboard.
- Double-click the **Favorite** menu to remove bookmarks.

The dashboard displays the following bot information:

- **Bot Name:** Displays the name of bots that are associated with the business dashboards.
- **Total Views:** Displays the number of users who viewed a dashboard.
- **Last Refreshed:** Displays the time and date on which a particular dashboard was last refreshed.

- **Modified By:** Displays the name of the user who had last modified the dashboard.

You can click the arrow next to the Business dashboard tabs to organize the dashboards to your requirements.

In the **Dashboard Name** tab, select the dashboard that you want to access to view the dashboard. You can also enter the name of the dashboard in the **Search** text box to access the dashboard directly.

Click **Rank** in the **Distinct Count** row to view the rank of each variable. You can view the string data type values that are logged by a variable for the maximum or minimum number of times. This further enhances your ability to verify that the data is logged correctly in the bot.

[Viewing ranks of string datatype values](#) on page 4196

The Business dashboard widgets displays the following information:

- The total number of variables
- The comparison between number variables and transaction status
- The comparison between number variable distribution and transaction status
- A bar chart representing the distribution between the number variables and string variables
- A pie chart representing the relationship between variables in numbers and strings

The Profile dashboard displays bot variables and the transaction data. The Task Name table displays the variable name, display name, data type, inclusion details, maximum, minimum, average, sum, distinct count for the date, string, and number variables.

The Transaction Data table displays the variable name, display name, data type, inclusion details, minimum, maximum, average, sum, and distinct count metrics for the following parameters:

- **Machine Name**
- **Transaction Name**
- **Transaction Start Time**
- **Transaction End Time**
- **Total Transaction Duration** (Start Time - End Time)
- **Transaction Status** (In Progress or Completed)
- **User Name** (User who runs the bot)

You can use the **Preview Data** option to view the total number of records maintained for each variable. When you create and run a bot with multiple **Transaction Blocks** with **Analyze**, **Open**, or **Close** commands, all the tagged business variables are displayed in the **Transaction Names** menu.

You can customize the widgets in the Business dashboard. You can perform the following functions:

- [Working with Bot Insight dashboards](#) on page 4195
- [Comparing dashboards](#) on page 4195
- [Sharing a dashboard](#) on page 4198
- [Taking a screenshot of a dashboard](#) on page 4199
- [Downloading a PDF file from a dashboard](#) on page 4199

## Document Workspace dashboard

The Document Workspace dashboards provide visualizations of learning instance performance and quality metrics as well as validation operations metrics.

Users with access to Document Automation can view and customize the Document Workspace dashboard without additional permissions.

The Document Workspace dashboard contains eight widgets, which contain visualizations of learning instance data. The widgets are customizable:

- You can reposition a widget by dragging and dropping it into a new location.
- You can apply filters, such as by specific learning instance or time frame. [Adding a dashboard filter](#) on page 4194
- You can click a data point in a widget to "drill down" or filter the metrics in that widget. See the following video:

## Document Workspace widgets

Widget	Description
Accuracy % by field	A horizontal stacked bar chart that shows the straight-through processing percentage for each field in the learning instances
Extraction time per documents	A horizontal stacked bar chart that shows the average extraction time per learning instance in milliseconds
Number of uploaded documents	A line chart that tracks the total number of files uploaded each day
Number of uploaded pages	A line chart that tracks the total number of pages uploaded each day
STP% by learning instance	A horizontal bar chart that shows the straight-through processing percentage for each learning instance
STP% over time	A line chart that tracks the straight-through processing percentage for all the leaning instances by day
Validator performance by weighted average validation time	A horizontal bar chart that shows the weighted average time each Validator user spent performing manual validation per document.
Validator performance by # of documents validated	A horizontal stacked bar chart that shows the number of documents each Validator user validated per day

## Dashboard filters

You can use the following dashboard filters to customize the metrics included in the dashboard:

- Learning Instance Name

**Note:** By default, both public and private learning instances are included in the dashboard.

- Document Type
- Page Count
- Created On

**Note:** When you set a filter, it is applied to the entire dashboard. To apply a filter to a specific widget, open the **Widgets** menu and select which widgets to apply the filter:

The screenshot displays the 'Dashboard Filter' interface. On the left, a sidebar lists filter categories: 'Attributes' (with 'Learning Instance Name' and 'Document Type' selected), 'Numeric' (with 'Page Count'), and 'Time' (with 'Created On'). A 'Clear All' button is located at the top right of the filter sidebar. The main area, titled 'Dashboard', shows a widget 'Extraction time per documents'. A 'Widgets' menu is highlighted with a red box, containing a 'Show' button. Below the menu, the 'Document Type' filter is configured with 'Include' selected. A search bar for 'Document Type' is present, and a list of document types is shown under the 'All' tab: 'Document Type', 'Invoices', 'Receipts', 'User-defined', and 'Utility Bill'. A large blue 'APPLY' button is at the bottom.

## Custom dashboard filters

You can use the following custom filters to build the custom widgets in a **Document Workspace** dashboard:

- **User Name**
- **Status**
- **OCR Engine**
- **Processing Phase**
- **Processing Time**
- **Start time**
- **End time**

Related tasks

[Sharing a dashboard](#) on page 4198

You can share the link to view a dashboard through email using the **Share via email** option.

[Downloading a PDF file from a dashboard](#) on page 4199

You can download the data available in the dashboard as a PDF file.

[Taking a screenshot of a dashboard](#) on page 4199

You can take a screenshot of the data available in the dashboard.

## Edit widget settings

You can edit widget settings to customize the general and advanced settings (such as chart title, chart type, metric, limit, and so on). You can build custom widgets with a custom filter, thereby increasing the data visualization effectiveness in the **Document Workspace** dashboard.

Users with access to Document Automation can view and customize the **Document Workspace** dashboard without additional permissions.

1. Open the Document Workspace dashboard.
2. Click the three dots icon in the required widget and click **Settings**.

---

**Note:** You can edit these widgets only: **Number of uploaded pages**, **Number of uploaded documents**, **Extraction time per documents**, **Validator performance by # of documents validated**, and **Validator performance by weighted average validation time**.

---

3. In the **Edit Chart** window, define the settings.
  - **General Settings**
    - **Chart Title:** Title of the chart (for example, `Number of uploaded documents`).
    - **Chart Type:** Type of the chart. See [Bot Insight visualizations](#) on page 4203.
    - **Group By:** Groups the data by **Learning Instance Name**, **Document Type**, **Created On**, **OCR Engine**, **User Name**, **Processing Phase**, **Status**, **Start Time**, and **End Time**.
    - **Date Interval:** The unit of interval (such as Hour, Day, Week, Month, and Year) in which data is presented.
    - **Metric:** Compares or assesses data by **Page Count**, **Processing Time Ms**, and **Volume**.
  - **Advanced Settings**
    - **Limit:** Limit for the X-axis and Y-axis values.

- **Sort By:** Sorts the data by **Volume** and **Start Time**.
- **Sort Order:** Order in which data is sorted (for example, **Descending** or **Ascending**).

4. Click **Next**.
5. Confirm the settings and click **Finish**.

## Automation Co-Pilot dashboard

Use the Automation Co-Pilot dashboard in Bot Insight to view various widgets that provide information about requests created from published processes in Automation Co-Pilot for Business Users (Automation Co-Pilot).

### Overview

The dashboard provides statistics and shows information about created requests for each process, which can vary from a simple summary to a complex cross-departmental view. You can use this real-time information to make process-related operational decisions. For example, consider a scenario where a manager can get a high-level activity overview of completed and pending tasks in the payroll process, which can then help the manager take necessary actions about the process.

From the Automation Co-Pilot dashboard, you can access both the Default and Custom dashboards. Bot Insight automatically creates the Default dashboard from the variables used in the process. You can use save the Default dashboard as a Custom dashboard if required. You can also add widgets from the visualizations menu to your custom dashboards.

Based on RBAC, the following users have access to view the data on the dashboard:

- **AAE\_Robotic\_Interface\_Admin** can view all data inside Automation Co-Pilot on the web interface across all teams.
- **AAE\_Robotic\_Interface\_Manager** can view all data inside Automation Co-Pilot on the web interface for their own teams.

### What you can view in Automation Co-Pilot dashboard

The dashboard helps you to visualize and track the number of requests that are open, completed, canceled, or failed.

The dashboard also provides the following capabilities:

- Heat map chart: Visualize data about the percentage of request created for each process for a day. You can specify the dates by function (day) to get specific information using the following criteria:
  - Group1: created date (interval: day)
  - Group 2: process name
  - Metric: request created in percentage (%) for each process
- Request activity history: This table provides the execution history of the processes deployed on each Bot Runner machine. It includes information such as the following:
  - Process name

- Username
  - Request details such as the status, ID, end time and start time, duration
  - Total human and bot duration
  - Total human and bot tasks
- Stacked bar chart: Analyze the average duration taken by each process for human and bot tasks. For example, consider that there are two processes named API Test-Form 1 and API Test-Form 2 in the bot task type. For each process, the chart shows the average time (in seconds) taken for its execution. You can view and analyze this information using the following criteria:
    - Group 1: task type (human and bot)
    - Group 2: process name
    - Metric: duration (average)

## Editing a data profile

You can modify the data profile of Default dashboards without modifying the bots.

You must have the **AAE\_Bot Insight Admin** role.

You can edit the data profile and regenerate the dashboard based on the new data profile. You can edit the display name of a variable, change its data type, and exclude it from the dashboard.

Bot Insight provides smart data profiling for information about countries, states, and zip or postal codes. Bot Insight analyzes the information provided in the variables and automatically identifies the information as:

- Country (country code or country name)
- State (state code or state name)
- Zip code (five-digit zip code)

You can edit the data profile to convert the above parameters from numeric format to string format (country and state) based on your requirements. You can convert the zip code to either string or numeric format, and use the information to create widgets (world and US map widgets) in the Bot Insight dashboard.

**1.** Open the Bot Insight dashboard.

**2.** Click **Profile**.

The **Profile** window appears, displaying all the variables that you have tagged during the bot creation.

**3.** Click **EDIT**.

**4.** Specify a new name for a variable in the **Display Name** field.

**5.** Select an option from the **Datatype** drop-down list to specify a new data type for a variable.

You can change the datatype of a numeric variable to string, string to country, state, and zip code.

---

**Note:** Changes to the **Data Type** parameter cannot be reverted.

---

**6.** Clear the **Inclusion** check box to exclude the variable from the dashboard. Select **Inclusion** to include a variable from the dashboard and configure how the initial SMART dashboard is generated.

You can view the minimum, maximum, average, sum, and last value for the numeric values, but not for the string and timestamp variable types.

7. Click **Save and Generate Dashboard** to save the changes and generate the dashboard with the updated value.

## Bot Insight dashboard filter

The Bot Insight dashboard filter enables you to apply filters across your dashboards to display the filtered data. You can save and publish the custom dashboards with preset filters.

Filters in the Bot Insight dashboard enables you to choose different views of the data. You can apply and save filters in a dashboard to preserve the filtered view. The filtered view displays the same view the next time you view the dashboard.

Dashboard filters enables different combinations of data in a single dashboard. The filter eliminates the need for separate dashboards for different users. A single-filtered dashboard allows you to serve data requirements for a wide range of users.

You can access the dashboard filter from both the Operations and Business dashboards. You can click each item in the filter list to view the parameters. You can search for a specific parameter in the **Search Automation Name** field in the **All** tab. You can select parameters based on whether to include or exclude them in the filter. The selected parameters appear in the **Selected** tab.

When you apply a specific filter, the visual indicator in the dashboard displays the name of the applied active filter. You can delete a dashboard filter by clicking the delete icon. When you publish a custom dashboard with the applied the dashboard-level filters, the published dashboard contains the same filters. You can click **Widgets** in the widget window to apply dashboard widgets.

The Bot Insight dashboard provides the following filters:

- **Attributes:** This filter enables you to include or exclude specific parameters of a given attribute. This can be the bot name, device name, or user name.

For example, you can use the parameters:

- **Model Version** to differentiate the payload and to determine if an upgrade is required in the dashboard. You can also use it as a filter so that the dashboard works correctly even with different job execution pay loads.
- **Job type** to identify the type of task such as TASK(Bot Run), WORKFLOW, WORKORDER, WLM\_TASK
- **Automation Name** to provide a name when running or scheduling the bot
- **Object Name** to identify the name of the entity for which the audit action is recorded. For example, to identify the username when the user is edited or created or the bot name when the bot is edited or created.
- **Numeric:** This filter enables you to select a specific duration for which you can get the numerical statistics of the bot. For example, this can be the **totalLines** that is processed by the bot, or the duration during which the bot was active.
- **Time:** This filter enables you to select a single date, or a range of dates to analyze the variables that are categorized under time and date. This can be the bot start time or end time.

Related concepts

[Operations dashboard](#) on page 4183

The Bot Insight Operations dashboard provides information about bots that are deployed on different Bot Runner machines and bot statistics based on performance. You can use this information to enhance productivity and take measures based on real-time information for RPA deployments.

## Adding a dashboard filter

To create a dashboard filter, select a field containing the information type you want to filter and define the return of the data. The filtered view is preserved so that the same view is displayed the next time you view the dashboard.

1. Open the dashboard to which you want to add a filter.
2. Select the parameter based on your requirements in the **Attributes** tab, .  
The parameter window appears.
  - a) Enter the name of the variable in the **Search** field.  
The variable appears in the **All** tab. Select the variable that you want to add in the filter.  
The selected variable appears in the **Selected** tab.
  - b) Choose one of the following options:
    - Click **Include** to include the variable in the dashboard filter.
    - Click **Exclude** to exclude the variable in the dashboard filter.
  - c) Click **Apply**.

The **Attributes** filter is added to the dashboard.

3. Select the parameter in the **Numeric** tab.
4. Perform these steps in the selected parameter window:
  - a) Select the condition that you want to specify in the filter.
  - b) Enter the minimum and the maximum values.
  - c) Click **Apply**.

The **Numeric** filter is added to the dashboard.

5. Select the parameter based on your requirement in the **Time** tab.
6. Perform these steps in the selected parameter window:
  - a) Select a specific date, or a range of dates.
  - b) Click **Apply**.  
The **Time** filter is added to the dashboard.

Related reference

[Customizing a dashboard](#) on page 4196

Log in to Bot Insight with the `AAE_Bot_Insight_Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

## Working with Bot Insight dashboards

You can save or delete a Bot Insight dashboard when required. You can also delete a user-created dashboard.

When you delete a dashboard, it does not impact the data associated with that dashboard. You can delete dashboards that are available in the **Analyze** and **Configure** tabs of the Bot Insight window. The dashboards available in the **Analyze** tab are the published dashboards. Therefore, if you delete a dashboard from the **Analyze** tab, it will no longer be available for other users.

- Save a dashboard:
  - a) Open the dashboard that you want to save.
  - b) From the **Actions** menu, select **Save as**.  
The **Save Dashboard** window appears.
  - c) In the **Dashboard Name** field, enter the name for the dashboard.

---

**Note:** Dashboard name cannot include angular brackets (< or >).

---
  - d) In the **Dashboard Description** field, enter the description of the dashboard.
  - e) Click **Save**.  
Click **Save As** to save a default dashboard as a customized dashboard.
- Open the dashboard you want to delete.
  - a) Click **Delete** on the toolbar.
  - b) Click **Okay**.

## Comparing dashboards

You can compare dashboards that belong to two separate processes, or the same process with different filters. The dashboards selected for comparison appears as a side-by-side view to enable you to obtain better insights.

- Compare dashboards:
  - a) Open the dashboard that you want to compare.
  - b) Navigate to **Actions > Compare** in the **Bots Dashboard**.  
Your dashboard is now in compare mode. The dashboard you have opened appears in both the **Left View** and **Right View**. You can apply widget filters to your dashboard at any time.
- Apply widgets to your dashboards:
  - a) Click the **Filter** option from your dashboards, represented by the three dots in the corner.  
The **Filter** window now appears and shows the available widgets.

---

**Note:** The **Filter** option next to the **Close** option accesses the same **Filter** window. You can also expand or minimize the **Filter** window.

---

- b) Select the **Left View** or **Right View**.
- c) Select the **Attributes**, **Numeric**, or **Time** widgets that you want to apply.
- d) Optional: Click **Clear All** to reset all your widget selections.
- e) Click **Apply** to confirm.  
You can now compare your dashboard with widgets.

## Customizing a dashboard

Log in to Bot Insight with the `AAE_Bot_Insight_Expert` role to customize the information displayed in the system-generated dashboard to make it more relevant for an analytics consumer.

To make changes in a Bot Insight dashboard, create a copy of the dashboard, and then update the copy.

After you create customized dashboards for a bot, you can make changes to the tagged variables. You can delete and add variables based on your requirements. By default, the standard dashboard always displays the latest data profile. We recommend you use the system-generated standard dashboard, and then create customized dashboards from it. Data profile updates are highlighted with a red dot in the following scenarios:

- When there are data profile updates.
  - The variables that are newly added display the message `NEW`.
  - The variables that are deleted display the message `DELETED`.
- When the customized dashboard data profile does not match that of the standard dashboard.

Related tasks

[Editing a data profile](#) on page 4192

You can modify the data profile of Default dashboards without modifying the bots.

## Viewing ranks of string datatype values

Among string datatype values, you can view the ranking based on the maximum and minimum number of times each string datatype value has been used, as logged by a variable. With this information, you can better verify whether the data logged in the bot is correct.

1. Open the dashboard for which you want to edit the data profile.
2. Click the **Profile** tab.
3. Click **Rank** within the **Distinct Count** column.

The **Distinct Count** column displays the number of unique values logged by a variable.

---

**Note:** The **Rank** option is only available for the variables that log values of string datatype. A message appears displaying the top five values that are logged for the maximum number of times in the variable.

---

4. Select **Bottom** from the list to display the five values that are logged the least number of times in the variable.
5. Select an option from the list to display five or ten values in the message box.

## Previewing data

You can view all the variable data associated with a task using the **Preview Data** option.

1. Open the dashboard for which you want to preview the data.
2. Click the **Data Profile** tab.
3. Click the **Preview data** option.  
A new window appears displaying all the variable data associated with that task.

## Verifying data populated in a custom dashboard

After you create a custom dashboard that contains new widgets or customized widgets from the system-generated dashboards, you can verify the data that is populated in the dashboard.

1. Open the task for which you want to verify the data in Bot Insight.
2. Click **Run** on the toolbar.
3. Click the **ANALYZE** tab.  
The system-generated dashboard for the task appears.
4. Click the **Analyze** tab in the Bot Insight window and search for the customized dashboard for which you want to verify the data.
5. Select the dashboard from the search results.  
The dashboard appears.
6. Click the **Data Profile** tab and verify the data for the dashboard.

## Publishing a business analytics dashboard

Bot Insight enables you to publish a business analytics dashboard that is generated for a task. You can publish both the Custom and Default Business dashboards.

Before you publish a dashboard, ensure that the particular bot resides in the Public folder in the Control Room.

1. Open the dashboard that you want to publish.
2. Customize the dashboard based on your requirements and verify the content and presentation formats.
3. Click **Publish** on the toolbar.
4. Specify a name for the dashboard, and then click **Okay**.  
The dashboard is now published and available to display the production data generated by the task. The dashboard updates the data each time a task runs in the production environment from the Control Room on a regular basis.  
In the Control Room, ensure that you deploy the bot in the Bot Runner device so that the published dashboards are populated with data.

---

**Note:** Dashboard name cannot include angular brackets (< or >).

---

Related tasks

[Import bots](#) on page 2176

You can import bots with their dependencies from one Control Room to another. The source environment can be Automation 360 Control Room, Enterprise 11 , or Enterprise 10 Control Room instance.

### Save a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also save a copy of the published dashboard when required.

Ensure you have the **AAE\_Bot Insight Admin** or **AAE\_Bot Insight Expert** roles assigned to you.

1. Open the Bot Insight Window.
2. Click the **Business** tab and search for the dashboard for which you want to save a copy of custom production dashboard.
3. Select the dashboard from the search results.  
The selected dashboard appears
4. Select the **SaveAs** from the **Action** menu to save the default **Production** dashboard as a **Custom Production** dashboard.
5. In the **Save Dashboard** window, specify a name for the dashboard and click **Okay**.  
You can add widgets from the **Visualizations** menu to your custom production dashboard.  
You can add, delete, change visualization, apply filters, and so on to customize the dashboard.

---

**Note:** Dashboard name cannot include angular brackets (< or >).

---

### Delete a published dashboard

You can publish a Bot Insight business analytics dashboard that is generated for a task. You can also delete a published dashboard when it is not longer required.

Ensure you have the **AAE\_Bot Insight Admin** or **AAE\_Bot Insight Expert** roles assigned to you.

You cannot delete a default **Production** dashboard if child (custom production dashboards) are associated with it. You must first delete the custom production dashboard and then delete the default **Production** dashboard. However, you can delete a **Custom Production** dashboard.

1. Open the Bot Insight Window
2. Click the **Business** tab and search for the dashboard you want to delete.
3. Click **Delete** from the **Action** menu.
4. Click **Okay** to confirm the deletion.

## Reviewing data in a published dashboard

You can review the data available in a published dashboard.

1. Open the Bot Insight window.
2. Search for the dashboard for which you want to view the data.
3. Select the dashboard from the search results.  
The selected dashboard appears.
4. Review the data available in the dashboard.  
The dashboard reflects the data processed by the task in the production environment.
5. Export the entire dashboard in PDF or PNG format for offline consumption and review.

## Sharing a dashboard

You can share the link to view a dashboard through email using the **Share via email** option.

1. Open the dashboard that you want to share.
2. Click **Share via email** on the toolbar.

The email client configured on your system appears. The email client contains a link to access the dashboard.

3. Specify the email address of the recipients and send the email.

### Downloading a PDF file from a dashboard

You can download the data available in the dashboard as a PDF file.

1. Open the Bot Insight window.
2. Search for the specific dashboard.
3. Select the dashboard from the search results.  
The selected dashboard appears.
4. Review the data available in the dashboard.
5. In the **Actions** menu, click **Download PDF**.

---

**Note:** For all dashboards, the **Download PDF** function does not work in Safari browser. You can use other browsers such as Chrome, Firefox, or Edge to download the PDF reports.

---

6. In the **Download PDF** window, navigate to the location on your local disk drive.
  7. Click **Save**.
- 

**Note:** Due to a limitation within the third-party recharts library, you might observe labels overlapping issue with data in downloaded PDF.

---

### Taking a screenshot of a dashboard

You can take a screenshot of the data available in the dashboard.

1. Open the Bot Insight window.
2. Search for the dashboard for which you want to view the data.
3. Select the dashboard from the search results.  
The selected dashboard appears.
4. Review the data available in the dashboard.
5. In the **Actions** menu, click **Screenshot**.
6. In the **Download PDF** window, navigate to your local disk drive location.
7. Click **Save**.

## Using Bot Insight

Use Automation Anywhere Bot Insight to track bot data for analytics.

Automation Anywhere bots are built, run, and monitored in the Control Room. Bot Insight accesses real-time business insights and digital workforce performance data to leverage content-level productivity data from the bots that are deployed. Data is logged for business analytics who has Attended and Unattended Bot Runner license .

Log in to Automation Anywhere Control Room as an `AAE_Bot Insight Expert` or `AAE_Bot Insight Consumer` to interactively analyze bot data and enhance bot widgets.

In the Control Room, select the Bot Insight tab, to do the following tasks:

- Interactively analyze the bot data in the dashboards.
- Refine and enhance widgets in the Bot Insight dashboards before they are published for wider consumption and deployed to production.

---

**Note:** To view the published business dashboards, you must have a custom role defined with the **View my bots** and **Check in** permissions to the folder that contains the corresponding tasks.

---

## Business analytics

Business analytics provide information about the transactional analytics for the data that is logged by the variable tagged in a task. The information provided can be about the total sales in a month, invoicing and payment trends, insight about new customers, or quote to order ratio.

When you tag variables for analytics in a task, and run the task, Bot Insight generates the analytics dashboard. By default, the generated dashboard has the same name as that of the task. You can customize the system generated dashboards based on your requirement.

## Configuring a task for business analytics

To configure a business analytics automation task, enable analytics (using the **Analyze: Open** and **Analyze: Close** actions) and tag the variables that are of interest for data analysis.

To configure a task for business analytics in an existing bot:

1. Log in to the Control Room.

---

**Note:** Ensure that you have the Bot Creator license assigned to you.

---

2. In the **Automation** pane, select the folder that contains the task for which you want to enable analytics.

The **Actions** palette appears in the left-hand side. See [Actions to build bots](#) on page 2515.

3. Build a bot.

For more information about building and editing a bot, see [Get started building bots](#) on page 3390.

4. Insert the **Analyze: Open** action at the beginning of the transaction.

---

**Note:** The session or transaction name cannot contain angular brackets (< or >).

---

5. Insert the **Analyze: Close** action at the end of the transaction.

The **Analyze: Close** menu lists all the variables in the transaction. Select the variables that are tagged in the transaction to process business analytics.

---

**Note:** This feature enables you to deselect variables that might raise potential privacy concerns, such as social security numbers or bank account details.

---

6. Click **Apply**.

Click **Reset** to reset the variable selection.

7. Click **Save**.

8. Click **Run**.

The **Bot Run Successfully** message appears.

9. Click **Analyze**.  
The Bot Insight window appears.
10. Select a bot from the **Select a Dashboard** drop-down list.  
Click the arrow to view the list of bots.

## Using widgets

The Bot Insight dashboard provides a host of highly customizable widgets that you can use to gain insights for specific scenarios.

When you select a particular bot, the default widgets automatically appear in the **Dashboard** window. You can select the widgets and reposition them in the dashboard. To search for specific information, use the **Smart Filter** function. You can enter the search parameters in the **Smart Filter** field.

You can also use multiple filters to search for data the widgets should display. Enter the filters, search parameters, separated by a comma in the **Smart Filter** field. You can create, move, rename, and edit the widget properties in a dashboard, based on your requirements.

The available options are:

- Chart filters
- Chart style
- Metric-based filters
- Comparison metrics

You can group information by dates and use the **Date Interval** to view when a particular bot was active.

The following **Date** type options are available:

- **Hour**
- **Day**
- **Week**
- **Month**

## Adding a dashboard widget

You can add custom widgets to the Bot Insight dashboard based on your requirements.

You can add a widget to the custom dashboards and not to the default dashboard.

1. Open the dashboard.
- 2.

Click the  icon.

The **Add Visualization** window appears.

3. Select a widget that you want to add in the dashboard. See [Bot Insight visualizations](#) on page 4203.

The **Selected Chart** window appears.

4. Optional: Click the **Switch Widget** button to change widgets.
5. Click **Next**.

The **Construct Your Query** window appears.

6. Enter the query information to construct your dashboard. For reference to create a widget query, see [Configuring a Line Bar Chart query](#) on page 4204.

7. Click **Next**.

The **Ready to build** window appears.

**8. Click Confirm.**

The widget appears in the dashboard.

## Bot Insight visualizations

The Bot Insight dashboards provide customizable widgets that you can use to gain insights for specific scenarios.

Bot Insight offers the following visualization widgets:

- **Gauge Chart**
- **KPI**
- **Vertical Bar Chart**
- **Line Bar Chart**
- **Clustered Line Bar Chart**
- **Horizontal Bar Chart**
- **Vertical Stacked Bar Chart**
- **Horizontal Stacked Bar Chart**
- **Vertical Clustered Bar Chart**
- **Horizontal Clustered Bar Chart**
- **Heat Map**
- **Pie Chart**
- **Donut Chart**
- **Line Chart**
- **Scatter Chart**
- **Bubble Chart**
- **Datatable Chart**
- **World Map**
- **US Map**

The **Pie Chart** widget enables you to visualize data in a circular statistical graphics that is divided into slices.

---

**Note:** Due to a limitation within the third-party recharts library, the data labels in a pie chart are overlapping if it contains many slices. As a result, the labels in a pie chart are not clear and are shown only when you hover over the slices.

---

The **Heat Map** widget enables you to visualize data as a heat map chart. You can specify the dates by function (day, week, month, or year) to drill down to specific information. This map displays all the possible available combinations of variable values in the X and Y axes. Blank heat map blocks appear if there the value attached to the variable is 0. The color of the heat map block depends on the value of the information displayed. A new window with all the relevant information appears when you hover your mouse over a particular heat map block.

The **Datatable Chart** widget enables you to view and analyze information about all the logged data in a tabular chart. You can select the attributes and metrics based on your requirement. All the available attributes and metrics are selected by default.

The **World Map** widget provides information about the data variables and enables you to drill down to specific information:

1. Country

2. State
3. Zip Code
4. Latitude
5. Longitude

The **US Map** widget provides the following information about the data variables and enables you to drill down to specific information:

1. Country
2. State
3. City
4. Zip Code

The **Line Bar Chart** and the **Clustered Line Bar Chart** widgets enable you to view and analyze information about your metrics and attributes. You can input two metrics and one attribute in **Line Bar Chart** widget, while in the **Clustered Line Bar Chart** widget, a **Sub group** option enables you to add one more attributes if necessary.

The widget displays a line bar graph aggregated by group values when only one attribute is selected or a clustered line bar graph aggregated by subgroup values when two attributes are selected. It displays group sectioning which forms multi-axes labels . You can use **Date** types as interval options, grouped by **Day, Week, Month, Quarter, and Year**, with the **Day** set as default.

[Configuring a Line Bar Chart query](#) on page 4204

Related tasks

[Adding a dashboard widget](#) on page 4202

You can add custom widgets to the Bot Insight dashboard based on your requirements.

## Configuring a Line Bar Chart query

You can construct a custom query based on specific parameters to apply to your widget for line bar and clustered line bar charts.

After you are in the **Construct Your Query** window, follow these steps to select parameters to apply to your widget:

- Construct your query settings.
  - The query settings vary from widget to widget, but the selection process remains the same.
  - a)** Enter the title of your widget in the **Chart Title** field.
  - b)** Select a metric option in the **Metric** or **Select Metrics** field.
    - For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Metric** field is renamed to **Y1 Axis** and **Y2 Axis**.
  - c)** Select an aggregated value in the **Aggregated By** field.
    - For **Line Bar Chart** and **Clustered Line Bar Chart**, the **Aggregated By** field is renamed to **Y1 Aggregated By** and **Y2 Aggregated By** with the same options.
  - d)** Select a value from the **Group By** or **Group 1** field.
  - e)** Select a secondary value from the **Sub Group By** or **Group 2** field.

---

**Note:** The **Sub Group By** or **Group 2** field is not available in the **Line Bar Chart**. For the **Metric**, **Group By** and **Sub Group By** fields, the first value is shown as the default value.

---

- f) Select a date value in the **Date Interval** field.
- 

**Note:** This field appears when you select the Date Type variable in the **Group By** and **Sub Group By** fields.

---

- Construct your advanced query settings.

You can enable more options to any widgets that support advanced settings.

- a) Click **Advanced Settings**.

The settings display the default values. You can change the value of the fields if required.

- b) Select a limit value in the **Limit** or **Group Limit** field.
- c) Select a sort value in the **Sort By** or **Group Sort By** field.
- d) Select a sort order value in the **Sort Order** or **Group Sort Order** field.
- e) Select a secondary limit value in the **Sub Group Limit** or **Group 2 Limit** field.
- f) Select a secondary sort value in the **Sub Group Sort By** or **Group 2 Sort By** field.
- g) Select a secondary sort order value in the **Sub Group Sort Order** or **Group 2 Sort Order** field.
- 

**Note:** The **Sub Group Limit**, **Sub Group Sort By** and **Sub Group Sort Order** fields are not available in the Line Bar Chart.

---

## Editing a dashboard widget

You can edit the dashboard widget properties based on your requirements.

You can resize and save the widgets in the Bot Insight dashboard based on your requirements. When you resize a dashboard widget, other widgets in the dashboard are automatically adjusted to fill in the available layout.

**Note:** Bot Insight allows you to resize widgets in the standard and the customized dashboards. However, it does not allow you to save the widgets after resizing in the standard dashboard.

---

- Open the dashboard widget.
- Click the **Edit** button.

The **Edit** window appears.

The **Edit** menu offers the following options:

Chart Title

Renames the chart

---

**Note:** The chart title cannot include angular brackets (< or >).

---

Metric

Changes the units

- |              |                                                                                      |
|--------------|--------------------------------------------------------------------------------------|
| Aggregate By | Displays the run time (such as minimum, maximum, average, and summation) of each bot |
| Group By     | Changes the parameters based on which the widgets are grouped together               |
3. Click the bottom of a widget to change the attribute of the chart displayed within the widget.
  4. Click **Save As** to save the widget.

## Drilling down information in dashboard widget

You can drill down information from a dashboard widget based on your requirement. Select the options available in the drop-down list to view specific information in the dashboard widgets.

To use the drill down function feature in the Bot Insight dashboard widget, do the following:

1. Open the dashboard and select the widget.
2. Right-click to view the **Drill Down** menu.

**Drill Down** menu sample for a mortgage analytics processing bot :

- **Gender**
- **Mortgage Type**
- **Customer ID**
- **Company Name**
- **Email**
- **Loan Due Date**
- **Loan Origin Date**

---

**Note:** Bot Insight dynamically generates the **Drill Down** menu options based on the variables you tag when creating the bot.

---

## Renaming a dashboard widget

You can rename a dashboard widget based on your requirement. The default name of a dashboard widget is based on the type of information that the widget displays.

To rename a widget in the Bot Insight dashboard, do the following:

1. Open the dashboard for the widget to edit.
2. Rollover and click the **Edit** button.  
The **Edit Chart** window appears.
3. In the **Chart Title** field, enter the name of the widget.

---

**Note:** The chart title cannot include angular brackets (< or >).

---

4. Click **Next**.  
The **Ready to build! Click Finish** window appears.
5. Click **Finish**.

The **Widget Updated** message appears.

## Exporting data from a dashboard widget

You can export data from the Bot Insight **Custom Business** dashboard widgets to CSV files based on the requirement.

1. Open the dashboard.
2. Identify the widget.
3. Click the **Actions** icon.
4. Click **Export**.

The CSV file is automatically saved in your local drive as `Chart name_summary_dd_mm_yyyy`.

## Data connector for Power BI

The data connector for Power BI enables you to establish a secure connection to Power BI, and generate and visualize data analytics. You can connect to the Bot Insight APIs in Power BI and apply specific parameters for each of the APIs.

The connector transforms the Bot Insight API responses to data visualizations in Power BI. The data connector for Power BI enables you to perform the following functions in Power BI:

- Authenticate and connect to the Control Room.
- Connect to APIs.
- Generate API responses.
- Transform the API responses to create a data model.
- Create visuals, charts or graphs, to represent the data.
- Create reports.
- Share reports with other users on Power BI.

You can access the following APIs from Power BI:

- `getaudittrialdata`
- `getbotrundata`
- `gettaskvariableprofile`
- `gettasklogdata`

---

**Note:** Automation Anywhere Power BI connector is certified and available as part of the Microsoft Power BI Desktop August release. The connector is available in the **Other** section of the **Get Data** dialog box in Power BI.

---

To update your Power BI to the latest certified release version and use the connector plug-in, manually deploy the data connector in Power BI. This enables you to retrieve information from the Bot Insight API for data analytics.

**Trouble:** When you attempt to refresh the data in a Microsoft Excel worksheet, an authentication error can occur from multiple simultaneous attempts through open windows and tabs. To avoid this error, perform the following steps:

1. In the Power BI desktop application, navigate to **File > Options and settings > Options**.
2. From the Current File section, select **Data Load**.

---

**Note:** Do not select **Data Load** from the Global section.

---

3. Disable the check box for **Enable parallel loading of tables**.
- 

Related information

[Microsoft Power BI](#)

## Deploy Power BI connector

Deploy the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

The connector can now be accessed directly from the Power BI desktop application. Ensure you meet the following prerequisites.

- You should be using Power BI desktop version 2.92.943.0 or above.
- You know your Automation Anywhere Control Room version.
- You have your Control Room credentials.
- You have your Control Room URL.

The following steps describe how to deploy the connector.

1. From your Power BI desktop application, select **Get data**.
2. In the search field, type and select **Automation Anywhere**.
3. Click **Connect**.
4. From the Login dialog box, enter your Control Room version and URL.
5. Enter your Control Room credentials.
6. Click **Connect**.

[Configure Power BI connector](#) on page 4208

## Configure Power BI connector

Configure the data connector in Power BI to retrieve information from the Bot Insight API to enable data analytics.

Ensure that you have the **Bot Insight Admin**, or **AAE\_Admin** role assigned to you in the Control Room.

---

**Notice:** A **Bot Creator** license is required to generate a default dashboard with tasklogdata for Power BI.

---

**Note:** The Power BI Connector is supported with Database Authenticated Control Room and Active Directory authentication.

---

1. Log in to the Power BI.
2. Click **Get Data**.  
The list of all the Power BI certified connectors appears.
  - For information about how to access non-certified custom connectors, see [Connector extensibility in Power BI](#).
  - When you update the dataset of two or more datasets, you might observe the **Authentication 500 Internal server error**. For resolving this error, see [Automation 360 | Authentication 500 Internal server error while refreshing in power BI \(A-People login required\)](#).
3. Select Automation Anywhere and click **Connect**.
4. In the **Automation Anywhere - Login** window, enter the following information:
  - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
  - b) In the **Control Room Host** field, enter the IP address or the host name of the Control Room server.
  - c) In the **Bot Insight Host** field, enter the IP address or host name of the Bot Insight server.
5. Click **OK**.
6. In the **Automation Anywhere Login** window, enter your Bot Insight user name and password.  
To provide the credentials for Active Directory authentication, you must enter the domain name delimited by a double backslash (\\) along with the user name in the **User name** field. For example: domain name\\user name.
7. Click **Connect**.  
The Bot Insight APIs are authenticated and the authorization tokens are generated. The Bot Insight APIs are loaded dynamically from Swagger, along with the applicable request parameters.
8. Select the required Bot Insight API from the **Navigator** menu and enter the information in the respective fields.
9. Click **Load**.  
The API retrieves specific information from the server.  
To learn how to retrieve information from Bot Insight APIs in Power BI, see [Bot Insight API](#).
10. Click **Transform Data** to convert the structured JSON response to a visual data model.

Related information

[Transform, shape, and model data in Power BI](#)

[Collaborate, share, and integrate across products with Power BI](#)

## Example: Retrieve information in Power BI using business information API

The Power BI connector enables you to access the Bot Insight API from Power BI. This example task shows you how to retrieve information from the Bot Insight API and build data visualizations in Power BI.

1. Open Power BI.
2. Open the **Navigator** window, and log in to the Control Room by entering the credentials.
3. In the **Display Options** menu, select **fx Business Information** check box. The **API** window appears.
4. In the **botName** field, enter the name of the bot, or the task for which you want to visualize the analytical data.  
To enter multiple bot names, separate each name with a comma.  
For example, SalesAPAC,SalesEMEA,SalesUS.
5. In the **pageNo** field, enter the offset value for the rows or records that you want to retrieve.
  - If page = 0, and limit =1000, then rows 0 -1000 will be retrieved.
  - If page = 1, and limit =1000, then rows 1001 -2000 will be retrieved.
6. Optional: In the **fromDate** field, enter the date from when you want to retrieve the information.  
Format: yyyy-mm-dd, or yyyy-mm-ddTh:m:s.msZ (2020-02-20T12:45:23.000z)

---

**Note:** If you do not enter a date, the API will return all available data.

---
7. Optional: In the **toDate** field, enter the date till when you want to retrieve the information.  
Format: yyyy-mm-dd, or yyyy-mm-ddTh:m:s.msZ (2020-03-21T15:45:32.000z)

---

**Note:** If you do not enter a date, the API defaults to the current date.

---
8. In the **limit** field, enter the number of rows or records you want to retrieve.
9. Click **Apply** and then click **Transform Data** to convert the structured JSON response to a visual data model.
10. Click **Record** and then click each list item until you drill down to the last element in business information.  
Power BI displays the data visualization.

## Configure Tableau web data connector in Bot Insight

The web data connector in Tableau enables you to establish a secure connection with Automation 360 and to extract, visualize, and analyze data from Bot Insight.

- Ensure that your user name is registered in the Control Room and that you have **Bot Insight Admin** or the **AAE\_Admin** role assigned to you.
- Ensure you have access to the desktop or public version of Tableau software.

**Note:** Single sign-on is not currently supported for Bot Insight. Connectors only work with the following authentication mechanisms.

- Control Room database based authentication
- Active directory based authentication

---

The Web data connector in Tableau enables you to perform the following functions in Tableau:

- Authenticate and connect to the Control Room.
  - Connect to Bot Insight APIs for business and operational information.
  - Use business and operational information to create a data model.
  - Create charts or graphs to represent the data.
  - Create reports and share them with other users on Tableau.
1. Open Tableau.
  2. Select **Web Data connector** from the **Connect** option in **Data** tab.
  3. In the **Web Data Connector** window, enter your Automation Anywhere URL in web data connector field: <control room url>/tableau/Login.html
  4. In the **Automation Anywhere - Login** window, enter the following information:
    - a) In the **Control Room Version** drop-down menu, select the version of the Control Room.
    - b) In the **Control Room URL** field, enter the URL or the host name of the Control Room.
    - c) In **User Name** and **Password** field, enter your Bot Insight user name and password.
  5. Click **Submit** to connect to Bot Insight APIs.
  6. Select either **Business Information** or **Operational Information** in the Bot Insight window. If you are an **AAE\_Admin**, you can choose between Audit APIs and Operations APIs.
  7. Click **Get Data**.  
Bot Insight API retrieves information from the server.
  8. Click **Update Now** to gather all the data from Bot Insight in Tableau.  
You can use the retrieved data from Bot Insight for data visualizations and analysis in Tableau.

## API References

The Automation 360 platform provides a comprehensive suite of API capabilities that enable customers, partners, and community developers to automate end-to-end processes using API.

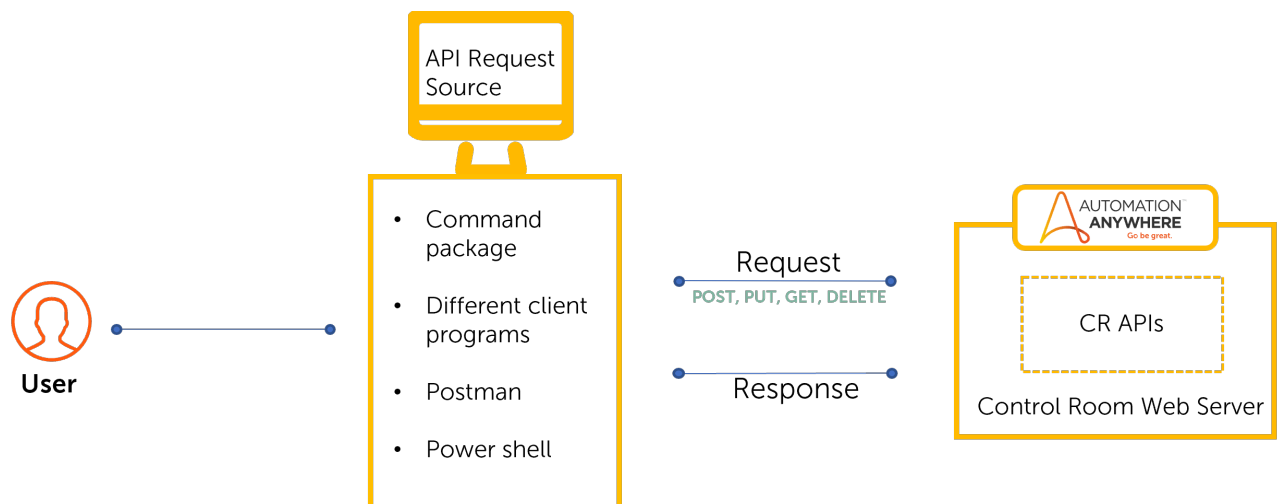

Automation Anywhere APIs are Representational State Transfer (RESTful) APIs. REST APIs allow you to manage, administer, and run automations programmatically from your own application. By incorporating Automation Anywhere APIs into various software programs, you can simplify application integration across different platforms and reduce development effort. Automation Anywhere APIs provide a secure communication gateway to interact and exchange data.

Automation Anywhere APIs offer the following capabilities:

- Automation Anywhere APIs are based on industry standards and best practices.
- Several authentication methods and protocols are supported.
- Enable high performance and scalability of automation projects.
- Leverage AI and machine learning capabilities in automation work flows.

You can use the Automation Anywhere APIs to:

- Register your device using the Bot Agent API.
- Perform various functionalities in the Control Room using the Control Room APIs.

## Control Room APIs

The Automation Anywhere Control Room provides APIs that enable you to customize how you (and your automations) interact with Automation Anywhere.

You use Control Room APIs to:

- Manage bot deployments
- Create and manage credentials in the Credential Vault
- Create and manage user accounts and roles
- Create and manage queues

## API endpoints

You can view all the Control Room API modules and the associated endpoints in the following table:

Versions	Endpoints
v1	<ul style="list-style-type: none"> <li>• <a href="#">Authentication API</a></li> <li>• <a href="#">User Management API</a></li> <li>• <a href="#">Audit API</a></li> <li>• <a href="#">Device API</a></li> <li>• <a href="#">Automations API</a></li> <li>• <a href="#">Trigger API</a></li> </ul>
v2	<ul style="list-style-type: none"> <li>• <a href="#">Authentication API</a></li> <li>• <a href="#">User Management API</a></li> <li>• <a href="#">Credential Vault API</a></li> <li>• <a href="#">Bot Execution Orchestrator API</a></li> <li>• <a href="#">Repository Management API</a></li> <li>• <a href="#">BotInsight API</a></li> <li>• <a href="#">BLM API</a></li> <li>• <a href="#">Device Pool API</a></li> <li>• <a href="#">License API</a></li> <li>• <a href="#">Process Composer API</a></li> </ul>
v3	<ul style="list-style-type: none"> <li>• <a href="#">Bot deploy API</a></li> <li>• <a href="#">Workload Management API</a></li> <li>• <a href="#">Migration API (Bot migration)</a></li> <li>• <a href="#">Bot Execution Orchestrator API</a></li> </ul>
v4	<ul style="list-style-type: none"> <li>• <a href="#">Bot deploy API (V4)</a></li> <li>• <a href="#">Migration API (Bot migration)</a></li> </ul>

## Getting started with Control Room APIs

All requests must include an X-Authorization header with the JSON authentication token, or an Authorization header with a Bearer token for requests to the Control Room. The following sections provide details about the Control Room APIs available endpoints, methods, resources, authentication protocols, parameters, and headers, as well as examples of common requests and responses.

**Note:** The Bearer token is supported as of the Automation 360 v.27 release and later. It is unsupported and ignored in any previous releases. You must obtain the Bearer token from our OAuth services. To authorize your access, use either X-Authorization (using Authentication API) or Authorization (using OAuth). You cannot use both in the same API.

The Control Room supports several REST API clients. You can use Control Room swagger to view and run the APIs. Access the Control Room swagger by using the link `https://{control-room}/swagger/` and replace `{control-room}` with your Control Room instance. The following sections provide useful information about how to write a Control Room API request:

- Some APIs require you to filter, paginate, and sort the results to get the desired output. For more information on filtering, pagination, and sorting, see [Filtering, pagination, and sorting](#) on page 4214.
- API response codes in the responses are described in the [API response codes](#) on page 4220.
- The [Comparing Automation 360 and Enterprise 11 APIs](#) on page 4221 compares the Enterprise 11 and Automation 360 APIs.

To learn how to test Control Room APIs in Swagger and Postman, watch the following video:

**v4**

## Filtering, pagination, and sorting

The Control Room API supports filtering, pagination, and sorting for endpoints that return arrays of resources.

The filtering mechanism filters the required resources, the sorting mechanism places the resources in order; and the pagination mechanism then returns a specific range of those ordered resources. This topic provides you the details to filter and sort the results of an API requests and also guides to handle the pagination of large result sets returned from an API request.

---

### Note:

- Sorting and filtering are supported for substrings. For example, if you want to search for bots or files that have `fin` in their names, enter `fin` as the search criterion. All the bots and files that contain `fin` in the names will be displayed, for example, Finance, Finder, DeltaFinance, and Dolfin.
  - Wildcards are not supported for searching and filtering bots or files.
-

## Filtering

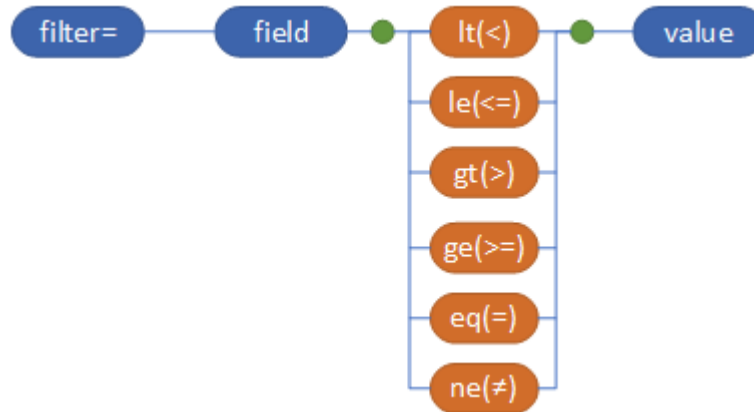

Filtering allows you to apply Boolean condition against a collection of returned resources in order to subset the collection to only those resources for which the condition is `true`. The most basic operation in an Control Room API filters is to compare a field to a given value. It is possible to use equality comparison, range comparison, or logical . Use the following operators to compare a field to a constant value.

Operation	Description	Example
Equality comparison		
eq	Equals	UserEmailAddress, eq first.last@aa.com
ne	Not Equals	UserEmailAddress, ne first.last@aa.com
Range comparison		
lt	Less than	Quantity lt 1500
le	Less Than or Equal	Quantity le 1500
ge	Greater Than or Equal	CreatedDateUtc ge 2021-03-15
gt	Greater Than	CreatedDateUtc gt 2021-03-15
Logical		
and	And	Field1 eq 'abc' and Field2 eq 'def'
or	Or	Field1 eq 'abc' or Field2 eq 'def'

The `filter` query parameter allows you to apply basic, multiple, and convention oriented filters to a request. The filters in the Control Room APIs are applied with single parameter or with multiple parameters.

### Single parameter filter

Single parameter filter allows the API request to select the responses by matching one or more members of the response to the value passed in the query. The single parameter filter is represented in the following image:

The JSON equivalent of the above image (single parameter filter) looks like:

```

{
 "filter": {
 "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or, not>",
 "field": "string",
 "value": "string"
 }
}

```

For example, to list all the device pools that has a substring `finance`, use the following single parameter filter:

```
POST http://{{ControlRoomURL}}/v2/devices/pools/list
```

```

{
 "filter":{
 "operator":"substring",
 "field":"name",
 "value":"finance"
 }
}

```

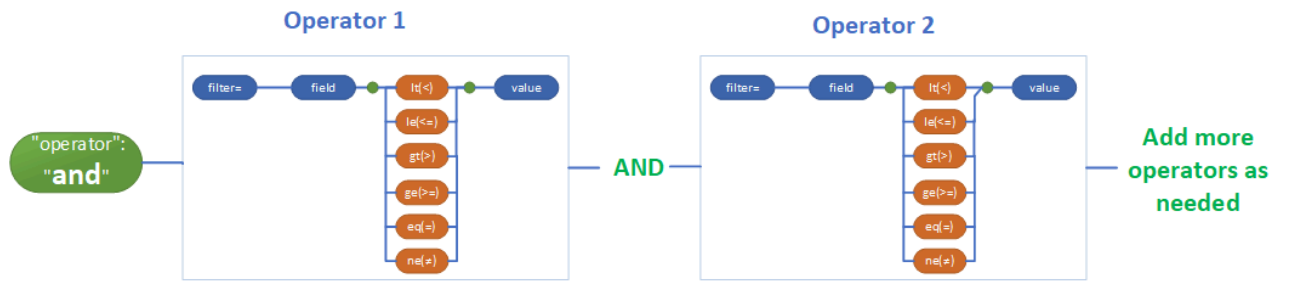

For more detailed sample on a single parameter filter, see [Device Pools API](#) .

#### Multiple parameter filter

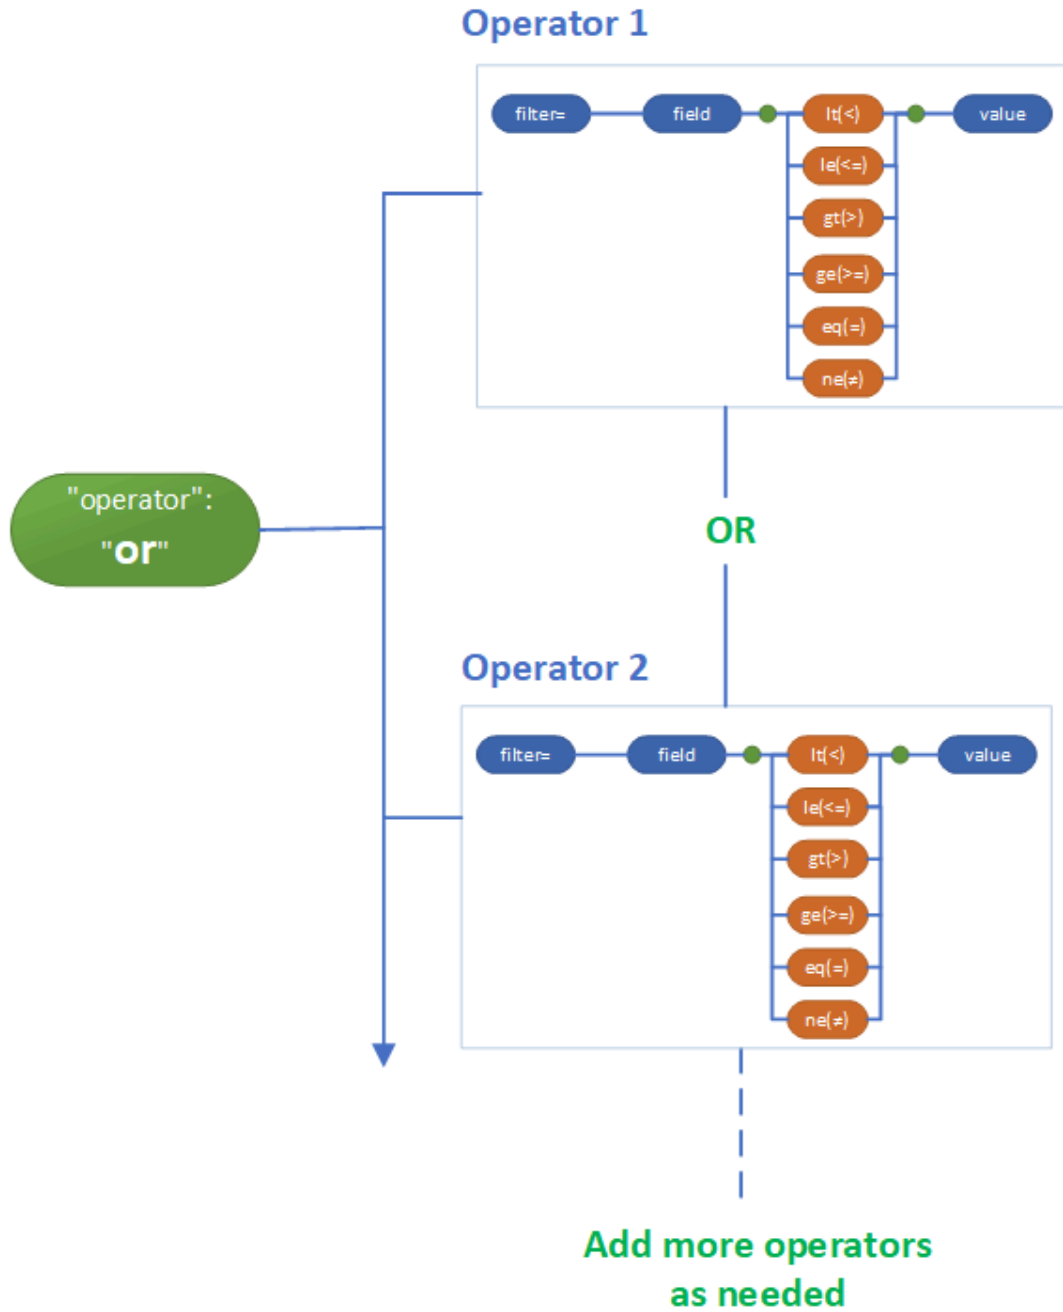

Multiple parameter filter allows you to filter the results based on combining multiple conditions wrapped in logical operands `and` or `or`.

- `and`: A binary operator that evaluates to `true` if all the conditions in the operands evaluate to `true`.

- `or`: A binary operator that evaluates to `true` if atleast one of the conditions in the operands evaluate to `true`.

The JSON equivalent of the above image (multiple parameter filter) looks like:

```

{
 "filter": {
 "operator": "<and, or>",
 "operands": [
 {
 "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or, not>",
 "field": "string",
 "value": "string"
 }
]
 }
}

```

```

 },
 {
 "operator": "<NONE, lt, le, eq, ne, ge, gt, substring, and, or,
not>",
 "field": "string",
 "value": "string"
 }
]
}
}
}

```

For example, to list all the roles that has a substring Device, createdOn is after 2022-04-01, and createdOn is before 2022-05-31, use the multiple parameter filtering with logical add operator as follows:

```
POST http://{{ControlRoomURL}}/v1/usermanagement/roles/list
```

```

{
 "filter":{
 "operator":"and",
 "operands":[
 {
 "operator":"substring",
 "field":"name",
 "value":"Device"
 },
 {
 "operator":"gt",
 "field":"createdOn",
 "value":"2022-04-01T00:00:00.989Z"
 },
 {
 "operator":"lt",
 "field":"createdOn",
 "value":"2022-05-31T23:00:00.123Z"
 }
]
 }
}
}

```

For more detailed sample on a single parameter filter, see [User Management API](#) .

## Pagination

Pagination allows you to:

- Retrieve a limited collection of results.
- Offset a collection of results.

All Control Room APIs that returns a collection of records are paginated. API methods that support pagination takes two (optional) parameters:

Operation	Description
offset	The offset parameter controls the starting point within the collection of response results. Default value is 0.

Operation	Description
length	The length parameter is the maximum number of records to retrieve starting from the offset. Default value is 200.

The JSON snippet for pagination looks like:

```
"page":{
 "offset":5,
 "length":10
}
```

For more detailed sample on a single parameter filter, see [User Management API](#) .

## Sorting

Sorting allows you to order the results by any field, in ascending or descending order. For example, if you are returning the roles, you can sort the roles by last modified date.

```
"sort": [
 {
 "field": "string",
 "direction": "<asc, desc>"
 }
]
```

Direction

Type: Enum [ desc, asc ]

- asc = ascending (smallest to largest, 0 to 9, A to Z)
- desc = descending (largest to smallest, 9 to 0, Z to A)

For more detailed sample on a single parameter filter, see [User Management API](#) .

## API response codes

Review the HTTP status codes of responses for Automation 360 APIs.

Status code	HTTP name	Description
200	OK	Success
201	Created	Success, for POST, PATCH or PUT requests.
202	Accepted	Indicates that the request has been accepted for processing, but the processing has not been completed.
204	No content	Success, for DELETE requests and some PATCH requests.
400	Bad request	Request URL or request parameters are incorrect.

Status code	HTTP name	Description
401	Authentication required	Provide authentication details.
403	Unauthorized access	The operation is not authorized.
404	Not found	Control Room server did not find the requested URL.
409	Conflict	The request could not be completed because the code conflicts with the current state of the resource, for example, a duplicate entry.
500	Internal server error	Indicates that the server encountered a problem. Clear the cookies and cache, and then reload the page.

## Comparing Automation 360 and Enterprise 11 APIs

Compare Automation 360 and Enterprise 11 APIs to understand the contract changes when you migrate from Enterprise 11 to Automation 360.

API details	Enterprise 11	Automation 360
Authentication API: Use this API to obtain the authentication token. The token is then used for all subsequent API calls.		
Method	POST	POST
Endpoint	v1/authentication	v2/authentication
Request body changes	Not applicable	No change
Response body changes	Not applicable	<ul style="list-style-type: none"> <li>Multi-factor authentication is not supported</li> <li>Automation 360 response returns the tenantUUID</li> </ul>
Auto login credentials API: Use this API to set the Windows credentials for a Bot Runner. These credentials are used for automatically login (auto-login).		
Method	POST	PUT
Endpoint	v1/credentialvault/external/credentials/loginsetting	v2/credentialvault/loginsetting
Request body changes	Not applicable	Endpoint version change

API details	Enterprise 11	Automation 360
Response body changes	Not applicable	Message displayed after successfully updating the credentials: Credentials updated for <username>. Enterprise 11 displays this message: Credentials were successfully updated.
Automation management API: Use this API to create automations (schedule bots), and edit and delete automations.		
Method	POST, PUT, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v1/schedule	v1/schedule
Request body changes	Not applicable	Minor change in request body to pass bot input variables
Response body changes	Not applicable	Detailed response with bot input variable details
User Management API: Use this API to create, edit, and delete users and roles.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v1/usermanagement	v2/usermanagement
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Migration API: Use this API to migrate bots from Enterprise 11 or Enterprise 10 to Automation 360		
Method	GET and POST	GET and POST
Endpoint	<ul style="list-style-type: none"> <li>v1/migration</li> <li>v2/migration</li> </ul>	v4/migration
Response body changes	Not applicable	<ul style="list-style-type: none"> <li>Endpoint version change</li> <li>APIs used to connect to the Enterprise 10 database to migrate users, roles, schedules, and bots</li> </ul>
Request body changes	Not applicable	Because the endpoints and request body are different, the response body is also different.

API details	Enterprise 11	Automation 360
Manual Dependency API: Use this API to add or remove a dependency (data files and such) to or from a bot.		
Method	POST and DELETE	Not available
Endpoint	v1/files/ manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Repository Management API: Use this API to get bots and files from the Control Room repository.		
Method	POST, DELETE, and GET	POST, DELETE, and GET
Endpoint	v1/repository	v2/repository
Request body changes	Not applicable	Additional APIs added to get folder permissions
Response body changes	Not applicable	No change
File Dependency API: Use this API to get the file dependency metadata to run and schedule bots.		
Method	GET	Not available
Endpoint	v1/files/ manualdependencies/	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Bot Lifecycle Management (BLM) API: Use this API to move (export or import) bots and dependent files across different Control Room environments.		
Method	POST	POST
Endpoint	v1/blm	v2/blm
Request body changes	Not applicable	<ul style="list-style-type: none"> <li>Endpoint version change</li> <li>You cannot choose dependencies when exporting and importing</li> </ul>
Response body changes	Not applicable	No change
Audit API: Use this API to get audit information about the product.		
Method	POST	POST
Endpoint	v1/audit	v1/audit
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Two-factor Authentication (2FA) API: Use this API to generate a 2FA token		

API details	Enterprise 11	Automation 360
Method	GET and POST	Not available
Endpoint	v1/mfa	Not available
Request body changes	Not applicable	Not available
Response body changes	Not applicable	Not available
Credential Vault API: Use this API to create, edit, and delete credentials and lockers.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/credentialvault	v2/credentialvault
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Execution Orchestration API: Use this API to get the repository, automations, and devices list.		
Method	POST	POST, PUT, GET, and DELETE
Endpoint	v2/automations/deploy	v3/automations/deploy
Request body changes	Not applicable	Bot deployment includes run-as users
Response body changes	Not applicable	Returns deploymentID. Enterprise 11 API response returns automationID.
License API: Use this API to get product license information.		
Method	GET	GET
Endpoint	v2/license	v2/license
Request body changes	Not applicable	No change
Response body changes	Not applicable	Additional APIs added to update with license server and additional details
Workload Management (WLM) API: Use this API to create, edit, and delete workload queues, templates, and work items.		
Method	POST, PUT, GET, and DELETE	POST, PUT, GET, and DELETE
Endpoint	v2/wlm	v3/wlm
Request body changes	Not applicable	No change
Response body changes	Not applicable	More APIs to manage WLM entities
Bot Insight API: Use this API to get Bot Insight data for an automation.		

API details	Enterprise 11	Automation 360
Method	POST, GET, and DELETE	POST, GET, and DELETE
Endpoint	v2/botinsight/data/api	v2/botinsight/data/api
Request body changes	Not applicable	No change
Response body changes	Not applicable	No change
Bot Insight JSON API: Use to get business insights for an automation.		
Method	GET	Not applicable
Endpoint	v2/botinsight/data/api	Not applicable
Request body changes	Not applicable	Not applicable
Response body changes	Not applicable	Merged with Bot Insight API

[Control Room APIs](#) on page 4212

The Automation Anywhere Control Room provides APIs that enable you to customize how you (and your automations) interact with Automation Anywhere.

## Configure the Control Room

Before you start creating workflows for bot deployment and workload management using Control Room APIs, ensure you complete specific prerequisites and steps in the Control Room.

Ensure you have following licenses and permissions:

- One or more Bot Creator and unattended Bot Runner licenses.
- Control Room admin credentials to view, create, and configure users, roles, and device pools.
- The **Create device pools** feature permission or the **AAE\_Pool Admin** role must be assigned to you.

Follow these steps to configure your Control Room with users, roles, and bots.

1. Log in to the Control Room as an admin.
2. Create a Control Room user.  
Ensure that the user is assigned the **AAE\_BASIC** role.  
[Create a user](#) on page 1845
3. Create a custom role to map the users you created to Bot Runners and Bot folders.
  - a) In the **Features** tab, ensure you select these permissions: **View my Scheduled Bots**, **Schedule my bots to run**, **Run my Bots**, **View my Bots**, and **Generate my API Key**.
  - b) In the **Automation** tab, expand the **Bots** folder and select the root folder or subfolders you want to provide access for use. Ensure you select these permissions: **Run and schedule** and **View content**.
  - c) In the **Run as** tab, select one or more Bot Runners from the list of **Available bot runners**.
  - d) In the **Users** tab, select the new user created in Step 1 to assign the custom role to this new user.

4. Create a new device pool.  
In the **Consumers** tab, ensure you select the custom role you created in Step 3.  
[Create device pools](#) on page 1999
5. Log in to the Control Room as a Bot Creator and create bots to automate routine business tasks.  
[Build a Go be Great bot](#) on page 3391  
Ensure you check in the bots in the `Bot` folder or folders selected when creating the custom role (Step 3). [Check in a bot](#) on page 2451

## Roles and permissions

Assign roles from the Automation 360 Administration user interface or through the User Management API to enable users to access features. You can assign a system-created role or create a custom role with specific permissions.

Roles are a logical container for permissions and have interdependencies with bots, users, and licenses. Users with the `AAE_Admin` role can create custom roles and assign roles to users.

Related concepts

[Code analysis](#) on page 2325

Code analysis (code review) enables you to evaluate a program without running the code. When you review the code, a list of violations based on a set of rules are displayed. You can review and fix any coding or stylistic errors for your automation.

Related reference

[Feature permissions for a role](#) on page 1856

A user with the **Manage roles** permission can create and assign roles to users to provide them with access to features and operations.

## System-created roles

Automation 360 includes predefined roles that cannot be edited or deleted. Each role has the standard permissions, plus the permissions necessary to perform the tasks within the scope of that role.

### Standard permissions

All system-created roles include the following permissions:

- View dashboards
- View my in progress activity
- Manage my credentials and lockers
- Create standard attributes for a credential (except for Discovery Bot roles)
- View and manage my Bot runners, Bot creators, and devices
- View and manage my queues
- View users and roles basic information

## Administration permissions

Enable users to create and manage users and roles, to manage and update migrations, and to install Control Room licenses.

You will be able to use the Retrieve role by ID. See [User Management API](#) endpoint with the role ID to retrieve the permissions assigned to any system or user defined roles.

### Users and roles permissions

Action	Resource Type	Description
usermanagement	usermanagement	Allows you to only view all other users in the system. You cannot create, edit, or delete users.  <b>Note:</b> You must assign this permission before assigning the <code>createuser</code> , <code>updateuser</code> , or <code>deleteuser</code> permission.
deleteuser	usermanagement	Allows you to delete other users the Control Room.
createuser	usermanagement	Allows you to create new users in the Control Room.
updateuser	usermanagement	Allows you to edit all users in the system.
rolesview	rolesmanagement	Users with this permission are able to view the roles in the Control Room.  <b>Note:</b> You must assign this permission before assigning the <code>rolesmanagement</code> permission.
rolesmanagement	rolesmanagement	Allows you to view and manage all roles in the Control Room.
viewuserrolebasicinfo	usermanagement	Allows you to view basic information on users and roles.

### Migration permissions

Action	Resource Type	Description
view	migration	Allows you to view new migrations, but not run them  <b>Note:</b> You must assign this permission before assigning the <code>manage migration</code> permission
manage	migration	Allows you to view and run new migrations

Action	Resource Type	Description
updatestatus	migration	Allows Bot Runner <b>Run-as</b> user to update the bot conversion status in the Control Room

## Licenses permissions

Action	Resource Type	Description
licensemanagement	licensemanagement	Allows you to view the license details for the Control Room.
licenseinstall	licensemanagement	Allows you to install Automation 360 licenses for the Control Room.
licenseuserallocation	licensemanagement	Allows you to assign device licenses to other users.

**Note:** Only a user with the `AAE_Admin` role has the ability to view and manage settings in the Control Room. See [System-created roles](#) on page 4226.

## Runtime Client Management permissions

Action	Resource Type	Description
runtimeclientsmanagement	runtimeclientsmanagement	Allows you to use the device mentioned in the resourceId for deployment. This permission is assigned when you are assigned a default device.
accessresourceany	runtimeclientsmanagement	Allows you to use any device for deployment. This permission is currently granted for all users with <code>AAE_ADMIN</code> role.

## Global Values Permissions

Action	Resource Type	Description
manageuserscopevalues	globalvalues	Manage tenant level global values, given to <code>AAE_Admin</code> only. This cannot be given to any custom role at the moment.
managetenantscopevalues	globalvalues	Not used, created for future purpose.

<sup>1</sup> Not available in the UI and is seen only in the API response.

## other permissions

Action	Resource Type	Description
systemadmin	system	This permission is given to AAE_Admin only.  It is a system call and cannot be called manually. This permission is used to count the number of pages consumed against the entitled pages for the IQ bot application.  It fetches a list of all the users with basic details and license information.
view	settings	View settings.  <b>Note:</b> You will be allowed to view settings only with the system-created Admin role to view Settings.
all	botrunners	Allows you to use any runAsUser for deployment. This permission is currently granted for all users with <u>AAE_ADMIN</u> role.
operationroom	operationroom	Legacy, not used and will be removed from the future releases.
manage	mfa	Legacy, not used and will be removed from the future releases.

## API permissions

Enables access to Bot Insight APIs and the ability to generate an API key.

Action	Resource Type	Description
botinsightapi	api	Allows access to Bot Insight RESTful APIs to the data logged by the Control Room and by a task during production runs.
generateapikey	api	Generate an <b>apiKey</b> that can be used in the Authentication API.  <b>Note:</b> Without the <code>generateapikey</code> permission, use APIs by authenticating using their username and password.
coadmin	botinsightapi	Reserved. Not used for now and will be used when COE dashboard is available in Automation 360. Allows you to access the COE dashboard when it is made available in Automation 360.
accessreportingapi	iqbotapi	Allows you to access reporting details via an API.

Action	Resource Type	Description
accessuploadanddownloadapi	uploadapi	Allows you to upload a document and download the digitized result via an API.
accessnlpapi	iqbotapi	Allows you to access natural language processing capabilities of the IQ Bot portal via an API.

## Audit log permissions

View audit logs and details to record user activities. Enable users to view logs from the Control Room.

Action	Resource Type	Description
recentactivities	recentactivities	Allows you to view all audit log activity for the Control Room
archiveaudit	recentactivities	Allows you to archive all audit log activity for the Control Room

## Automation Co-Pilot (Previously named AARI) permissions

Assign Automation Co-Pilot permissions to a custom role.

Action	Resource Type	Description
aaricrosssteamread	aari	View all teams and see the team members
aaricrossprocessread	aari	View all processes and see team members and managers
aariteammanagement	aari	Create and view teams, edit team names, descriptions, and process tags. Add new teams, team members, and assigned processes
aaritaskmanagement	aari	Submit and view tasks from processes that are assigned to the team
aaricasemanagement	aari	Create and view requests from processes that are assigned to the team
aariglobalcasemanagement	aari	View process requests and tasks.  <b>Note:</b> This permission does not grant the ability to create a request or submit a task
aariglobalprocessmanagement	aari	View checked-in public processes and assigned managers and teams, edit process tags, and assign managers and teams  <b>Note:</b> This permission does not grant the ability to create a process.

Action	Resource Type	Description
aariglobalteammanagement	aari	View teams and assigned users, edit team names and descriptions. Add new processes, managers and users to a team  <b>Note:</b> This permission does not grant the ability to create a team.
aarischeduler	aari	Allows users to be used as Automation Co-Pilot scheduler

## Bot and bot credential permissions

Enables users to access features for managing bots and the credentials used by bots.

### Bots permissions

Action	Resource Type	Description
view	repositorymanager	Allows you to view the bots they created and bots that were assigned to them.  <b>Note:</b> You must assign this permission before assigning any other bots permissions.
run	repositorymanager	Allows you to run the bots they created and bots that were assigned to them.
export	repositorymanager	Allows you to export bots and related bot dependencies for which they have download permission.
import	repositorymanager	Allows you to import bots and bot dependencies for which they have upload permission.
createfolders	repositorymanager	Allows users to create folders within the folders that they have access to.
renamefolders	repositorymanager	Allows you to rename the folders they have access to.  <b>Note:</b> Only empty folders can be renamed.
cancelcheckout	repositorymanager	Allows you to cancel bot checkout and unlock the file from the public repository.
forceunlock	repositorymanager	Allows you to unlock locked bots.

Action	Resource Type	Description
accessresourceany	repositorymanager	Allows you to get permissions to the resources. For example, runtimeclientsmanagement, pool, queue and so on.
setproductionversion	repositorymanager	Allows you to set the production version of bots.
all	repositorymanager	Allows you to get all the repository permissions.
gitrestore	repositorymanager	Allows you to get git restore permissions.

## Credentials and lockers permissions

Action	Resource Type	Description
managecredentials	credentials	Allows you to create, edit, and delete their own credentials. In addition, the user can interact with credentials from their assigned lockers.  <b>Note:</b> All roles have this permission by default.
create	locker	Allows you to create and manage their own lockers.
consume	locker	Allows you to consume a locker locker
createstandard	credentialattribute	Allows you to create a standard attribute for a credential that is shared across all users of that credential .
updateany	credentialattribute	Allows you to view and edit their own masked attributes.
botautologinapi	credentialattribute	Allows you to automate the login process to run bots remotely.
addcredential	credentialmanager	Legacy, not used and will be removed from the future releases.
updatecredential	credentialmanager	
deletecredential	credentialmanager	

**Note:** A user with the `AAE_Locker_Admin` role can view all credentials and lockers in the Control Room. See [System-created roles](#) on page 4226.

## Bot Store permissions

Enables users to view and manage Bot Store packages.

Action	Resource Type	Description
view	botstore	Allows you to view Bot Store.
addfrom	botstore	Allows you to add bot packages from Bot Store to their Control Room private workspace.
submit	botstore	Allows you to submit bot packages to Bot Store.

## Dashboard and activity permissions

Enables all users to view dashboards. Activity permissions enable users to view, manage, and schedule bot activities.

### Dashboard and Activity Permissions

Action	Resource Type	Description
view	dashboard	View dashboard.  <b>Note:</b> All roles have this permission by default.
myschedule	taskscheduling	All users can view their own activity.  <b>Note:</b> All roles have this permission by default.
managemyschedule	taskscheduling	All users can pause, resume, or cancel their own activity and move their finished activities to history.
manageeveryone	taskscheduling	A user can monitor ongoing automations where a user has either run or schedule access on the respective bot. The user can monitor and manage ongoing automations.
view	taskscheduling	Users can see their scheduled bots regardless of which user scheduled the bot.
addschedule	taskscheduling	It requires permission to view and manage Bot Runners.
updateschedule	taskscheduling	Users can edit their scheduled bots, even if the bots are scheduled by a different user.
deleteschedule	taskscheduling	Users can delete schedules for any of their bots regardless of which users scheduled the bot.
manageallmyfolders	taskscheduling	Users can view, edit, and delete all the schedules on the bot folders that the user has access to. This includes the schedules that the user created or schedules created by other users.

Action	Resource Type	Description
manageallschedules	taskscheduling	Users can view, edit, and delete all the schedules in the system. This includes the schedules that the user created or schedules created by other users.
setautomationpriority	taskscheduling	Users can set the automation priority to high from the default medium. Automations with high priority are deployed ahead of automations with medium and low priority.
everyoneschedules	taskscheduling	Users can monitor those ongoing automations where they have either run or schedule access on the respective Task Bot.

## Devices permissions

Enable you to register, view, and manage devices used to run bots.

Action	Resource Type	Description
register	devices	Allows you to register a localhost device.
all	devices	Allows you to view and manage all devices in the Control Room.
delete	devices	Allows you to delete devices that they registered.
edit	devices	<p>Allows you to edit the devices that they have permission to see.</p> <p>Allows you to view and manage all (registered and non-registered) devices from a specific accessible group.</p> <hr/> <p><b>Note:</b> To view and manage registered and non-registered devices,</p> <ul style="list-style-type: none"> <li>The Control Room administrator must grant access to manage a specific set of devices.</li> <li>You must select <b>Devices from my device pool(s)</b> to edit devices from device pools and <b>Run as user(s) default device</b> to edit Run as user(s) default device options in the <b>Edit devices</b> permission.</li> </ul> <hr/>
view	devices	<p>Allows you to view and manage Bot Creators, Bot Runners, and device pools.</p> <hr/> <p><b>Note:</b> All roles have this permission by default.</p> <hr/>
attestcredentials	devices	Allows you to deploy the bot during a session on the user's device without system password.

Action	Resource Type	Description
create	pool	Allows you to create and manage their own device pools.

**Note:** A user with the `AAE_Pool Admin` role is able to manage all device pools in the Control Room. See [System-created roles](#) on page 4226.

## Discovery Bot permissions

Enable users to view or manage Discovery Bot processes, recordings, aggregations, and opportunities.

### Process permissions

Action	Resource Type	Description
viewprocess	processdiscovery	Allows users to view assigned processes.  <b>Note:</b> This is the standard permission. You must assign this permission before assigning any process discovery permissions.
viewallprocess	processdiscovery	Allows users to view all the defined processes.
editprocess	processdiscovery	Allows users to create and edit processes.

### Recording permissions

Action	Resource Type	Description
viewrecording	processdiscovery	Allows users to view their own recording.  <b>Note:</b> You must assign this permission before assigning any of the permissions below.
createrecording	processdiscovery	Allows users to run recorder and create recording.
editrecording	processdiscovery	Allows users to edit their own recording.
deleterecording	processdiscovery	Allows users to delete their own recording.
viewallrecording	processdiscovery	Allows users to view all recordings.
editallrecording	processdiscovery	Allows users to edit all recordings.

## Aggregation permissions

Action	Resource Type	Description
viewmanualaggregation	processdiscovery	Allows users to view their own aggregations.
viewallaggregations	processdiscovery	Allows users to view all aggregations.
createdeletemanualaggregation	processdiscovery	Allows users to create and delete aggregations.
updatemanualaggregation	processdiscovery	Allows users to update aggregations.
viewssystemaggregation	processdiscovery	Allows users to view system aggregations.

## Opportunity permissions

Action	Resource Type	Description
viewopportunity	processdiscovery	Allows users to view opportunities within an assigned process.  <b>Note:</b> You must assign this permission before assigning any of the opportunity permissions.
editopportunity	processdiscovery	Allows users to edit opportunities within an assigned process.
viewalloppportunity	processdiscovery	Allows users to view all the opportunities.
createdeleteopportunity	processdiscovery	Allows users to create and delete opportunities within the assigned process.
converttobot	processdiscovery	Allows users to convert an opportunity to a bot.
exportopportunity	processdiscovery	Allows users to export an opportunity.

## Event triggers permissions

Enable users to run bots automatically depending on a specific event, such as a new window opening. You can limit users ability to only view or to view and manage triggers.

Action	Resource type	Description
view	eventtriggers	Allows users to view event triggers.
manage	eventtriggers	Allows users to view and manage event triggers.
managemytriggers	eventtriggers	Allows users to view and manage event triggers from their private repository, on their local devices.

Additionally, you must enable the view packages permission as well:

Action	Resource type	Description
view	packagemanager	Allows users to view packages

## IQ Bot permissions

Enable users to view IQ Bot permissions, create and manage learning instances, import and export domains, and manage IQ Bot configuration settings and migration.

### IQ Bot permissions

Action	Resource Type	Description
viewiqbot	iqbot	Allows you to view the default dashboards in the IQ Bot portal.  <b>Note:</b> You must assign this permission before assigning any of the permissions below.
view	iqbotpages	Allows to view the iqbot pages licensed
utilize	iqbotpages	Allows to utilize the iqbot pages licensed

### Learning instance permissions

Action	Resource Type	Description
viewlearninginstance	viewiqbot	Allows you to view their learning instances in the IQ Bot portal.  <b>Note:</b> You must assign this permission before assigning any other learning instance permission.
viewlearninginstancefromlearninginstance	viewlearninginstance	Allows you to view learning instances created by other you with the same role in the IQ Bot portal.
assignroletolearninginstance	viewlearninginstance	Allows you to assign some custom roles to a learning instance.
viewalllearninginstances	viewlearninginstance	Allows you to view all learning instances in the IQ Bot portal.
launchvalidator	viewlearninginstance	Allows you to access the IQ Bot Validator to review and update documents with exceptions.
createlearninginstance	viewlearninginstance	Allows you to create learning instances in the IQ Bot portal.
editlearninginstances	viewlearninginstance	Allows you to edit learning instances in the IQ Bot portal.

Action	Resource Type	Description
delelearninginstances	viewlearninginstance	Allows you to delete their learning instances in the IQ Bot portal.
sendlearninginstances	viewlearninginstance	Allows you to send their learning instances to production in the IQ Bot portal.
trainlearninginstances	viewlearninginstance	Allows you to train their learning instance groups in the IQ Bot portal.

## Domains permissions

Action	Resource Type	Description
viewdomain	viewiqbot	Allows you to view all domains in the IQ Bot portal.  <b>Note:</b> You must assign this permission before assigning any other domain permissions.
createdomains	viewdomain	Allows you to create domains in the IQ Bot portal.
editdomains	viewdomain	Allows you to edit domains in the IQ Bot portal.
importdomains	viewdomain	Allows you to import domains in the IQ Bot portal.
exportdomains	viewdomain	Allows you to export domains in the IQ Bot portal.
deletedomains	viewdomain	Allows you to delete domains in the IQ Bot portal.

## Administration permissions

Action	Resource Type	Description
viewadministration	viewiqbot	Allows you to access the <b>Administration</b> tab in the IQ Bot portal.  <b>Note:</b> You must assign this permission before assigning any other administration permissions.
viewandmanagesettings	viewadministration	Allows you to manage the IQ Bot portal advanced configuration settings.
viewandmanagemigration	viewadministration	Allows you to access the migration utility to import and export learning instances in the IQ Bot portal.

## MetaBot permission

MetaBots are obsolete in Automation 360. However, this permission is valid to ensure that all functionality previously available is supported in Automation 360.

Access to MetaBot Designer

Permission/feature ID is not available.

Bot Creator users can access MetaBot Designer to view, create, and update MetaBots.

---

**Note:** This feature is available for internal use only.

---

## Package manager permissions

Enable users to view and manage packages.

Action	Resource Type	Description
view	packagemanager	Allows you to view packages.
manage	packagemanager	Allows you to view and manage packages.

## Workload permissions

Enable you to create and manage workitems, workitem models, queues, and automations in the Control Room.

Action	Resource Type	Description
myschedule	taskscheduling	Allows you to view and manage their own schedules.
create	queue	Allows you to create and manage their own queues.

---

**Note:** A user with the `AAE_Queue Admin` role has all the above permissions. In addition, the `AAE_Queue Admin` is able to manage all the queues in the Control Room. See [System-created roles](#) on page 4226.

---

## How to find a migration journalid

Migrations can have more than one journalid. You can find the journalid in the response of a results list for a specific migration id.

In this request, we searched for results for the migration with the id 16.

```
<your_control_room_url>/v3/migration/16/results/list
```

The request returned the id in each object list as the journalid. In this example, there are two journal identifiers, 30 and 31, for the migration id 16.

```
{
 "page": {
 "offset": 0,
 "total": 2,
 "totalFilter": 2
 },
 "list": [
 {
 "sourceId": 12,
 "sourceName": "Dependency of IGN-23437.mbot",
 "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
\\Dependency of IGN-23437.mbot",
 "sourceType": "application/vnd.aa.mbot",
 "targetId": 0,
 "status": "FAILED",
 "reason": "The logic IGN-23437 has some commands or actions
which are not yet supported for migration.",
 "selectedByUser": true,
 "userId": 9,
 "id": 30,
 "targetName": "",
 "targetPath": "",
 "targetType": ""
 },
 {
 "sourceId": 12,
 "sourceName": "Dependency of IGN-23437.mbot",
 "sourcePath": "Automation Anywhere\\Bots\\My MetaBots\\
\\Dependency of IGN-23437.mbot",
 "sourceType": "application/vnd.aa.mbot",
 "targetId": 0,
 "status": "FAILED",
 "reason": "Migration of MetaBot failed.",
 "selectedByUser": false,
 "userId": 9,
 "id": 31,
 "targetName": "",
 "targetPath": "",
 "targetType": ""
 }
]
}
```

You can use the migration id and journal id in an action mapping request.

```
<your_control_room_url>/v3/migration/16/journal/31/actionmappings/list
```

## Using Auto registration API

Automatically register and connect your device to a Control Room by using the Auto registration API.

This API uses the generic registration token from the `autoregistration.properties` file to register the device in the specified Control Room URL. You cannot autoregister the device

if the Control Room URL is not available in the `autoregistration.properties` file. The `autoregistration.properties` file must be available on your local system, and you must not delete the file after the registration is complete.

**Note:** To register the device from the command line or API, you must set the `AA_DELAY_REGISTRATION_UNTIL_LOGIN` MSI parameter. You can enable this parameter in the `Bot Agent` MSI file or in the `autoregistration.properties` file. For more information, see [Bulk install Bot Agent on devices](#) on page 1458. You can also view a sample `autoregistration.properties` file in the bulk install topic.

## Request

```
POST http://127.0.0.1:22113/v1/registration/auto
```

Request body:

```
{
 "url": "https://{controlroom url}",
 "userName": "dpcreator"
}
```

## Request parameters

Parameter	Type	Required	Description
url	String	Yes	Specify the Control Room URL to autoregister the device.
userName	String	No	Specify the Control Room user to associate the device as the default device.

## Response

```
{
 "result": "REGISTERED",
 "deviceId": "11",
 "crUrl": "control_room_url",
 "userName": "dpcreator",
 "installationType": "SYSTEM_WIDE",
 "crSwitchAllowed": "false",
}
```

## Response parameters

Parameter	Type	Description
result	String	Status of the device registration.

---

Parameter	Type	Description
deviceId	Number	Unique ID of the device the Bot Agent is installed on.
crUrl	String	The Control Room URL where the device is autoregistered.
userName	String	The username for which the device is associated as default device.
installationType	String	The type of installation that is performed.
crSwitchAllowed	String	Indicates whether the device can be registered on a different Control Room.

The REST API responds to each request with an HTTP response code. For response codes, see [API response codes](#) on page 4220.
