Process Discovery version 1.79.0 release notes

Review the new features, enhancement, and fixes available in this release.

Release Date: [14-December-2023](#)

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: [Process Discovery documentation \(release versions\)](#).

What's changed

Enhanced account properties

In Process Discovery currently, an account is specified by an email address, which can only be linked to a specific tenant in a region.

With this release, we are enabling user accounts to have log-in with a username instead of an email address. Usernames will still require to be unique within a tenant and region, but the same email address can now be re-used across tenants. From this release onward, all new user accounts will be created with a username and password. For existing users, the email address has been set as the username.

Here's is a list of impacted Process Discovery log-in scenarios:

- **Current user log-in:** For any account created prior to this release, the account's email address is now mapped to the new **Username** field for that account. From this release, all current users would use their email address for the **Username** field to log-in.
- **New user log-in:** When new users log-in, they would see the **Username** and **Password** fields to enter their log-in credentials, instead of the **Email** and **Password** fields.
- **Create new user:** When creating a new user, users will now be asked to create a **Username** and **Password**. While the username must be unique for a tenant and region, the email address field provided when creating a user does not have to be unique across a tenant or region.
- **Edit user :** When editing an existing user account, users can update their email address, first, and last name fields.
- **User log-in validation:** While logging in to a tenant, if the log-in credentials are incorrect, the user would see a message saying that either the username or password is incorrect.
- **Forgot password:** If a user forgets their log-in password, they would get a log-in reset screen with a **Username** field, instead of an **Email** field; and an updated message saying *'If your Username is valid, a password reset link will be sent to your associated email address'*.

 **Note:** These enhancements will not impact the existing users.

Fixes

An Admin user gets created in Kibana when converting from a non-admin role

You can now successfully convert non-admin accounts to admin accounts in Kibana and the system will update the role and create a new admin account for that user. Earlier, converting a non-admin account to an admin account was not updating the user role, hence an admin account was not getting created.

Number of processes and paths in the Create a Mining Run > Advanced tab is now limited

When defining the process and path parameters for creating a new mining run, you can now limit the **NUMBER OF PROCESSES** to 50, and the **NUMBER OF PATHS** to 100. Earlier you could define up to 999 processes and paths.
