Process Discovery v.1.80 release notes

Review what's changed, fixes, and limitations in Process Discovery for the v.1.80 release.

Release Date: 31-January-2024

For information related to features and fixes in previous Process Discovery releases, see the PDFs for these releases: Process Discovery documentation (release versions).

What's changed

Corresponding step number label for Process Definition Documents (PDD) screenshots

With this enhancement, as a developer viewing the Process Definition Documents (PDD), you can now easily identify the associated step in the screenshot, and understand how it maps to the process. The step number label for each screenshot makes it easy to reference.

Process Discovery Platform enhancements

In this release, we have made several enhancements across the Process Discovery Platform to improve performance as follows:

- underlying infrastructure enhancements to improve data retrieval of your observer and cycle data
- efficient performance scaling during peak load times across regions

Fixes

Export Process as .csv working as expected

When you select the **Export Process as .csv** option for a process without an associated mining run, the csv is downloading as expected. Earlier, this option was working intermittently.

Processes created in the Explore a Process screen render properly in the Instance Viewer

When creating a new process or a sub-process (for an existing process), or duplicating a process from the **Explore a Process** page, the processes were not rendering in the **Instance Viewer**. This feature is now working as expected, and you can view all processes in the **Instance Viewer**.

Limitations

In the **Data** > **Mining Run** > **Processes** column, clicking the '+' icon does not always expand the drop-down list but instead, displays a server error message.
